# LAMMPS DOCUMENTATION

<b>I</b>	<b>User Guide</b>	<b>3</b>
<b>1</b>	<b>Introduction</b>	<b>5</b>
1.1	Overview of LAMMPS	5
1.2	What does a LAMMPS version mean	6
1.3	LAMMPS features	6
1.3.1	General features	7
1.3.2	Particle and model types	7
1.3.3	Interatomic potentials (force fields)	8
1.3.4	Atom creation	9
1.3.5	Ensembles, constraints, and boundary conditions	9
1.3.6	Integrators	9
1.3.7	Diagnostics	10
1.3.8	Output	10
1.3.9	Multi-replica models	10
1.3.10	Pre- and post-processing	10
1.3.11	Specialized features	11
1.4	LAMMPS non-features	11
1.5	LAMMPS open-source license	12
1.5.1	GPL version of LAMMPS	12
1.5.2	LGPL version of LAMMPS	13
1.6	Authors of LAMMPS	13
1.7	Citing LAMMPS	14
1.7.1	Core Algorithms	14
1.7.2	DOI for the LAMMPS source code	15
1.7.3	Home page	15
1.7.4	Citing contributions	15
1.8	Additional website links	15
<b>2</b>	<b>Install LAMMPS</b>	<b>17</b>
2.1	Download an executable for Linux	17
2.1.1	Pre-built Ubuntu Linux executables	18
2.1.2	Pre-built Fedora Linux executables	18
2.1.3	Pre-built EPEL Linux executable	19
2.1.4	Pre-built OpenSuse Linux executable	19
2.1.5	Gentoo Linux executable	20
2.1.6	Archlinux build-script	20
2.2	Download an executable for Mac	20
2.3	Download an executable for Windows	21
2.4	Download an executable for Linux or Mac via Conda	22
2.5	Download source and documentation as a tarball	22

2.6	Download the LAMMPS source with git	23
<b>3</b>	<b>Build LAMMPS</b>	<b>27</b>
3.1	Build LAMMPS with CMake	27
3.1.1	Advantages of using CMake	27
3.1.2	Getting started	28
3.1.3	Configuration and build options	29
3.1.4	Multi-configuration build systems	29
3.1.5	Installing CMake	29
3.2	Build LAMMPS with make	30
3.2.1	Requirements	30
3.2.2	Getting started	30
3.2.3	Customized builds and alternate makefiles	31
3.3	Link LAMMPS as a library to another code	31
3.3.1	Link with LAMMPS as a static library	32
3.3.2	Link with LAMMPS as a shared library	33
3.4	Basic build options	35
3.4.1	Serial vs parallel build	35
3.4.2	Choice of compiler and compile/link options	37
3.4.3	Build the LAMMPS executable and library	39
3.4.4	Including or removing debug support	41
3.4.5	Build LAMMPS tools	41
3.4.6	Install LAMMPS after a build	42
3.5	Optional build settings	42
3.5.1	C++11 standard compliance	43
3.5.2	FFT library	43
3.5.3	Size of LAMMPS integer types and size limits	45
3.5.4	Output of JPG, PNG, and movie files	46
3.5.5	Read or write compressed files	47
3.5.6	Memory allocation alignment	48
3.5.7	Workaround for long long integers	48
3.5.8	Exception handling when using LAMMPS as a library	49
3.5.9	Trigger selected floating-point exceptions	49
3.6	Include packages in build	50
3.6.1	Information for both build systems	51
3.6.2	CMake presets for installing many packages	52
3.6.3	Make shortcuts for installing many packages	53
3.7	Packages with extra build options	54
3.7.1	COMPRESS package	54
3.7.2	GPU package	55
3.7.3	KIM package	58
3.7.4	KOKKOS package	60
3.7.5	LATTE package	64
3.7.6	ML-IAP package	65
3.7.7	MSCG package	65
3.7.8	OPT package	66
3.7.9	POEMS package	66
3.7.10	PYTHON package	67
3.7.11	VORONOI package	68
3.7.12	ADIOS package	68
3.7.13	ATC package	69
3.7.14	AWPMD package	70
3.7.15	COLVARS package	71
3.7.16	ELECTRODE package	72

3.7.17	ML-PACE package	72
3.7.18	PLUMED package	73
3.7.19	H5MD package	74
3.7.20	ML-HDNNP package	75
3.7.21	INTEL package	76
3.7.22	MDI package	77
3.7.23	MESONT package	77
3.7.24	MOLFILE package	78
3.7.25	NETCDF package	78
3.7.26	OPENMP package	79
3.7.27	QMMM package	79
3.7.28	ML-QUIP package	80
3.7.29	SCAFACOS package	81
3.7.30	MACHDYN package	82
3.7.31	VTK package	82
3.8	Build the LAMMPS documentation	83
3.8.1	Build using GNU make	83
3.8.2	Build using CMake	84
3.8.3	Prerequisites for HTML	84
3.8.4	Prerequisites for PDF	85
3.8.5	Prerequisites for ePUB and MOBI	85
3.8.6	Instructions for Developers	85
3.9	Notes for building LAMMPS on Windows	86
3.9.1	General remarks	87
3.9.2	Running Linux on Windows	87
3.9.3	Using a GNU GCC ported to Windows	87
3.9.4	Using Microsoft Visual Studio	87
3.9.5	Using Intel oneAPI Compilers and Libraries	88
3.9.6	Using a cross-compiler	89
3.10	Notes for saving disk space when building LAMMPS from source	89
3.11	Development build options	90
3.11.1	Monitor compilation flags (CMake only)	90
3.11.2	Enable static code analysis with clang-tidy (CMake only)	90
3.11.3	Report missing and unneeded '#include' statements (CMake only)	90
3.11.4	Address, Undefined Behavior, and Thread Sanitizer Support (CMake only)	91
3.11.5	Code Coverage and Unit Testing (CMake only)	91
3.11.6	Coding style utilities	96
3.11.7	Clang-format support	96
<b>4</b>	<b>Run LAMMPS</b>	<b>97</b>
4.1	Basics of running LAMMPS	97
4.2	Command-line options	98
4.3	Screen and logfile output	106
4.4	Running LAMMPS on Windows	108
<b>5</b>	<b>Commands</b>	<b>111</b>
5.1	LAMMPS input scripts	111
5.2	Parsing rules for input scripts	112
5.3	Input script structure	114
5.3.1	Initialization	115
5.3.2	System definition	115
5.3.3	Simulation settings	115
5.3.4	Run a simulation	115
5.4	Commands by category	115

5.4.1	Initialization:	116
5.4.2	Setup simulation box:	116
5.4.3	Setup atoms:	116
5.4.4	Force fields:	116
5.4.5	Settings:	116
5.4.6	Operations within timestepping (fixes) and diagnostics (computes):	116
5.4.7	Output:	117
5.4.8	Actions:	117
5.4.9	Input script control:	117
5.5	General commands	117
5.6	Fix commands	118
5.7	Compute commands	119
5.8	Pair_style potentials	120
5.9	Bond_style potentials	122
5.10	Angle_style potentials	122
5.11	Dihedral_style potentials	122
5.12	Improper_style potentials	123
5.13	KSpace solvers	123
5.14	Dump commands	123
5.15	Removed commands and packages	124
5.15.1	Fix ave/spatial and fix ave/spatial/sphere	124
5.15.2	Reset_ids command	124
5.15.3	MEAM package	124
5.15.4	REAX package	124
5.15.5	USER-CUDA package	124
5.15.6	restart2data tool	124
<b>6</b>	<b>Optional packages</b>	<b>125</b>
6.1	Available Packages	125
6.2	Package details	127
6.2.1	ADIOS package	128
6.2.2	AMOEBA package	129
6.2.3	ASPHERE package	129
6.2.4	ATC package	130
6.2.5	AWPMD package	130
6.2.6	BOCS package	130
6.2.7	BODY package	131
6.2.8	BPM package	131
6.2.9	BROWNIAN package	132
6.2.10	CG-DNA package	132
6.2.11	CG-SPICA package	133
6.2.12	CLASS2 package	133
6.2.13	COLLOID package	133
6.2.14	COLVARS package	134
6.2.15	COMPRESS package	134
6.2.16	CORESHELL package	135
6.2.17	DIELECTRIC package	135
6.2.18	DIFFRACTION package	136
6.2.19	DIPOLE package	136
6.2.20	DPD-BASIC package	137
6.2.21	DPD-MESO package	137
6.2.22	DPD-REACT package	138
6.2.23	DPD-SMOOTH package	138
6.2.24	DRUDE package	139

6.2.25	EFF package	139
6.2.26	ELECTRODE package	140
6.2.27	EXTRA-COMPUTE package	140
6.2.28	EXTRA-DUMP package	141
6.2.29	EXTRA-FIX package	141
6.2.30	EXTRA-MOLECULE package	141
6.2.31	EXTRA-PAIR package	141
6.2.32	FEP package	142
6.2.33	GPU package	142
6.2.34	GRANULAR package	143
6.2.35	H5MD package	143
6.2.36	INTEL package	144
6.2.37	INTERLAYER package	145
6.2.38	KIM package	145
6.2.39	KOKKOS package	146
6.2.40	KSPACE package	147
6.2.41	LATBOLTZ package	147
6.2.42	LATTE package	148
6.2.43	MACHDYN package	148
6.2.44	MANIFOLD package	149
6.2.45	MANYBODY package	149
6.2.46	MC package	150
6.2.47	MDI package	150
6.2.48	MEAM package	151
6.2.49	MESONT package	151
6.2.50	MGPT package	152
6.2.51	MISC package	152
6.2.52	ML-HDNNP package	153
6.2.53	ML-IAP package	153
6.2.54	ML-PACE package	154
6.2.55	ML-QUIP package	154
6.2.56	ML-RANN package	155
6.2.57	ML-SNAP package	155
6.2.58	MOFFF package	156
6.2.59	MOLECULE package	156
6.2.60	MOLFILE package	157
6.2.61	MPIIO package	157
6.2.62	MSCG package	158
6.2.63	NETCDF package	158
6.2.64	OPENMP package	159
6.2.65	OPT package	159
6.2.66	ORIENT package	160
6.2.67	PERI package	160
6.2.68	PHONON package	161
6.2.69	PLUGIN package	161
6.2.70	PLUMED package	162
6.2.71	POEMS package	162
6.2.72	PTM package	163
6.2.73	PYTHON package	163
6.2.74	QEQ package	163
6.2.75	QMMM package	164
6.2.76	QTB package	164
6.2.77	REACTION package	165
6.2.78	REAXFF package	165

6.2.79	REPLICA package	166
6.2.80	RIGID package	166
6.2.81	SCAFACOS package	167
6.2.82	SHOCK package	167
6.2.83	SMTBQ package	168
6.2.84	SPH package	168
6.2.85	SPIN package	169
6.2.86	SRD package	169
6.2.87	TALLY package	170
6.2.88	UEF package	170
6.2.89	VORONOI package	171
6.2.90	VTK package	171
6.2.91	YAFF package	172
<b>7</b>	<b>Accelerate performance</b>	<b>173</b>
7.1	Benchmarks	173
7.2	Measuring performance	174
7.3	General tips	175
7.4	Accelerator packages	176
7.4.1	GPU package	177
7.4.2	INTEL package	180
7.4.3	KOKKOS package	188
7.4.4	OPENMP package	194
7.4.5	OPT package	197
7.5	Comparison of various accelerator packages	200
<b>8</b>	<b>Howto discussions</b>	<b>203</b>
8.1	General howto	203
8.1.1	Restart a simulation	203
8.1.2	Visualize LAMMPS snapshots	204
8.1.3	Run multiple simulations from one input script	205
8.1.4	Multi-replica simulations	206
8.1.5	Library interface to LAMMPS	207
8.1.6	Coupling LAMMPS to other codes	207
8.1.7	Using LAMMPS with the MDI library for code coupling	208
8.1.8	Bonded particle models	210
8.1.9	Broken Bonds	211
8.2	Settings howto	212
8.2.1	2d simulations	212
8.2.2	Type labels	213
8.2.3	Triclinic (non-orthogonal) simulation boxes	214
8.2.4	Thermostats	217
8.2.5	Barostats	219
8.2.6	Walls	220
8.2.7	NEMD simulations	221
8.2.8	Long-range dispersion settings	221
8.3	Analysis howto	222
8.3.1	Output from LAMMPS (thermo, dumps, computes, fixes, variables)	222
8.3.2	Use chunks to calculate system properties	227
8.3.3	Calculate temperature	230
8.3.4	Calculate elastic constants	231
8.3.5	Calculate thermal conductivity	232
8.3.6	Calculate viscosity	232
8.3.7	Calculate diffusion coefficients	235

8.3.8	Output structured data from LAMMPS . . . . .	235
8.4	Force fields howto . . . . .	241
8.4.1	CHARMM, AMBER, COMPASS, and DREIDING force fields . . . . .	241
8.4.2	AMOEBA and HIPPO force fields . . . . .	243
8.4.3	TIP3P water model . . . . .	248
8.4.4	TIP4P water model . . . . .	249
8.4.5	SPC water model . . . . .	251
8.5	Packages howto . . . . .	252
8.5.1	Finite-size spherical and aspherical particles . . . . .	252
8.5.2	Granular models . . . . .	255
8.5.3	Body particles . . . . .	256
8.5.4	Polarizable models . . . . .	262
8.5.5	Adiabatic core/shell model . . . . .	263
8.5.6	Drude induced dipoles . . . . .	266
8.5.7	Tutorial for Thermalized Drude oscillators in LAMMPS . . . . .	267
8.5.8	Manifolds (surfaces) . . . . .	274
8.5.9	Magnetic spins . . . . .	275
8.6	Tutorials howto . . . . .	275
8.6.1	Using CMake with LAMMPS tutorial . . . . .	275
8.6.2	LAMMPS GitHub tutorial . . . . .	283
8.6.3	PyLammps Tutorial . . . . .	295
8.6.4	Using LAMMPS on Windows 10 with WSL . . . . .	308
<b>9</b>	<b>Example scripts . . . . .</b>	<b>319</b>
9.1	Lowercase directories . . . . .	319
9.2	Uppercase directories . . . . .	321
<b>10</b>	<b>Auxiliary tools . . . . .</b>	<b>323</b>
10.1	Pre-processing tools . . . . .	323
10.2	Post-processing tools . . . . .	323
10.3	Miscellaneous tools . . . . .	324
10.4	Tool descriptions . . . . .	324
10.4.1	amber2lmp tool . . . . .	324
10.4.2	binary2txt tool . . . . .	324
10.4.3	ch2lmp tool . . . . .	324
10.4.4	chain tool . . . . .	325
10.4.5	LAMMPS coding standard . . . . .	325
10.4.6	colvars tools . . . . .	325
10.4.7	createatoms tool . . . . .	326
10.4.8	drude tool . . . . .	326
10.4.9	eam database tool . . . . .	326
10.4.10	eam generate tool . . . . .	326
10.4.11	eff tool . . . . .	327
10.4.12	emacs tool . . . . .	327
10.4.13	fep tool . . . . .	327
10.4.14	i-pi tool . . . . .	327
10.4.15	ipp tool . . . . .	327
10.4.16	kate tool . . . . .	328
10.4.17	LAMMPS shell . . . . .	328
10.4.18	lmp2arc tool . . . . .	331
10.4.19	lmp2cfg tool . . . . .	331
10.4.20	Magic patterns for the “file” command . . . . .	331
10.4.21	matlab tool . . . . .	332
10.4.22	micelle2d tool . . . . .	332

10.4.23	moltemplate tool	332
10.4.24	msi2lmp tool	332
10.4.25	Scripts for building LAMMPS when offline	333
10.4.26	phonon tool	334
10.4.27	polybond tool	334
10.4.28	pymol_asphere tool	335
10.4.29	python tool	335
10.4.30	replica tool	335
10.4.31	smd tool	335
10.4.32	spin tool	336
10.4.33	singularity/apptainer tool	336
10.4.34	stl_bin2txt tool	336
10.4.35	SWIG interface	336
10.4.36	vim tool	338
10.4.37	xmgrace tool	338
<b>11</b>	<b>Errors</b>	<b>339</b>
11.1	Common problems	339
11.2	Error and warning details	340
11.2.1	Unknown identifier in data file	341
11.3	Reporting bugs	341
11.4	Debugging crashes	341
11.4.1	Using the GDB debugger to get a stack trace	343
11.4.2	Using valgrind to get a stack trace	344
11.5	Error messages	345
11.6	Warning messages	469
<b>II</b>	<b>Programmer Guide</b>	<b>483</b>
<b>12</b>	<b>LAMMPS Library Interfaces</b>	<b>485</b>
12.1	LAMMPS C Library API	485
12.1.1	Creating or deleting a LAMMPS object	486
12.1.2	Executing commands	491
12.1.3	System properties	493
12.1.4	Per-atom properties	503
12.1.5	Compute, fixes, variables	504
12.1.6	Scatter/gather operations	509
12.1.7	Neighbor list access	512
12.1.8	Configuration information	514
12.1.9	Utility functions	521
12.1.10	Extending the C API	528
12.2	LAMMPS Python APIs	529
12.3	LAMMPS Fortran API	529
12.3.1	The LIBLAMMPS Fortran Module	529
12.3.2	Creating or deleting a LAMMPS object	530
12.3.3	The LIBLAMMPS module API	532
12.4	LAMMPS C++ API	533
12.4.1	Using the C++ API directly	533
12.4.2	Creating or deleting a LAMMPS object	533
12.4.3	Executing LAMMPS commands	534
<b>13</b>	<b>Use Python with LAMMPS</b>	<b>535</b>
13.1	Overview	535

13.2	Installation	537
13.2.1	Installing the LAMMPS Python Module and Shared Library	537
13.2.2	Extending Python to run in parallel	543
13.3	Run LAMMPS from Python	544
13.3.1	Running LAMMPS and Python in serial	545
13.3.2	Running LAMMPS and Python in parallel with MPI	545
13.3.3	Running Python scripts	546
13.3.4	Creating or deleting a LAMMPS object	546
13.3.5	Executing commands	548
13.3.6	System properties	550
13.3.7	Per-atom properties	552
13.3.8	Compute, fixes, variables	553
13.3.9	Scatter/gather operations	555
13.3.10	Neighbor list access	556
13.3.11	Configuration information	557
13.4	The <code>lammops</code> Python module	558
13.4.1	The <code>lammops</code> class API	558
13.4.2	The <code>PyLammops</code> class API	577
13.4.3	The <code>IPyLammops</code> class API	582
13.4.4	Additional components of the <code>lammops</code> module	583
13.5	Extending the Python interface	585
13.6	Calling Python from LAMMPS	586
13.7	Output Readers	586
13.8	Example Python scripts	587
13.9	Handling LAMMPS errors	588
13.10	Troubleshooting	589
13.10.1	Testing if Python can launch LAMMPS	589
<b>14</b>	<b>Modifying &amp; extending LAMMPS</b>	<b>591</b>
14.1	Overview	591
14.2	Submitting new features for inclusion in LAMMPS	592
14.2.1	Communication with the LAMMPS developers	593
14.2.2	Packages versus individual files	593
14.2.3	Time and effort required	593
14.2.4	Submission procedure	593
14.2.5	Licensing	594
14.2.6	External contributions	594
14.3	LAMMPS programming style and requirements for contributions	594
14.3.1	Motivation	594
14.3.2	Licensing requirements (strict)	595
14.3.3	Using Pull Requests on GitHub (preferred)	595
14.3.4	Integration Testing (strict)	595
14.3.5	Documentation (strict)	596
14.3.6	Examples (preferred)	596
14.3.7	Howto document (optional)	597
14.3.8	Programming Style Requirements (varied)	597
14.3.9	Contributing a package	601
14.3.10	Build system (strongly preferred)	601
14.3.11	Citation reminder (suggested)	601
14.3.12	Testing (optional)	601
14.4	Atom styles	602
14.5	Pair styles	604
14.6	Bond, angle, dihedral, improper styles	604
14.7	Compute styles	605

14.8	Fix styles	606
14.9	Input script command style	607
14.10	Dump styles	608
14.11	Kspace styles	608
14.12	Minimization styles	608
14.13	Region styles	609
14.14	Body styles	609
14.15	Thermodynamic output options	609
14.16	Variable options	610
<b>15</b>	<b>Information for Developers</b>	<b>611</b>
15.1	Source files	611
15.2	Class topology	612
15.3	Code design	615
15.3.1	Object oriented code	615
15.3.2	I/O and output formatting	619
15.3.3	Memory management	620
15.4	Parallel algorithms	621
15.4.1	Partitioning	621
15.4.2	Communication	622
15.4.3	Neighbor lists	624
15.4.4	Long-range interactions	626
15.4.5	OpenMP Parallelism	628
15.5	Communication patterns	630
15.5.1	Owned and ghost atoms	630
15.5.2	Higher level communication	631
15.6	How a timestep works	633
15.7	Writing new styles	636
15.7.1	Writing a new fix style	636
15.8	Notes for developers and code maintainers	640
15.8.1	Reading and parsing of text and text files	640
15.8.2	Requesting and accessing neighbor lists	641
15.8.3	Fix contributions to instantaneous energy, virial, and cumulative energy	643
15.8.4	KSpace PPPM FFT grids	644
15.9	Notes for updating code written for older LAMMPS versions	646
15.9.1	Setting flags in the constructor	646
15.9.2	Rename of pack/unpack_comm() to pack/unpack_forward_comm()	646
15.9.3	Use ev_init() to initialize variables derived from eflag and vflag	647
15.9.4	Use utils::numeric() functions instead of force->numeric()	648
15.9.5	Use utils::open_potential() function to open potential files	648
15.9.6	Simplify customized error messages	648
15.9.7	Use of “override” instead of “virtual”	649
15.9.8	Simplified function names for forward and reverse communication	649
15.9.9	Simplified and more compact neighbor list requests	650
15.9.10	Split of fix STORE into fix STORE/GLOBAL and fix STORE/PERATOM	650
15.9.11	Use Output::get_dump_by_id() instead of Output::find_dump()	651
15.10	Writing plugins	652
15.10.1	Members of lammpsplugin_t	653
15.10.2	Pair style example	653
15.10.3	Fix style example	654
15.10.4	Command style example	654
15.10.5	Additional Details	655
15.10.6	Compiling plugins	656
15.11	Adding tests for unit testing	656

15.11.1	Tests for utility functions	657
15.11.2	Tests for individual LAMMPS commands	658
15.11.3	Tests for the C-style library interface	659
15.11.4	Tests for the Python module and package	660
15.11.5	Tests for the Fortran interface	660
15.11.6	Tests for the C++-style library interface	660
15.11.7	Tests for reading and writing file formats	660
15.11.8	Tests for styles computing or modifying forces	660
15.11.9	Tests for programs in the tools folder	663
15.12	C++ base classes	663
15.12.1	LAMMPS Class	664
15.12.2	LAMMPS Atom and AtomVec Base Classes	665
15.12.3	LAMMPS Input Base Class	668
15.13	Platform abstraction functions	669
15.13.1	Time functions	669
15.13.2	Platform information functions	670
15.13.3	File and path functions and global constants	671
15.13.4	Standard I/O function wrappers	674
15.13.5	Environment variable functions	675
15.13.6	Dynamically loaded object or library functions	676
15.13.7	Compressed file I/O functions	676
15.14	Utility functions	677
15.14.1	I/O with status check and similar functions	677
15.14.2	String to number conversions with validity check	679
15.14.3	String processing	682
15.14.4	Potential file functions	687
15.14.5	Argument processing	688
15.14.6	Convenience functions	690
15.14.7	Customized standard functions	692
15.15	Special Math functions	692
15.16	Tokenizer classes	694
15.17	Argument parsing classes	699
15.18	File reader classes	702
15.19	Memory pool classes	706
15.20	Eigensolver functions	710
15.21	Communication buffer coding with <i>ubuf</i>	711

### III Command Reference

713

#### 16 Commands

715

16.1	angle_coeff command	715
16.1.1	Syntax	715
16.1.2	Examples	715
16.1.3	Description	715
16.1.4	Restrictions	716
16.1.5	Related commands	716
16.1.6	Default	716
16.2	angle_style command	716
16.2.1	Syntax	716
16.2.2	Examples	717
16.2.3	Description	717
16.2.4	Restrictions	718
16.2.5	Related commands	718

16.2.6	Default	718
16.3	atom_modify command	718
16.3.1	Syntax	718
16.3.2	Examples	719
16.3.3	Description	719
16.3.4	Restrictions	720
16.3.5	Related commands	720
16.3.6	Default	721
16.4	atom_style command	721
16.4.1	Syntax	721
16.4.2	Examples	721
16.4.3	Description	722
16.4.4	Restrictions	725
16.4.5	Related commands	726
16.4.6	Default	726
16.5	balance command	726
16.5.1	Syntax	726
16.5.2	Examples	727
16.5.3	Description	727
16.5.4	Restrictions	733
16.5.5	Related commands	733
16.5.6	Default	733
16.6	bond_coeff command	733
16.6.1	Syntax	733
16.6.2	Examples	733
16.6.3	Description	734
16.6.4	Restrictions	734
16.6.5	Related commands	734
16.6.6	Default	735
16.7	bond_style command	735
16.7.1	Syntax	735
16.7.2	Examples	735
16.7.3	Description	735
16.7.4	Restrictions	737
16.7.5	Related commands	737
16.7.6	Default	737
16.8	bond_write command	737
16.8.1	Syntax	737
16.8.2	Examples	737
16.8.3	Description	737
16.8.4	Restrictions	738
16.8.5	Related commands	738
16.8.6	Default	738
16.9	boundary command	738
16.9.1	Syntax	738
16.9.2	Examples	738
16.9.3	Description	739
16.9.4	Restrictions	740
16.9.5	Related commands	740
16.9.6	Default	740
16.10	box command	740
16.10.1	Syntax	740
16.10.2	Examples	740
16.10.3	Description	740

16.10.4	Restrictions	741
16.10.5	Related commands	741
16.10.6	Default	741
16.11	change_box command	741
16.11.1	Syntax	741
16.11.2	Examples	742
16.11.3	Description	742
16.11.4	Restrictions	745
16.11.5	Related commands	745
16.11.6	Default	746
16.12	clear command	746
16.12.1	Syntax	746
16.12.2	Examples	746
16.12.3	Description	746
16.12.4	Restrictions	746
16.12.5	Related commands	746
16.12.6	Default	746
16.13	comm_modify command	747
16.13.1	Syntax	747
16.13.2	Examples	747
16.13.3	Description	747
16.13.4	Restrictions	749
16.13.5	Related commands	749
16.13.6	Default	749
16.14	comm_style command	749
16.14.1	Syntax	749
16.14.2	Examples	750
16.14.3	Description	750
16.14.4	Restrictions	750
16.14.5	Related commands	750
16.14.6	Default	750
16.15	compute command	750
16.15.1	Syntax	750
16.15.2	Examples	751
16.15.3	Description	751
16.15.4	Restrictions	757
16.15.5	Related commands	757
16.15.6	Default	757
16.16	compute_modify command	757
16.16.1	Syntax	757
16.16.2	Examples	758
16.16.3	Description	758
16.16.4	Restrictions	758
16.16.5	Related commands	758
16.16.6	Default	758
16.17	create_atoms command	758
16.17.1	Syntax	758
16.17.2	Examples	760
16.17.3	Description	760
16.17.4	Restrictions	765
16.17.5	Related commands	765
16.17.6	Default	765
16.18	create_bonds command	765
16.18.1	Syntax	765

16.18.2	Examples	766
16.18.3	Description	766
16.18.4	Restrictions	768
16.18.5	Related commands	768
16.18.6	Default	768
16.19	create_box command	768
16.19.1	Syntax	768
16.19.2	Examples	769
16.19.3	Description	769
16.19.4	Restrictions	770
16.19.5	Related commands	770
16.19.6	Default	770
16.20	delete_atoms command	770
16.20.1	Syntax	770
16.20.2	Examples	771
16.20.3	Description	771
16.20.4	Restrictions	773
16.20.5	Related commands	773
16.20.6	Default	773
16.21	delete_bonds command	773
16.21.1	Syntax	773
16.21.2	Examples	774
16.21.3	Description	774
16.21.4	Restrictions	775
16.21.5	Related commands	775
16.21.6	Default	775
16.22	dielectric command	775
16.22.1	Syntax	775
16.22.2	Examples	776
16.22.3	Description	776
16.22.4	Restrictions	776
16.22.5	Related commands	776
16.22.6	Default	776
16.23	dihedral_coeff command	776
16.23.1	Syntax	776
16.23.2	Examples	776
16.23.3	Description	777
16.23.4	Restrictions	778
16.23.5	Related commands	778
16.23.6	Default	778
16.24	dihedral_style command	778
16.24.1	Syntax	778
16.24.2	Examples	778
16.24.3	Description	778
16.24.4	Restrictions	780
16.24.5	Related commands	780
16.24.6	Default	780
16.25	dimension command	780
16.25.1	Syntax	780
16.25.2	Examples	780
16.25.3	Description	780
16.25.4	Restrictions	781
16.25.5	Related commands	781
16.25.6	Default	781

16.26	displace_atoms command	781
16.26.1	Syntax	781
16.26.2	Examples	782
16.26.3	Description	782
16.26.4	Restrictions	783
16.26.5	Related commands	783
16.26.6	Default	783
16.27	dump command	783
16.28	dump vtk command	783
16.29	dump h5md command	783
16.30	dump molfile command	783
16.31	dump netcdf command	783
16.32	dump image command	783
16.33	dump movie command	783
16.34	dump atom/adios command	783
16.35	dump custom/adios command	783
16.36	dump cfg/uef command	783
16.36.1	Syntax	783
16.36.2	Examples	786
16.36.3	Description	786
16.36.4	Restrictions	793
16.36.5	Related commands	794
16.36.6	Default	794
16.37	dump atom/adios command	794
16.38	dump custom/adios command	794
16.38.1	Syntax	794
16.38.2	Examples	794
16.38.3	Description	794
16.38.4	Restrictions	795
16.38.5	Related commands	795
16.39	dump cfg/uef command	795
16.39.1	Syntax	795
16.39.2	Examples	795
16.39.3	Description	796
16.39.4	Restrictions	796
16.39.5	Related commands	796
16.39.6	Default	796
16.40	dump h5md command	796
16.40.1	Syntax	796
16.40.2	Examples	797
16.40.3	Description	797
16.40.4	Restrictions	798
16.40.5	Related commands	798
16.41	dump image command	798
16.42	dump movie command	798
16.42.1	Syntax	798
16.43	dump_modify options for dump image/movie	800
16.43.1	Syntax	800
16.43.2	Examples	801
16.43.3	Description	801
16.43.4	Dump_modify keywords for dump image and dump movie	807
16.43.5	Restrictions	810
16.43.6	Related commands	811
16.43.7	Default	811

16.44	dump_modify command	814
16.45	dump_modify command for image/movie options	814
16.45.1	Syntax	814
16.45.2	Examples	816
16.45.3	Description	816
16.45.4	Restrictions	825
16.45.5	Related commands	825
16.45.6	Default	825
16.46	dump molfile command	826
16.46.1	Syntax	826
16.46.2	Examples	826
16.46.3	Description	826
16.46.4	Restrictions	827
16.46.5	Related commands	827
16.46.6	Default	827
16.47	dump netcdf command	828
16.48	dump netcdf/mpiio command	828
16.48.1	Syntax	828
16.48.2	Examples	828
16.48.3	Description	828
16.48.4	Restrictions	829
16.48.5	Related commands	829
16.49	dump vtk command	829
16.49.1	Syntax	829
16.49.2	Examples	829
16.49.3	Description	829
16.49.4	Restrictions	831
16.49.5	Related commands	831
16.49.6	Default	831
16.50	dynamical_matrix command	831
16.50.1	Syntax	831
16.50.2	Examples	832
16.50.3	Description	832
16.50.4	Restrictions	832
16.50.5	Related commands	833
16.50.6	Default	833
16.51	echo command	833
16.51.1	Syntax	833
16.51.2	Examples	833
16.51.3	Description	833
16.51.4	Restrictions	833
16.51.5	Related commands	833
16.51.6	Default	834
16.52	fix command	834
16.52.1	Syntax	834
16.52.2	Examples	834
16.52.3	Description	834
16.52.4	Restrictions	843
16.52.5	Related commands	843
16.52.6	Default	843
16.53	fix_modify command	843
16.53.1	Syntax	843
16.53.2	Examples	844
16.53.3	Description	844

16.53.4	Restrictions	846
16.53.5	Related commands	846
16.53.6	Default	846
16.54	group command	846
16.54.1	Syntax	846
16.54.2	Examples	847
16.54.3	Description	847
16.54.4	Restrictions	850
16.54.5	Related commands	850
16.54.6	Default	850
16.55	group2ndx command	850
16.56	ndx2group command	850
16.56.1	Syntax	850
16.56.2	Examples	851
16.56.3	Description	851
16.56.4	Restrictions	851
16.56.5	Related commands	851
16.56.6	Default	851
16.57	hyper command	851
16.57.1	Syntax	851
16.57.2	Examples	852
16.57.3	Description	852
16.57.4	Restrictions	854
16.57.5	Related commands	854
16.57.6	Default	854
16.58	if command	854
16.58.1	Syntax	854
16.58.2	Examples	854
16.58.3	Description	855
16.58.4	Restrictions	857
16.58.5	Related commands	857
16.58.6	Default	857
16.59	improper_coeff command	857
16.59.1	Syntax	857
16.59.2	Examples	857
16.59.3	Description	858
16.59.4	Restrictions	858
16.59.5	Related commands	858
16.59.6	Default	859
16.60	improper_style command	859
16.60.1	Syntax	859
16.60.2	Examples	859
16.60.3	Description	859
16.60.4	Restrictions	860
16.60.5	Related commands	860
16.60.6	Default	860
16.61	include command	860
16.61.1	Syntax	860
16.61.2	Examples	861
16.61.3	Description	861
16.61.4	Restrictions	861
16.61.5	Related commands	861
16.61.6	Default	861
16.62	info command	861

16.62.1	Syntax	861
16.62.2	Examples	862
16.62.3	Description	862
16.62.4	Restrictions	863
16.62.5	Related commands	863
16.62.6	Default	863
16.63	jump command	863
16.63.1	Syntax	863
16.63.2	Examples	864
16.63.3	Description	864
16.63.4	Restrictions	865
16.63.5	Related commands	865
16.63.6	Default	865
16.64	kim command	866
16.64.1	Syntax	866
16.64.2	Examples	866
16.64.3	Description	866
16.64.4	Using OpenKIM IMs with LAMMPS ( <i>kim init, kim interactions</i> )	867
16.64.5	Using OpenKIM Web Queries in LAMMPS ( <i>kim query</i> )	871
16.64.6	Accessing KIM Model Parameters from LAMMPS ( <i>kim param</i> )	874
16.64.7	Writing material properties in standard KIM Property Instance format ( <i>kim property</i> )	878
16.64.8	Citation of OpenKIM IMs	884
16.64.9	Restrictions	884
16.64.10	Related commands	884
16.65	kspace_modify command	884
16.65.1	Syntax	884
16.65.2	Examples	885
16.65.3	Description	886
16.65.4	Restrictions	890
16.65.5	Related commands	890
16.65.6	Default	890
16.66	kspace_style command	891
16.66.1	Syntax	891
16.66.2	Examples	892
16.66.3	Description	893
16.66.4	Restrictions	897
16.66.5	Related commands	897
16.66.6	Default	897
16.67	label command	898
16.67.1	Syntax	898
16.67.2	Examples	898
16.67.3	Description	898
16.67.4	Restrictions	898
16.67.5	Related commands	898
16.67.6	Default	899
16.68	labelmap command	899
16.68.1	Syntax	899
16.68.2	Examples	899
16.68.3	Description	899
16.68.4	Restrictions	900
16.68.5	Related commands	900
16.68.6	Default	900
16.69	lattice command	900
16.69.1	Syntax	900

16.69.2	Examples	901
16.69.3	Description	901
16.69.4	Restrictions	904
16.69.5	Related commands	904
16.69.6	Default	904
16.70	log command	904
16.70.1	Syntax	904
16.70.2	Examples	904
16.70.3	Description	904
16.70.4	Restrictions	905
16.70.5	Related commands	905
16.70.6	Default	905
16.71	mass command	905
16.71.1	Syntax	905
16.71.2	Examples	905
16.71.3	Description	905
16.71.4	Restrictions	906
16.71.5	Related commands	906
16.71.6	Default	906
16.72	mdi command	906
16.72.1	Syntax	906
16.72.2	Examples	907
16.72.3	Description	907
16.72.4	Restrictions	911
16.72.5	Related commands	911
16.72.6	Default	911
16.73	min_modify command	912
16.73.1	Syntax	912
16.73.2	Examples	912
16.73.3	Description	912
16.73.4	Restrictions	914
16.73.5	Related commands	914
16.73.6	Default	914
16.74	min_style spin command	914
16.75	min_style spin/cg command	914
16.76	min_style spin/lbfgs command	914
16.76.1	Syntax	914
16.76.2	Examples	914
16.76.3	Description	914
16.76.4	Restrictions	915
16.76.5	Related commands	915
16.76.6	Default	916
16.77	min_style cg command	916
16.78	min_style hftn command	916
16.79	min_style sd command	916
16.80	min_style quickmin command	916
16.81	min_style fire command	916
16.82	min_style fire/old command	916
16.83	min_style spin command	916
16.84	min_style spin/cg command	916
16.85	min_style spin/lbfgs command	916
16.85.1	Syntax	916
16.85.2	Examples	916
16.85.3	Description	917

16.85.4	Restrictions	918
16.85.5	Related commands	918
16.85.6	Default	918
16.86	minimize command	918
16.87	minimize/kk command	918
16.87.1	Syntax	918
16.87.2	Examples	919
16.87.3	Description	919
16.87.4	Restrictions	923
16.87.5	Related commands	923
16.87.6	Default	923
16.88	molecule command	923
16.88.1	Syntax	923
16.88.2	Examples	924
16.88.3	Description	924
16.88.4	Restrictions	930
16.88.5	Related commands	931
16.88.6	Default	931
16.89	neb command	931
16.89.1	Syntax	931
16.89.2	Examples	931
16.89.3	Description	932
16.89.4	Restrictions	936
16.89.5	Related commands	936
16.89.6	Default	936
16.90	neb/spin command	936
16.90.1	Syntax	936
16.90.2	Examples	937
16.90.3	Description	937
16.90.4	Restrictions	941
16.90.5	Related commands	941
16.90.6	Default	941
16.91	neigh_modify command	941
16.91.1	Syntax	941
16.91.2	Examples	942
16.91.3	Description	942
16.91.4	Restrictions	944
16.91.5	Related commands	945
16.91.6	Default	945
16.92	neighbor command	945
16.92.1	Syntax	945
16.92.2	Examples	945
16.92.3	Description	945
16.92.4	Restrictions	946
16.92.5	Related commands	946
16.92.6	Default	946
16.93	newton command	947
16.93.1	Syntax	947
16.93.2	Examples	947
16.93.3	Description	947
16.93.4	Restrictions	947
16.93.5	Related commands	947
16.93.6	Default	948
16.94	next command	948

16.94.1	Syntax . . . . .	948
16.94.2	Examples . . . . .	948
16.94.3	Description . . . . .	948
16.94.4	Restrictions . . . . .	950
16.94.5	Related commands . . . . .	950
16.94.6	Default . . . . .	950
16.95	package command . . . . .	950
16.95.1	Syntax . . . . .	950
16.95.2	Examples . . . . .	952
16.95.3	Description . . . . .	952
16.95.4	Restrictions . . . . .	958
16.95.5	Related commands . . . . .	959
16.95.6	Default . . . . .	959
16.96	pair_coeff command . . . . .	959
16.96.1	Syntax . . . . .	959
16.96.2	Examples . . . . .	959
16.96.3	Description . . . . .	960
16.96.4	Restrictions . . . . .	961
16.96.5	Related commands . . . . .	961
16.96.6	Default . . . . .	961
16.97	pair_modify command . . . . .	962
16.97.1	Syntax . . . . .	962
16.97.2	Examples . . . . .	962
16.97.3	Description . . . . .	963
16.97.4	Restrictions . . . . .	966
16.97.5	Related commands . . . . .	966
16.97.6	Default . . . . .	966
16.98	pair_style command . . . . .	966
16.98.1	Syntax . . . . .	966
16.98.2	Examples . . . . .	966
16.98.3	Description . . . . .	966
16.98.4	Restrictions . . . . .	975
16.98.5	Related commands . . . . .	975
16.98.6	Default . . . . .	975
16.99	pair_write command . . . . .	975
16.99.1	Syntax . . . . .	975
16.99.2	Examples . . . . .	976
16.99.3	Description . . . . .	976
16.99.4	Restrictions . . . . .	976
16.99.5	Related commands . . . . .	976
16.99.6	Default . . . . .	977
16.100	partition command . . . . .	977
16.100.1	Syntax . . . . .	977
16.100.2	Examples . . . . .	977
16.100.3	Description . . . . .	977
16.100.4	Restrictions . . . . .	978
16.100.5	Related commands . . . . .	978
16.100.6	Default . . . . .	978
16.101	plugin command . . . . .	978
16.101.1	Syntax . . . . .	978
16.101.2	Examples . . . . .	978
16.101.3	Description . . . . .	978
16.101.4	Restrictions . . . . .	979
16.101.5	Related commands . . . . .	979

16.101.6Default	979
16.102prd command	979
16.102.1Syntax	979
16.102.2Examples	980
16.102.3Description	980
16.102.4Restrictions	983
16.102.5Related commands	983
16.102.6Default	983
16.103print command	983
16.103.1Syntax	983
16.103.2Examples	984
16.103.3Description	984
16.103.4Restrictions	985
16.103.5Related commands	985
16.103.6Default	985
16.104processors command	985
16.104.1Syntax	985
16.104.2Examples	986
16.104.3Description	986
16.104.4Restrictions	989
16.104.5Related commands	989
16.104.6Default	989
16.105python command	989
16.105.1Syntax	989
16.105.2Examples	990
16.105.3Description	991
16.105.4Restrictions	996
16.105.5Related commands	996
16.105.6Default	996
16.106quit command	996
16.106.1Syntax	996
16.106.2Examples	997
16.106.3Description	997
16.106.4Restrictions	997
16.106.5Related commands	997
16.106.6Default	997
16.107read_data command	997
16.107.1Syntax	997
16.107.2Examples	998
16.107.3Description	998
16.107.4Reading multiple data files	999
16.107.5Format of a data file	1000
16.107.6Format of the header of a data file	1001
16.107.7Format of the body of a data file	1004
16.107.8Restrictions	1017
16.107.9Related commands	1018
16.107.10Default	1018
16.108read_dump command	1018
16.108.1Syntax	1018
16.108.2Examples	1019
16.108.3Description	1019
16.108.4Restrictions	1022
16.108.5Related commands	1023
16.108.6Default	1023

16.109	read_restart command	1023
16.109.1	Syntax	1023
16.109.2	Examples	1023
16.109.3	Description	1023
16.109.4	Restrictions	1026
16.109.5	Related commands	1026
16.109.6	Default	1026
16.110	region command	1026
16.110.1	Syntax	1026
16.110.2	Examples	1028
16.110.3	Description	1028
16.110.4	Restrictions	1032
16.110.5	Related commands	1032
16.110.6	Default	1032
16.111	replicate command	1032
16.111.1	Syntax	1032
16.111.2	Examples	1032
16.111.3	Description	1032
16.111.4	Restrictions	1033
16.111.5	Related commands	1033
16.111.6	Default	1033
16.112	rerun command	1033
16.112.1	Syntax	1033
16.112.2	Examples	1034
16.112.3	Description	1034
16.112.4	Restrictions	1036
16.112.5	Related commands	1036
16.112.6	Default	1036
16.113	reset_atom_ids command	1036
16.113.1	Syntax	1036
16.113.2	Examples	1037
16.113.3	Description	1037
16.113.4	Restrictions	1037
16.113.5	Related commands	1037
16.113.6	Default	1038
16.114	reset_mol_ids command	1038
16.114.1	Syntax	1038
16.114.2	Examples	1038
16.114.3	Description	1038
16.114.4	Restrictions	1039
16.114.5	Related commands	1039
16.114.6	Default	1039
16.115	reset_timestep command	1039
16.115.1	Syntax	1039
16.115.2	Examples	1040
16.115.3	Description	1040
16.115.4	Restrictions	1040
16.115.5	Related commands	1040
16.115.6	Default	1040
16.116	restart command	1040
16.116.1	Syntax	1040
16.116.2	Examples	1041
16.116.3	Description	1041
16.116.4	Restrictions	1043

16.116.5	Related commands	1043
16.116.6	Default	1043
16.117	run command	1043
16.117.1	Syntax	1043
16.117.2	Examples	1043
16.117.3	Description	1044
16.117.4	Restrictions	1046
16.117.5	Related commands	1046
16.117.6	Default	1046
16.118	run_style command	1046
16.118.1	Syntax	1046
16.118.2	Examples	1047
16.118.3	Description	1047
16.118.4	Restrictions	1050
16.118.5	Related commands	1050
16.118.6	Default	1050
16.119	set command	1050
16.119.1	Syntax	1050
16.119.2	Examples	1053
16.119.3	Description	1053
16.119.4	Restrictions	1057
16.119.5	Related commands	1057
16.119.6	Default	1058
16.120	shell command	1058
16.120.1	Syntax	1058
16.120.2	Examples	1058
16.120.3	Description	1058
16.120.4	Restrictions	1059
16.120.5	Related commands	1059
16.120.6	Default	1060
16.121	special_bonds command	1060
16.121.1	Syntax	1060
16.121.2	Examples	1060
16.121.3	Description	1060
16.121.4	Restrictions	1063
16.121.5	Related commands	1063
16.121.6	Default	1063
16.122	suffix command	1063
16.122.1	Syntax	1063
16.122.2	Examples	1063
16.122.3	Description	1064
16.122.4	Restrictions	1065
16.122.5	Related commands	1065
16.122.6	Default	1065
16.123	ad command	1065
16.123.1	Syntax	1065
16.123.2	Examples	1066
16.123.3	Description	1066
16.123.4	Restrictions	1068
16.123.5	Related commands	1069
16.123.6	Default	1069
16.124	temper command	1069
16.124.1	Syntax	1069
16.124.2	Examples	1069

16.124.3	Description	1069
16.124.4	Restrictions	1071
16.124.5	Related commands	1071
16.124.6	Default	1071
16.125	temper/grem command	1071
16.125.1	Syntax	1071
16.125.2	Examples	1072
16.125.3	Description	1072
16.125.4	Restrictions	1073
16.125.5	Related commands	1073
16.125.6	Default	1073
16.126	temper/npt command	1073
16.126.1	Syntax	1073
16.126.2	Examples	1073
16.126.3	Description	1074
16.126.4	Restrictions	1074
16.126.5	Related commands	1074
16.126.6	Default	1074
16.127	thermo command	1074
16.127.1	Syntax	1074
16.127.2	Examples	1075
16.127.3	Description	1075
16.127.4	Restrictions	1075
16.127.5	Related commands	1075
16.127.6	Default	1075
16.128	thermo_modify command	1075
16.128.1	Syntax	1075
16.128.2	Examples	1076
16.128.3	Description	1076
16.128.4	Restrictions	1079
16.128.5	Related commands	1079
16.128.6	Default	1079
16.129	thermo_style command	1079
16.129.1	Syntax	1079
16.129.2	Examples	1081
16.129.3	Description	1081
16.129.4	Restrictions	1085
16.129.5	Related commands	1085
16.129.6	Default	1085
16.130	third_order command	1085
16.130.1	Syntax	1085
16.130.2	Examples	1085
16.130.3	Description	1086
16.130.4	Restrictions	1086
16.130.5	Related commands	1086
16.130.6	Default	1086
16.131	timer command	1087
16.131.1	Syntax	1087
16.131.2	Examples	1087
16.131.3	Description	1087
16.131.4	Restrictions	1088
16.131.5	Related commands	1088
16.131.6	Default	1088
16.132	timestep command	1088

16.132.1	Syntax . . . . .	1088
16.132.2	Examples . . . . .	1089
16.132.3	Description . . . . .	1089
16.132.4	Restrictions . . . . .	1089
16.132.5	Related commands . . . . .	1089
16.132.6	Default . . . . .	1089
16.133	uncompute command . . . . .	1089
16.133.1	Syntax . . . . .	1089
16.133.2	Examples . . . . .	1090
16.133.3	Description . . . . .	1090
16.133.4	Restrictions . . . . .	1090
16.133.5	Related commands . . . . .	1090
16.133.6	Default . . . . .	1090
16.134	undump command . . . . .	1090
16.134.1	Syntax . . . . .	1090
16.134.2	Examples . . . . .	1090
16.134.3	Description . . . . .	1090
16.134.4	Restrictions . . . . .	1091
16.134.5	Related commands . . . . .	1091
16.134.6	Default . . . . .	1091
16.135	unfix command . . . . .	1091
16.135.1	Syntax . . . . .	1091
16.135.2	Examples . . . . .	1091
16.135.3	Description . . . . .	1091
16.135.4	Restrictions . . . . .	1091
16.135.5	Related commands . . . . .	1091
16.135.6	Default . . . . .	1092
16.136	units command . . . . .	1092
16.136.1	Syntax . . . . .	1092
16.136.2	Examples . . . . .	1092
16.136.3	Description . . . . .	1092
16.136.4	Restrictions . . . . .	1096
16.136.5	Related commands . . . . .	1096
16.136.6	Default . . . . .	1096
16.137	variable command . . . . .	1097
16.137.1	Syntax . . . . .	1097
16.137.2	Examples . . . . .	1098
16.137.3	Description . . . . .	1099
16.137.4	Immediate Evaluation of Variables . . . . .	1113
16.137.5	Variable Accuracy . . . . .	1114
16.137.6	Restrictions . . . . .	1116
16.137.7	Related commands . . . . .	1116
16.137.8	Default . . . . .	1116
16.138	velocity command . . . . .	1116
16.138.1	Syntax . . . . .	1116
16.138.2	Examples . . . . .	1117
16.138.3	Description . . . . .	1117
16.138.4	Restrictions . . . . .	1119
16.138.5	Related commands . . . . .	1119
16.138.6	Default . . . . .	1119
16.139	write_coeff command . . . . .	1120
16.139.1	Syntax . . . . .	1120
16.139.2	Examples . . . . .	1120
16.139.3	Description . . . . .	1120

16.139.4	Restrictions	1120
16.139.5	Related commands	1120
16.140	write_data command	1120
16.140.1	Syntax	1120
16.140.2	Examples	1121
16.140.3	Description	1121
16.140.4	Restrictions	1122
16.140.5	Related commands	1122
16.140.6	Default	1123
16.141	write_dump command	1123
16.141.1	Syntax	1123
16.141.2	Examples	1123
16.141.3	Description	1123
16.141.4	Restrictions	1124
16.141.5	Related commands	1124
16.141.6	Default	1124
16.142	write_restart command	1124
16.142.1	Syntax	1124
16.142.2	Examples	1125
16.142.3	Description	1125
16.142.4	Restrictions	1126
16.142.5	Related commands	1126
16.142.6	Default	1126
<b>17</b>	<b>Fixes</b>	<b>1127</b>
17.1	fix accelerate/cos command	1127
17.1.1	Syntax	1127
17.1.2	Examples	1127
17.1.3	Description	1127
17.1.4	Restart, fix_modify, output, run start/stop, minimize info	1128
17.1.5	Restrictions	1128
17.1.6	Related commands	1128
17.1.7	Default	1128
17.2	fix acks2/reaxff command	1128
17.2.1	Syntax	1128
17.2.2	Examples	1129
17.2.3	Description	1129
17.2.4	Restart, fix_modify, output, run start/stop, minimize info	1130
17.2.5	Restrictions	1130
17.2.6	Related commands	1130
17.2.7	Default	1130
17.3	fix adapt command	1131
17.3.1	Syntax	1131
17.3.2	Examples	1132
17.3.3	Description	1132
17.3.4	Restart, fix_modify, output, run start/stop, minimize info	1136
17.3.5	Restrictions	1136
17.3.6	Related commands	1136
17.3.7	Default	1136
17.4	fix adapt/fep command	1136
17.4.1	Syntax	1136
17.4.2	Examples	1137
17.4.3	Description	1137
17.4.4	Restart, fix_modify, output, run start/stop, minimize info	1140

17.4.5	Restrictions	1140
17.4.6	Related commands	1140
17.4.7	Default	1140
17.5	fix addforce command	1140
17.5.1	Syntax	1140
17.5.2	Examples	1141
17.5.3	Description	1141
17.5.4	Restart, fix_modify, output, run start/stop, minimize info	1142
17.5.5	Restrictions	1143
17.5.6	Related commands	1143
17.5.7	Default	1143
17.6	fix addtorque command	1143
17.6.1	Syntax	1143
17.6.2	Examples	1143
17.6.3	Description	1143
17.6.4	Restart, fix_modify, output, run start/stop, minimize info	1144
17.6.5	Restrictions	1144
17.6.6	Related commands	1144
17.6.7	Default	1144
17.7	fix amoeba/bitorsion command	1144
17.7.1	Syntax	1144
17.7.2	Examples	1145
17.7.3	Description	1145
17.7.4	Restart, fix_modify, output, run start/stop, minimize info	1146
17.7.5	Restrictions	1146
17.7.6	Related commands	1146
17.7.7	Default	1146
17.8	fix amoeba/pitorsion command	1147
17.8.1	Syntax	1147
17.8.2	Examples	1147
17.8.3	Description	1147
17.8.4	Restart, fix_modify, output, run start/stop, minimize info	1148
17.8.5	Restrictions	1149
17.8.6	Related commands	1149
17.8.7	Default	1149
17.9	fix append/atoms command	1149
17.9.1	Syntax	1149
17.9.2	Examples	1150
17.9.3	Description	1150
17.9.4	Restart, fix_modify, output, run start/stop, minimize info	1150
17.9.5	Restrictions	1150
17.9.6	Related commands	1151
17.9.7	Default	1151
17.10	fix atc command	1151
17.10.1	Syntax	1151
17.10.2	Examples	1151
17.10.3	Description	1151
17.10.4	Restart, fix_modify, output, run start/stop, minimize info	1153
17.10.5	Restrictions	1154
17.10.6	Related commands	1154
17.10.7	Default	1156
17.11	fix atom/swap command	1157
17.11.1	Syntax	1157
17.11.2	Examples	1157

17.11.3	Description	1157
17.11.4	Restart, fix_modify, output, run start/stop, minimize info	1159
17.11.5	Restrictions	1159
17.11.6	Related commands	1159
17.11.7	Default	1159
17.12	fix ave/atom command	1159
17.12.1	Syntax	1159
17.12.2	Examples	1160
17.12.3	Description	1160
17.12.4	Restart, fix_modify, output, run start/stop, minimize info	1162
17.12.5	Restrictions	1162
17.12.6	Related commands	1162
17.12.7	Default	1162
17.13	fix ave/chunk command	1162
17.13.1	Syntax	1162
17.13.2	Examples	1163
17.13.3	Description	1164
17.13.4	Restart, fix_modify, output, run start/stop, minimize info	1168
17.13.5	Restrictions	1168
17.13.6	Related commands	1169
17.13.7	Default	1169
17.14	fix ave/correlate command	1169
17.14.1	Syntax	1169
17.14.2	Examples	1170
17.14.3	Description	1170
17.14.4	Restart, fix_modify, output, run start/stop, minimize info	1173
17.14.5	Restrictions	1174
17.14.6	Related commands	1174
17.14.7	Default	1174
17.15	fix ave/correlate/long command	1174
17.15.1	Syntax	1174
17.15.2	Examples	1175
17.15.3	Description	1175
17.15.4	Restart, fix_modify, output, run start/stop, minimize info	1176
17.15.5	Restrictions	1176
17.15.6	Related commands	1176
17.15.7	Default	1176
17.16	fix ave/histo command	1176
17.17	fix ave/histo/weight command	1176
17.17.1	Syntax	1176
17.17.2	Examples	1177
17.17.3	Description	1178
17.17.4	Restart, fix_modify, output, run start/stop, minimize info	1181
17.17.5	Restrictions	1181
17.17.6	Related commands	1181
17.17.7	Default	1181
17.18	fix ave/time command	1181
17.18.1	Syntax	1181
17.18.2	Examples	1182
17.18.3	Description	1183
17.18.4	Restart, fix_modify, output, run start/stop, minimize info	1186
17.18.5	Restrictions	1186
17.18.6	Related commands	1186
17.18.7	Default	1186

17.19	fix aveforce command	1186
17.19.1	Syntax	1186
17.19.2	Examples	1187
17.19.3	Description	1187
17.19.4	Restart, fix_modify, output, run start/stop, minimize info	1188
17.19.5	Restrictions	1188
17.19.6	Related commands	1188
17.19.7	Default	1188
17.20	fix balance command	1188
17.20.1	Syntax	1188
17.20.2	Examples	1189
17.20.3	Description	1189
17.20.4	Restart, fix_modify, output, run start/stop, minimize info	1193
17.20.5	Restrictions	1194
17.20.6	Related commands	1194
17.20.7	Default	1194
17.21	fix bocs command	1194
17.21.1	Syntax	1194
17.21.2	Examples	1194
17.21.3	Description	1194
17.21.4	Restart, fix_modify, output, run start/stop, minimize info	1195
17.21.5	Restrictions	1195
17.21.6	Further information	1196
17.22	fix bond/break command	1196
17.22.1	Syntax	1196
17.22.2	Examples	1196
17.22.3	Description	1196
17.22.4	Restart, fix_modify, output, run start/stop, minimize info	1197
17.22.5	Restrictions	1198
17.22.6	Related commands	1198
17.22.7	Default	1198
17.23	fix bond/create command	1198
17.24	fix bond/create/angle command	1198
17.24.1	Syntax	1198
17.24.2	Examples	1199
17.24.3	Description	1199
17.24.4	Restart, fix_modify, output, run start/stop, minimize info	1201
17.24.5	Restrictions	1201
17.24.6	Related commands	1201
17.24.7	Default	1201
17.25	fix bond/react command	1202
17.25.1	Syntax	1202
17.25.2	Examples	1203
17.25.3	Description	1203
17.25.4	Restart, fix_modify, output, run start/stop, minimize info	1210
17.25.5	Restrictions	1210
17.25.6	Related commands	1210
17.25.7	Default	1210
17.26	fix bond/swap command	1210
17.26.1	Syntax	1210
17.26.2	Examples	1211
17.26.3	Description	1211
17.26.4	Restart, fix_modify, output, run start/stop, minimize info	1213
17.26.5	Restrictions	1213

17.26.6	Related commands	1213
17.26.7	Default	1214
17.27	fix box/relax command	1214
17.27.1	Syntax	1214
17.27.2	Examples	1214
17.27.3	Description	1214
17.27.4	Restart, fix_modify, output, run start/stop, minimize info	1218
17.27.5	Restrictions	1218
17.27.6	Related commands	1218
17.27.7	Default	1219
17.28	fix brownian command	1219
17.29	fix brownian/sphere command	1219
17.30	fix brownian/asphere command	1219
17.30.1	Syntax	1219
17.30.2	Examples	1220
17.30.3	Description	1220
17.30.4	Restart, fix_modify, output, run start/stop, minimize info	1222
17.30.5	Restrictions	1222
17.30.6	Related commands	1222
17.30.7	Default	1222
17.31	fix charge/regulation command	1222
17.31.1	Syntax	1222
17.31.2	Examples	1223
17.31.3	Description	1223
17.31.4	Output	1225
17.31.5	Restrictions	1226
17.31.6	Related commands	1226
17.31.7	Default	1226
17.32	fix cmap command	1226
17.32.1	Syntax	1226
17.32.2	Examples	1227
17.32.3	Description	1227
17.32.4	Restart, fix_modify, output, run start/stop, minimize info	1228
17.32.5	Restrictions	1228
17.32.6	Related commands	1228
17.32.7	Default	1228
17.33	fix colvars command	1229
17.33.1	Syntax	1229
17.33.2	Examples	1229
17.33.3	Description	1229
17.33.4	Restart, fix_modify, output, run start/stop, minimize info	1230
17.33.5	Restrictions	1230
17.33.6	Related commands	1230
17.33.7	Default	1231
17.34	fix controller command	1231
17.34.1	Syntax	1231
17.34.2	Examples	1231
17.34.3	Description	1232
17.34.4	Restart, fix_modify, output, run start/stop, minimize info	1233
17.34.5	Restrictions	1234
17.34.6	Related commands	1234
17.34.7	Default	1234
17.35	fix damping/cundall command	1234
17.35.1	Syntax	1234

17.35.2	Examples	1234
17.35.3	Description	1235
17.35.4	Restart, fix_modify, output, run start/stop, minimize info	1235
17.35.5	Restrictions	1236
17.35.6	Related commands	1236
17.35.7	Default	1236
17.35.8	References	1236
17.36	fix deform command	1236
17.36.1	Syntax	1236
17.36.2	Examples	1238
17.36.3	Description	1238
17.36.4	Restart, fix_modify, output, run start/stop, minimize info	1243
17.36.5	Restrictions	1243
17.36.6	Related commands	1244
17.36.7	Default	1244
17.37	fix deposit command	1244
17.37.1	Syntax	1244
17.37.2	Examples	1245
17.37.3	Description	1245
17.37.4	Restart, fix_modify, output, run start/stop, minimize info	1247
17.37.5	Restrictions	1248
17.37.6	Related commands	1248
17.37.7	Default	1248
17.38	fix dpd/energy command	1248
17.38.1	Syntax	1248
17.38.2	Examples	1248
17.38.3	Description	1248
17.38.4	Restrictions	1249
17.38.5	Related commands	1249
17.38.6	Default	1249
17.39	fix edpd/source command	1249
17.40	fix tdpd/source command	1249
17.40.1	Syntax	1249
17.40.2	Examples	1250
17.40.3	Description	1250
17.40.4	Restart, fix_modify, output, run start/stop, minimize info	1250
17.40.5	Restrictions	1251
17.40.6	Related commands	1251
17.40.7	Default	1251
17.41	fix drag command	1251
17.41.1	Syntax	1251
17.41.2	Examples	1251
17.41.3	Description	1252
17.41.4	Restart, fix_modify, output, run start/stop, minimize info	1252
17.41.5	Restrictions	1252
17.41.6	Related commands	1252
17.41.7	Default	1252
17.42	fix drude command	1252
17.42.1	Syntax	1252
17.42.2	Examples	1253
17.42.3	Description	1253
17.42.4	Restrictions	1253
17.42.5	Related commands	1253
17.42.6	Default	1253

17.43	fix drude/transform/direct command	1253
17.44	fix drude/transform/inverse command	1253
17.44.1	Syntax	1253
17.44.2	Examples	1254
17.44.3	Description	1254
17.44.4	Restart, fix_modify, output, run start/stop, minimize info	1256
17.44.5	Restrictions	1256
17.44.6	Related commands	1256
17.44.7	Default	1256
17.45	fix dt/reset command	1256
17.45.1	Syntax	1256
17.45.2	Examples	1257
17.45.3	Description	1257
17.45.4	Restart, fix_modify, output, run start/stop, minimize info	1257
17.45.5	Restrictions	1258
17.45.6	Related commands	1258
17.45.7	Default	1258
17.46	fix efield command	1258
17.46.1	Syntax	1258
17.46.2	Examples	1258
17.46.3	Description	1258
17.46.4	Restart, fix_modify, output, run start/stop, minimize info	1259
17.46.5	Restrictions	1260
17.46.6	Related commands	1260
17.46.7	Default	1260
17.47	fix ehex command	1260
17.47.1	Syntax	1260
17.47.2	Examples	1261
17.47.3	Description	1261
17.47.4	Restart, fix_modify, output, run start/stop, minimize info	1263
17.47.5	Restrictions	1263
17.47.6	Related commands	1263
17.47.7	Default	1263
17.48	fix electrode/conp command	1263
17.49	fix electrode/conq command	1263
17.50	fix electrode/thermo command	1263
17.50.1	Syntax	1263
17.50.2	Examples	1264
17.50.3	Description	1264
17.51	fix electron/stopping command	1266
17.52	fix electron/stopping/fit command	1266
17.52.1	Syntax	1266
17.52.2	Examples	1267
17.52.3	Description	1267
17.52.4	Restart, fix_modify, output, run start/stop, minimize info	1268
17.52.5	Restrictions	1269
17.52.6	Default	1269
17.53	fix enforce2d command	1269
17.53.1	Syntax	1269
17.53.2	Examples	1269
17.53.3	Description	1270
17.53.4	Restart, fix_modify, output, run start/stop, minimize info	1270
17.53.5	Restrictions	1270
17.53.6	Related commands	1270

17.53.7	Default	1270
17.54	fix eos/cv command	1270
17.54.1	Syntax	1270
17.54.2	Examples	1271
17.54.3	Description	1271
17.54.4	Restrictions	1271
17.54.5	Related commands	1271
17.54.6	Default	1271
17.55	fix eos/table command	1271
17.55.1	Syntax	1271
17.55.2	Examples	1272
17.55.3	Description	1272
17.55.4	Restrictions	1273
17.55.5	Related commands	1273
17.55.6	Default	1273
17.56	fix eos/table/rx command	1273
17.56.1	Syntax	1273
17.56.2	Examples	1274
17.56.3	Description	1274
17.56.4	Restrictions	1276
17.56.5	Related commands	1276
17.56.6	Default	1276
17.57	fix evaporate command	1276
17.57.1	Syntax	1276
17.57.2	Examples	1277
17.57.3	Description	1277
17.57.4	Restart, fix_modify, output, run start/stop, minimize info	1277
17.57.5	Restrictions	1277
17.57.6	Related commands	1278
17.57.7	Default	1278
17.58	fix external command	1278
17.58.1	Syntax	1278
17.58.2	Examples	1278
17.58.3	Description	1278
17.58.4	Restart, fix_modify, output, run start/stop, minimize info	1280
17.58.5	Restrictions	1280
17.58.6	Related commands	1280
17.58.7	Default	1280
17.59	fix ffl command	1280
17.59.1	Syntax	1280
17.59.2	Examples	1281
17.59.3	Description	1281
17.59.4	Restart, fix_modify, output, run start/stop, minimize info	1281
17.59.5	Restrictions	1282
17.59.6	Related commands	1282
17.60	fix filter/corotate command	1282
17.60.1	Syntax	1282
17.60.2	Examples	1282
17.60.3	Description	1283
17.60.4	Restart, fix_modify, output, run start/stop, minimize info	1283
17.60.5	Restrictions	1283
17.60.6	Related commands	1283
17.60.7	Default	1283
17.61	fix flow/gauss command	1283

17.61.1	Syntax	1283
17.61.2	Examples	1284
17.61.3	Description	1284
17.61.4	Restart, fix_modify, output, run start/stop, minimize info	1285
17.61.5	Restrictions	1285
17.61.6	Related commands	1285
17.61.7	Default	1286
17.62	fix freeze command	1286
17.62.1	Syntax	1286
17.62.2	Examples	1286
17.62.3	Description	1286
17.62.4	Restart, fix_modify, output, run start/stop, minimize info	1287
17.62.5	Restrictions	1287
17.62.6	Related commands	1287
17.62.7	Default	1287
17.63	fix gcmc command	1287
17.63.1	Syntax	1287
17.63.2	Examples	1288
17.63.3	Description	1288
17.63.4	Restart, fix_modify, output, run start/stop, minimize info	1292
17.63.5	Restrictions	1293
17.63.6	Related commands	1293
17.63.7	Default	1293
17.64	fix gld command	1294
17.64.1	Syntax	1294
17.64.2	Examples	1294
17.64.3	Description	1294
17.64.4	Restart, fix_modify, output, run start/stop, minimize info	1296
17.64.5	Restrictions	1296
17.64.6	Related commands	1296
17.64.7	Default	1296
17.65	fix gle command	1296
17.65.1	Syntax	1296
17.65.2	Examples	1297
17.65.3	Description	1297
17.65.4	Restart, fix_modify, output, run start/stop, minimize info	1298
17.65.5	Restrictions	1298
17.65.6	Related commands	1298
17.66	fix gravity command	1298
17.66.1	Syntax	1299
17.66.2	Examples	1299
17.66.3	Description	1299
17.66.4	Restart, fix_modify, output, run start/stop, minimize info	1300
17.66.5	Restrictions	1300
17.66.6	Related commands	1300
17.66.7	Default	1301
17.67	fix grem command	1301
17.67.1	Syntax	1301
17.67.2	Examples	1301
17.67.3	Description	1301
17.67.4	Restart, fix_modify, output, run start/stop, minimize info	1302
17.67.5	Restrictions	1302
17.67.6	Related commands	1302
17.67.7	Default	1302

17.68	fix halt command . . . . .	1302
17.68.1	Syntax . . . . .	1302
17.68.2	Examples . . . . .	1303
17.68.3	Description . . . . .	1303
17.68.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1304
17.68.5	Restrictions . . . . .	1305
17.68.6	Related commands . . . . .	1305
17.68.7	Default . . . . .	1305
17.69	fix heat command . . . . .	1305
17.69.1	Syntax . . . . .	1305
17.69.2	Examples . . . . .	1305
17.69.3	Description . . . . .	1305
17.69.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1306
17.69.5	Restrictions . . . . .	1307
17.69.6	Related commands . . . . .	1307
17.69.7	Default . . . . .	1307
17.70	fix hyper/global command . . . . .	1307
17.70.1	Syntax . . . . .	1307
17.70.2	Examples . . . . .	1307
17.70.3	Description . . . . .	1307
17.70.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1309
17.70.5	Restrictions . . . . .	1310
17.70.6	Related commands . . . . .	1310
17.70.7	Default . . . . .	1310
17.71	fix hyper/local command . . . . .	1311
17.71.1	Syntax . . . . .	1311
17.71.2	Examples . . . . .	1311
17.71.3	Description . . . . .	1311
17.71.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1315
17.71.5	Restrictions . . . . .	1317
17.71.6	Related commands . . . . .	1317
17.71.7	Default . . . . .	1317
17.72	fix imd command . . . . .	1318
17.72.1	Syntax . . . . .	1318
17.72.2	Examples . . . . .	1318
17.72.3	Description . . . . .	1318
17.72.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1319
17.72.5	Restrictions . . . . .	1320
17.72.6	Related commands . . . . .	1320
17.72.7	Default . . . . .	1320
17.73	fix indent command . . . . .	1320
17.73.1	Syntax . . . . .	1320
17.73.2	Examples . . . . .	1321
17.73.3	Description . . . . .	1321
17.73.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1322
17.73.5	Restrictions . . . . .	1323
17.73.6	Related commands . . . . .	1323
17.73.7	Default . . . . .	1323
17.74	fix ipi command . . . . .	1323
17.74.1	Syntax . . . . .	1323
17.74.2	Examples . . . . .	1323
17.74.3	Description . . . . .	1324
17.74.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1324
17.74.5	Restrictions . . . . .	1324

17.74.6	Related commands	1324
17.75	fix langevin command	1325
17.75.1	Syntax	1325
17.75.2	Examples	1325
17.75.3	Description	1326
17.75.4	Restart, fix_modify, output, run start/stop, minimize info	1328
17.75.5	Restrictions	1329
17.75.6	Related commands	1329
17.75.7	Default	1329
17.76	fix langevin/drude command	1329
17.76.1	Syntax	1329
17.76.2	Examples	1330
17.76.3	Description	1330
17.76.4	Restart, fix_modify, output, run start/stop, minimize info	1332
17.76.5	Restrictions	1333
17.76.6	Related commands	1333
17.76.7	Default	1333
17.77	fix langevin/eff command	1333
17.77.1	Syntax	1333
17.77.2	Examples	1334
17.77.3	Description	1334
17.77.4	Restart, fix_modify, output, run start/stop, minimize info	1334
17.77.5	Restrictions	1335
17.77.6	Related commands	1335
17.77.7	Default	1335
17.78	fix langevin/spin command	1335
17.78.1	Syntax	1335
17.78.2	Examples	1335
17.78.3	Description	1335
17.78.4	Restart, fix_modify, output, run start/stop, minimize info	1336
17.78.5	Restrictions	1336
17.78.6	Related commands	1336
17.78.7	Default	1336
17.79	fix latte command	1337
17.79.1	Syntax	1337
17.79.2	Examples	1337
17.79.3	Description	1337
17.79.4	Restart, fix_modify, output, run start/stop, minimize info	1338
17.79.5	Restrictions	1339
17.79.6	Related commands	1339
17.79.7	Default	1339
17.80	fix lb/fluid command	1340
17.80.1	Syntax	1340
17.80.2	Examples	1341
17.80.3	Description	1341
17.80.4	Restart, fix_modify, output, run start/stop, minimize info	1344
17.80.5	Restrictions	1345
17.80.6	Related commands	1345
17.80.7	Default	1345
17.81	fix lb/momentum command	1345
17.81.1	Syntax	1345
17.81.2	Examples	1346
17.81.3	Description	1346
17.81.4	Restart, fix_modify, output, run start/stop, minimize info	1346

17.81.5	Restrictions	1346
17.81.6	Related commands	1346
17.81.7	Default	1347
17.82	fix lb/viscous command	1347
17.82.1	Syntax	1347
17.82.2	Examples	1347
17.82.3	Description	1347
17.82.4	Restart, fix_modify, output, run start/stop, minimize info	1347
17.82.5	Restrictions	1348
17.82.6	Related commands	1348
17.82.7	Default	1348
17.83	fix lineforce command	1348
17.83.1	Syntax	1348
17.83.2	Examples	1348
17.83.3	Description	1348
17.83.4	Restart, fix_modify, output, run start/stop, minimize info	1349
17.83.5	Restrictions	1349
17.83.6	Related commands	1349
17.83.7	Default	1349
17.84	fix manifoldforce command	1349
17.84.1	Syntax	1349
17.84.2	Examples	1349
17.84.3	Description	1349
17.84.4	Restart, fix_modify, output, run start/stop, minimize info	1350
17.84.5	Restrictions	1350
17.84.6	Related commands	1350
17.85	fix mdi/qm command	1350
17.85.1	Syntax	1350
17.85.2	Examples	1351
17.85.3	Description	1351
17.85.4	Restart, fix_modify, output, run start/stop, minimize info	1353
17.85.5	Restrictions	1353
17.85.6	Related commands	1354
17.85.7	Default	1354
17.86	fix meso/move command	1354
17.86.1	Syntax	1354
17.86.2	Examples	1354
17.86.3	Description	1355
17.86.4	Restart, fix_modify, output, run start/stop, minimize info	1357
17.86.5	Restrictions	1357
17.86.6	Related commands	1357
17.86.7	Default	1357
17.87	fix_modify AtC commands	1357
17.87.1	fix_modify AtC add_molecule command	1357
17.87.2	fix_modify AtC add_species command	1358
17.87.3	fix_modify AtC atom_element_map command	1359
17.87.4	fix_modify AtC atom_weight command	1360
17.87.5	fix_modify AtC atomic_charge command	1361
17.87.6	fix_modify AtC boundary_dynamics command	1362
17.87.7	fix_modify AtC boundary_faceset command	1363
17.87.8	fix_modify AtC boundary_type command	1364
17.87.9	fix_modify AtC consistent_fe_initialization command	1364
17.87.10	fix_modify AtC control localized_lambda command	1365
17.87.11	fix_modify AtC control momentum command	1366

17.87.12	fix_modify AtC control thermal command . . . . .	1367
17.87.13	fix_modify AtC decomposition command . . . . .	1369
17.87.14	fix_modify AtC extrinsic electron_integration command . . . . .	1370
17.87.15	fix_modify AtC equilibrium_start command . . . . .	1371
17.87.16	fix_modify AtC extrinsic exchange command . . . . .	1371
17.87.17	fix_modify AtC fe_md_boundary command . . . . .	1372
17.87.18	fix_modify AtC filter scale command . . . . .	1373
17.87.19	fix_modify AtC filter type command . . . . .	1374
17.87.20	fix_modify AtC fix command . . . . .	1375
17.87.21	fix_modify AtC fix_flux command . . . . .	1376
17.87.22	fix_modify AtC computes command . . . . .	1376
17.87.23	fix_modify AtC fields command . . . . .	1377
17.87.24	fix_modify AtC gradients command . . . . .	1379
17.87.25	fix_modify AtC kernel command . . . . .	1381
17.87.26	fix_modify AtC on_the_fly command . . . . .	1382
17.87.27	fix_modify AtC rates command . . . . .	1383
17.87.28	fix_modify AtC initial command . . . . .	1384
17.87.29	fix_modify AtC internal_element_set command . . . . .	1385
17.87.30	fix_modify AtC internal_quadrature command . . . . .	1386
17.87.31	fix_modify AtC kernel_bandwidth command . . . . .	1387
17.87.32	fix_modify AtC control lumped_lambda_solve command . . . . .	1388
17.87.33	fix_modify AtC control mask_direction command . . . . .	1388
17.87.34	fix_modify AtC mass_matrix command . . . . .	1389
17.87.35	fix_modify AtC material command . . . . .	1390
17.87.36	fix_modify AtC mesh add_to_nodeset command . . . . .	1391
17.87.37	fix_modify AtC mesh create command . . . . .	1391
17.87.38	fix_modify AtC mesh create_elementset command . . . . .	1392
17.87.39	fix_modify AtC mesh create_faceset box command . . . . .	1393
17.87.40	fix_modify AtC mesh create_faceset plane command . . . . .	1394
17.87.41	fix_modify AtC mesh create_nodeset command . . . . .	1395
17.87.42	fix_modify AtC mesh delete_elements command . . . . .	1396
17.87.43	fix_modify AtC mesh nodeset_to_elementset command . . . . .	1397
17.87.44	fix_modify AtC mesh output command . . . . .	1398
17.87.45	fix_modify AtC mesh quadrature command . . . . .	1398
17.87.46	fix_modify AtC mesh read command . . . . .	1399
17.87.47	fix_modify AtC mesh write command . . . . .	1400
17.87.48	fix_modify AtC output command . . . . .	1401
17.87.49	fix_modify AtC output boundary_integral command . . . . .	1402
17.87.50	fix_modify AtC output contour_integral command . . . . .	1403
17.87.51	fix_modify AtC output nodeset command . . . . .	1404
17.87.52	fix_modify AtC output volume_integral command . . . . .	1405
17.87.53	fix_modify AtC pair_interactions command . . . . .	1405
17.87.54	fix_modify AtC bond_interactions command . . . . .	1405
17.87.55	fix_modify AtC poisson_solver command . . . . .	1406
17.87.56	fix_modify AtC read_restart command . . . . .	1407
17.87.57	fix_modify AtC remove_molecule command . . . . .	1408
17.87.58	fix_modify AtC remove_source command . . . . .	1409
17.87.59	fix_modify AtC remove_species command . . . . .	1409
17.87.60	fix_modify AtC reset_atomic_reference_positions command . . . . .	1410
17.87.61	fix_modify AtC reset_time command . . . . .	1411
17.87.62	fix_modify AtC sample_frequency command . . . . .	1412
17.87.63	fix_modify AtC set reference_potential_energy command . . . . .	1413
17.87.64	fix_modify AtC source command . . . . .	1413
17.87.65	fix_modify AtC source_integration command . . . . .	1414

17.87.66	fix_modify AtC temperature_definition command . . . . .	1415
17.87.67	fix_modify AtC filter command . . . . .	1416
17.87.68	fix_modify AtC time_integration command . . . . .	1417
17.87.69	fix_modify AtC track_displacement command . . . . .	1418
17.87.70	fix_modify AtC unfix command . . . . .	1419
17.87.71	fix_modify AtC unfix_flux command . . . . .	1419
17.87.72	fix_modify AtC write_atom_weights command . . . . .	1420
17.87.73	fix_modify AtC write_restart command . . . . .	1421
17.88	fix mol/swap command . . . . .	1422
17.88.1	Syntax . . . . .	1422
17.88.2	Examples . . . . .	1422
17.88.3	Description . . . . .	1422
17.88.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1424
17.88.5	Restrictions . . . . .	1424
17.88.6	Related commands . . . . .	1424
17.88.7	Default . . . . .	1424
17.89	fix momentum command . . . . .	1424
17.90	fix momentum/chunk command . . . . .	1425
17.90.1	Syntax . . . . .	1425
17.90.2	Examples . . . . .	1425
17.90.3	Description . . . . .	1425
17.90.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1426
17.90.5	Restrictions . . . . .	1426
17.90.6	Related commands . . . . .	1426
17.90.7	Default . . . . .	1426
17.91	fix move command . . . . .	1426
17.91.1	Syntax . . . . .	1426
17.91.2	Examples . . . . .	1427
17.91.3	Description . . . . .	1427
17.91.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1429
17.91.5	Restrictions . . . . .	1430
17.91.6	Related commands . . . . .	1430
17.91.7	Default . . . . .	1430
17.92	fix mscg command . . . . .	1430
17.92.1	Syntax . . . . .	1430
17.92.2	Examples . . . . .	1430
17.92.3	Description . . . . .	1431
17.92.4	Restrictions . . . . .	1432
17.92.5	Related commands . . . . .	1432
17.92.6	Default . . . . .	1432
17.93	fix msst command . . . . .	1432
17.93.1	Syntax . . . . .	1432
17.93.2	Examples . . . . .	1433
17.93.3	Description . . . . .	1433
17.93.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1434
17.93.5	Restrictions . . . . .	1435
17.93.6	Related commands . . . . .	1435
17.93.7	Default . . . . .	1435
17.94	fix mvv/dpd command . . . . .	1435
17.95	fix mvv/edpd command . . . . .	1435
17.96	fix mvv/tdpd command . . . . .	1435
17.96.1	Syntax . . . . .	1435
17.96.2	Examples . . . . .	1436
17.96.3	Description . . . . .	1436

17.96.4	Restart, fix_modify, output, run start/stop, minimize info	1436
17.96.5	Restrictions	1437
17.96.6	Related commands	1437
17.96.7	Default	1437
17.97	fix neb command	1437
17.97.1	Syntax	1437
17.97.2	Examples	1438
17.97.3	Description	1438
17.97.4	Restart, fix_modify, output, run start/stop, minimize info	1440
17.97.5	Restrictions	1440
17.97.6	Related commands	1440
17.97.7	Default	1440
17.98	fix neb/spin command	1440
17.98.1	Syntax	1440
17.98.2	Examples	1441
17.98.3	Description	1441
17.98.4	Restart, fix_modify, output, run start/stop, minimize info	1441
17.98.5	Restrictions	1441
17.98.6	Related commands	1441
17.98.7	Default	1441
17.99	fix nvt command	1442
17.100	fix npt command	1442
17.101	fix nph command	1442
17.101.1	Syntax	1442
17.101.2	Examples	1443
17.101.3	Description	1443
17.101.4	Restart, fix_modify, output, run start/stop, minimize info	1449
17.101.5	Restrictions	1450
17.101.6	Related commands	1450
17.101.7	Default	1450
17.102	fix nvt/eff command	1451
17.103	fix npt/eff command	1451
17.104	fix nph/eff command	1451
17.104.1	Syntax	1451
17.104.2	Examples	1451
17.104.3	Description	1452
17.104.4	Restart, fix_modify, output, run start/stop, minimize info	1452
17.104.5	Restrictions	1452
17.104.6	Related commands	1453
17.104.7	Default	1453
17.105	fix nvt/uef command	1453
17.106	fix npt/uef command	1453
17.106.1	Syntax	1453
17.106.2	Examples	1454
17.106.3	Description	1454
17.106.4	Restart, fix_modify, output, run start/stop, minimize info	1456
17.106.5	Restrictions	1456
17.106.6	Related commands	1456
17.106.7	Default	1456
17.107	fix nph/asphere command	1457
17.107.1	Syntax	1457
17.107.2	Examples	1457
17.107.3	Description	1457
17.107.4	Restart, fix_modify, output, run start/stop, minimize info	1458

17.107.5	Restrictions	1458
17.107.6	Related commands	1459
17.107.7	Default	1459
17.108	fix nph/body command	1459
17.108.1	Syntax	1459
17.108.2	Examples	1459
17.108.3	Description	1459
17.108.4	Restart, fix_modify, output, run start/stop, minimize info	1460
17.108.5	Restrictions	1461
17.108.6	Related commands	1461
17.108.7	Default	1461
17.109	fix nph/sphere command	1461
17.109.1	Syntax	1461
17.109.2	Examples	1461
17.109.3	Description	1462
17.109.4	Restart, fix_modify, output, run start/stop, minimize info	1463
17.109.5	Restrictions	1463
17.109.6	Related commands	1463
17.109.7	Default	1463
17.110	fix nphug command	1463
17.110.1	Syntax	1463
17.110.2	Examples	1464
17.110.3	Description	1464
17.110.4	Restart, fix_modify, output, run start/stop, minimize info	1466
17.110.5	Restrictions	1466
17.110.6	Related commands	1466
17.110.7	Default	1466
17.111	fix npt/asphere command	1467
17.111.1	Syntax	1467
17.111.2	Examples	1467
17.111.3	Description	1467
17.111.4	Restart, fix_modify, output, run start/stop, minimize info	1468
17.111.5	Restrictions	1469
17.111.6	Related commands	1469
17.111.7	Default	1469
17.112	fix npt/body command	1469
17.112.1	Syntax	1469
17.112.2	Examples	1469
17.112.3	Description	1469
17.112.4	Restart, fix_modify, output, run start/stop, minimize info	1471
17.112.5	Restrictions	1471
17.112.6	Related commands	1471
17.112.7	Default	1471
17.113	fix npt/cauchy command	1471
17.113.1	Syntax	1471
17.113.2	Examples	1472
17.113.3	Description	1472
17.113.4	Restart, fix_modify, output, run start/stop, minimize info	1477
17.113.5	Restrictions	1478
17.113.6	Related commands	1479
17.113.7	Default	1479
17.114	fix npt/sphere command	1479
17.114.1	Syntax	1479
17.114.2	Examples	1479

17.114.3	Description	1480
17.114.4	Restart, fix_modify, output, run start/stop, minimize info	1481
17.114.5	Restrictions	1481
17.114.6	Related commands	1481
17.114.7	Default	1481
17.115	fix numdiff command	1482
17.115.1	Syntax	1482
17.115.2	Examples	1482
17.115.3	Description	1482
17.115.4	Restart, fix_modify, output, run start/stop, minimize info	1483
17.115.5	Restrictions	1483
17.115.6	Related commands	1483
17.115.7	Default	1483
17.116	fix numdiff/virial command	1483
17.116.1	Syntax	1483
17.116.2	Examples	1484
17.116.3	Description	1484
17.116.4	Restart, fix_modify, output, run start/stop, minimize info	1484
17.116.5	Restrictions	1485
17.116.6	Related commands	1485
17.116.7	Default	1485
17.117	fix nve command	1485
17.117.1	Syntax	1485
17.117.2	Examples	1485
17.117.3	Description	1485
17.117.4	Restart, fix_modify, output, run start/stop, minimize info	1486
17.117.5	Restrictions	1486
17.117.6	Related commands	1486
17.117.7	Default	1486
17.118	fix nve/asphere command	1486
17.118.1	Syntax	1486
17.118.2	Examples	1486
17.118.3	Description	1487
17.118.4	Restart, fix_modify, output, run start/stop, minimize info	1487
17.118.5	Restrictions	1487
17.118.6	Related commands	1487
17.118.7	Default	1487
17.119	fix nve/asphere/noforce command	1488
17.119.1	Syntax	1488
17.119.2	Examples	1488
17.119.3	Description	1488
17.119.4	Restart, fix_modify, output, run start/stop, minimize info	1488
17.119.5	Restrictions	1488
17.119.6	Related commands	1489
17.119.7	Default	1489
17.120	fix nve/awpmd command	1489
17.120.1	Syntax	1489
17.120.2	Examples	1489
17.120.3	Description	1489
17.120.4	Restart, fix_modify, output, run start/stop, minimize info	1489
17.120.5	Restrictions	1490
17.120.6	Related commands	1490
17.120.7	Default	1490
17.121	fix nve/body command	1490

17.121.1	Syntax . . . . .	1490
17.121.2	Examples . . . . .	1490
17.121.3	Description . . . . .	1490
17.121.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1490
17.121.5	Restrictions . . . . .	1491
17.121.6	Related commands . . . . .	1491
17.121.7	Default . . . . .	1491
17.122	fix nve/bpm/sphere command . . . . .	1491
17.122.1	Syntax . . . . .	1491
17.122.2	Examples . . . . .	1491
17.122.3	Description . . . . .	1491
17.122.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1492
17.122.5	Restrictions . . . . .	1492
17.122.6	Related commands . . . . .	1492
17.122.7	Default . . . . .	1492
17.123	fix nve/dot command . . . . .	1492
17.123.1	Syntax . . . . .	1492
17.123.2	Examples . . . . .	1492
17.123.3	Description . . . . .	1493
17.123.4	Restrictions . . . . .	1493
17.123.5	Related commands . . . . .	1493
17.123.6	Default . . . . .	1493
17.124	fix nve/dotc/langevin command . . . . .	1493
17.124.1	Syntax . . . . .	1493
17.124.2	Examples . . . . .	1494
17.124.3	Description . . . . .	1494
17.124.4	Restrictions . . . . .	1495
17.124.5	Related commands . . . . .	1495
17.124.6	Default . . . . .	1495
17.125	fix nve/eff command . . . . .	1496
17.125.1	Syntax . . . . .	1496
17.125.2	Examples . . . . .	1496
17.125.3	Description . . . . .	1496
17.125.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1496
17.125.5	Restrictions . . . . .	1496
17.125.6	Related commands . . . . .	1496
17.125.7	Default . . . . .	1496
17.126	fix nve/limit command . . . . .	1497
17.126.1	Syntax . . . . .	1497
17.126.2	Examples . . . . .	1497
17.126.3	Description . . . . .	1497
17.126.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1497
17.126.5	Restrictions . . . . .	1498
17.126.6	Related commands . . . . .	1498
17.126.7	Default . . . . .	1498
17.127	fix nve/line command . . . . .	1498
17.127.1	Syntax . . . . .	1498
17.127.2	Examples . . . . .	1498
17.127.3	Description . . . . .	1498
17.127.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1498
17.127.5	Restrictions . . . . .	1499
17.127.6	Related commands . . . . .	1499
17.127.7	Default . . . . .	1499
17.128	fix nve/manifold/rattle command . . . . .	1499

17.128.1	Syntax . . . . .	1499
17.128.2	Examples . . . . .	1499
17.128.3	Description . . . . .	1500
17.128.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1500
17.128.5	Restrictions . . . . .	1500
17.128.6	Related commands . . . . .	1500
17.128.7	Default . . . . .	1500
17.129	fix nve/noforce command . . . . .	1501
17.129.1	Syntax . . . . .	1501
17.129.2	Examples . . . . .	1501
17.129.3	Description . . . . .	1501
17.129.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1501
17.129.5	Restrictions . . . . .	1501
17.129.6	Related commands . . . . .	1501
17.129.7	Default . . . . .	1502
17.130	fix nve/sphere command . . . . .	1502
17.130.1	Syntax . . . . .	1502
17.130.2	Examples . . . . .	1502
17.130.3	Description . . . . .	1502
17.130.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1503
17.130.5	Restrictions . . . . .	1503
17.130.6	Related commands . . . . .	1503
17.130.7	Default . . . . .	1503
17.131	fix nve/spin command . . . . .	1503
17.131.1	Syntax . . . . .	1503
17.131.2	Examples . . . . .	1504
17.131.3	Description . . . . .	1504
17.131.4	Restrictions . . . . .	1505
17.131.5	Related commands . . . . .	1505
17.131.6	Default . . . . .	1505
17.132	fix nve/tri command . . . . .	1505
17.132.1	Syntax . . . . .	1505
17.132.2	Examples . . . . .	1505
17.132.3	Description . . . . .	1505
17.132.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1506
17.132.5	Restrictions . . . . .	1506
17.132.6	Related commands . . . . .	1506
17.132.7	Default . . . . .	1506
17.133	fix nvk command . . . . .	1506
17.133.1	Syntax . . . . .	1506
17.133.2	Examples . . . . .	1506
17.133.3	Description . . . . .	1506
17.133.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1507
17.133.5	Restrictions . . . . .	1507
17.133.6	Related commands . . . . .	1507
17.133.7	Default . . . . .	1507
17.134	fix nvt/asphere command . . . . .	1507
17.134.1	Syntax . . . . .	1507
17.134.2	Examples . . . . .	1508
17.134.3	Description . . . . .	1508
17.134.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1509
17.134.5	Restrictions . . . . .	1509
17.134.6	Related commands . . . . .	1509
17.134.7	Default . . . . .	1509

17.135	fix nvt/body command	1509
17.135.1	Syntax	1509
17.135.2	Examples	1510
17.135.3	Description	1510
17.135.4	Restart, fix_modify, output, run start/stop, minimize info	1511
17.135.5	Restrictions	1511
17.135.6	Related commands	1511
17.135.7	Default	1511
17.136	fix nvt/manifold/rattle command	1511
17.136.1	Syntax	1511
17.136.2	Examples	1512
17.136.3	Description	1512
17.136.4	Restart, fix_modify, output, run start/stop, minimize info	1512
17.136.5	Restrictions	1512
17.136.6	Related commands	1512
17.137	fix nvt/sllod command	1513
17.137.1	Syntax	1513
17.137.2	Examples	1513
17.137.3	Description	1513
17.137.4	Restart, fix_modify, output, run start/stop, minimize info	1514
17.137.5	Restrictions	1515
17.137.6	Related commands	1515
17.137.7	Default	1515
17.138	fix nvt/sllod/eff command	1515
17.138.1	Syntax	1515
17.138.2	Examples	1515
17.138.3	Description	1515
17.138.4	Restart, fix_modify, output, run start/stop, minimize info	1516
17.138.5	Restrictions	1516
17.138.6	Related commands	1516
17.138.7	Default	1516
17.139	fix nvt/sphere command	1516
17.139.1	Syntax	1516
17.139.2	Examples	1517
17.139.3	Description	1517
17.139.4	Restart, fix_modify, output, run start/stop, minimize info	1518
17.139.5	Restrictions	1518
17.139.6	Related commands	1518
17.139.7	Default	1519
17.140	fix oneway command	1519
17.140.1	Syntax	1519
17.140.2	Examples	1519
17.140.3	Description	1519
17.140.4	Restart, fix_modify, output, run start/stop, minimize info	1519
17.140.5	Restrictions	1520
17.140.6	Related commands	1520
17.140.7	Default	1520
17.141	fix orient/fcc command	1520
17.142	fix orient/bcc command	1520
17.142.1	Syntax	1520
17.142.2	Examples	1520
17.142.3	Description	1521
17.142.4	Restart, fix_modify, output, run start/stop, minimize info	1522
17.142.5	Restrictions	1522

17.142.6	Related commands	1523
17.142.7	Default	1523
17.143	fix orient/eco command	1523
17.143.1	Examples	1524
17.143.2	Description	1524
17.143.3	Restart, fix_modify, output, run start/stop, minimize info	1525
17.143.4	Restrictions	1525
17.143.5	Related commands	1525
17.143.6	Default	1525
17.144	fix pafi command	1526
17.144.1	Syntax	1526
17.144.2	Examples	1526
17.144.3	Description	1526
17.144.4	Restart, fix_modify, output, run start/stop, minimize info	1527
17.144.5	Restrictions	1527
17.144.6	Default	1527
17.145	fix pair command	1527
17.145.1	Syntax	1527
17.145.2	Examples	1528
17.145.3	Description	1528
17.145.4	Restart, fix_modify, output, run start/stop, minimize info	1528
17.145.5	Restrictions	1529
17.145.6	Related commands	1529
17.145.7	Default	1529
17.146	fix phonon command	1529
17.146.1	Syntax	1529
17.146.2	Examples	1530
17.146.3	Description	1530
17.146.4	Restart, fix_modify, output, run start/stop, minimize info	1531
17.146.5	Restrictions	1531
17.146.6	Related commands	1531
17.146.7	Default	1531
17.147	fix pimd command	1532
17.147.1	Syntax	1532
17.147.2	Examples	1532
17.147.3	Description	1532
17.147.4	Restrictions	1535
17.147.5	Default	1535
17.148	fix planeforce command	1535
17.148.1	Syntax	1535
17.148.2	Examples	1535
17.148.3	Description	1536
17.148.4	Restart, fix_modify, output, run start/stop, minimize info	1536
17.148.5	Restrictions	1536
17.148.6	Related commands	1536
17.148.7	Default	1536
17.149	fix plumed command	1536
17.149.1	Syntax	1536
17.149.2	Examples	1537
17.149.3	Description	1537
17.149.4	Restart, fix_modify, output, run start/stop, minimize info	1537
17.149.5	Restrictions	1538
17.149.6	Related commands	1538
17.149.7	Default	1538

17.150	fix poems command	1538
17.150.1	Syntax	1538
17.150.2	Examples	1538
17.150.3	Description	1539
17.150.4	Restart, fix_modify, output, run start/stop, minimize info	1540
17.150.5	Restrictions	1540
17.150.6	Related commands	1540
17.150.7	Default	1540
17.151	fix polarize/bem/gmres command	1540
17.152	fix polarize/bem/icc command	1540
17.153	fix polarize/functional command	1540
17.153.1	Syntax	1540
17.153.2	Examples	1541
17.153.3	Description	1541
17.153.4	Restart, fix_modify, output, run start/stop, minimize info	1542
17.153.5	Restrictions	1542
17.153.6	Related commands	1542
17.153.7	Default	1543
17.154	fix pour command	1543
17.154.1	Syntax	1543
17.154.2	Examples	1544
17.154.3	Description	1544
17.154.4	Restart, fix_modify, output, run start/stop, minimize info	1546
17.154.5	Restrictions	1546
17.154.6	Related commands	1546
17.154.7	Default	1546
17.155	fix precession/spin command	1547
17.155.1	Syntax	1547
17.155.2	Examples	1547
17.155.3	Description	1547
17.155.4	Restart, fix_modify, output, run start/stop, minimize info	1549
17.155.5	Restrictions	1549
17.155.6	Related commands	1549
17.155.7	Default	1549
17.156	fix press/berendsen command	1550
17.156.1	Syntax	1550
17.156.2	Examples	1550
17.156.3	Description	1550
17.156.4	Restart, fix_modify, output, run start/stop, minimize info	1552
17.156.5	Restrictions	1552
17.156.6	Related commands	1552
17.156.7	Default	1553
17.157	fix print command	1553
17.157.1	Syntax	1553
17.157.2	Examples	1553
17.157.3	Description	1553
17.157.4	Restart, fix_modify, output, run start/stop, minimize info	1554
17.157.5	Restrictions	1554
17.157.6	Related commands	1554
17.157.7	Default	1555
17.158	fix propel/self command	1555
17.158.1	Syntax	1555
17.158.2	Examples	1555
17.158.3	Description	1555

17.158.4Restart, fix_modify, output, run start/stop, minimize info	1556
17.158.5Restrictions	1556
17.158.6Related commands	1557
17.158.7Default	1557
17.159fix property/atom command	1557
17.159.1Syntax	1557
17.159.2Examples	1557
17.159.3Description	1558
17.159.4Restart, fix_modify, output, run start/stop, minimize info	1561
17.159.5Restrictions	1561
17.159.6Related commands	1561
17.159.7Default	1561
17.160fix python/invoke command	1561
17.160.1Syntax	1561
17.160.2Examples	1562
17.160.3Description	1562
17.160.4Restrictions	1562
17.160.5Related commands	1563
17.161fix python/move command	1563
17.161.1Syntax	1563
17.161.2Examples	1563
17.161.3Description	1563
17.161.4Restart, fix_modify, output, run start/stop, minimize info	1564
17.161.5Restrictions	1564
17.161.6Related commands	1564
17.161.7Default	1564
17.162fix qbmsst command	1564
17.162.1Syntax	1564
17.162.2Examples	1565
17.162.3Description	1566
17.162.4Restart, fix_modify, output, run start/stop, minimize info	1567
17.162.5Restrictions	1568
17.162.6Related commands	1568
17.162.7Default	1568
17.163fix qeq/point command	1568
17.164fix qeq/shielded command	1568
17.165fix qeq/slater command	1568
17.166fix qeq/dynamic command	1568
17.167fix qeq/fire command	1568
17.167.1Syntax	1568
17.167.2Examples	1569
17.167.3Description	1569
17.167.4Restart, fix_modify, output, run start/stop, minimize info	1571
17.167.5Restrictions	1571
17.167.6Related commands	1571
17.167.7Default	1572
17.168fix qeq/comb command	1572
17.168.1Syntax	1572
17.168.2Examples	1572
17.168.3Description	1572
17.168.4Restart, fix_modify, output, run start/stop, minimize info	1573
17.168.5Restrictions	1573
17.168.6Related commands	1574
17.168.7Default	1574

17.169	fix qeq/reaxff command	1574
17.169.1	Syntax	1574
17.169.2	Examples	1574
17.169.3	Description	1575
17.169.4	Restart, fix_modify, output, run start/stop, minimize info	1575
17.169.5	Restrictions	1576
17.169.6	Related commands	1576
17.169.7	Default	1576
17.170	fix qmmm command	1576
17.170.1	Syntax	1576
17.170.2	Examples	1577
17.170.3	Description	1577
17.170.4	Restart, fix_modify, output, run start/stop, minimize info	1577
17.170.5	Restrictions	1577
17.170.6	Related commands	1577
17.170.7	Default	1577
17.171	fix qtb command	1578
17.171.1	Syntax	1578
17.171.2	Examples	1578
17.171.3	Description	1578
17.171.4	Restart, fix_modify, output, run start/stop, minimize info	1579
17.171.5	Restrictions	1580
17.171.6	Related commands	1580
17.171.7	Default	1580
17.172	fix reaxff/bonds command	1580
17.172.1	Syntax	1580
17.172.2	Examples	1580
17.172.3	Description	1581
17.172.4	Restart, fix_modify, output, run start/stop, minimize info	1581
17.172.5	Restrictions	1582
17.172.6	Related commands	1582
17.172.7	Default	1582
17.173	fix reaxff/species command	1582
17.173.1	Syntax	1582
17.173.2	Examples	1583
17.173.3	Description	1583
17.173.4	Restart, fix_modify, output, run start/stop, minimize info	1584
17.173.5	Restrictions	1585
17.173.6	Related commands	1585
17.173.7	Default	1585
17.174	fix recenter command	1585
17.174.1	Syntax	1585
17.174.2	Examples	1585
17.174.3	Description	1586
17.174.4	Restart, fix_modify, output, run start/stop, minimize info	1586
17.174.5	Restrictions	1587
17.174.6	Related commands	1587
17.174.7	Default	1587
17.175	fix restrain command	1587
17.175.1	Syntax	1587
17.175.2	Examples	1588
17.175.3	Description	1588
17.175.4	Restart, fix_modify, output, run start/stop, minimize info	1590
17.175.5	Restrictions	1591

17.175.6	Related commands	1591
17.175.7	Default	1591
17.176	fix rhok command	1591
17.176.1	Syntax	1591
17.176.2	Examples	1591
17.176.3	Description	1591
17.176.4	Restart, fix_modify, output, run start/stop, minimize info	1592
17.176.5	Restrictions	1592
17.176.6	Related commands	1592
17.176.7	Default	1592
17.177	fix rigid command	1592
17.178	fix rigid/nve command	1592
17.179	fix rigid/nvt command	1592
17.180	fix rigid/npt command	1593
17.181	fix rigid/nph command	1593
17.182	fix rigid/small command	1593
17.183	fix rigid/nve/small command	1593
17.184	fix rigid/nvt/small command	1593
17.185	fix rigid/npt/small command	1593
17.186	fix rigid/nph/small command	1593
17.186.1	Syntax	1593
17.186.2	Examples	1594
17.186.3	Description	1595
17.186.4	Restart, fix_modify, output, run start/stop, minimize info	1602
17.186.5	Restrictions	1603
17.186.6	Related commands	1603
17.186.7	Default	1603
17.187	fix rigid/meso command	1604
17.187.1	Syntax	1604
17.187.2	Examples	1604
17.187.3	Description	1604
17.187.4	Restart, fix_modify, output, run start/stop, minimize info	1607
17.187.5	Restrictions	1608
17.187.6	Related commands	1608
17.187.7	Default	1608
17.188	fix rx command	1608
17.188.1	Syntax	1608
17.188.2	Examples	1609
17.188.3	Description	1609
17.188.4	Restrictions	1611
17.188.5	Related commands	1611
17.188.6	Default	1611
17.189	fix saed/vtk command	1611
17.189.1	Syntax	1611
17.189.2	Examples	1612
17.189.3	Description	1612
17.189.4	Restart, fix_modify, output, run start/stop, minimize info	1614
17.189.5	Restrictions	1614
17.189.6	Related commands	1614
17.189.7	Default	1614
17.190	fix setforce command	1614
17.191	fix setforce/spin command	1614
17.191.1	Syntax	1614
17.191.2	Examples	1615

17.191.3	Description	1615
17.191.4	Restart, fix_modify, output, run start/stop, minimize info	1616
17.191.5	Restrictions	1616
17.191.6	Related commands	1616
17.191.7	Default	1616
17.192	fix shake command	1616
17.193	fix rattle command	1616
17.193.1	Syntax	1616
17.193.2	Examples	1617
17.193.3	Description	1617
17.193.4	Restart, fix_modify, output, run start/stop, minimize info	1619
17.193.5	Restrictions	1620
17.193.6	Related commands	1620
17.193.7	Default	1620
17.194	fix shardlow command	1620
17.194.1	Syntax	1620
17.194.2	Examples	1621
17.194.3	Description	1621
17.194.4	Restrictions	1621
17.194.5	Related commands	1622
17.194.6	Default	1622
17.195	fix smd command	1622
17.195.1	Syntax	1622
17.195.2	Examples	1623
17.195.3	Description	1623
17.195.4	Restart, fix_modify, output, run start/stop, minimize info	1623
17.195.5	Restrictions	1624
17.195.6	Related commands	1624
17.195.7	Default	1624
17.196	fix smd/adjust_dt command	1624
17.196.1	Syntax	1624
17.196.2	Examples	1625
17.196.3	Description	1625
17.196.4	Restart, fix_modify, output, run start/stop, minimize info	1625
17.196.5	Restrictions	1625
17.196.6	Related commands	1625
17.196.7	Default	1625
17.197	fix smd/integrate_tlsph command	1625
17.197.1	Syntax	1625
17.197.2	Examples	1626
17.197.3	Description	1626
17.197.4	Restart, fix_modify, output, run start/stop, minimize info	1626
17.197.5	Restrictions	1626
17.197.6	Related commands	1626
17.197.7	Default	1626
17.198	fix smd/integrate_ulsph command	1626
17.198.1	Syntax	1626
17.198.2	Examples	1627
17.198.3	Description	1627
17.198.4	Restart, fix_modify, output, run start/stop, minimize info	1627
17.198.5	Restrictions	1627
17.198.6	Related commands	1627
17.198.7	Default	1627
17.199	fix smd/move_tri_surf command	1628

17.199.1	Syntax . . . . .	1628
17.199.2	Examples . . . . .	1628
17.199.3	Description . . . . .	1628
17.199.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1629
17.199.5	Restrictions . . . . .	1629
17.199.6	Related commands . . . . .	1629
17.199.7	Default . . . . .	1629
17.200	fix smd/setvel command . . . . .	1629
17.200.1	Syntax . . . . .	1629
17.200.2	Examples . . . . .	1629
17.200.3	Description . . . . .	1630
17.200.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1630
17.200.5	Restrictions . . . . .	1630
17.200.6	Related commands . . . . .	1630
17.200.7	Default . . . . .	1630
17.201	fix smd/wall_surface command . . . . .	1631
17.201.1	Syntax . . . . .	1631
17.201.2	Examples . . . . .	1631
17.201.3	Description . . . . .	1631
17.201.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1631
17.201.5	Restrictions . . . . .	1631
17.201.6	Related commands . . . . .	1632
17.201.7	Default . . . . .	1632
17.202	fix sph command . . . . .	1632
17.202.1	Syntax . . . . .	1632
17.202.2	Examples . . . . .	1632
17.202.3	Description . . . . .	1632
17.202.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1632
17.202.5	Restrictions . . . . .	1632
17.202.6	Related commands . . . . .	1633
17.202.7	Default . . . . .	1633
17.203	fix sph/stationary command . . . . .	1633
17.203.1	Syntax . . . . .	1633
17.203.2	Examples . . . . .	1633
17.203.3	Description . . . . .	1633
17.203.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1633
17.203.5	Restrictions . . . . .	1633
17.203.6	Related commands . . . . .	1634
17.203.7	Default . . . . .	1634
17.204	fix spring command . . . . .	1634
17.204.1	Syntax . . . . .	1634
17.204.2	Examples . . . . .	1634
17.204.3	Description . . . . .	1634
17.204.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1635
17.204.5	Restrictions . . . . .	1636
17.204.6	Related commands . . . . .	1636
17.204.7	Default . . . . .	1636
17.205	fix spring/chunk command . . . . .	1636
17.205.1	Syntax . . . . .	1636
17.205.2	Examples . . . . .	1636
17.205.3	Description . . . . .	1636
17.205.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1637
17.205.5	Restrictions . . . . .	1637
17.205.6	Related commands . . . . .	1637

17.205.7Default	1637
17.206fix spring/rg command	1637
17.206.1Syntax	1637
17.206.2Examples	1638
17.206.3Description	1638
17.206.4Restart, fix_modify, output, run start/stop, minimize info	1638
17.206.5Restrictions	1639
17.206.6Related commands	1639
17.206.7Default	1639
17.207fix spring/self command	1639
17.207.1Syntax	1639
17.207.2Examples	1639
17.207.3Description	1639
17.207.4Restart, fix_modify, output, run start/stop, minimize info	1640
17.207.5Restrictions	1640
17.207.6Related commands	1640
17.207.7Default	1640
17.208fix srd command	1640
17.208.1Syntax	1640
17.208.2Examples	1641
17.208.3Description	1641
17.208.4Restart, fix_modify, output, run start/stop, minimize info	1645
17.208.5Restrictions	1645
17.208.6Related commands	1645
17.208.7Default	1645
17.209fix store/force command	1646
17.209.1Syntax	1646
17.209.2Examples	1646
17.209.3Description	1646
17.209.4Restart, fix_modify, output, run start/stop, minimize info	1646
17.209.5Restrictions	1647
17.209.6Related commands	1647
17.209.7Default	1647
17.210fix store/state command	1647
17.210.1Syntax	1647
17.210.2Examples	1648
17.210.3Description	1648
17.210.4Restart, fix_modify, output, run start/stop, minimize info	1649
17.210.5Restrictions	1649
17.210.6Related commands	1649
17.210.7Default	1649
17.211fix temp/berendsen command	1649
17.211.1Syntax	1649
17.211.2Examples	1650
17.211.3Description	1650
17.211.4Restart, fix_modify, output, run start/stop, minimize info	1651
17.211.5Restrictions	1651
17.211.6Related commands	1651
17.211.7Default	1651
17.212fix temp/csvr command	1652
17.213fix temp/csld command	1652
17.213.1Syntax	1652
17.213.2Examples	1652
17.213.3Description	1652

17.213.4	Restart, fix_modify, output, run start/stop, minimize info	1653
17.213.5	Restrictions	1654
17.213.6	Related commands	1654
17.213.7	Default	1654
17.214	fix temp/rescale command	1654
17.214.1	Syntax	1654
17.214.2	Examples	1655
17.214.3	Description	1655
17.214.4	Restart, fix_modify, output, run start/stop, minimize info	1656
17.214.5	Restrictions	1656
17.214.6	Related commands	1656
17.214.7	Default	1656
17.215	fix temp/rescale/eff command	1657
17.215.1	Syntax	1657
17.215.2	Examples	1657
17.215.3	Description	1657
17.215.4	Restart, fix_modify, output, run start/stop, minimize info	1657
17.215.5	Restrictions	1658
17.215.6	Related commands	1658
17.215.7	Default	1658
17.216	fix tfmc command	1658
17.216.1	Syntax	1658
17.216.2	Examples	1658
17.216.3	Description	1659
17.216.4	Restart, fix_modify, output, run start/stop, minimize info	1660
17.216.5	Restrictions	1660
17.216.6	Related commands	1660
17.216.7	Default	1660
17.217	fix tgnvt/drude command	1660
17.218	fix tgnpt/drude command	1660
17.218.1	Syntax	1660
17.218.2	Examples	1661
17.218.3	Description	1661
17.218.4	Restart, fix_modify, output, run start/stop, minimize info	1663
17.218.5	Restrictions	1664
17.218.6	Related commands	1664
17.218.7	Default	1664
17.219	fix thermal/conductivity command	1664
17.219.1	Syntax	1664
17.219.2	Examples	1665
17.219.3	Description	1665
17.219.4	Restart, fix_modify, output, run start/stop, minimize info	1666
17.219.5	Restrictions	1666
17.219.6	Related commands	1666
17.219.7	Default	1666
17.220	fix ti/spring command	1667
17.220.1	Syntax	1667
17.220.2	Example	1667
17.220.3	Description	1667
17.220.4	Restart, fix_modify, output, run start/stop, minimize info	1668
17.220.5	Related commands	1669
17.220.6	Restrictions	1669
17.220.7	Default	1669
17.221	fix tmd command	1669

17.221.1	Syntax . . . . .	1669
17.221.2	Examples . . . . .	1669
17.221.3	Description . . . . .	1669
17.221.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1670
17.221.5	Restrictions . . . . .	1671
17.221.6	Related commands . . . . .	1671
17.221.7	Default . . . . .	1671
17.222	fix ttm command . . . . .	1671
17.223	fix ttm/grid command . . . . .	1671
17.224	fix ttm/mod command . . . . .	1671
17.224.1	Syntax . . . . .	1671
17.224.2	Examples . . . . .	1672
17.224.3	Description . . . . .	1672
17.224.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1675
17.224.5	Restrictions . . . . .	1676
17.224.6	Related commands . . . . .	1676
17.224.7	Default . . . . .	1676
17.225	fix tune/kSPACE command . . . . .	1676
17.225.1	Syntax . . . . .	1676
17.225.2	Examples . . . . .	1677
17.225.3	Description . . . . .	1677
17.225.4	Restrictions . . . . .	1677
17.225.5	Related commands . . . . .	1678
17.225.6	Default . . . . .	1678
17.226	fix vector command . . . . .	1678
17.226.1	Syntax . . . . .	1678
17.226.2	Examples . . . . .	1678
17.226.3	Description . . . . .	1678
17.226.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1679
17.226.5	Restrictions . . . . .	1680
17.226.6	Related commands . . . . .	1680
17.226.7	Default . . . . .	1680
17.227	fix viscosity command . . . . .	1680
17.227.1	Syntax . . . . .	1680
17.227.2	Examples . . . . .	1681
17.227.3	Description . . . . .	1681
17.227.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1682
17.227.5	Restrictions . . . . .	1682
17.227.6	Related commands . . . . .	1682
17.227.7	Default . . . . .	1682
17.228	fix viscous command . . . . .	1683
17.228.1	Syntax . . . . .	1683
17.228.2	Examples . . . . .	1683
17.228.3	Description . . . . .	1683
17.228.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1684
17.228.5	Restrictions . . . . .	1684
17.228.6	Related commands . . . . .	1684
17.228.7	Default . . . . .	1684
17.229	fix viscous/sphere command . . . . .	1684
17.229.1	Syntax . . . . .	1684
17.229.2	Examples . . . . .	1685
17.229.3	Description . . . . .	1685
17.229.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	1685
17.229.5	Restrictions . . . . .	1685

17.229.6	Related commands	1686
17.229.7	Default	1686
17.230	fix wall/lj93 command	1686
17.231	fix wall/lj126 command	1686
17.232	fix wall/lj1043 command	1686
17.233	fix wall/colloid command	1686
17.234	fix wall/harmonic command	1686
17.235	fix wall/morse command	1686
17.235.1	Syntax	1686
17.235.2	Examples	1687
17.235.3	Description	1687
17.235.4	Restart, fix_modify, output, run start/stop, minimize info	1690
17.235.5	Restrictions	1691
17.235.6	Related commands	1691
17.235.7	Default	1691
17.236	fix wall/body/polygon command	1691
17.236.1	Syntax	1691
17.236.2	Examples	1692
17.236.3	Description	1692
17.236.4	Restart, fix_modify, output, run start/stop, minimize info	1692
17.236.5	Restrictions	1692
17.236.6	Related commands	1693
17.236.7	Default	1693
17.237	fix wall/body/polyhedron command	1693
17.237.1	Syntax	1693
17.237.2	Examples	1693
17.237.3	Description	1694
17.237.4	Restart, fix_modify, output, run start/stop, minimize info	1694
17.237.5	Restrictions	1694
17.237.6	Related commands	1694
17.237.7	Default	1695
17.238	fix wall/ees command	1695
17.239	fix wall/region/ees command	1695
17.239.1	Syntax	1695
17.239.2	Examples	1695
17.239.3	Description	1696
17.239.4	Restart, fix_modify, output, run start/stop, minimize info	1697
17.239.5	Restrictions	1697
17.239.6	Related commands	1697
17.239.7	Default	1697
17.240	fix wall/gran command	1697
17.240.1	Syntax	1697
17.240.2	Examples	1698
17.240.3	Description	1699
17.240.4	Restart, fix_modify, output, run start/stop, minimize info	1700
17.240.5	Restrictions	1700
17.240.6	Related commands	1700
17.240.7	Default	1701
17.241	fix wall/gran/region command	1701
17.241.1	Syntax	1701
17.241.2	Examples	1701
17.241.3	Description	1702
17.241.4	Restart, fix_modify, output, run start/stop, minimize info	1704
17.241.5	Restrictions	1704

17.241.6	Related commands	1704
17.241.7	Default	1705
17.242	fix wall/piston command	1705
17.242.1	Syntax	1705
17.242.2	Examples	1705
17.242.3	Description	1705
17.242.4	Restart, fix_modify, output, run start/stop, minimize info	1706
17.242.5	Restrictions	1706
17.242.6	Related commands	1706
17.242.7	Default	1706
17.243	fix wall/reflect command	1707
17.243.1	Syntax	1707
17.243.2	Examples	1707
17.243.3	Description	1707
17.243.4	Restart, fix_modify, output, run start/stop, minimize info	1709
17.243.5	Restrictions	1709
17.243.6	Related commands	1709
17.243.7	Default	1709
17.244	fix wall/reflect/stochastic command	1709
17.244.1	Syntax	1709
17.244.2	Examples	1710
17.244.3	Description	1710
17.244.4	Restrictions	1711
17.244.5	Related commands	1711
17.244.6	Default	1711
17.245	fix wall/region command	1711
17.245.1	Syntax	1711
17.245.2	Examples	1712
17.245.3	Description	1712
17.245.4	Restart, fix_modify, output, run start/stop, minimize info	1713
17.245.5	Restrictions	1714
17.245.6	Related commands	1714
17.245.7	Default	1714
17.246	fix wall/srd command	1714
17.246.1	Syntax	1714
17.246.2	Examples	1715
17.246.3	Description	1715
17.246.4	Restart, fix_modify, output, run start/stop, minimize info	1717
17.246.5	Restrictions	1717
17.246.6	Related commands	1717
17.246.7	Default	1717
17.247	fix widom command	1717
17.247.1	Syntax	1717
17.247.2	Examples	1718
17.247.3	Description	1718
17.247.4	Restart, fix_modify, output, run start/stop, minimize info	1719
17.247.5	Restrictions	1720
17.247.6	Related commands	1720
17.247.7	Default	1720
<b>18</b>	<b>Computes</b>	<b>1721</b>
18.1	compute ackland/atom command	1721
18.1.1	Syntax	1721
18.1.2	Examples	1721

18.1.3	Description	1721
18.1.4	Output info	1722
18.1.5	Restrictions	1722
18.1.6	Related commands	1722
18.1.7	Default	1722
18.2	compute adf command	1722
18.2.1	Syntax	1722
18.2.2	Examples	1723
18.2.3	Description	1723
18.2.4	Output info	1725
18.2.5	Restrictions	1725
18.2.6	Related commands	1725
18.2.7	Default	1725
18.3	compute angle command	1725
18.3.1	Syntax	1725
18.3.2	Examples	1726
18.3.3	Description	1726
18.3.4	Output info	1726
18.3.5	Restrictions	1726
18.3.6	Related commands	1726
18.3.7	Default	1726
18.4	compute angle/local command	1726
18.4.1	Syntax	1726
18.4.2	Examples	1727
18.4.3	Description	1727
18.4.4	Output info	1728
18.4.5	Restrictions	1728
18.4.6	Related commands	1728
18.4.7	Default	1728
18.5	compute angmom/chunk command	1729
18.5.1	Syntax	1729
18.5.2	Examples	1729
18.5.3	Description	1729
18.5.4	Output info	1730
18.5.5	Restrictions	1730
18.5.6	Related commands	1730
18.5.7	Default	1730
18.6	compute ave/sphere/atom command	1730
18.6.1	Syntax	1730
18.6.2	Examples	1730
18.6.3	Description	1731
18.6.4	Output info	1731
18.6.5	Restrictions	1732
18.6.6	Related commands	1732
18.6.7	Default	1732
18.7	compute basal/atom command	1732
18.7.1	Syntax	1732
18.7.2	Examples	1732
18.7.3	Description	1732
18.7.4	Output info	1733
18.7.5	Restrictions	1733
18.7.6	Related commands	1733
18.7.7	Default	1733
18.8	compute body/local command	1733

18.8.1	Syntax . . . . .	1733
18.8.2	Examples . . . . .	1734
18.8.3	Description . . . . .	1734
18.8.4	Output info . . . . .	1734
18.8.5	Restrictions . . . . .	1735
18.8.6	Related commands . . . . .	1735
18.8.7	Default . . . . .	1735
18.9	compute bond command . . . . .	1735
18.9.1	Syntax . . . . .	1735
18.9.2	Examples . . . . .	1735
18.9.3	Description . . . . .	1735
18.9.4	Output info . . . . .	1735
18.9.5	Restrictions . . . . .	1736
18.9.6	Related commands . . . . .	1736
18.9.7	Default . . . . .	1736
18.10	compute bond/local command . . . . .	1736
18.10.1	Syntax . . . . .	1736
18.10.2	Examples . . . . .	1737
18.10.3	Description . . . . .	1737
18.10.4	Output info . . . . .	1738
18.10.5	Restrictions . . . . .	1739
18.10.6	Related commands . . . . .	1739
18.10.7	Default . . . . .	1739
18.11	compute born/matrix command . . . . .	1739
18.11.1	Syntax . . . . .	1739
18.11.2	Examples . . . . .	1739
18.11.3	Description . . . . .	1740
18.11.4	Restrictions . . . . .	1741
18.11.5	Default . . . . .	1742
18.12	compute centro/atom command . . . . .	1742
18.12.1	Syntax . . . . .	1742
18.12.2	Examples . . . . .	1742
18.12.3	Description . . . . .	1742
18.12.4	Output info . . . . .	1743
18.12.5	Restrictions . . . . .	1744
18.12.6	Related commands . . . . .	1744
18.12.7	Default . . . . .	1744
18.13	compute chunk/atom command . . . . .	1744
18.13.1	Syntax . . . . .	1744
18.13.2	Examples . . . . .	1746
18.13.3	Description . . . . .	1746
18.13.4	Output info . . . . .	1752
18.13.5	Restrictions . . . . .	1752
18.13.6	Related commands . . . . .	1752
18.13.7	Default . . . . .	1752
18.14	compute chunk/spread/atom command . . . . .	1753
18.14.1	Syntax . . . . .	1753
18.14.2	Examples . . . . .	1753
18.14.3	Description . . . . .	1753
18.14.4	Output info . . . . .	1755
18.14.5	Restrictions . . . . .	1755
18.14.6	Related commands . . . . .	1756
18.14.7	Default . . . . .	1756
18.15	compute cluster/atom command . . . . .	1756

18.16	compute fragment/atom command . . . . .	1756
18.17	compute aggregate/atom command . . . . .	1756
	18.17.1 Syntax . . . . .	1756
	18.17.2 Examples . . . . .	1756
	18.17.3 Description . . . . .	1756
	18.17.4 Output info . . . . .	1757
	18.17.5 Restrictions . . . . .	1757
	18.17.6 Related commands . . . . .	1757
	18.17.7 Default . . . . .	1758
18.18	compute cna/atom command . . . . .	1758
	18.18.1 Syntax . . . . .	1758
	18.18.2 Examples . . . . .	1758
	18.18.3 Description . . . . .	1758
	18.18.4 Output info . . . . .	1759
	18.18.5 Restrictions . . . . .	1759
	18.18.6 Related commands . . . . .	1759
	18.18.7 Default . . . . .	1759
18.19	compute cnp/atom command . . . . .	1759
	18.19.1 Syntax . . . . .	1759
	18.19.2 Examples . . . . .	1760
	18.19.3 Description . . . . .	1760
	18.19.4 Output info . . . . .	1761
	18.19.5 Restrictions . . . . .	1761
	18.19.6 Related commands . . . . .	1761
	18.19.7 Default . . . . .	1761
18.20	compute com command . . . . .	1761
	18.20.1 Syntax . . . . .	1761
	18.20.2 Examples . . . . .	1762
	18.20.3 Description . . . . .	1762
	18.20.4 Output info . . . . .	1762
	18.20.5 Restrictions . . . . .	1762
	18.20.6 Related commands . . . . .	1762
	18.20.7 Default . . . . .	1762
18.21	compute com/chunk command . . . . .	1762
	18.21.1 Syntax . . . . .	1762
	18.21.2 Examples . . . . .	1763
	18.21.3 Description . . . . .	1763
	18.21.4 Output info . . . . .	1763
	18.21.5 Restrictions . . . . .	1764
	18.21.6 Related commands . . . . .	1764
	18.21.7 Default . . . . .	1764
18.22	compute contact/atom command . . . . .	1764
	18.22.1 Syntax . . . . .	1764
	18.22.2 Examples . . . . .	1764
	18.22.3 Description . . . . .	1764
	18.22.4 Output info . . . . .	1764
	18.22.5 Restrictions . . . . .	1765
	18.22.6 Related commands . . . . .	1765
	18.22.7 Default . . . . .	1765
18.23	compute coord/atom command . . . . .	1765
	18.23.1 Syntax . . . . .	1765
	18.23.2 Examples . . . . .	1765
	18.23.3 Description . . . . .	1766
	18.23.4 Output info . . . . .	1767

18.23.5	Restrictions	1767
18.23.6	Related commands	1767
18.23.7	Default	1767
18.24	compute damage/atom command	1767
18.24.1	Syntax	1767
18.24.2	Examples	1768
18.24.3	Description	1768
18.24.4	Output info	1768
18.24.5	Restrictions	1768
18.24.6	Related commands	1768
18.24.7	Default	1768
18.25	compute dihedral command	1768
18.25.1	Syntax	1768
18.25.2	Examples	1769
18.25.3	Description	1769
18.25.4	Output info	1769
18.25.5	Restrictions	1769
18.25.6	Related commands	1769
18.25.7	Default	1769
18.26	compute dihedral/local command	1769
18.26.1	Syntax	1769
18.26.2	Examples	1770
18.26.3	Description	1770
18.26.4	Output info	1771
18.26.5	Restrictions	1771
18.26.6	Related commands	1771
18.26.7	Default	1771
18.27	compute dilatation/atom command	1771
18.27.1	Syntax	1771
18.27.2	Examples	1772
18.27.3	Description	1772
18.27.4	Output info	1772
18.27.5	Restrictions	1772
18.27.6	Related commands	1772
18.27.7	Default	1772
18.28	compute dipole command	1772
18.28.1	Syntax	1772
18.28.2	Examples	1773
18.28.3	Description	1773
18.28.4	Output info	1773
18.28.5	Restrictions	1773
18.28.6	Related commands	1773
18.28.7	Default	1773
18.29	compute dipole/chunk command	1774
18.29.1	Syntax	1774
18.29.2	Examples	1774
18.29.3	Description	1774
18.29.4	Output info	1775
18.29.5	Restrictions	1775
18.29.6	Related commands	1775
18.29.7	Default	1775
18.30	compute displace/atom command	1775
18.30.1	Syntax	1775
18.30.2	Examples	1775

18.30.3	Description	1776
18.30.4	Output info	1777
18.30.5	Restrictions	1777
18.30.6	Related commands	1777
18.30.7	Default	1777
18.31	compute dpd command	1777
18.31.1	Syntax	1777
18.31.2	Examples	1778
18.31.3	Description	1778
18.31.4	Output info	1778
18.31.5	Restrictions	1778
18.31.6	Related commands	1779
18.31.7	Default	1779
18.32	compute dpd/atom command	1779
18.32.1	Syntax	1779
18.32.2	Examples	1779
18.32.3	Description	1779
18.32.4	Output info	1779
18.32.5	Restrictions	1780
18.32.6	Related commands	1780
18.32.7	Default	1780
18.33	compute edpd/temp/atom command	1780
18.33.1	Syntax	1780
18.33.2	Examples	1780
18.33.3	Description	1780
18.33.4	Output info	1781
18.33.5	Restrictions	1781
18.33.6	Related commands	1781
18.33.7	Default	1781
18.34	compute efield/atom command	1781
18.34.1	Syntax	1781
18.34.2	Examples	1781
18.34.3	Description	1782
18.34.4	Output info	1782
18.34.5	Restrictions	1782
18.34.6	Related commands	1782
18.34.7	Default	1782
18.35	compute entropy/atom command	1782
18.35.1	Syntax	1782
18.35.2	Examples	1783
18.35.3	Description	1783
18.35.4	Output info	1784
18.35.5	Restrictions	1784
18.35.6	Related commands	1784
18.35.7	Default	1784
18.36	compute erotate/asphere command	1784
18.36.1	Syntax	1784
18.36.2	Examples	1785
18.36.3	Description	1785
18.36.4	Output info	1785
18.36.5	Restrictions	1785
18.36.6	Related commands	1785
18.36.7	Default	1786
18.37	compute erotate/rigid command	1786

18.37.1	Syntax . . . . .	1786
18.37.2	Examples . . . . .	1786
18.37.3	Description . . . . .	1786
18.37.4	Output info . . . . .	1786
18.37.5	Restrictions . . . . .	1786
18.37.6	Related commands . . . . .	1787
18.37.7	Default . . . . .	1787
18.38	compute erotate/sphere command . . . . .	1787
18.38.1	Syntax . . . . .	1787
18.38.2	Examples . . . . .	1787
18.38.3	Description . . . . .	1787
18.38.4	Output info . . . . .	1787
18.38.5	Restrictions . . . . .	1788
18.38.6	Related commands . . . . .	1788
18.38.7	Default . . . . .	1788
18.39	compute erotate/sphere/atom command . . . . .	1788
18.39.1	Syntax . . . . .	1788
18.39.2	Examples . . . . .	1788
18.39.3	Description . . . . .	1788
18.39.4	Output info . . . . .	1789
18.39.5	Restrictions . . . . .	1789
18.39.6	Related commands . . . . .	1789
18.39.7	Default . . . . .	1789
18.40	compute event/displace command . . . . .	1789
18.40.1	Syntax . . . . .	1789
18.40.2	Examples . . . . .	1789
18.40.3	Description . . . . .	1789
18.40.4	Output info . . . . .	1790
18.40.5	Restrictions . . . . .	1790
18.40.6	Related commands . . . . .	1790
18.40.7	Default . . . . .	1790
18.41	compute fabric command . . . . .	1790
18.41.1	Syntax . . . . .	1790
18.41.2	Examples . . . . .	1791
18.41.3	Description . . . . .	1791
18.41.4	Output info . . . . .	1792
18.41.5	Restrictions . . . . .	1792
18.41.6	Related commands . . . . .	1792
18.41.7	Default . . . . .	1792
18.42	compute fep command . . . . .	1793
18.42.1	Syntax . . . . .	1793
18.42.2	Examples . . . . .	1793
18.42.3	Description . . . . .	1793
18.42.4	Output info . . . . .	1796
18.42.5	Restrictions . . . . .	1796
18.42.6	Related commands . . . . .	1796
18.42.7	Default . . . . .	1796
18.43	compute fep/ta command . . . . .	1797
18.43.1	Syntax . . . . .	1797
18.43.2	Examples . . . . .	1797
18.43.3	Description . . . . .	1797
18.43.4	Output info . . . . .	1797
18.43.5	Restrictions . . . . .	1798
18.43.6	Related commands . . . . .	1798

18.43.7	Default	1798
18.44	compute global/atom command	1798
18.44.1	Syntax	1798
18.44.2	Examples	1799
18.44.3	Description	1799
18.44.4	Output info	1801
18.44.5	Restrictions	1801
18.44.6	Related commands	1801
18.44.7	Default	1801
18.45	compute group/group command	1801
18.45.1	Syntax	1801
18.45.2	Examples	1802
18.45.3	Description	1802
18.45.4	Output info	1803
18.45.5	Restrictions	1803
18.45.6	Related commands	1803
18.45.7	Default	1803
18.46	compute gyration command	1804
18.46.1	Syntax	1804
18.46.2	Examples	1804
18.46.3	Description	1804
18.46.4	Output info	1804
18.46.5	Restrictions	1805
18.46.6	Related commands	1805
18.46.7	Default	1805
18.47	compute gyration/chunk command	1805
18.47.1	Syntax	1805
18.47.2	Examples	1805
18.47.3	Description	1805
18.47.4	Output info	1806
18.47.5	Restrictions	1806
18.47.6	Related commands	1806
18.47.7	Default	1807
18.48	compute gyration/shape command	1807
18.48.1	Syntax	1807
18.48.2	Examples	1807
18.48.3	Description	1807
18.48.4	Output info	1808
18.48.5	Restrictions	1808
18.48.6	Related commands	1808
18.48.7	Default	1808
18.49	compute gyration/shape/chunk command	1808
18.49.1	Syntax	1808
18.49.2	Examples	1808
18.49.3	Description	1809
18.49.4	Output info	1809
18.49.5	Restrictions	1809
18.49.6	Related commands	1810
18.49.7	Default	1810
18.50	compute heat/flux command	1810
18.50.1	Syntax	1810
18.50.2	Examples	1810
18.50.3	Description	1810
18.50.4	Output info	1812

18.50.5	Restrictions	1812
18.50.6	Related commands	1812
18.50.7	Default	1812
18.51	compute hexorder/atom command	1814
18.51.1	Syntax	1814
18.51.2	Examples	1814
18.51.3	Description	1814
18.51.4	Output info	1815
18.51.5	Restrictions	1815
18.51.6	Related commands	1815
18.51.7	Default	1815
18.52	compute hma command	1815
18.52.1	Syntax	1815
18.52.2	Examples	1816
18.52.3	Description	1816
18.52.4	Output info	1818
18.52.5	Restrictions	1818
18.52.6	Related commands	1818
18.52.7	Default	1818
18.53	compute improper command	1818
18.53.1	Syntax	1818
18.53.2	Examples	1818
18.53.3	Description	1819
18.53.4	Output info	1819
18.53.5	Restrictions	1819
18.53.6	Related commands	1819
18.53.7	Default	1819
18.54	compute improper/local command	1819
18.54.1	Syntax	1819
18.54.2	Examples	1820
18.54.3	Description	1820
18.54.4	Output info	1820
18.54.5	Restrictions	1820
18.54.6	Related commands	1820
18.54.7	Default	1821
18.55	compute inertia/chunk command	1821
18.55.1	Syntax	1821
18.55.2	Examples	1821
18.55.3	Description	1821
18.55.4	Output info	1822
18.55.5	Restrictions	1822
18.55.6	Related commands	1822
18.55.7	Default	1822
18.56	compute ke command	1822
18.56.1	Syntax	1822
18.56.2	Examples	1822
18.56.3	Description	1822
18.56.4	Output info	1823
18.56.5	Restrictions	1823
18.56.6	Related commands	1823
18.56.7	Default	1823
18.57	compute ke/atom command	1823
18.57.1	Syntax	1823
18.57.2	Examples	1823

18.57.3	Description	1823
18.57.4	Output info	1824
18.57.5	Restrictions	1824
18.57.6	Related commands	1824
18.57.7	Default	1824
18.58	compute ke/atom/eff command	1824
18.58.1	Syntax	1824
18.58.2	Examples	1824
18.58.3	Description	1824
18.58.4	Output info	1825
18.58.5	Restrictions	1825
18.58.6	Related commands	1825
18.58.7	Default	1825
18.59	compute ke/eff command	1825
18.59.1	Syntax	1825
18.59.2	Examples	1826
18.59.3	Description	1826
18.59.4	Output info	1826
18.59.5	Restrictions	1826
18.59.6	Related commands	1827
18.59.7	Default	1827
18.60	compute ke/rigid command	1827
18.60.1	Syntax	1827
18.60.2	Examples	1827
18.60.3	Description	1827
18.60.4	Output info	1827
18.60.5	Restrictions	1828
18.60.6	Related commands	1828
18.60.7	Default	1828
18.61	compute mesont command	1828
18.61.1	Syntax	1828
18.61.2	Examples	1828
18.61.3	Description	1828
18.61.4	Output info	1828
18.61.5	Restrictions	1829
18.61.6	Related commands	1829
18.61.7	Default	1829
18.62	compute mliap command	1829
18.62.1	Syntax	1829
18.62.2	Examples	1829
18.62.3	Description	1829
18.62.4	Output info	1831
18.62.5	Restrictions	1831
18.62.6	Related commands	1831
18.62.7	Default	1831
18.63	compute momentum command	1831
18.63.1	Syntax	1831
18.63.2	Examples	1832
18.63.3	Description	1832
18.63.4	Output info	1832
18.63.5	Restrictions	1832
18.63.6	Related commands	1832
18.63.7	Default	1832
18.64	compute msd command	1832

18.64.1	Syntax	1832
18.64.2	Examples	1833
18.64.3	Description	1833
18.64.4	Output info	1834
18.64.5	Restrictions	1834
18.64.6	Related commands	1834
18.64.7	Default	1834
18.65	compute msd/chunk command	1834
18.65.1	Syntax	1834
18.65.2	Examples	1834
18.65.3	Description	1834
18.65.4	Output info	1835
18.65.5	Restrictions	1836
18.65.6	Related commands	1836
18.65.7	Default	1836
18.66	compute msd/nongauss command	1836
18.66.1	Syntax	1836
18.66.2	Examples	1836
18.66.3	Description	1836
18.66.4	Output info	1837
18.66.5	Restrictions	1837
18.66.6	Related commands	1837
18.66.7	Default	1837
18.67	compute nbond/atom command	1837
18.67.1	Syntax	1837
18.67.2	Examples	1837
18.67.3	Description	1838
18.67.4	Output info	1838
18.67.5	Restrictions	1838
18.67.6	Related commands	1838
18.67.7	Default	1838
18.68	compute omega/chunk command	1838
18.68.1	Syntax	1838
18.68.2	Examples	1838
18.68.3	Description	1838
18.68.4	Output info	1839
18.68.5	Restrictions	1839
18.68.6	Related commands	1839
18.68.7	Default	1839
18.69	compute orientorder/atom command	1840
18.69.1	Syntax	1840
18.69.2	Examples	1840
18.69.3	Description	1840
18.69.4	Output info	1842
18.69.5	Restrictions	1842
18.69.6	Related commands	1842
18.69.7	Default	1842
18.70	compute pair command	1843
18.70.1	Syntax	1843
18.70.2	Examples	1843
18.70.3	Description	1843
18.70.4	Output info	1844
18.70.5	Restrictions	1844
18.70.6	Related commands	1844

18.70.7	Default	1844
18.71	compute pair/local command	1844
18.71.1	Syntax	1844
18.71.2	Examples	1845
18.71.3	Description	1845
18.71.4	Output info	1846
18.71.5	Restrictions	1846
18.71.6	Related commands	1846
18.71.7	Default	1846
18.72	compute pe command	1846
18.72.1	Syntax	1846
18.72.2	Examples	1847
18.72.3	Description	1847
18.72.4	Output info	1847
18.72.5	Restrictions	1848
18.72.6	Related commands	1848
18.72.7	Default	1848
18.73	compute pe/atom command	1848
18.73.1	Syntax	1848
18.73.2	Examples	1848
18.73.3	Description	1848
18.73.4	Output info	1849
18.73.5	Restrictions	1849
18.73.6	Related commands	1849
18.73.7	Default	1849
18.74	compute plasticity/atom command	1850
18.74.1	Syntax	1850
18.74.2	Examples	1850
18.74.3	Description	1850
18.74.4	Output info	1850
18.74.5	Restrictions	1850
18.74.6	Related commands	1850
18.74.7	Default	1851
18.75	compute pressure command	1851
18.75.1	Syntax	1851
18.75.2	Examples	1851
18.75.3	Description	1851
18.75.4	Output info	1853
18.75.5	Restrictions	1853
18.75.6	Related commands	1853
18.75.7	Default	1853
18.76	compute pressure/uef command	1853
18.76.1	Syntax	1853
18.76.2	Examples	1853
18.76.3	Description	1854
18.76.4	Restrictions	1854
18.76.5	Related commands	1854
18.76.6	Default	1854
18.77	compute property/atom command	1854
18.77.1	Syntax	1854
18.77.2	Examples	1856
18.77.3	Description	1856
18.77.4	Output info	1857
18.77.5	Restrictions	1857

18.77.6	Related commands	1857
18.77.7	Default	1857
18.78	compute property/chunk command	1857
18.78.1	Syntax	1857
18.78.2	Examples	1858
18.78.3	Description	1858
18.78.4	Output info	1859
18.78.5	Restrictions	1859
18.78.6	Related commands	1859
18.78.7	Default	1859
18.79	compute property/local command	1859
18.79.1	Syntax	1859
18.79.2	Examples	1860
18.79.3	Description	1860
18.79.4	Output info	1861
18.79.5	Restrictions	1861
18.79.6	Related commands	1862
18.79.7	Default	1862
18.80	compute ptm/atom command	1862
18.80.1	Syntax	1862
18.80.2	Examples	1862
18.80.3	Description	1862
18.80.4	Output info	1863
18.80.5	Restrictions	1864
18.80.6	Related commands	1864
18.80.7	Default	1864
18.81	compute rdf command	1864
18.81.1	Syntax	1864
18.81.2	Examples	1864
18.81.3	Description	1865
18.81.4	Output info	1866
18.81.5	Restrictions	1866
18.81.6	Related commands	1867
18.81.7	Default	1867
18.82	compute reduce command	1867
18.83	compute reduce/region command	1867
18.83.1	Syntax	1867
18.83.2	Examples	1868
18.83.3	Description	1868
18.83.4	Output info	1870
18.83.5	Restrictions	1870
18.83.6	Related commands	1870
18.83.7	Default	1870
18.84	compute reduce/chunk command	1870
18.84.1	Syntax	1870
18.84.2	Examples	1871
18.84.3	Description	1871
18.84.4	Output info	1872
18.84.5	Restrictions	1873
18.84.6	Related commands	1873
18.84.7	Default	1873
18.85	compute rigid/local command	1873
18.85.1	Syntax	1873
18.85.2	Examples	1874

18.85.3	Description	1874
18.85.4	Output info	1875
18.85.5	Restrictions	1875
18.85.6	Related commands	1876
18.85.7	Default	1876
18.86	compute saed command	1876
18.86.1	Syntax	1876
18.86.2	Examples	1876
18.86.3	Description	1877
18.86.4	Output info	1879
18.86.5	Restrictions	1879
18.86.6	Related commands	1879
18.86.7	Default	1879
18.87	compute slice command	1879
18.87.1	Syntax	1879
18.87.2	Examples	1880
18.87.3	Description	1880
18.87.4	Output info	1881
18.87.5	Restrictions	1881
18.87.6	Related commands	1881
18.87.7	Default	1881
18.88	compute smd/contact/radius command	1881
18.88.1	Syntax	1881
18.88.2	Examples	1881
18.88.3	Description	1882
18.88.4	Output info	1882
18.88.5	Restrictions	1882
18.88.6	Related commands	1882
18.88.7	Default	1882
18.89	compute smd/damage command	1882
18.89.1	Syntax	1882
18.89.2	Examples	1883
18.89.3	Description	1883
18.89.4	Restrictions	1883
18.89.5	Related commands	1883
18.89.6	Default	1883
18.90	compute smd/hourglass/error command	1883
18.90.1	Syntax	1883
18.90.2	Examples	1884
18.90.3	Description	1884
18.90.4	Restrictions	1884
18.90.5	Related commands	1884
18.90.6	Default	1884
18.91	compute smd/internal/energy command	1884
18.91.1	Syntax	1884
18.91.2	Examples	1885
18.91.3	Description	1885
18.91.4	Output Info	1885
18.91.5	Restrictions	1885
18.91.6	Related commands	1885
18.91.7	Default	1885
18.92	compute smd/plastic/strain command	1885
18.92.1	Syntax	1885
18.92.2	Examples	1886

18.92.3	Description	1886
18.92.4	Restrictions	1886
18.92.5	Related commands	1886
18.92.6	Default	1886
18.93	compute smd/plastic/strain/rate command	1886
18.93.1	Syntax	1886
18.93.2	Examples	1887
18.93.3	Description	1887
18.93.4	Restrictions	1887
18.93.5	Related commands	1887
18.93.6	Default	1887
18.94	compute smd/rho command	1887
18.94.1	Syntax	1887
18.94.2	Examples	1888
18.94.3	Description	1888
18.94.4	Output info	1888
18.94.5	Restrictions	1888
18.94.6	Related commands	1888
18.94.7	Default	1888
18.95	compute smd/tlsph/defgrad command	1888
18.95.1	Syntax	1888
18.95.2	Examples	1889
18.95.3	Description	1889
18.95.4	Output info	1889
18.95.5	Restrictions	1889
18.95.6	Related commands	1889
18.95.7	Default	1889
18.96	compute smd/tlsph/dt command	1889
18.96.1	Syntax	1889
18.96.2	Examples	1890
18.96.3	Description	1890
18.96.4	Output info	1890
18.96.5	Restrictions	1890
18.96.6	Related commands	1890
18.96.7	Default	1890
18.97	compute smd/tlsph/num/neighs command	1890
18.97.1	Syntax	1890
18.97.2	Examples	1891
18.97.3	Description	1891
18.97.4	Output info	1891
18.97.5	Restrictions	1891
18.97.6	Related commands	1891
18.97.7	Default	1891
18.98	compute smd/tlsph/shape command	1891
18.98.1	Syntax	1891
18.98.2	Examples	1892
18.98.3	Description	1892
18.98.4	Output info	1892
18.98.5	Restrictions	1892
18.98.6	Related commands	1892
18.98.7	Default	1892
18.99	compute smd/tlsph/strain command	1892
18.99.1	Syntax	1892
18.99.2	Examples	1893

18.99.3	Description	1893
18.99.4	Output info	1893
18.99.5	Restrictions	1893
18.99.6	Related commands	1893
18.99.7	Default	1893
18.100	compute smd/tlsph/strain/rate command	1893
18.100.1	Syntax	1893
18.100.2	Examples	1894
18.100.3	Description	1894
18.100.4	Output info	1894
18.100.5	Restrictions	1894
18.100.6	Related commands	1894
18.100.7	Default	1894
18.101	compute smd/tlsph/stress command	1894
18.101.1	Syntax	1894
18.101.2	Examples	1895
18.101.3	Description	1895
18.101.4	Output info	1895
18.101.5	Restrictions	1895
18.101.6	Related commands	1895
18.101.7	Default	1895
18.102	compute smd/triangle/vertices command	1895
18.102.1	Syntax	1895
18.102.2	Examples	1896
18.102.3	Description	1896
18.102.4	Output info	1896
18.102.5	Restrictions	1896
18.102.6	Related commands	1896
18.102.7	Default	1896
18.103	compute smd/ulsph/effm command	1896
18.103.1	Syntax	1896
18.103.2	Examples	1897
18.103.3	Description	1897
18.103.4	Output info	1897
18.103.5	Restrictions	1897
18.103.6	Related commands	1897
18.103.7	Default	1897
18.104	compute smd/ulsph/num/neighs command	1897
18.104.1	Syntax	1897
18.104.2	Examples	1898
18.104.3	Description	1898
18.104.4	Output info	1898
18.104.5	Restrictions	1898
18.104.6	Related commands	1898
18.104.7	Default	1898
18.105	compute smd/ulsph/strain command	1898
18.105.1	Syntax	1898
18.105.2	Examples	1899
18.105.3	Description	1899
18.105.4	Output info	1899
18.105.5	Restrictions	1899
18.105.6	Related commands	1899
18.105.7	Default	1899
18.106	compute smd/ulsph/strain/rate command	1899

18.106.1	Syntax . . . . .	1899
18.106.2	Examples . . . . .	1900
18.106.3	Description . . . . .	1900
18.106.4	Output info . . . . .	1900
18.106.5	Restrictions . . . . .	1900
18.106.6	Related commands . . . . .	1900
18.106.7	Default . . . . .	1900
18.107	compute smd/ulsph/stress command . . . . .	1900
18.107.1	Syntax . . . . .	1900
18.107.2	Examples . . . . .	1901
18.107.3	Description . . . . .	1901
18.107.4	Output info . . . . .	1901
18.107.5	Restrictions . . . . .	1901
18.107.6	Related commands . . . . .	1901
18.107.7	Default . . . . .	1901
18.108	compute smd/vol command . . . . .	1901
18.108.1	Syntax . . . . .	1901
18.108.2	Examples . . . . .	1902
18.108.3	Description . . . . .	1902
18.108.4	Output info . . . . .	1902
18.108.5	Restrictions . . . . .	1902
18.108.6	Related commands . . . . .	1902
18.108.7	Default . . . . .	1902
18.109	compute sna/atom command . . . . .	1903
18.110	compute snad/atom command . . . . .	1903
18.111	compute snav/atom command . . . . .	1903
18.112	compute snap command . . . . .	1903
18.113	compute sna/grid command . . . . .	1903
18.114	compute sna/grid/local command . . . . .	1903
18.114.1	Syntax . . . . .	1903
18.114.2	Examples . . . . .	1904
18.114.3	Description . . . . .	1904
18.114.4	Output info . . . . .	1908
18.114.5	Restrictions . . . . .	1910
18.114.6	Related commands . . . . .	1910
18.114.7	Default . . . . .	1910
18.115	compute sph/e/atom command . . . . .	1910
18.115.1	Syntax . . . . .	1910
18.115.2	Examples . . . . .	1910
18.115.3	Description . . . . .	1911
18.115.4	Output info . . . . .	1911
18.115.5	Restrictions . . . . .	1911
18.115.6	Related commands . . . . .	1911
18.115.7	Default . . . . .	1911
18.116	compute sph/rho/atom command . . . . .	1911
18.116.1	Syntax . . . . .	1911
18.116.2	Examples . . . . .	1912
18.116.3	Description . . . . .	1912
18.116.4	Output info . . . . .	1912
18.116.5	Restrictions . . . . .	1912
18.116.6	Related commands . . . . .	1912
18.116.7	Default . . . . .	1912
18.117	compute sph/t/atom command . . . . .	1912
18.117.1	Syntax . . . . .	1912

18.117.2	Examples	1913
18.117.3	Description	1913
18.117.4	Output info	1913
18.117.5	Restrictions	1913
18.117.6	Related commands	1913
18.117.7	Default	1913
18.118	compute spin command	1913
18.118.1	Syntax	1913
18.118.2	Examples	1914
18.118.3	Description	1914
18.118.4	Output info	1914
18.118.5	Restrictions	1914
18.118.6	Default	1915
18.119	compute stress/atom command	1915
18.120	compute centroid/stress/atom command	1915
18.120.1	Syntax	1915
18.120.2	Examples	1915
18.120.3	Description	1915
18.120.4	Output info	1918
18.120.5	Restrictions	1918
18.120.6	Related commands	1918
18.120.7	Default	1918
18.121	compute stress/mop command	1919
18.122	compute stress/mop/profile command	1919
18.122.1	Syntax	1919
18.122.2	Examples	1919
18.122.3	Description	1919
18.122.4	Output info	1920
18.122.5	Restrictions	1920
18.122.6	Related commands	1920
18.122.7	Default	1921
18.123	compute stress/cartesian command	1921
18.124	compute stress/cylinder command	1921
18.125	compute stress/spherical command	1921
18.125.1	Syntax	1921
18.125.2	Examples	1921
18.125.3	Description	1922
18.125.4	Output info	1922
18.125.5	Restrictions	1923
18.125.6	Related commands	1923
18.125.7	Default	1923
18.126	compute force/tally command	1923
18.127	compute heat/flux/tally command	1923
18.128	compute heat/flux/virial/tally command	1923
18.129	compute pe/tally command	1923
18.130	compute pe/mol/tally command	1923
18.131	compute stress/tally command	1923
18.131.1	Syntax	1923
18.131.2	Examples	1924
18.131.3	Description	1924
18.131.4	Output info	1925
18.131.5	Restrictions	1926
18.131.6	Related commands	1926
18.131.7	Default	1926

18.132	compute tdpd/cc/atom command . . . . .	1926
18.132.1	Syntax . . . . .	1926
18.132.2	Examples . . . . .	1926
18.132.3	Description . . . . .	1926
18.132.4	Output info . . . . .	1927
18.132.5	Restrictions . . . . .	1927
18.132.6	Related commands . . . . .	1927
18.132.7	Default . . . . .	1927
18.133	compute temp command . . . . .	1927
18.133.1	Syntax . . . . .	1927
18.133.2	Examples . . . . .	1927
18.133.3	Description . . . . .	1928
18.133.4	Output info . . . . .	1928
18.133.5	Restrictions . . . . .	1929
18.133.6	Related commands . . . . .	1929
18.133.7	Default . . . . .	1929
18.134	compute temp/asphere command . . . . .	1929
18.134.1	Syntax . . . . .	1929
18.134.2	Examples . . . . .	1929
18.134.3	Description . . . . .	1929
18.134.4	Output info . . . . .	1931
18.134.5	Restrictions . . . . .	1931
18.134.6	Related commands . . . . .	1931
18.134.7	Default . . . . .	1931
18.135	compute temp/body command . . . . .	1931
18.135.1	Syntax . . . . .	1931
18.135.2	Examples . . . . .	1932
18.135.3	Description . . . . .	1932
18.135.4	Output info . . . . .	1933
18.135.5	Restrictions . . . . .	1933
18.135.6	Related commands . . . . .	1933
18.135.7	Default . . . . .	1933
18.136	compute temp/chunk command . . . . .	1933
18.136.1	Syntax . . . . .	1933
18.136.2	Examples . . . . .	1934
18.136.3	Description . . . . .	1934
18.136.4	Output info . . . . .	1936
18.136.5	Restrictions . . . . .	1936
18.136.6	Related commands . . . . .	1936
18.136.7	Default . . . . .	1936
18.137	compute temp/com command . . . . .	1936
18.137.1	Syntax . . . . .	1936
18.137.2	Examples . . . . .	1937
18.137.3	Description . . . . .	1937
18.137.4	Output info . . . . .	1937
18.137.5	Restrictions . . . . .	1938
18.137.6	Related commands . . . . .	1938
18.137.7	Default . . . . .	1938
18.138	compute temp/cs command . . . . .	1938
18.138.1	Syntax . . . . .	1938
18.138.2	Examples . . . . .	1938
18.138.3	Description . . . . .	1938
18.138.4	Output info . . . . .	1939
18.138.5	Restrictions . . . . .	1939

18.138.6	Related commands	1939
18.138.7	Default	1940
18.139	compute temp/deform command	1940
18.139.1	Syntax	1940
18.139.2	Examples	1940
18.139.3	Description	1940
18.139.4	Output info	1941
18.139.5	Restrictions	1941
18.139.6	Related commands	1942
18.139.7	Default	1942
18.140	compute temp/deform/eff command	1942
18.140.1	Syntax	1942
18.140.2	Examples	1942
18.140.3	Description	1942
18.140.4	Output info	1942
18.140.5	Restrictions	1943
18.140.6	Related commands	1943
18.140.7	Default	1943
18.141	compute temp/drude command	1943
18.141.1	Syntax	1943
18.141.2	Examples	1943
18.141.3	Description	1943
18.141.4	Output info	1944
18.141.5	Restrictions	1944
18.141.6	Related commands	1944
18.141.7	Default	1944
18.142	compute temp/eff command	1944
18.142.1	Syntax	1944
18.142.2	Examples	1945
18.142.3	Description	1945
18.142.4	Output info	1946
18.142.5	Restrictions	1946
18.142.6	Related commands	1946
18.142.7	Default	1946
18.143	compute temp/partial command	1946
18.143.1	Syntax	1946
18.143.2	Examples	1946
18.143.3	Description	1946
18.143.4	Output info	1947
18.143.5	Restrictions	1947
18.143.6	Related commands	1948
18.143.7	Default	1948
18.144	compute temp/profile command	1948
18.144.1	Syntax	1948
18.144.2	Examples	1948
18.144.3	Description	1949
18.144.4	Output info	1950
18.144.5	Restrictions	1950
18.144.6	Related commands	1950
18.144.7	Default	1951
18.145	compute temp/ramp command	1951
18.145.1	Syntax	1951
18.145.2	Examples	1951
18.145.3	Description	1951

18.145.4	Output info	1952
18.145.5	Restrictions	1952
18.145.6	Related commands	1952
18.145.7	Default	1952
18.146	compute temp/region command	1953
18.146.1	Syntax	1953
18.146.2	Examples	1953
18.146.3	Description	1953
18.146.4	Output info	1954
18.146.5	Restrictions	1954
18.146.6	Related commands	1954
18.146.7	Default	1954
18.147	compute temp/region/eff command	1954
18.147.1	Syntax	1954
18.147.2	Examples	1954
18.147.3	Description	1955
18.147.4	Output info	1955
18.147.5	Restrictions	1955
18.147.6	Related commands	1955
18.147.7	Default	1955
18.148	compute temp/rotate command	1955
18.148.1	Syntax	1955
18.148.2	Examples	1956
18.148.3	Description	1956
18.148.4	Output info	1956
18.148.5	Restrictions	1957
18.148.6	Related commands	1957
18.148.7	Default	1957
18.149	compute temp/sphere command	1957
18.149.1	Syntax	1957
18.149.2	Examples	1957
18.149.3	Description	1957
18.149.4	Output info	1958
18.149.5	Restrictions	1959
18.149.6	Related commands	1959
18.149.7	Default	1959
18.150	compute temp/uef command	1959
18.150.1	Syntax	1959
18.150.2	Examples	1959
18.150.3	Description	1959
18.150.4	Restrictions	1959
18.150.5	Related commands	1960
18.150.6	Default	1960
18.151	compute ti command	1960
18.151.1	Syntax	1960
18.151.2	Examples	1960
18.151.3	Description	1961
18.151.4	Output info	1961
18.151.5	Restrictions	1962
18.151.6	Related commands	1962
18.151.7	Default	1962
18.152	compute torque/chunk command	1962
18.152.1	Syntax	1962
18.152.2	Examples	1962

18.152.3	Description	1962
18.152.4	Output info	1963
18.152.5	Restrictions	1963
18.152.6	Related commands	1963
18.152.7	Default	1963
18.153	compute vacf command	1963
18.153.1	Syntax	1963
18.153.2	Examples	1964
18.153.3	Description	1964
18.153.4	Output info	1964
18.153.5	Restrictions	1964
18.153.6	Related commands	1965
18.153.7	Default	1965
18.154	compute vcm/chunk command	1965
18.154.1	Syntax	1965
18.154.2	Examples	1965
18.154.3	Description	1965
18.154.4	Output info	1966
18.154.5	Restrictions	1966
18.154.6	Related commands	1966
18.154.7	Default	1966
18.155	compute viscosity/cos command	1966
18.155.1	Syntax	1966
18.155.2	Examples	1966
18.155.3	Description	1967
18.155.4	Output info	1968
18.155.5	Restrictions	1968
18.155.6	Related commands	1968
18.155.7	Default	1968
18.156	compute voronoi/atom command	1968
18.156.1	Syntax	1968
18.156.2	Examples	1969
18.156.3	Description	1969
18.156.4	Output info	1971
18.156.5	Restrictions	1971
18.156.6	Related commands	1971
18.156.7	Default	1971
18.157	compute xrd command	1971
18.157.1	Syntax	1971
18.157.2	Examples	1972
18.157.3	Description	1972
18.157.4	Output info	1974
18.157.5	Restrictions	1974
18.157.6	Related commands	1974
18.157.7	Default	1974
<b>19</b>	<b>Pair Styles</b>	<b>1975</b>
19.1	pair_style adp command	1975
19.1.1	Syntax	1975
19.1.2	Examples	1975
19.1.3	Description	1975
19.1.4	Mixing, shift, table, tail correction, restart, rRESPA info	1977
19.1.5	Restrictions	1977
19.1.6	Related commands	1977

19.1.7	Default	1977
19.2	pair_style agni command	1978
19.2.1	Syntax	1978
19.2.2	Examples	1978
19.2.3	Description	1978
19.2.4	Mixing, shift, table, tail correction, restart, rRESPA info	1979
19.2.5	Restrictions	1979
19.2.6	Related commands	1979
19.2.7	Default	1979
19.3	pair_style airebo command	1980
19.4	pair_style airebo/morse command	1980
19.5	pair_style rebo command	1980
19.5.1	Syntax	1980
19.5.2	Examples	1980
19.5.3	Description	1980
19.5.4	Mixing, shift, table, tail correction, restart, rRESPA info	1982
19.5.5	Restrictions	1983
19.5.6	Related commands	1983
19.5.7	Default	1983
19.6	pair_style amoeba command	1983
19.7	pair_style hippo command	1983
19.7.1	Syntax	1983
19.7.2	Examples	1983
19.7.3	Additional info	1984
19.7.4	Description	1984
19.7.5	Mixing, shift, table, tail correction, restart, rRESPA info	1985
19.7.6	Restrictions	1986
19.7.7	Related commands	1986
19.7.8	Default	1986
19.8	pair_style atm command	1987
19.8.1	Syntax	1987
19.8.2	Examples	1987
19.8.3	Description	1987
19.8.4	Mixing, shift, table, tail correction, restart, rRESPA info	1989
19.8.5	Restrictions	1989
19.8.6	Related commands	1989
19.8.7	Default	1989
19.9	pair_style awpmd/cut command	1989
19.9.1	Syntax	1989
19.9.2	Examples	1990
19.9.3	Description	1990
19.9.4	Mixing, shift, table, tail correction, restart, rRESPA info	1991
19.9.5	Restrictions	1991
19.9.6	Related commands	1991
19.9.7	Default	1991
19.10	pair_style beck command	1991
19.10.1	Syntax	1991
19.10.2	Examples	1991
19.10.3	Description	1992
19.10.4	Mixing, shift, table, tail correction, restart, rRESPA info	1992
19.10.5	Restrictions	1993
19.10.6	Related commands	1993
19.10.7	Default	1993
19.11	pair_style body/nparticle command	1993

19.11.1	Syntax	1993
19.11.2	Examples	1993
19.11.3	Description	1993
19.11.4	Mixing, shift, table, tail correction, restart, rRESPA info	1994
19.11.5	Restrictions	1994
19.11.6	Related commands	1995
19.11.7	Default	1995
19.12	pair_style body/rounded/polygon command	1995
19.12.1	Syntax	1995
19.12.2	Examples	1995
19.12.3	Description	1995
19.12.4	Mixing, shift, table, tail correction, restart, rRESPA info	1997
19.12.5	Restrictions	1997
19.12.6	Related commands	1997
19.12.7	Default	1997
19.13	pair_style body/rounded/polyhedron command	1998
19.13.1	Syntax	1998
19.13.2	Examples	1998
19.13.3	Description	1998
19.13.4	Mixing, shift, table, tail correction, restart, rRESPA info	2000
19.13.5	Restrictions	2000
19.13.6	Related commands	2000
19.13.7	Default	2000
19.14	pair_style bop command	2000
19.14.1	Syntax	2000
19.14.2	Examples	2001
19.14.3	Description	2001
19.14.4	Mixing, shift, table, tail correction, restart, rRESPA info	2005
19.14.5	Restrictions	2005
19.14.6	Related commands	2006
19.14.7	Default	2006
19.15	pair_style born command	2006
19.16	pair_style born/coul/long command	2006
19.17	pair_style born/coul/msm command	2006
19.18	pair_style born/coul/wolf command	2006
19.19	pair_style born/coul/dsf command	2006
19.19.1	Syntax	2006
19.19.2	Examples	2007
19.19.3	Description	2008
19.19.4	Mixing, shift, table, tail correction, restart, rRESPA info	2009
19.19.5	Restrictions	2009
19.19.6	Related commands	2009
19.19.7	Default	2009
19.20	pair_style bpm/spring command	2009
19.20.1	Syntax	2009
19.20.2	Examples	2010
19.20.3	Description	2010
19.20.4	Mixing, shift, table, tail correction, restart, rRESPA info	2010
19.20.5	Restrictions	2011
19.20.6	Related commands	2011
19.20.7	Default	2011
19.21	pair_style brownian command	2011
19.22	pair_style brownian/poly command	2011
19.22.1	Syntax	2011

19.22.2	Examples	2012
19.22.3	Description	2012
19.22.4	Mixing, shift, table, tail correction, restart, rRESPA info	2013
19.22.5	Restrictions	2013
19.22.6	Related commands	2013
19.22.7	Default	2013
19.23	pair_style buck command	2013
19.24	pair_style buck/coul/cut command	2013
19.25	pair_style buck/coul/long command	2014
19.26	pair_style buck/coul/msm command	2014
19.26.1	Syntax	2014
19.26.2	Examples	2014
19.26.3	Description	2015
19.26.4	Mixing, shift, table, tail correction, restart, rRESPA info	2016
19.26.5	Restrictions	2016
19.26.6	Related commands	2016
19.26.7	Default	2016
19.27	pair_style buck6d/coul/gauss/dsf command	2016
19.28	pair_style buck6d/coul/gauss/long command	2016
19.28.1	Syntax	2016
19.28.2	Examples	2017
19.28.3	Description	2017
19.28.4	Mixing, shift, table, tail correction, restart, rRESPA info	2018
19.28.5	Restrictions	2018
19.28.6	Related commands	2018
19.28.7	Default	2018
19.29	pair_style buck/long/coul/long command	2019
19.29.1	Syntax	2019
19.29.2	Examples	2019
19.29.3	Description	2019
19.29.4	Mixing, shift, table, tail correction, restart, rRESPA info	2020
19.29.5	Restrictions	2021
19.29.6	Related commands	2021
19.29.7	Default	2021
19.30	pair_style lj/charmm/coul/charmm command	2021
19.31	pair_style lj/charmm/coul/charmm/implicit command	2021
19.32	pair_style lj/charmm/coul/long command	2021
19.33	pair_style lj/charmm/coul/msm command	2021
19.34	pair_style lj/charmmfsw/coul/charmmfsh command	2021
19.35	pair_style lj/charmmfsw/coul/long command	2021
19.35.1	Syntax	2021
19.35.2	Examples	2022
19.35.3	Description	2023
19.35.4	Mixing, shift, table, tail correction, restart, rRESPA info	2025
19.35.5	Restrictions	2025
19.35.6	Related commands	2025
19.35.7	Default	2025
19.36	pair_style lj/class2 command	2026
19.37	pair_style lj/class2/coul/cut command	2026
19.38	pair_style lj/class2/coul/long command	2026
19.38.1	Syntax	2026
19.38.2	Examples	2026
19.38.3	Description	2027
19.38.4	Mixing, shift, table, tail correction, restart, rRESPA info	2028

19.38.5	Restrictions	2028
19.38.6	Related commands	2028
19.38.7	Default	2028
19.39	pair_style colloid command	2028
19.39.1	Syntax	2028
19.39.2	Examples	2029
19.39.3	Description	2029
19.39.4	Mixing, shift, table, tail correction, restart, rRESPA info	2031
19.39.5	Restrictions	2031
19.39.6	Related commands	2031
19.39.7	Default	2031
19.40	pair_style comb command	2031
19.41	pair_style comb3 command	2032
19.41.1	Syntax	2032
19.41.2	Examples	2032
19.41.3	Description	2032
19.41.4	Mixing, shift, table, tail correction, restart, rRESPA info	2034
19.41.5	Restrictions	2034
19.41.6	Related commands	2034
19.41.7	Default	2034
19.42	pair_style cosine/squared command	2034
19.42.1	Syntax	2034
19.42.2	Examples	2035
19.42.3	Description	2035
19.42.4	Mixing, shift, table, tail correction, restart, rRESPA info	2036
19.42.5	Restrictions	2036
19.42.6	Related commands	2036
19.42.7	Default	2036
19.43	pair_style coul/cut command	2037
19.44	pair_style coul/debye command	2037
19.45	pair_style coul/dsf command	2037
19.46	pair_style coul/exclude command	2037
19.47	pair_style coul/cut/global command	2037
19.48	pair_style coul/long command	2037
19.49	pair_style coul/msm command	2037
19.50	pair_style coul/streitz command	2037
19.51	pair_style coul/wolf command	2037
19.52	pair_style tip4p/cut command	2038
19.53	pair_style tip4p/long command	2038
19.53.1	Syntax	2038
19.53.2	Examples	2038
19.53.3	Description	2039
19.53.4	Mixing, shift, table, tail correction, restart, rRESPA info	2041
19.53.5	Restrictions	2042
19.53.6	Related commands	2042
19.53.7	Default	2042
19.54	pair_style coul/diel command	2042
19.54.1	Syntax	2042
19.54.2	Examples	2042
19.54.3	Description	2043
19.54.4	Mixing, shift, table, tail correction, restart, rRESPA info	2043
19.54.5	Restrictions	2044
19.54.6	Related commands	2044
19.54.7	Default	2044

19.55	pair_style coul/shield command	2044
19.55.1	Syntax	2044
19.55.2	Examples	2044
19.55.3	Description	2044
19.55.4	Mixing, shift, table, tail correction, restart, rRESPA info	2045
19.55.5	Restrictions	2045
19.55.6	Related commands	2045
19.55.7	Default	2045
19.56	pair_style coul/slatter command	2046
19.57	pair_style coul/slatter/cut command	2046
19.58	pair_style coul/slatter/long command	2046
19.58.1	Syntax	2046
19.58.2	Examples	2046
19.58.3	Description	2046
19.58.4	Mixing, shift, table, tail correction, restart, rRESPA info	2047
19.58.5	Restrictions	2047
19.58.6	Related commands	2047
19.58.7	Default	2047
19.59	pair_style coul/tt command	2047
19.59.1	Syntax	2047
19.59.2	Examples	2048
19.59.3	Description	2048
19.59.4	Mixing, shift, table, tail correction, restart, rRESPA info	2049
19.59.5	Restrictions	2049
19.59.6	Related commands	2049
19.59.7	Default	2049
19.60	pair_style born/coul/dsf/cs command	2049
19.61	pair_style born/coul/long/cs command	2049
19.62	pair_style born/coul/wolf/cs command	2049
19.63	pair_style buck/coul/long/cs command	2049
19.64	pair_style coul/long/cs command	2049
19.65	pair_style coul/wolf/cs command	2050
19.66	pair_style lj/cut/coul/long/cs command	2050
19.67	pair_style lj/class2/coul/long/cs command	2050
19.67.1	Syntax	2050
19.67.2	Examples	2050
19.67.3	Description	2051
19.67.4	Mixing, shift, table, tail correction, restart, rRESPA info	2052
19.67.5	Restrictions	2052
19.67.6	Related commands	2052
19.67.7	Default	2052
19.68	pair_style coul/cut/dielectric command	2053
19.69	pair_style coul/long/dielectric command	2053
19.70	pair_style lj/cut/coul/cut/dielectric command	2053
19.71	pair_style lj/cut/coul/debye/dielectric command	2053
19.72	pair_style lj/cut/coul/long/dielectric command	2053
19.73	pair_style lj/cut/coul/msm/dielectric command	2053
19.74	pair_style lj/long/coul/long/dielectric command	2053
19.74.1	Syntax	2053
19.74.2	Examples	2053
19.74.3	Description	2054
19.74.4	Mixing, shift, table, tail correction, restart, rRESPA info	2054
19.74.5	Restrictions	2054
19.74.6	Related commands	2055

19.74.7	Default	2055
19.75	pair_style lj/cut/dipole/cut command	2055
19.76	pair_style lj/sf/dipole/sf command	2055
19.77	pair_style lj/cut/dipole/long command	2055
19.78	pair_style lj/long/dipole/long command	2055
19.78.1	Syntax	2055
19.78.2	Examples	2056
19.78.3	Description	2056
19.78.4	Mixing, shift, table, tail correction, restart, rRESPA info	2059
19.78.5	Restrictions	2060
19.78.6	Related commands	2060
19.78.7	Default	2060
19.79	pair_style dpd command	2060
19.80	pair_style dpd/tstat command	2060
19.80.1	Syntax	2060
19.80.2	Examples	2061
19.80.3	Description	2061
19.80.4	Mixing, shift, table, tail correction, restart, rRESPA info	2062
19.80.5	Restrictions	2063
19.80.6	Related commands	2063
19.80.7	Default	2063
19.81	pair_style dpd/ext command	2063
19.82	pair_style dpd/ext/tstat command	2063
19.82.1	Syntax	2063
19.82.2	Examples	2064
19.82.3	Description	2064
19.82.4	Restrictions	2066
19.82.5	Related commands	2066
19.83	pair_style dpd/fdt command	2066
19.84	pair_style dpd/fdt/energy command	2066
19.84.1	Syntax	2066
19.84.2	Examples	2067
19.84.3	Description	2067
19.84.4	Restrictions	2068
19.84.5	Related commands	2069
19.84.6	Default	2069
19.85	pair_style drip command	2069
19.85.1	Syntax	2069
19.85.2	Examples	2069
19.85.3	Description	2069
19.85.4	Mixing, shift, table, tail correction, restart, rRESPA info	2070
19.85.5	Restrictions	2071
19.85.6	Related commands	2071
19.86	pair_style dsmc command	2071
19.86.1	Syntax	2071
19.86.2	Examples	2071
19.86.3	Description	2072
19.86.4	Mixing, shift, table, tail correction, restart, rRESPA info	2073
19.86.5	Restrictions	2073
19.86.6	Related commands	2073
19.86.7	Default	2073
19.87	pair_style e3b command	2073
19.87.1	Syntax	2073
19.87.2	Examples	2074

19.87.3	Description	2074
19.87.4	Mixing, shift, table, tail correction, restart, rRESPA info	2075
19.87.5	Restrictions	2075
19.87.6	Related commands	2076
19.87.7	Default	2076
19.88	pair_style eam command	2076
19.89	pair_style eam/alloy command	2076
19.90	pair_style eam/cd command	2076
19.91	pair_style eam/cd/old command	2076
19.92	pair_style eam/fs command	2076
19.93	pair_style eam/he command	2076
19.93.1	Syntax	2076
19.93.2	Examples	2077
19.93.3	Description	2077
19.93.4	Mixing, shift, table, tail correction, restart, rRESPA info	2082
19.93.5	Restrictions	2082
19.93.6	Related commands	2082
19.93.7	Default	2082
19.94	pair_style edip command	2083
19.95	pair_style edip/multi command	2083
19.95.1	Syntax	2083
19.95.2	Examples	2083
19.95.3	Description	2083
19.95.4	Mixing, shift, table, tail correction, restart, rRESPA info	2085
19.95.5	Restrictions	2085
19.95.6	Related commands	2086
19.95.7	Default	2086
19.96	pair_style eff/cut command	2086
19.96.1	Syntax	2086
19.96.2	Examples	2086
19.96.3	Description	2086
19.96.4	Mixing, shift, table, tail correction, restart, rRESPA info	2089
19.96.5	Restrictions	2090
19.96.6	Related commands	2090
19.96.7	Default	2090
19.97	pair_style eim command	2090
19.97.1	Syntax	2090
19.97.2	Examples	2090
19.97.3	Description	2091
19.97.4	Restrictions	2093
19.97.5	Related commands	2093
19.97.6	Default	2093
19.98	pair_style exp6/rx command	2093
19.98.1	Syntax	2093
19.98.2	Examples	2093
19.98.3	Description	2094
19.98.4	Mixing, shift, table, tail correction, restart, rRESPA info	2095
19.98.5	Restrictions	2096
19.98.6	Related commands	2096
19.98.7	Default	2096
19.99	pair_style extep command	2096
19.99.1	Syntax	2096
19.99.2	Examples	2096
19.99.3	Description	2096

19.99.4	Restrictions	2096
19.99.5	Related commands	2096
19.99.6	Default	2097
19.100	pair_style lj/cut/soft command	2097
19.101	pair_style lj/cut/coul/cut/soft command	2097
19.102	pair_style lj/cut/coul/long/soft command	2097
19.103	pair_style lj/cut/tip4p/long/soft command	2097
19.104	pair_style lj/charmm/coul/long/soft command	2097
19.105	pair_style lj/class2/soft command	2097
19.106	pair_style lj/class2/coul/cut/soft command	2097
19.107	pair_style lj/class2/coul/long/soft command	2097
19.108	pair_style coul/cut/soft command	2097
19.109	pair_style coul/long/soft command	2098
19.110	pair_style tip4p/long/soft command	2098
19.111	pair_style morse/soft command	2098
19.111.1	Syntax	2098
19.111.2	Examples	2099
19.111.3	Description	2100
19.111.4	Mixing, shift, table, tail correction, restart, rRESPA info	2103
19.111.5	Restrictions	2103
19.111.6	Related commands	2104
19.111.7	Default	2104
19.112	pair_style gauss command	2104
19.113	pair_style gauss/cut command	2104
19.113.1	Syntax	2104
19.113.2	Examples	2104
19.113.3	Description	2104
19.113.4	Mixing, shift, table, tail correction, restart, rRESPA info	2105
19.113.5	Restrictions	2106
19.113.6	Related commands	2106
19.113.7	Default	2106
19.114	pair_style gayberne command	2107
19.114.1	Syntax	2107
19.114.2	Examples	2107
19.114.3	Description	2107
19.114.4	Mixing, shift, table, tail correction, restart, rRESPA info	2109
19.114.5	Restrictions	2109
19.114.6	Related commands	2109
19.114.7	Default	2109
19.115	pair_style gran/hooke command	2110
19.116	pair_style gran/hooke/history command	2110
19.117	pair_style gran/hertz/history command	2110
19.117.1	Syntax	2110
19.117.2	Examples	2111
19.117.3	Description	2111
19.117.4	Mixing, shift, table, tail correction, restart, rRESPA info	2113
19.117.5	Restrictions	2113
19.117.6	Related commands	2114
19.117.7	Default	2114
19.118	pair_style granular command	2114
19.118.1	Syntax	2114
19.118.2	Examples	2114
19.118.3	Description	2115
19.118.4	Mixing, shift, table, tail correction, restart, rRESPA info	2122

19.118.5	Restrictions	2123
19.118.6	Related commands	2123
19.118.7	Default	2123
19.118.8	References	2123
19.119	pair_style lj/gromacs command	2124
19.120	pair_style lj/gromacs/coul/gromacs command	2124
19.120.1	Syntax	2124
19.120.2	Examples	2124
19.120.3	Description	2125
19.120.4	Mixing, shift, table, tail correction, restart, rRESPA info	2126
19.120.5	Restrictions	2126
19.120.6	Related commands	2126
19.120.7	Default	2126
19.121	pair_style gw command	2126
19.122	pair_style gw/zbl command	2126
19.122.1	Syntax	2126
19.122.2	Examples	2127
19.122.3	Description	2127
19.122.4	Mixing, shift, table, tail correction, restart, rRESPA info	2128
19.122.5	Restrictions	2128
19.122.6	Related commands	2128
19.122.7	Default	2128
19.123	pair_style harmonic/cut command	2128
19.123.1	Syntax	2128
19.123.2	Examples	2129
19.123.3	Description	2129
19.123.4	Mixing, shift, table, tail correction, restart, rRESPA info	2129
19.123.5	Restrictions	2130
19.123.6	Related commands	2130
19.123.7	Default	2130
19.124	pair_style hbond/dreiding/lj command	2130
19.125	pair_style hbond/dreiding/morse command	2130
19.125.1	Syntax	2130
19.125.2	Examples	2130
19.125.3	Description	2131
19.125.4	Mixing, shift, table, tail correction, restart, rRESPA info	2133
19.125.5	Restrictions	2134
19.125.6	Related commands	2134
19.125.7	Default	2134
19.126	pair_style hdnp command	2134
19.126.1	Syntax	2134
19.126.2	Examples	2135
19.126.3	Description	2135
19.126.4	Mixing, shift, table, tail correction, restart, rRESPA info	2136
19.126.5	Restrictions	2137
19.127	pair_style hybrid command	2137
19.128	pair_style hybrid/overlay command	2137
19.129	pair_style hybrid/scaled command	2137
19.129.1	Syntax	2137
19.129.2	Examples	2138
19.129.3	Description	2138
19.129.4	Mixing, shift, table, tail correction, restart, rRESPA info	2143
19.129.5	Restrictions	2143
19.129.6	Related commands	2143

19.129.7Default	2143
19.130pair_style ilp/graphene/hbn command	2144
19.130.1Syntax	2144
19.130.2Examples	2144
19.130.3Description	2144
19.130.4Mixing, shift, table, tail correction, restart, rRESPA info	2146
19.130.5Restrictions	2146
19.130.6Related commands	2146
19.130.7Default	2146
19.131pair_style ilp/tmd command	2146
19.131.1Syntax	2147
19.131.2Examples	2147
19.131.3Description	2147
19.131.4Mixing, shift, table, tail correction, restart, rRESPA info	2148
19.131.5Restrictions	2148
19.131.6Related commands	2149
19.131.7Default	2149
19.132pair_style kim command	2149
19.132.1Syntax	2149
19.132.2Examples	2149
19.132.3Description	2149
19.132.4Mixing, shift, table, tail correction, restart, rRESPA info	2150
19.132.5Restrictions	2150
19.132.6Related commands	2150
19.132.7Default	2150
19.133pair_style kolmogorov/crespi/full command	2151
19.133.1Syntax	2151
19.133.2Examples	2151
19.133.3Description	2151
19.133.4Mixing, shift, table, tail correction, restart, rRESPA info	2152
19.133.5Restrictions	2152
19.133.6Related commands	2153
19.133.7Default	2153
19.134pair_style kolmogorov/crespi/z command	2153
19.134.1Syntax	2153
19.134.2Examples	2153
19.134.3Description	2153
19.134.4Restrictions	2154
19.134.5Related commands	2154
19.134.6Default	2154
19.135pair_style lcbop command	2154
19.135.1Syntax	2154
19.135.2Examples	2154
19.135.3Description	2155
19.135.4Mixing, shift, table, tail correction, restart, rRESPA info	2155
19.135.5Restrictions	2155
19.135.6Related commands	2156
19.135.7Default	2156
19.136pair_style lebedeva/z command	2156
19.136.1Syntax	2156
19.136.2Examples	2156
19.136.3Description	2156
19.136.4Restrictions	2157
19.136.5Related commands	2157

19.136.6	Default	2157
19.137	pair_style line/lj command	2157
19.137.1	Syntax	2157
19.137.2	Examples	2158
19.137.3	Description	2158
19.137.4	Mixing, shift, table, tail correction, restart, rRESPA info	2159
19.137.5	Restrictions	2159
19.137.6	Related commands	2159
19.137.7	Default	2159
19.138	pair_style list command	2159
19.138.1	Syntax	2159
19.138.2	Examples	2160
19.138.3	Description	2160
19.138.4	Mixing, shift, table, tail correction, restart, rRESPA info	2161
19.138.5	Restrictions	2161
19.138.6	Related commands	2162
19.138.7	Default	2162
19.139	pair_style lj/cut command	2162
19.139.1	Syntax	2162
19.139.2	Examples	2162
19.139.3	Description	2162
19.139.4	Coefficients	2163
19.139.5	Mixing, shift, table, tail correction, restart, rRESPA info	2163
19.139.6	Related commands	2164
19.139.7	Default	2164
19.140	pair_style lj96/cut command	2164
19.140.1	Syntax	2164
19.140.2	Examples	2164
19.140.3	Description	2164
19.140.4	Mixing, shift, table, tail correction, restart, rRESPA info	2165
19.140.5	Restrictions	2165
19.140.6	Related commands	2166
19.140.7	Default	2166
19.141	pair_style lj/cubic command	2166
19.141.1	Syntax	2166
19.141.2	Examples	2166
19.141.3	Description	2166
19.141.4	Mixing, shift, table, tail correction, restart, rRESPA info	2167
19.141.5	Restrictions	2167
19.141.6	Related commands	2167
19.141.7	Default	2168
19.142	pair_style lj/cut/coul/cut command	2168
19.143	pair_style lj/cut/coul/debye command	2168
19.144	pair_style lj/cut/coul/dsf command	2168
19.145	pair_style lj/cut/coul/long command	2168
19.146	pair_style lj/cut/coul/msm command	2168
19.147	pair_style lj/cut/coul/wolf command	2168
19.147.1	Syntax	2168
19.147.2	Examples	2169
19.147.3	Description	2170
19.147.4	Coefficients	2171
19.147.5	Mixing, shift, table, tail correction, restart, rRESPA info	2171
19.147.6	Restrictions	2172
19.147.7	Related commands	2172

19.147.8	Default	2172
19.148	pair_style lj/cut/tip4p/cut command	2172
19.149	pair_style lj/cut/tip4p/long command	2172
19.149.1	Syntax	2172
19.149.2	Examples	2173
19.149.3	Description	2173
19.149.4	Coefficients	2174
19.149.5	Mixing, shift, table, tail correction, restart, rRESPA info	2175
19.149.6	Restrictions	2175
19.149.7	Related commands	2175
19.149.8	Default	2175
19.150	pair_style lj/expand command	2175
19.151	pair_style lj/expand/coul/long command	2176
19.151.1	Syntax	2176
19.151.2	Examples	2176
19.151.3	Description	2176
19.151.4	Mixing, shift, table, tail correction, restart, rRESPA info	2177
19.151.5	Restrictions	2177
19.151.6	Related commands	2177
19.151.7	Default	2177
19.152	pair_style lj/long/coul/long command	2177
19.153	pair_style lj/long/tip4p/long command	2178
19.153.1	Syntax	2178
19.153.2	Examples	2178
19.153.3	Description	2179
19.153.4	Mixing, shift, table, tail correction, restart, rRESPA info	2180
19.153.5	Restrictions	2181
19.153.6	Related commands	2181
19.153.7	Default	2181
19.154	pair_style lj/relres command	2181
19.154.1	Syntax	2181
19.154.2	Examples	2181
19.154.3	Description	2181
19.154.4	Mixing, shift, table, tail correction, restart, rRESPA info	2184
19.154.5	Restrictions	2185
19.154.6	Related commands	2185
19.154.7	Default	2185
19.155	pair_style lj/smooth command	2185
19.155.1	Syntax	2185
19.155.2	Examples	2185
19.155.3	Description	2185
19.155.4	Mixing, shift, table, tail correction, restart, rRESPA info	2186
19.155.5	Restrictions	2187
19.155.6	Related commands	2187
19.155.7	Default	2187
19.156	pair_style lj/smooth/linear command	2187
19.156.1	Syntax	2187
19.156.2	Examples	2187
19.156.3	Description	2187
19.156.4	Mixing, shift, table, tail correction, restart, rRESPA info	2188
19.156.5	Restrictions	2188
19.156.6	Related commands	2188
19.156.7	Default	2189
19.157	pair_style lj/switch3/coulgauss/long command	2189

19.158	pair_style mm3/switch3/coulgauss/long command	2189
19.158.1	Syntax	2189
19.158.2	Examples	2189
19.158.3	Description	2190
19.158.4	Mixing, shift, table, tail correction, restart, rRESPA info	2190
19.158.5	Restrictions	2191
19.158.6	Related commands	2191
19.158.7	Default	2191
19.159	pair_style local/density command	2191
19.159.1	Syntax	2191
19.159.2	Examples	2191
19.159.3	Description	2191
19.159.4	Mixing, shift, table, tail correction, restart, rRESPA info	2194
19.159.5	Restrictions	2194
19.159.6	Related commands	2194
19.159.7	Default	2194
19.160	pair_style lubricate command	2195
19.161	pair_style lubricate/poly command	2195
19.161.1	Syntax	2195
19.161.2	Examples	2195
19.161.3	Description	2195
19.161.4	Mixing, shift, table, tail correction, restart, rRESPA info	2197
19.161.5	Restrictions	2197
19.161.6	Related commands	2198
19.161.7	Default	2198
19.162	pair_style lubricateU command	2198
19.163	pair_style lubricateU/poly command	2198
19.163.1	Syntax	2198
19.163.2	Examples	2198
19.163.3	Description	2199
19.163.4	Mixing, shift, table, tail correction, restart, rRESPA info	2200
19.163.5	Restrictions	2200
19.163.6	Related commands	2201
19.163.7	Default	2201
19.164	pair_style lj/mdf command	2201
19.165	pair_style buck/mdf command	2201
19.166	pair_style lennard/mdf command	2201
19.166.1	Syntax	2201
19.166.2	Examples	2202
19.166.3	Description	2202
19.166.4	Mixing, shift, table, tail correction, restart, rRESPA info	2203
19.166.5	Restrictions	2203
19.166.6	Related commands	2204
19.166.7	Default	2204
19.167	pair_style meam command	2204
19.167.1	Syntax	2204
19.167.2	Examples	2204
19.167.3	Description	2204
19.167.4	Mixing, shift, table, tail correction, restart, rRESPA info	2209
19.167.5	Restrictions	2209
19.167.6	Related commands	2210
19.167.7	Default	2210
19.168	pair_style meam/spline command	2210
19.168.1	Syntax	2210

19.168.2	Examples	2210
19.168.3	Description	2210
19.168.4	Mixing, shift, table, tail correction, restart, rRESPA info	2212
19.168.5	Restrictions	2212
19.168.6	Related commands	2212
19.168.7	Default	2212
19.169	pair_style meam/sw/spline command	2213
19.169.1	Syntax	2213
19.169.2	Examples	2213
19.169.3	Description	2213
19.169.4	Mixing, shift, table, tail correction, restart, rRESPA info	2214
19.169.5	Restrictions	2214
19.169.6	Related commands	2214
19.169.7	Default	2214
19.170	pair_style mesocnt command	2215
19.171	pair_style mesocnt/viscous command	2215
19.171.1	Syntax	2215
19.171.2	Examples	2215
19.171.3	Description	2215
19.171.4	Mixing, shift, table, tail correction, restart, rRESPA info	2217
19.171.5	Restrictions	2217
19.171.6	Related commands	2218
19.171.7	Default	2218
19.172	pair_style edpd command	2218
19.173	pair_style mdpd command	2218
19.174	pair_style mdpd/rhosum command	2218
19.175	pair_style tdpd command	2218
19.175.1	Syntax	2218
19.175.2	Examples	2219
19.175.3	Description	2219
19.175.4	Example scripts	2222
19.175.5	Mixing, shift, table, tail correction, restart, rRESPA info	2223
19.175.6	Restrictions	2224
19.175.7	Related commands	2224
19.175.8	Default	2224
19.176	pair_style mesont/tpm command	2224
19.176.1	Syntax	2224
19.176.2	Examples	2225
19.176.3	Description	2225
19.176.4	Restrictions	2226
19.176.5	Related commands	2226
19.177	pair_style mgpt command	2227
19.177.1	Syntax	2227
19.177.2	Examples	2227
19.177.3	Description	2227
19.177.4	Mixing, shift, table, tail correction, restart, rRESPA info	2229
19.177.5	Restrictions	2229
19.177.6	Related commands	2229
19.177.7	Default	2229
19.178	pair_style mie/cut command	2230
19.178.1	Syntax	2230
19.178.2	Examples	2230
19.178.3	Description	2230
19.178.4	Mixing, shift, table, tail correction, restart, rRESPA info	2231

19.178.5	Restrictions	2231
19.178.6	Related commands	2231
19.178.7	Default	2231
19.179	pair_style mliap command	2231
19.179.1	Syntax	2231
19.179.2	Examples	2232
19.179.3	Description	2232
19.179.4	Mixing, shift, table, tail correction, restart, rRESPA info	2234
19.179.5	Restrictions	2234
19.179.6	Related commands	2234
19.179.7	Default	2234
19.180	pair_style momb command	2234
19.180.1	Syntax	2234
19.180.2	Examples	2235
19.180.3	Description	2235
19.180.4	Restrictions	2235
19.180.5	Related commands	2235
19.180.6	Default	2235
19.181	pair_style morse command	2236
19.182	pair_style morse/smooth/linear command	2236
19.182.1	Syntax	2236
19.182.2	Examples	2236
19.182.3	Description	2236
19.182.4	Mixing, shift, table, tail correction, restart, rRESPA info	2237
19.182.5	Restrictions	2238
19.182.6	Related commands	2238
19.182.7	Default	2238
19.183	pair_style multi/lucy command	2238
19.183.1	Syntax	2238
19.183.2	Examples	2238
19.183.3	Description	2238
19.183.4	Mixing, shift, table, tail correction, restart, rRESPA info	2240
19.183.5	Restrictions	2240
19.183.6	Related commands	2240
19.183.7	Default	2241
19.184	pair_style multi/lucy/rx command	2241
19.184.1	Syntax	2241
19.184.2	Examples	2241
19.184.3	Description	2241
19.184.4	Mixing, shift, table, tail correction, restart, rRESPA info	2243
19.184.5	Restrictions	2244
19.184.6	Related commands	2244
19.184.7	Default	2244
19.185	pair_style nb3b/harmonic command	2244
19.185.1	Syntax	2244
19.185.2	Examples	2244
19.185.3	Description	2245
19.185.4	Restrictions	2246
19.185.5	Related commands	2246
19.185.6	Default	2246
19.186	pair_style nm/cut command	2246
19.187	pair_style nm/cut/split command	2246
19.188	pair_style nm/cut/coul/cut command	2246
19.189	pair_style nm/cut/coul/long command	2246

19.189.1	Syntax	2246
19.189.2	Examples	2247
19.189.3	Description	2247
19.189.4	Mixing, shift, table, tail correction, restart, rRESPA info	2248
19.189.5	Restrictions	2248
19.189.6	Related commands	2249
19.189.7	Default	2249
19.190	pair_style none command	2249
19.190.1	Syntax	2249
19.190.2	Examples	2249
19.190.3	Description	2249
19.190.4	Restrictions	2250
19.190.5	Related commands	2250
19.190.6	Default	2250
19.191	pair_style oxdna/excv command	2250
19.192	pair_style oxdna/stk command	2250
19.193	pair_style oxdna/hbond command	2250
19.194	pair_style oxdna/xstk command	2250
19.195	pair_style oxdna/coaxstk command	2250
19.195.1	Syntax	2250
19.195.2	Examples	2251
19.195.3	Description	2251
19.195.4	Restrictions	2252
19.195.5	Related commands	2252
19.195.6	Default	2252
19.196	pair_style oxdna2/excv command	2252
19.197	pair_style oxdna2/stk command	2252
19.198	pair_style oxdna2/hbond command	2252
19.199	pair_style oxdna2/xstk command	2252
19.200	pair_style oxdna2/coaxstk command	2252
19.201	pair_style oxdna2/dh command	2252
19.201.1	Syntax	2252
19.201.2	Examples	2253
19.201.3	Description	2254
19.201.4	Restrictions	2254
19.201.5	Related commands	2255
19.201.6	Default	2255
19.202	pair_style oxrna2/excv command	2255
19.203	pair_style oxrna2/stk command	2255
19.204	pair_style oxrna2/hbond command	2255
19.205	pair_style oxrna2/xstk command	2255
19.206	pair_style oxrna2/coaxstk command	2255
19.207	pair_style oxrna2/dh command	2255
19.207.1	Syntax	2255
19.207.2	Examples	2256
19.207.3	Description	2256
19.207.4	Restrictions	2257
19.207.5	Related commands	2257
19.207.6	Default	2257
19.208	pair_style pace command	2258
19.208.1	Syntax	2258
19.208.2	Examples	2258
19.208.3	Description	2258
19.208.4	Mixing, shift, table, tail correction, restart, rRESPA info	2259

19.208.5	Restrictions	2259
19.208.6	Related commands	2259
19.208.7	Default	2259
19.209	pair_style peri/pmb command	2260
19.210	pair_style peri/lps command	2260
19.211	pair_style peri/ves command	2260
19.212	pair_style peri/eps command	2260
19.212.1	Syntax	2260
19.212.2	Examples	2260
19.212.3	Description	2260
19.212.4	Mixing, shift, table, tail correction, restart, rRESPA info	2262
19.212.5	Restrictions	2262
19.212.6	Related commands	2262
19.212.7	Default	2263
19.213	pair_style polymorphic command	2263
19.213.1	Syntax	2263
19.213.2	Examples	2263
19.213.3	Description	2263
19.213.4	Mixing, shift, table, tail correction, restart, rRESPA info	2267
19.213.5	Restrictions	2267
19.213.6	Related commands	2267
19.214	pair_style python command	2268
19.214.1	Syntax	2268
19.214.2	Examples	2268
19.214.3	Description	2268
19.214.4	Mixing, shift, table, tail correction, restart, rRESPA info	2271
19.214.5	Restrictions	2272
19.214.6	Related commands	2272
19.214.7	Default	2272
19.215	pair_style quip command	2272
19.215.1	Syntax	2272
19.215.2	Examples	2272
19.215.3	Description	2272
19.215.4	Mixing, shift, table, tail correction, restart, rRESPA info	2273
19.215.5	Restrictions	2273
19.215.6	Related commands	2273
19.216	pair_style rann command	2273
19.216.1	Syntax	2273
19.216.2	Examples	2274
19.216.3	Description	2274
19.216.4	Potential file syntax	2274
19.216.5	Formulation	2277
19.216.6	Restrictions	2279
19.216.7	Defaults	2279
19.217	pair_style reaxff command	2279
19.217.1	Syntax	2280
19.217.2	Examples	2280
19.217.3	Description	2280
19.217.4	Control file	2283
19.217.5	Mixing, shift, table, tail correction, restart, rRESPA info	2284
19.217.6	Restrictions	2284
19.217.7	Related commands	2285
19.217.8	Default	2285
19.218	pair_style resquared command	2285

19.218.1	Syntax . . . . .	2285
19.218.2	Examples . . . . .	2285
19.218.3	Description . . . . .	2285
19.218.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2287
19.218.5	Restrictions . . . . .	2287
19.218.6	Related commands . . . . .	2288
19.218.7	Default . . . . .	2288
19.219	pair_style saip/metal command . . . . .	2288
19.219.1	Syntax . . . . .	2288
19.219.2	Examples . . . . .	2288
19.219.3	Description . . . . .	2289
19.219.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2290
19.219.5	Restrictions . . . . .	2290
19.219.6	Related commands . . . . .	2290
19.219.7	Default . . . . .	2290
19.220	pair_style sdpd/taitwater/isothermal command . . . . .	2291
19.220.1	Syntax . . . . .	2291
19.220.2	Examples . . . . .	2291
19.220.3	Description . . . . .	2291
19.220.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2292
19.220.5	Restrictions . . . . .	2292
19.220.6	Related commands . . . . .	2292
19.220.7	Default . . . . .	2292
19.221	pair_style smatb command . . . . .	2292
19.222	pair_style smatb/single command . . . . .	2292
19.222.1	Syntax . . . . .	2292
19.222.2	Examples . . . . .	2293
19.222.3	Description . . . . .	2293
19.222.4	Coefficients . . . . .	2293
19.222.5	Mixing info . . . . .	2294
19.222.6	Restrictions . . . . .	2294
19.222.7	Related commands . . . . .	2294
19.222.8	Default . . . . .	2294
19.223	pair_style smd/hertz command . . . . .	2294
19.223.1	Syntax . . . . .	2294
19.223.2	Examples . . . . .	2294
19.223.3	Description . . . . .	2294
19.223.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2295
19.223.5	Restrictions . . . . .	2295
19.223.6	Related commands . . . . .	2295
19.223.7	Default . . . . .	2295
19.224	pair_style smd/tlsph command . . . . .	2295
19.224.1	Syntax . . . . .	2295
19.224.2	Examples . . . . .	2295
19.224.3	Description . . . . .	2295
19.224.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2296
19.224.5	Restrictions . . . . .	2296
19.224.6	Related commands . . . . .	2296
19.224.7	Default . . . . .	2296
19.225	pair_style smd/tri_surface command . . . . .	2296
19.225.1	Syntax . . . . .	2296
19.225.2	Examples . . . . .	2297
19.225.3	Description . . . . .	2297
19.225.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2297

19.225.5	Restrictions	2297
19.225.6	Related commands	2297
19.225.7	Default	2297
19.226	pair_style smd/ulsph command	2297
19.226.1	Syntax	2297
19.226.2	Examples	2298
19.226.3	Description	2298
19.226.4	Mixing, shift, table, tail correction, restart, rRESPA info	2298
19.226.5	Restrictions	2298
19.226.6	Related commands	2299
19.226.7	Default	2299
19.227	pair_style smtbq command	2299
19.227.1	Syntax	2299
19.227.2	Examples	2299
19.227.3	Description	2299
19.227.4	Mixing, shift, table, tail correction, restart, rRESPA info	2302
19.227.5	Restrictions	2303
19.227.6	Citing this work	2303
19.228	pair_style snap command	2303
19.228.1	Syntax	2303
19.228.2	Examples	2303
19.228.3	Description	2303
19.228.4	Mixing, shift, table, tail correction, restart, rRESPA info	2306
19.228.5	Restrictions	2307
19.228.6	Related commands	2307
19.228.7	Default	2307
19.229	pair_style soft command	2307
19.229.1	Syntax	2307
19.229.2	Examples	2307
19.229.3	Description	2308
19.229.4	Mixing, shift, table, tail correction, restart, rRESPA info	2309
19.229.5	Restrictions	2309
19.229.6	Related commands	2309
19.229.7	Default	2309
19.230	pair_style sph/heatconduction command	2309
19.230.1	Syntax	2309
19.230.2	Examples	2309
19.230.3	Description	2310
19.230.4	Mixing, shift, table, tail correction, restart, rRESPA info	2310
19.230.5	Restrictions	2310
19.230.6	Related commands	2310
19.230.7	Default	2310
19.231	pair_style sph/idealgas command	2310
19.231.1	Syntax	2310
19.231.2	Examples	2311
19.231.3	Description	2311
19.231.4	Mixing, shift, table, tail correction, restart, rRESPA info	2311
19.231.5	Restrictions	2311
19.231.6	Related commands	2311
19.231.7	Default	2312
19.232	pair_style sph/lj command	2312
19.232.1	Syntax	2312
19.232.2	Examples	2312
19.232.3	Description	2312

19.232.4	Mixing, shift, table, tail correction, restart, rRESPA info	2312
19.232.5	Restrictions	2313
19.232.6	Related commands	2313
19.232.7	Default	2313
19.233	pair_style sph/rhosome command	2313
19.233.1	Syntax	2313
19.233.2	Examples	2313
19.233.3	Description	2313
19.233.4	Mixing, shift, table, tail correction, restart, rRESPA info	2314
19.233.5	Restrictions	2314
19.233.6	Related commands	2314
19.233.7	Default	2314
19.234	pair_style sph/taitwater command	2314
19.234.1	Syntax	2314
19.234.2	Examples	2314
19.234.3	Description	2314
19.234.4	Mixing, shift, table, tail correction, restart, rRESPA info	2315
19.234.5	Restrictions	2315
19.234.6	Related commands	2315
19.234.7	Default	2315
19.235	pair_style sph/taitwater/morris command	2315
19.235.1	Syntax	2315
19.235.2	Examples	2316
19.235.3	Description	2316
19.235.4	Mixing, shift, table, tail correction, restart, rRESPA info	2316
19.235.5	Restrictions	2316
19.235.6	Related commands	2317
19.235.7	Default	2317
19.236	pair_style lj/spica command	2317
19.237	pair_style lj/spica/coul/long command	2317
19.238	pair_style lj/spica/coul/msm command	2317
19.238.1	Syntax	2317
19.238.2	Examples	2317
19.238.3	Description	2318
19.238.4	Mixing, shift, table, tail correction, restart, rRESPA info	2319
19.238.5	Restrictions	2319
19.238.6	Related commands	2319
19.238.7	Default	2319
19.239	pair_style spin/dipole/cut command	2320
19.240	pair_style spin/dipole/long command	2320
19.240.1	Syntax	2320
19.240.2	Examples	2320
19.240.3	Description	2320
19.240.4	Restrictions	2321
19.240.5	Related commands	2321
19.240.6	Default	2321
19.241	pair_style spin/dmi command	2321
19.241.1	Syntax	2321
19.241.2	Examples	2321
19.241.3	Description	2321
19.241.4	Restrictions	2322
19.241.5	Related commands	2322
19.241.6	Default	2322
19.242	pair_style spin/exchange command	2322

19.243	pair_style spin/exchange/biquadratic command	2322
19.243.1	Syntax	2322
19.243.2	Examples	2323
19.243.3	Description	2323
19.243.4	Restrictions	2325
19.243.5	Related commands	2325
19.243.6	Default	2325
19.244	pair_style spin/magelec command	2325
19.244.1	Syntax	2325
19.244.2	Examples	2325
19.244.3	Description	2325
19.244.4	Restrictions	2326
19.244.5	Related commands	2326
19.244.6	Default	2326
19.245	pair_style spin/neel command	2326
19.245.1	Syntax	2326
19.245.2	Examples	2327
19.245.3	Description	2327
19.245.4	Restrictions	2327
19.245.5	Related commands	2328
19.245.6	Default	2328
19.246	pair_style srp command	2328
19.247	pair_style srp/react command	2328
19.247.1	Syntax	2328
19.247.2	Examples	2328
19.247.3	Mixing, shift, table, tail correction, restart, rRESPA info	2330
19.247.4	Restrictions	2330
19.247.5	Related commands	2330
19.247.6	Default	2330
19.248	pair_style sw command	2331
19.249	pair_style sw/mod command	2331
19.249.1	Syntax	2331
19.249.2	Examples	2331
19.249.3	Description	2331
19.249.4	Mixing, shift, table, tail correction, restart, rRESPA info	2334
19.249.5	Restrictions	2335
19.249.6	Related commands	2335
19.249.7	Default	2335
19.250	pair_style sw/angle/table command	2335
19.250.1	Syntax	2335
19.250.2	Examples	2335
19.250.3	Description	2336
19.250.4	Mixing, shift, table, tail correction, restart, rRESPA info	2339
19.250.5	Restrictions	2339
19.250.6	Related commands	2339
19.251	pair_style table command	2339
19.251.1	Syntax	2339
19.251.2	Examples	2340
19.251.3	Description	2340
19.251.4	Mixing, shift, table, tail correction, restart, rRESPA info	2342
19.251.5	Restrictions	2343
19.251.6	Related commands	2343
19.251.7	Default	2343
19.252	pair_style table/rx command	2343

19.252.1	Syntax . . . . .	2343
19.252.2	Examples . . . . .	2343
19.252.3	Description . . . . .	2343
19.252.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2346
19.252.5	Restrictions . . . . .	2346
19.252.6	Related commands . . . . .	2346
19.252.7	Default . . . . .	2346
19.253	pair_style tersoff command . . . . .	2347
19.254	pair_style tersoff/table command . . . . .	2347
19.254.1	Syntax . . . . .	2347
19.254.2	Examples . . . . .	2347
19.254.3	Description . . . . .	2348
19.254.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2351
19.254.5	Restrictions . . . . .	2351
19.254.6	Related commands . . . . .	2351
19.254.7	Default . . . . .	2351
19.255	pair_style tersoff/mod command . . . . .	2352
19.256	pair_style tersoff/mod/c command . . . . .	2352
19.256.1	Syntax . . . . .	2352
19.256.2	Examples . . . . .	2352
19.256.3	Description . . . . .	2353
19.256.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2355
19.256.5	Restrictions . . . . .	2355
19.256.6	Related commands . . . . .	2355
19.256.7	Default . . . . .	2355
19.257	pair_style tersoff/zbl command . . . . .	2356
19.257.1	Syntax . . . . .	2356
19.257.2	Examples . . . . .	2356
19.257.3	Description . . . . .	2356
19.257.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2360
19.257.5	Restrictions . . . . .	2360
19.257.6	Related commands . . . . .	2360
19.257.7	Default . . . . .	2360
19.258	pair_style thole command . . . . .	2361
19.259	pair_style lj/cut/thole/long command . . . . .	2361
19.259.1	Syntax . . . . .	2361
19.259.2	Examples . . . . .	2361
19.259.3	Description . . . . .	2361
19.259.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2363
19.259.5	Restrictions . . . . .	2363
19.259.6	Related commands . . . . .	2363
19.259.7	Default . . . . .	2363
19.260	pair_style threebody/table command . . . . .	2363
19.260.1	Syntax . . . . .	2363
19.260.2	Examples . . . . .	2364
19.260.3	Description . . . . .	2364
19.260.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2366
19.260.5	Restrictions . . . . .	2367
19.260.6	Related commands . . . . .	2367
19.261	pair_style tracker command . . . . .	2367
19.261.1	Syntax . . . . .	2367
19.261.2	Examples . . . . .	2368
19.261.3	Description . . . . .	2368
19.261.4	Mixing, shift, table, tail correction, restart, rRESPA info . . . . .	2369

19.261.5	Restrictions	2369
19.261.6	Related commands	2369
19.261.7	Default	2369
19.262	pair_style tri/lj command	2369
19.262.1	Syntax	2369
19.262.2	Examples	2370
19.262.3	Description	2370
19.262.4	Mixing, shift, table, tail correction, restart, rRESPA info	2371
19.262.5	Restrictions	2371
19.262.6	Related commands	2371
19.262.7	Default	2371
19.263	pair_style ufm command	2371
19.263.1	Syntax	2371
19.263.2	Examples	2371
19.263.3	Description	2372
19.263.4	Mixing, shift, table, tail correction, restart, rRESPA info	2373
19.263.5	Restrictions	2373
19.263.6	Related commands	2373
19.263.7	Default	2373
19.264	pair_style vashishta command	2373
19.265	pair_style vashishta/table command	2373
19.265.1	Syntax	2374
19.265.2	Examples	2374
19.265.3	Description	2374
19.265.4	Mixing, shift, table, tail correction, restart, rRESPA info	2376
19.265.5	Restrictions	2377
19.265.6	Related commands	2377
19.265.7	Default	2377
19.266	pair_style wf/cut command	2377
19.266.1	Syntax	2377
19.266.2	Examples	2377
19.266.3	Description	2377
19.266.4	Restrictions	2379
19.266.5	Related commands	2379
19.267	pair_style yukawa command	2379
19.267.1	Syntax	2379
19.267.2	Examples	2379
19.267.3	Description	2379
19.267.4	Mixing, shift, table, tail correction, restart, rRESPA info	2380
19.267.5	Restrictions	2380
19.267.6	Related commands	2380
19.267.7	Default	2380
19.268	pair_style yukawa/colloid command	2381
19.268.1	Syntax	2381
19.268.2	Examples	2381
19.268.3	Description	2381
19.268.4	Mixing, shift, table, tail correction, restart, rRESPA info	2382
19.268.5	Restrictions	2382
19.268.6	Related commands	2383
19.268.7	Default	2383
19.269	pair_style zbl command	2383
19.269.1	Syntax	2383
19.269.2	Examples	2383
19.269.3	Description	2383

19.269.4	Mixing, shift, table, tail correction, restart, rRESPA info	2384
19.269.5	Restrictions	2385
19.269.6	Related commands	2385
19.269.7	Default	2385
19.270	pair_style zero command	2385
19.270.1	Syntax	2385
19.270.2	Examples	2385
19.270.3	Description	2385
19.270.4	Mixing, shift, table, tail correction, restart, rRESPA info	2386
19.270.5	Restrictions	2386
19.270.6	Related commands	2386
19.270.7	Default	2386
<b>20</b>	<b>Bond Styles</b>	<b>2387</b>
20.1	bond_style bpm/rotational command	2387
20.1.1	Syntax	2387
20.1.2	Examples	2387
20.1.3	Description	2388
20.1.4	Restart and other info	2389
20.1.5	Restrictions	2390
20.1.6	Related commands	2390
20.1.7	Default	2390
20.2	bond_style bpm/spring command	2390
20.2.1	Syntax	2390
20.2.2	Examples	2391
20.2.3	Description	2391
20.2.4	Restart and other info	2392
20.2.5	Restrictions	2392
20.2.6	Related commands	2393
20.2.7	Default	2393
20.3	bond_style class2 command	2393
20.3.1	Syntax	2393
20.3.2	Examples	2393
20.3.3	Description	2393
20.3.4	Restrictions	2394
20.3.5	Related commands	2394
20.3.6	Default	2394
20.4	bond_style fene command	2394
20.5	bond_style fene/nm command	2394
20.5.1	Syntax	2394
20.5.2	Examples	2394
20.5.3	Description	2395
20.5.4	Restrictions	2396
20.5.5	Related commands	2396
20.5.6	Default	2396
20.6	bond_style fene/expand command	2396
20.6.1	Syntax	2396
20.6.2	Examples	2396
20.6.3	Description	2396
20.6.4	Restrictions	2397
20.6.5	Related commands	2397
20.6.6	Default	2397
20.7	bond_style gaussian command	2397
20.7.1	Syntax	2397

20.7.2	Examples	2398
20.7.3	Description	2398
20.7.4	Restrictions	2398
20.7.5	Related commands	2398
20.7.6	Default	2398
20.8	bond_style gromos command	2399
20.8.1	Syntax	2399
20.8.2	Examples	2399
20.8.3	Description	2399
20.8.4	Restrictions	2400
20.8.5	Related commands	2400
20.8.6	Default	2400
20.9	bond_style harmonic command	2400
20.9.1	Syntax	2400
20.9.2	Examples	2400
20.9.3	Description	2400
20.9.4	Restrictions	2401
20.9.5	Related commands	2401
20.9.6	Default	2401
20.10	bond_style harmonic/shift command	2401
20.10.1	Syntax	2401
20.10.2	Examples	2401
20.10.3	Description	2401
20.10.4	Restrictions	2402
20.10.5	Related commands	2402
20.10.6	Default	2402
20.11	bond_style harmonic/shift/cut command	2402
20.11.1	Syntax	2402
20.11.2	Examples	2402
20.11.3	Description	2403
20.11.4	Restrictions	2403
20.11.5	Related commands	2403
20.11.6	Default	2403
20.12	bond_style hybrid command	2404
20.12.1	Syntax	2404
20.12.2	Examples	2404
20.12.3	Description	2404
20.12.4	Restrictions	2404
20.12.5	Related commands	2405
20.12.6	Default	2405
20.13	bond_style mesocnt command	2405
20.13.1	Syntax	2405
20.13.2	Examples	2405
20.13.3	Description	2405
20.13.4	Restrictions	2406
20.13.5	Related commands	2406
20.13.6	Default	2406
20.14	bond_style mm3 command	2406
20.14.1	Syntax	2406
20.14.2	Examples	2406
20.14.3	Description	2406
20.14.4	Restrictions	2407
20.14.5	Related commands	2407
20.14.6	Default	2407

20.15	bond_style morse command	2407
20.15.1	Syntax	2407
20.15.2	Examples	2407
20.15.3	Description	2407
20.15.4	Restrictions	2408
20.15.5	Related commands	2408
20.15.6	Default	2408
20.16	bond_style none command	2408
20.16.1	Syntax	2408
20.16.2	Examples	2408
20.16.3	Description	2409
20.16.4	Restrictions	2409
20.16.5	Related commands	2409
20.16.6	Default	2409
20.17	bond_style nonlinear command	2409
20.17.1	Syntax	2409
20.17.2	Examples	2409
20.17.3	Description	2409
20.17.4	Restrictions	2410
20.17.5	Related commands	2410
20.17.6	Default	2410
20.18	bond_style oxdna/fene command	2410
20.19	bond_style oxdna2/fene command	2410
20.20	bond_style oxrna2/fene command	2410
20.20.1	Syntax	2410
20.20.2	Examples	2411
20.20.3	Description	2411
20.20.4	Restrictions	2412
20.20.5	Related commands	2412
20.20.6	Default	2412
20.21	bond_style quartic command	2412
20.21.1	Syntax	2413
20.21.2	Examples	2413
20.21.3	Description	2413
20.21.4	Restrictions	2414
20.21.5	Related commands	2414
20.21.6	Default	2414
20.22	bond_style special command	2414
20.22.1	Syntax	2414
20.22.2	Examples	2415
20.22.3	Description	2415
20.22.4	Restrictions	2416
20.22.5	Related commands	2416
20.22.6	Default	2416
20.23	bond_style table command	2416
20.23.1	Syntax	2416
20.23.2	Examples	2416
20.23.3	Description	2416
20.23.4	Restart, fix_modify, output, run start/stop, minimize info	2418
20.23.5	Restrictions	2418
20.23.6	Related commands	2418
20.23.7	Default	2418
20.24	bond_style zero command	2418
20.24.1	Syntax	2418

20.24.2	Examples	2419
20.24.3	Description	2419
20.24.4	Restrictions	2419
20.24.5	Related commands	2419
20.24.6	Default	2419
<b>21</b>	<b>Angle Styles</b>	<b>2421</b>
21.1	angle_style amoeba command	2421
21.1.1	Syntax	2421
21.1.2	Examples	2421
21.1.3	Description	2421
21.1.4	Restrictions	2423
21.1.5	Related commands	2423
21.1.6	Default	2423
21.2	angle_style charmm command	2423
21.2.1	Syntax	2423
21.2.2	Examples	2423
21.2.3	Description	2423
21.2.4	Restrictions	2424
21.2.5	Related commands	2424
21.2.6	Default	2424
21.3	angle_style class2 command	2424
21.4	angle_style class2/p6 command	2424
21.4.1	Syntax	2424
21.4.2	Examples	2425
21.4.3	Description	2425
21.4.4	Restrictions	2426
21.4.5	Related commands	2427
21.4.6	Default	2427
21.5	angle_style cosine command	2427
21.5.1	Syntax	2427
21.5.2	Examples	2427
21.5.3	Description	2427
21.5.4	Restrictions	2428
21.5.5	Related commands	2428
21.5.6	Default	2428
21.6	angle_style cosine/buck6d command	2428
21.6.1	Syntax	2428
21.6.2	Examples	2428
21.6.3	Description	2428
21.6.4	Restrictions	2429
21.6.5	Related commands	2429
21.6.6	Default	2429
21.7	angle_style cosine/delta command	2429
21.7.1	Syntax	2429
21.7.2	Examples	2429
21.7.3	Description	2429
21.7.4	Restrictions	2430
21.7.5	Related commands	2430
21.7.6	Default	2430
21.8	angle_style cosine/periodic command	2430
21.8.1	Syntax	2430
21.8.2	Examples	2430
21.8.3	Description	2431

21.8.4	Restrictions	2431
21.8.5	Related commands	2431
21.8.6	Default	2431
21.9	angle_style cosine/shift command	2432
21.9.1	Syntax	2432
21.9.2	Examples	2432
21.9.3	Description	2432
21.9.4	Restrictions	2433
21.9.5	Related commands	2433
21.9.6	Default	2433
21.10	angle_style cosine/shift/exp command	2433
21.10.1	Syntax	2433
21.10.2	Examples	2433
21.10.3	Description	2433
21.10.4	Restrictions	2434
21.10.5	Related commands	2434
21.10.6	Default	2434
21.11	angle_style cosine/squared command	2434
21.11.1	Syntax	2434
21.11.2	Examples	2434
21.11.3	Description	2435
21.11.4	Restrictions	2435
21.11.5	Related commands	2435
21.11.6	Default	2435
21.12	angle_style cross command	2436
21.12.1	Syntax	2436
21.12.2	Examples	2436
21.12.3	Description	2436
21.12.4	Restrictions	2436
21.12.5	Related commands	2437
21.12.6	Default	2437
21.13	angle_style dipole command	2437
21.13.1	Syntax	2437
21.13.2	Examples	2437
21.13.3	Description	2437
21.13.4	Restrictions	2438
21.13.5	Related commands	2439
21.13.6	Default	2439
21.14	angle_style fourier command	2439
21.14.1	Syntax	2439
21.14.2	Examples	2439
21.14.3	Description	2439
21.14.4	Restrictions	2440
21.14.5	Related commands	2440
21.14.6	Default	2440
21.15	angle_style fourier/simple command	2440
21.15.1	Syntax	2440
21.15.2	Examples	2440
21.15.3	Description	2440
21.15.4	Restrictions	2441
21.15.5	Related commands	2441
21.15.6	Default	2441
21.16	angle_style gaussian command	2441
21.16.1	Syntax	2441

21.16.2	Examples	2441
21.16.3	Description	2442
21.16.4	Restrictions	2442
21.16.5	Related commands	2442
21.16.6	Default	2442
21.17	angle_style harmonic command	2442
21.17.1	Syntax	2443
21.17.2	Examples	2443
21.17.3	Description	2443
21.17.4	Restrictions	2443
21.17.5	Related commands	2444
21.17.6	Default	2444
21.18	angle_style hybrid command	2444
21.18.1	Syntax	2444
21.18.2	Examples	2444
21.18.3	Description	2444
21.18.4	Restrictions	2445
21.18.5	Related commands	2445
21.18.6	Default	2445
21.19	angle_style mesocnt command	2445
21.19.1	Syntax	2445
21.19.2	Examples	2445
21.19.3	Description	2446
21.19.4	Restrictions	2447
21.19.5	Related commands	2447
21.19.6	Default	2447
21.20	angle_style mm3 command	2447
21.20.1	Syntax	2447
21.20.2	Examples	2447
21.20.3	Description	2448
21.20.4	Restrictions	2448
21.20.5	Related commands	2448
21.20.6	Default	2448
21.21	angle_style none command	2448
21.21.1	Syntax	2448
21.21.2	Examples	2448
21.21.3	Description	2449
21.21.4	Restrictions	2449
21.21.5	Related commands	2449
21.21.6	Default	2449
21.22	angle_style quartic command	2449
21.22.1	Syntax	2449
21.22.2	Examples	2449
21.22.3	Description	2449
21.22.4	Restrictions	2450
21.22.5	Related commands	2450
21.22.6	Default	2450
21.23	angle_style spica command	2450
21.23.1	Syntax	2450
21.23.2	Examples	2451
21.23.3	Description	2451
21.23.4	Restrictions	2451
21.23.5	Related commands	2452
21.23.6	Default	2452

21.24	angle_style table command . . . . .	2452
21.24.1	Syntax . . . . .	2452
21.24.2	Examples . . . . .	2452
21.24.3	Description . . . . .	2452
21.24.4	Restart, fix_modify, output, run start/stop, minimize info . . . . .	2454
21.24.5	Restrictions . . . . .	2454
21.24.6	Related commands . . . . .	2454
21.24.7	Default . . . . .	2454
21.25	angle_style zero command . . . . .	2454
21.25.1	Syntax . . . . .	2454
21.25.2	Examples . . . . .	2454
21.25.3	Description . . . . .	2454
21.25.4	Restrictions . . . . .	2455
21.25.5	Related commands . . . . .	2455
21.25.6	Default . . . . .	2455
<b>22</b>	<b>Dihedral Styles . . . . .</b>	<b>2457</b>
22.1	dihedral_style charmm command . . . . .	2457
22.2	dihedral_style charmmfsw command . . . . .	2457
22.2.1	Syntax . . . . .	2457

LAMMPS stands for **L**arge-scale **A**tomic/**M**olecular **M**assively **P**arallel **S**imulator.

LAMMPS is a classical molecular dynamics simulation code with a focus on materials modeling. It was designed to run efficiently on parallel computers. It was developed originally at Sandia National Laboratories, a US Department of Energy facility. The majority of funding for LAMMPS has come from the US Department of Energy (DOE). LAMMPS is an open-source code, distributed freely under the terms of the GNU Public License Version 2 (GPLv2).

The [LAMMPS website](#) has a variety of information about the code. It includes links to an on-line version of this manual, an [online forum](#) where users can post questions and discuss LAMMPS, and a [GitHub site](#) where all LAMMPS development is coordinated.

---

The content for this manual is part of the LAMMPS distribution. The online version always corresponds to the latest development version. If needed, you can download or build a local copy of the manual as HTML pages or a PDF file by following the steps on the [Build the LAMMPS documentation](#) page. If you have difficulties viewing the pages please [see this note](#).

---

The manual is organized in three parts: 1) the [User Guide](#) for how to install and use LAMMPS, 2) the [Programmer Guide](#) for how to write programs using the LAMMPS library from different programming languages and how to modify and extend LAMMPS, and 3) the [Command Reference](#) which includes detailed descriptions of all commands included in the LAMMPS code.

---

**Part I**

**User Guide**

## INTRODUCTION

These pages provide a brief introduction to LAMMPS.

### 1.1 Overview of LAMMPS

LAMMPS is a classical molecular dynamics (MD) code that models ensembles of particles in a liquid, solid, or gaseous state. It can model atomic, polymeric, biological, solid-state (metals, ceramics, oxides), granular, coarse-grained, or macroscopic systems using a variety of interatomic potentials (force fields) and boundary conditions. It can model 2d or 3d systems with only a few particles up to millions or billions.

LAMMPS can be built and run on a laptop or desktop machine, but is designed for parallel computers. It will run in serial and on any parallel machine that supports the [MPI](#) message-passing library. This includes shared-memory boxes and distributed-memory clusters and supercomputers. Parts of LAMMPS also support [OpenMP multi-threading](#), vectorization and GPU acceleration.

LAMMPS is written in C++ and requires a compiler that is at least compatible with the C++-11 standard. Earlier versions were written in F77, F90, and C++-98. See the [History page](#) of the website for details. All versions can be downloaded as source code from the [LAMMPS website](#).

LAMMPS is designed to be easy to modify or extend with new capabilities, such as new force fields, atom types, boundary conditions, or diagnostics. See the [Modify](#) page for more details.

In the most general sense, LAMMPS integrates Newton's equations of motion for a collection of interacting particles. A single particle can be an atom or molecule or electron, a coarse-grained cluster of atoms, or a mesoscopic or macroscopic clump of material. The interaction models that LAMMPS includes are mostly short-range in nature; some long-range models are included as well.

LAMMPS uses neighbor lists to keep track of nearby particles. The lists are optimized for systems with particles that are repulsive at short distances, so that the local density of particles never becomes too large. This is in contrast to methods used for modeling plasma or gravitational bodies (e.g. galaxy formation).

On parallel machines, LAMMPS uses spatial-decomposition techniques with MPI parallelization to partition the simulation domain into small sub-domains of equal computational cost, one of which is assigned to each processor. Processors communicate and store "ghost" atom information for atoms that border their sub-domain. Multi-threading parallelization and GPU acceleration with with particle-decomposition can be used in addition.

## 1.2 What does a LAMMPS version mean

The LAMMPS “version” is the date when it was released, such as 1 May 2014. LAMMPS is updated continuously and we aim to keep it working correctly and reliably at all times. You can follow its development in a public [git repository on GitHub](#).

Whenever we fix a bug or update or add a feature, it will be merged into the *develop* branch of the git repository. When a sufficient number of changes have accumulated *and* the software passes a set of automated tests, we release it in the next *patch* release, which are made every few weeks. The *release* branch of the git repository is updated with every such release. Info on patch releases are on [this website page](#).

Once or twice a year, we apply only bug fixes and small, non-intrusive changes to the *develop* branch and the code is subjected to more detailed and thorough testing than the default automated testing. The latest patch release after such a period is then also labeled as a *stable* version and the *stable* branch is updated with it. Between stable releases we occasionally release some updates to the stable release containing only bug fixes and updates back-ported from *develop* but no new features and update the *stable* branch accordingly.

Each version of LAMMPS contains all the documented features up to and including its version date.

The version date is printed to the screen and logfile every time you run LAMMPS. It is also in the file `src/version.h` and in the LAMMPS directory name created when you unpack a tarball. And it is on the first page of the [manual](#).

- If you browse the HTML pages on the LAMMPS WWW site, they will by default describe the most current patch release version of LAMMPS. In the navigation bar on the bottom left, there is the option to view instead the documentation for the most recent *stable* version or the latest version from the current development branch.
- If you browse the HTML pages included in your tarball, they describe the version you have, which may be older.

## 1.3 LAMMPS features

LAMMPS is a classical molecular dynamics (MD) code with these general classes of functionality:

1. *General features*
2. *Particle and model types*
3. *Interatomic potentials (force fields)*
4. *Atom creation*
5. *Ensembles, constraints, and boundary conditions*
6. *Integrators*
7. *Diagnostics*
8. *Output*
9. *Multi-replica models*
10. *Pre- and post-processing*
11. *Specialized features (beyond MD itself)*

### 1.3.1 General features

- runs on a single processor or in parallel
- distributed memory message-passing parallelism (MPI)
- shared memory multi-threading parallelism (OpenMP)
- spatial decomposition of simulation domain for MPI parallelism
- particle decomposition inside of spatial decomposition for OpenMP and GPU parallelism
- GPLv2 licensed open-source distribution
- highly portable C++-11
- modular code with most functionality in optional packages
- only depends on MPI library for basic parallel functionality, MPI stub for serial compilation
- other libraries are optional and only required for specific packages
- GPU (CUDA, OpenCL, HIP, SYCL), Intel Xeon Phi, and OpenMP support for many code features
- easy to extend with new features and functionality
- runs from an input script
- syntax for defining and using variables and formulas
- syntax for looping over runs and breaking out of loops
- run one or multiple simulations simultaneously (in parallel) from one script
- build as library, invoke LAMMPS through library interface or provided Python wrapper or SWIG based wrappers
- couple with other codes: LAMMPS calls other code, other code calls LAMMPS, umbrella code calls both

### 1.3.2 Particle and model types

(See *atom style* command)

- atoms
- coarse-grained particles (e.g. bead-spring polymers)
- united-atom polymers or organic molecules
- all-atom polymers, organic molecules, proteins, DNA
- metals
- granular materials
- coarse-grained mesoscale models
- finite-size spherical and ellipsoidal particles
- finite-size line segment (2d) and triangle (3d) particles
- finite-size rounded polygons (2d) and polyhedra (3d) particles
- point dipole particles
- particles with magnetic spin
- rigid collections of n particles

- hybrid combinations of these

### 1.3.3 Interatomic potentials (force fields)

(See *pair style*, *bond style*, *angle style*, *dihedral style*, *improper style*, *kpace style* commands)

- pairwise potentials: Lennard-Jones, Buckingham, Morse, Born-Mayer-Huggins, Yukawa, soft, class 2 (COMPASS), hydrogen bond, tabulated
- charged pairwise potentials: Coulombic, point-dipole
- many-body potentials: EAM, Finnis/Sinclair EAM, modified EAM (MEAM), embedded ion method (EIM), EDIP, ADP, Stillinger-Weber, Tersoff, REBO, AIREBO, ReaxFF, COMB, Streitz-Mintmire, 3-body polymorphic, BOP, Vashishta
- machine learning potentials: SNAP, GAP, ACE, N2P2, RANN, AGNI
- long-range interactions for charge, point-dipoles, and LJ dispersion: Ewald, Wolf, PPPM (similar to particle-mesh Ewald), MSM
- polarization models: *QEq*, *core/shell model*, *Drude dipole model*
- charge equilibration (QEq via dynamic, point, shielded, Slater methods)
- coarse-grained potentials: DPD, GayBerne, REsquared, colloidal, DLVO
- mesoscopic potentials: granular, Peridynamics, SPH, mesoscopic tubular potential (MESONT)
- semi-empirical potentials: multi-ion generalized pseudopotential theory (MGPT), second moment tight binding + QEq (SMTB-Q), density functional tight-binding (LATTE)
- electron force field (eFF, AWPMD)
- bond potentials: harmonic, FENE, Morse, nonlinear, class 2, quartic (breakable), tabulated
- angle potentials: harmonic, CHARMM, cosine, cosine/squared, cosine/periodic, class 2 (COMPASS), tabulated
- dihedral potentials: harmonic, CHARMM, multi-harmonic, helix, class 2 (COMPASS), OPLS, tabulated
- improper potentials: harmonic, cvff, umbrella, class 2 (COMPASS), tabulated
- polymer potentials: all-atom, united-atom, bead-spring, breakable
- water potentials: TIP3P, TIP4P, SPC, SPC/E and variants
- interlayer potentials for graphene and analogues
- metal-organic framework potentials (QuickFF, MO-FF)
- implicit solvent potentials: hydrodynamic lubrication, Debye
- force-field compatibility with common CHARMM, AMBER, DREIDING, OPLS, GROMACS, COMPASS options
- access to the [OpenKIM Repository](#) of potentials via *kim command*
- hybrid potentials: multiple pair, bond, angle, dihedral, improper potentials can be used in one simulation
- overlaid potentials: superposition of multiple pair potentials (including many-body) with optional scale factor

### 1.3.4 Atom creation

(See *read\_data*, *lattice*, *create\_atoms*, *delete\_atoms*, *displace\_atoms*, *replicate* commands)

- read in atom coords from files
- create atoms on one or more lattices (e.g. grain boundaries)
- delete geometric or logical groups of atoms (e.g. voids)
- replicate existing atoms multiple times
- displace atoms

### 1.3.5 Ensembles, constraints, and boundary conditions

(See *fix* command)

- 2d or 3d systems
- orthogonal or non-orthogonal (triclinic symmetry) simulation domains
- constant NVE, NVT, NPT, NPH, Parrinello/Rahman integrators
- thermostatting options for groups and geometric regions of atoms
- pressure control via Nose/Hoover or Berendsen barostatting in 1 to 3 dimensions
- simulation box deformation (tensile and shear)
- harmonic (umbrella) constraint forces
- rigid body constraints
- SHAKE bond and angle constraints
- motion constraints to manifold surfaces
- Monte Carlo bond breaking, formation, swapping, template based reaction modeling
- atom/molecule insertion and deletion
- walls of various kinds, static and moving
- non-equilibrium molecular dynamics (NEMD)
- variety of additional boundary conditions and constraints

### 1.3.6 Integrators

(See *run*, *run\_style*, *minimize* commands)

- velocity-Verlet integrator
- Brownian dynamics
- rigid body integration
- energy minimization via conjugate gradient or steepest descent relaxation
- rRESPA hierarchical timestepping
- rerun command for post-processing of dump files

### 1.3.7 Diagnostics

- see various flavors of the *fix* and *compute* commands
- introspection command for system, simulation, and compile time settings and configurations

### 1.3.8 Output

(*dump*, *restart* commands)

- log file of thermodynamic info
- text dump files of atom coords, velocities, other per-atom quantities
- binary restart files
- parallel I/O of dump and restart files
- per-atom quantities (energy, stress, centro-symmetry parameter, CNA, etc)
- user-defined system-wide (log file) or per-atom (dump file) calculations
- custom partitioning (chunks) for binning, and static or dynamic grouping of atoms for analysis
- spatial, time, and per-chunk averaging of per-atom quantities
- time averaging and histogramming of system-wide quantities
- atom snapshots in native, XYZ, XTC, DCD, CFG formats

### 1.3.9 Multi-replica models

- *nudged elastic band*
- *hyperdynamics*
- *parallel replica dynamics*
- *temperature accelerated dynamics*
- *parallel tempering*
- path-integral MD: *first variant* `<fix_pimd>`, *second variant* `<fix_ipi>`
- multi-walker collective variables with *Colvars* and *Plumed*

### 1.3.10 Pre- and post-processing

- A handful of pre- and post-processing tools are packaged with LAMMPS, some of which can convert input and output files to/from formats used by other codes; see the *Tools* page.
- Our group has also written and released a separate toolkit called *Pizza.py* which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations. *Pizza.py* is written in *Python* and is available for download from the *Pizza.py* [WWW site](#).

### 1.3.11 Specialized features

LAMMPS can be built with optional packages which implement a variety of additional capabilities. See the *Optional Packages* page for details.

These are LAMMPS capabilities which you may not think of as typical classical MD options:

- *static and dynamic load-balancing*, optional with recursive bisectioning decomposition
- *generalized aspherical particles*
- *stochastic rotation dynamics (SRD)*
- *real-time visualization and interactive MD, built-in renderer for images and movies*
- calculate *virtual diffraction patterns*
- calculate *finite temperature phonon dispersion* and the *dynamical matrix of minimized structures*
- *atom-to-continuum coupling* with finite elements
- coupled rigid body integration via the *POEMS* library
- *QM/MM coupling*
- Monte Carlo via *GCMC* and *tfMC* and *atom swapping*
- *path-integral molecular dynamics (PIMD)* and *this as well*
- *Direct Simulation Monte Carlo* for low-density fluids
- *Peridynamics modeling*
- *Lattice Boltzmann fluid*
- *targeted* and *steered* molecular dynamics
- *two-temperature electron model*

## 1.4 LAMMPS non-features

LAMMPS is designed to be a fast, parallel engine for molecular dynamics (MD) simulations. It provides only a modest amount of functionality for setting up simulations and analyzing their output.

Specifically, LAMMPS was not conceived and designed for:

- being run through a GUI
- building molecular systems, or building molecular topologies
- assign force-field coefficients automatically
- perform sophisticated analysis of your MD simulation
- visualize your MD simulation interactively
- plot your output data

Over the years some of these limitations have been reduced or removed, through features added to LAMMPS or external tools that either closely interface with LAMMPS or extend LAMMPS.

Here are suggestions on how to perform these tasks:

- **GUI:** LAMMPS can be built as a library and a Python wrapper that wraps the library interface is provided. Thus, GUI interfaces can be written in Python (or C or C++ if desired) that run LAMMPS and visualize or plot its output. Examples of this are provided in the `python` directory and described on the [Python](#) doc page. Also, there are several external wrappers or GUI front ends.
- **Builder:** Several pre-processing tools are packaged with LAMMPS. Some of them convert input files in formats produced by other MD codes such as CHARMM, AMBER, or Insight into LAMMPS input formats. Some of them are simple programs that will build simple molecular systems, such as linear bead-spring polymer chains. The `moltemplate` program is a true molecular builder that will generate complex molecular models. See the [Tools](#) page for details on tools packaged with LAMMPS. The [Pre/post processing page](#) of the LAMMPS website describes a variety of third party tools for this task. Furthermore, some LAMMPS internal commands allow to reconstruct, or selectively add topology information, as well as provide the option to insert molecule templates instead of atoms for building bulk molecular systems.
- **Force-field assignment:** The conversion tools described in the previous bullet for CHARMM, AMBER, and Insight will also assign force field coefficients in the LAMMPS format, assuming you provide CHARMM, AMBER, or BIOVIA (formerly Accelrys) force field files. The tools [ParmEd](#) and [InterMol](#) are particularly powerful and flexible in converting force field and topology data between various MD simulation programs.
- **Simulation analysis:** If you want to perform analysis on-the-fly as your simulation runs, see the [compute](#) and [fix](#) doc pages, which list commands that can be used in a LAMMPS input script. Also see the [Modify](#) page for info on how to add your own analysis code or algorithms to LAMMPS. For post-processing, LAMMPS output such as [dump file snapshots](#) can be converted into formats used by other MD or post-processing codes. To some degree, that conversion can be done directly inside of LAMMPS by interfacing to the VMD molfile plugins. The [rerun](#) command also allows to do some post-processing of existing trajectories, and through being able to read a variety of file formats, this can also be used for analyzing trajectories from other MD codes. Some post-processing tools packaged with LAMMPS will do these conversions. Scripts provided in the `tools/python` directory can extract and massage data in dump files to make it easier to import into other programs. See the [Tools](#) page for details on these various options.
- **Visualization:** LAMMPS can produce NETPBM, JPG or PNG snapshot images on-the-fly via its [dump image](#) command and pass them to an external program, [FFmpeg](#) to generate movies from them. For high-quality, interactive visualization there are many excellent and free tools available. See the [Visualization Tools](#) page of the LAMMPS website for visualization packages that can process LAMMPS output data.
- **Plotting:** See the next bullet about [Pizza.py](#) as well as the [Python](#) page for examples of plotting LAMMPS output. Scripts provided with the `python` tool in the `tools` directory will extract and massage data in log and dump files to make it easier to analyze and plot. See the [Tools](#) doc page for more discussion of the various tools.
- **Pizza.py:** Our group has also written a separate toolkit called [Pizza.py](#) which can do certain kinds of setup, analysis, plotting, and visualization (via OpenGL) for LAMMPS simulations. It thus provides some functionality for several of the above bullets. [Pizza.py](#) is written in [Python](#) and is available for download from [this page](#).

## 1.5 LAMMPS open-source license

### 1.5.1 GPL version of LAMMPS

LAMMPS is an open-source code, available free-of-charge, and distributed under the terms of the [GNU Public License Version 2 \(GPLv2\)](#), which means you can use or modify the code however you wish for your own purposes, but have to adhere to certain rules when redistributing it - specifically in binary form - or are distributing software derived from it or that includes parts of it.

LAMMPS comes with no warranty of any kind.

As each source file states in its header, it is a copyrighted code, and thus not in the public domain. For more information about open-source software and open-source distribution, see [www.gnu.org](http://www.gnu.org) or [www.opensource.org](http://www.opensource.org). The legal text of

the GPL as it applies to LAMMPS is in the LICENSE file included in the LAMMPS distribution.

Here is a more specific summary of what the GPL means for LAMMPS users:

- (1) Anyone is free to use, copy, modify, or extend LAMMPS in any way they choose, including for commercial purposes.
- (2) If you **distribute** a modified version of LAMMPS, it must remain open-source, meaning you are required to distribute **all** of it under the terms of the GPL. You should clearly annotate such a modified code as a derivative version of LAMMPS.
- (3) If you release any code that includes or uses LAMMPS source code, then it must also be open-sourced, meaning you distribute it under the terms of the GPL. You may write code that interfaces LAMMPS to a differently licensed library. In that case the code that provides the interface must be licensed GPL, but not necessarily that library unless you are distributing binaries that require the library to run.
- (4) If you give LAMMPS files to someone else, the GPL LICENSE file and source file headers (including the copyright and GPL notices) should remain part of the code.

## 1.5.2 LGPL version of LAMMPS

We occasionally make stable LAMMPS releases available under the [GNU Lesser Public License v2.1](#). This is on request only and with non-LGPL compliant files removed. This allows uses linking non-GPL compatible software with the (otherwise unmodified) LAMMPS library or loading it dynamically at runtime. Any **modifications** to the LAMMPS code however, even with the LGPL licensed version, must still be made available under the same open source terms as LAMMPS itself.

## 1.6 Authors of LAMMPS

The primary LAMMPS developers are at Sandia National Labs and Temple University:

- [Steve Plimpton](#), sjplimp at sandia.gov
- Aidan Thompson, athomps at sandia.gov
- Stan Moore, stamoor at sandia.gov
- Axel Kohlmeyer, akohlmey at gmail.com
- Richard Berger, richard.berger at outlook.com

Past developers include Paul Crozier and Mark Stevens, both at Sandia, and Ray Shan, now at Materials Design.

---

The [Authors](#) page of the [LAMMPS website](#) has a comprehensive list of all the individuals who have contributed code for a new feature or command or tool to LAMMPS.

---

The following folks deserve special recognition. Many of the packages they have written are unique for an MD code and LAMMPS would not be as general-purpose as it is without their expertise and efforts.

- Metin Aktulga (MSU), REAXFF package for C/C++ version of ReaxFF
- Mike Brown (Intel), GPU and INTEL packages
- Colin Denniston (U Western Ontario), LATBOLTZ package
- Georg Ganzenmuller (EMI), MACHDYN and SPH packages
- Andres Jaramillo-Botero (Caltech), EFF package for electron force field

- Reese Jones (Sandia) and colleagues, ATC package for atom/continuum coupling
- Christoph Kloss (DCS Computing), LIGGGHTS code for granular materials, built on top of LAMMPS
- Rudra Mukherjee (JPL), POEMS package for articulated rigid body motion
- Trung Ngyuen (Northwestern U), GPU, RIGID, BODY, and DIELECTRIC packages
- Mike Parks (Sandia), PERI package for Peridynamics
- Roy Pollock (LLNL), Ewald and PPPM solvers
- Julien Tranchida (Sandia), SPIN package
- Christian Trott (Sandia), CUDA and KOKKOS packages
- Ilya Valuev (JIHT), AWPMD package for wave packet MD
- Greg Wagner (Northwestern U), MEAM package for MEAM potential

---

As discussed on the [History page](#) of the website, LAMMPS originated as a cooperative project between DOE labs and industrial partners. Folks involved in the design and testing of the original version of LAMMPS were the following:

- John Carpenter (Mayo Clinic, formerly at Cray Research)
- Terry Stouch (Lexicon Pharmaceuticals, formerly at Bristol Myers Squibb)
- Steve Lustig (Dupont)
- Jim Belak and Roy Pollock (LLNL)

## 1.7 Citing LAMMPS

### 1.7.1 Core Algorithms

The paper mentioned below is the best overview of LAMMPS, but there are also publications describing particular models or algorithms implemented in LAMMPS or complementary software that it has interfaces to. Please see below for how to cite contributions to LAMMPS.

The latest canonical publication that describes the basic features, the source code design, the program structure, the spatial decomposition approach, the neighbor finding, basic communications algorithms, and how users and developers have contributed to LAMMPS is:

LAMMPS - A flexible simulation tool for particle-based materials modeling at the atomic, meso, and continuum scales, *Comp. Phys. Comm.* 271, 108171 (2022)

So a project using LAMMPS or a derivative application that uses LAMMPS as a simulation engine should cite this paper. The paper is expected to be published in its final form under the same DOI in the first half of 2022. Please also give the URL of the LAMMPS website in your paper, namely <https://www.lammps.org>.

The original publication describing the parallel algorithms used in the initial versions of LAMMPS is:

S. Plimpton, Fast Parallel Algorithms for Short-Range Molecular Dynamics, *J Comp Phys*, 117, 1-19 (1995).

## 1.7.2 DOI for the LAMMPS source code

The LAMMPS developers use the [Zenodo service at CERN](#) to create digital object identifiers (DOI) for stable releases of the LAMMPS source code. There are two types of DOIs for the LAMMPS source code.

The canonical DOI for **all** versions of LAMMPS, which will always point to the **latest** stable release version is:

- DOI: [10.5281/zenodo.3726416](https://doi.org/10.5281/zenodo.3726416)

In addition there are DOIs for individual stable releases. Currently there are:

- 3 March 2020 version: DOI:[10.5281/zenodo.3726417](https://doi.org/10.5281/zenodo.3726417)
- 29 October 2020 version: DOI:[10.5281/zenodo.4157471](https://doi.org/10.5281/zenodo.4157471)
- 29 September 2021 version: DOI:[10.5281/zenodo.6386596](https://doi.org/10.5281/zenodo.6386596)

## 1.7.3 Home page

The LAMMPS website at <https://www.lammps.org/> is the canonical location for information about LAMMPS and its features.

## 1.7.4 Citing contributions

LAMMPS has many features that use either previously published methods and algorithms or novel features. It also includes potential parameter files for specific models. Where available, a reminder about references for optional features used in a specific run is printed to the screen and log file. Style and output location can be selected with the *-cite command-line switch*. Additional references are given in the documentation of the *corresponding commands* or in the *Howto tutorials*. So please make certain, that you provide the proper acknowledgments and citations in any published works using LAMMPS.

## 1.8 Additional website links

The [LAMMPS website](#) has a variety of additional info about LAMMPS, beyond what is in this manual. Some other useful resources available online are listed below.

- [Brief intro and recently added significant features](#)
- [List of features](#)
- [List of non-features](#)
- [Recent bug fixes and new features](#)
- [Download info](#)
- [GitHub site](#)
- [SourceForge site](#)
- [LAMMPS open-source license](#)
- [Glossary of terms relevant to LAMMPS](#)
- [LAMMPS highlights with images](#)
- [LAMMPS highlights with movies](#)
- [LAMMPS forum](#)

- Workshops
- Tutorials
- Pre- and post-processing tools for LAMMPS
- Other software usable with LAMMPS
- Viz tools usable with LAMMPS
- Benchmark performance
- Publications that have cited LAMMPS
- Authors of LAMMPS
- History of LAMMPS development
- Funding for LAMMPS

## INSTALL LAMMPS

You can download LAMMPS as an executable or as source code.

When downloading the LAMMPS source code, you also have to *build LAMMPS*. But you have more flexibility as to what features to include or exclude in the build. When you download and install pre-compiled LAMMPS executables, you are limited to install which version of LAMMPS is available and which features are included of these builds. If you plan to *modify or extend LAMMPS*, then you **must** build LAMMPS from the source code.

---

**Note:** If you have questions about the pre-compiled LAMMPS executables, you need to contact the people preparing those executables. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

---

### 2.1 Download an executable for Linux

Binaries are available for different versions of Linux:

- *Pre-built Ubuntu Linux executables*
- *Pre-built Fedora Linux executables*
- *Pre-built EPEL Linux executables (RHEL, CentOS)*
- *Pre-built OpenSuse Linux executables*
- *Gentoo Linux executable*
- *Arch Linux build-script*

---

**Note:** If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

---

### 2.1.1 Pre-built Ubuntu Linux executables

A pre-built LAMMPS executable suitable for running on the latest Ubuntu Linux versions, can be downloaded as a Debian package. This allows you to install LAMMPS with a single command, and stay (mostly) up-to-date with the current stable version of LAMMPS by simply updating your operating system.

To install LAMMPS do the following once:

```
$ sudo apt-get install lammeps
```

This downloads an executable named `lmp` to your box and multiple packages with supporting data, examples and libraries as well as any missing dependencies. This executable can then be used in the usual way to run input scripts:

```
$ lmp -in in.lj
```

To update LAMMPS to the latest packaged version, do the following:

```
$ sudo apt-get update
```

which will also update other packages on your system.

The `lmp` binary is built with the *KIM package* included, which results in the above command also installing the `kim-api` binaries when LAMMPS is installed. In order to use potentials from [openkim.org](http://openkim.org), you can also install the `openkim-models` package

```
$ sudo apt-get install openkim-models
```

Or use the KIM-API commands to download and install individual models. To un-install LAMMPS, do the following:

```
$ sudo apt-get remove lammeps
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Anton Gladky ([gladky.anton@gmail.com](mailto:gladky.anton@gmail.com)) for setting up this Ubuntu package capability.

---

### 2.1.2 Pre-built Fedora Linux executables

Pre-built LAMMPS packages for stable releases are available in the Fedora Linux distribution as of Fedora version 28. The packages can be installed via the `dnf` package manager. There are 3 basic varieties (`lammeps` = no MPI, `lammeps-mpich` = MPICH MPI library, `lammeps-openmpi` = OpenMPI MPI library) and for each support for linking to the C library interface (`lammeps-devel`, `lammeps-mpich-devel`, `lammeps-openmpi-devel`), the header for compiling programs using the C library interface (`lammeps-headers`), and the LAMMPS python module for Python 3. All packages can be installed at the same time and the name of the LAMMPS executable is `lmp` and `lmp_openmpi` or `lmp_mpich` respectively. By default, `lmp` will refer to the serial executable, unless one of the MPI environment modules is loaded (`module load mpi/mpich-x86_64` or `module load mpi/openmpi-x86_64`). Then the corresponding parallel LAMMPS executable can be used. The same mechanism applies when loading the LAMMPS python module.

To install LAMMPS with OpenMPI and run an input `in.lj` with 2 CPUs do:

```
$ dnf install lammeps-openmpi
$ module load mpi/openmpi-x86_64
$ mpirun -np 2 lmp -in in.lj
```

The `dnf install` command is needed only once. In case of a new LAMMPS stable release, `dnf update` will automatically update to the newer version as soon as the RPM files are built and uploaded to the download mirrors. The `module load` command is needed once per (shell) session or shell terminal instance, unless it is automatically loaded from the shell profile.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](http://openkim.org), you can install the *openkim-models* package

```
$ dnf install openkim-models
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in Fedora.

---

### 2.1.3 Pre-built EPEL Linux executable

Pre-built LAMMPS (and KIM) packages for stable releases are available in the [Extra Packages for Enterprise Linux \(EPEL\) repository](#) for use with Red Hat Enterprise Linux (RHEL) or CentOS version 7.x and compatible Linux distributions. Names of packages, executable, and content are the same as described above for Fedora Linux. But RHEL/CentOS 7.x uses the `yum` package manager instead of `dnf` in Fedora 28.

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in EPEL.

---

### 2.1.4 Pre-built OpenSuse Linux executable

A pre-built LAMMPS package for stable releases is available in OpenSuse as of Leap 15.0. You can install the package with:

```
$ zypper install lammps
```

This includes support for OpenMPI. The name of the LAMMPS executable is `lmp`. Thus to run an input in parallel on 2 CPUs you would do:

```
$ mpirun -np 2 lmp -in in.lj
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](http://openkim.org), you can install the *openkim-models* package

```
$ zypper install openkim-models
```

Thanks to Christoph Junghans (LANL) for making LAMMPS available in OpenSuse.

---

## 2.1.5 Gentoo Linux executable

LAMMPS is part of Gentoo's main package tree and can be installed by typing:

```
% emerge --ask lammmps
```

Note that in Gentoo the LAMMPS source is downloaded and the package is built on the your machine.

Certain LAMMPS packages can be enable via USE flags, type

```
% equery uses lammmps
```

for details.

Thanks to Nicolas Bock and Christoph Junghans (LANL) for setting up this Gentoo capability.

---

## 2.1.6 Archlinux build-script

LAMMPS is available via Arch's unofficial Arch User repository (AUR). There are three scripts available, named lammmps, lammmps-beta and lammmps-git. They respectively package the stable, patch and git releases.

To install, you will need to have the git package installed. You may use any of the above names in-place of lammmps.

```
$ git clone https://aur.archlinux.org/lammmps.git
$ cd lammmps
$ makepkg -s
$ makepkg -i
```

To update, you may repeat the above, or change into the cloned directory, and execute the following, after which, if there are any changes, you may use makepkg as above.

```
$ git pull
```

Alternatively, you may use an AUR helper to install these packages.

Note that the AUR provides build-scripts that download the source and the build the package on your machine.

---

**Note:** It looks like the Arch Linux AUR repository build scripts for LAMMPS have not been updated since the 29 October 2020 version. You may want to consider installing a more current version of LAMMPS from source directly.

---

## 2.2 Download an executable for Mac

LAMMPS can be downloaded, built, and configured for OS X on a Mac with [Homebrew](#). (Alternatively, see the install instructions for *Download an executable via Conda*.) The following LAMMPS packages are unavailable at this time because of additional needs not yet met: GPU, KOKKOS, LATTE, MSCG, MPIIO, POEMS, VORONOI.

After installing Homebrew, you can install LAMMPS on your system with the following commands:

```
% brew install lammmps
```

This will install the executables “lammmps\_serial” and “lammmps\_mpi”, as well as the LAMMPS “doc”, “potentials”, “tools”, “bench”, and “examples” directories.

Once LAMMPS is installed, you can test the installation with the Lennard-Jones benchmark file:

```
% brew test lammmps -v
```

The LAMMPS binary is built with the *KIM package* which results in Homebrew also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](http://openkim.org), you can install the *openkim-models* package

```
% brew install openkim-models
```

If you have problems with the installation you can post issues to [this link](#).

Thanks to Derek Thomas ([derekt at cello.t.u-tokyo.ac.jp](mailto:derekt@cello.t.u-tokyo.ac.jp)) for setting up the Homebrew capability.

## 2.3 Download an executable for Windows

Pre-compiled Windows installers which install LAMMPS executables on a Windows system can be downloaded from this site:

<http://packages.lammps.org/windows.html>

Note that each installer package has a date in its name, which corresponds to the LAMMPS version of the same date. Installers for current and older versions of LAMMPS are available. 32-bit and 64-bit installers are available, and each installer contains both a serial and parallel executable. The installer website also explains how to install the Windows MPI package (MPICH2 from Argonne National Labs), needed to run in parallel with MPI.

The LAMMPS binaries contain *all optional packages* included in the source distribution except: KIM, KOKKOS, MSCG, PYTHON, ADIOS, H5MD, NETCDF, QMMM, ML-QUIP, and VTK. The serial version also does not include the MPIIO and LATBOLTZ packages. The GPU package is compiled for OpenCL with mixed precision kernels.

The LAMMPS library is compiled as a shared library and the *LAMMPS Python module* is installed, so that it is possible to load LAMMPS into a Python interpreter.

The installer site also has instructions on how to run LAMMPS under Windows, once it is installed, in both serial and parallel.

When you download the installer package, you run it on your Windows machine. It will then prompt you with a dialog, where you can choose the installation directory, unpack and copy several executables, potential files, documentation pdfs, selected example files, etc. It will then update a few system settings (e.g. PATH, LAMMPS\_POTENTIALS) and add an entry into the Start Menu (with references to the documentation, LAMMPS homepage and more). From that menu, there is also a link to an uninstaller that removes the files and undoes the environment manipulations.

Note that to update to a newer version of LAMMPS, you should typically uninstall the version you currently have, download a new installer, and go through the install procedure described above. I.e. the same procedure for installing/updating most Windows programs. You can install multiple versions of LAMMPS (in different directories), but only the executable for the last-installed package will be found automatically, so this should only be done for debugging purposes.

## 2.4 Download an executable for Linux or Mac via Conda

Binaries are available for MacOS or Linux via [Conda](#).

First, one must setup the Conda package manager on your system. Follow the instructions to install [Miniconda](#), then create a conda environment (named *my-lammps-env* or whatever you prefer) for your lammps install:

```
% conda config --add channels conda-forge
% conda create -n my-lammps-env
```

Then, you can install lammps on your system with the following command:

```
% conda activate my-lammps-env
% conda install lammps
```

The LAMMPS binary is built with the *KIM package* which results in Conda also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](http://openkim.org), you can install the *openkim-models* package

```
% conda install openkim-models
```

If you have problems with the installation you can post issues to [this link](#). Thanks to Jan Janssen (Max-Planck-Institut fuer Eisenforschung) for setting up the Conda capability.

---

**Note:** If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

---

## 2.5 Download source and documentation as a tarball

You can download a current LAMMPS tarball from the [download page](#) of the [LAMMPS website](#).

You have two choices of tarballs, either the most recent stable release or the most current patch release. Stable releases occur a few times per year, and undergo more testing before release. Patch releases occur a couple times per month. The new contents in all releases are listed on the [bug and feature page](#) of the website.

Both tarballs include LAMMPS documentation (HTML and PDF files) corresponding to that version. The download page also has an option to download the current-version LAMMPS documentation by itself.

Older versions of LAMMPS can also be downloaded from [this page](#).

Once you have a tarball, unzip and untar it with the following command:

```
$ tar -xzvf lammps*.tar.gz
```

This will create a LAMMPS directory with the version date in its name, e.g. lammps-23Jun18.

---

You can also download a compressed tar or zip archives from the “Assets” sections of the [LAMMPS GitHub releases site](#). The file name will be lammps-<version>.zip which can be unzipped with the following command, to create a lammps-<version> dir:

```
$ unzip lammps*.zip
```

This version corresponds to the selected LAMMPS patch or stable release.

## 2.6 Download the LAMMPS source with git

All LAMMPS development is coordinated through the “LAMMPS GitHub site”. If you clone the LAMMPS repository onto your local machine, it has several advantages:

- You can stay current with changes to LAMMPS with a single git command.
- You can create your own development branches to add code to LAMMPS.
- You can submit your new features back to GitHub for inclusion in LAMMPS. For that you should first create your own *fork on GitHub*.

You must have `git` installed on your system to use the commands explained below to communicate with the git servers on GitHub. For people still using subversion (svn), GitHub also provides [limited support for subversion clients](#).

---

**Note:** As of October 2016, the official home of public LAMMPS development is on GitHub. The previously advertised LAMMPS git repositories on `git.lammps.org` and `bitbucket.org` are now offline or deprecated.

---

You can follow the LAMMPS development on 3 different git branches:

- **stable** : this branch is updated from the *release* branch with every stable release version and also has selected bug fixes and updates back-ported from the *develop* branch
- **release** : this branch is updated with every patch release; updates are always “fast forward” merges from *develop*
- **develop** : this branch follows the ongoing development and is updated with every merge commit of a pull request

To access the git repositories on your box, use the clone command to create a local copy of the LAMMPS repository with a command like:

```
$ git clone -b release https://github.com/lammps/lammps.git mylammps
```

where “mylammps” is the name of the directory you wish to create on your machine and “release” is one of the 3 branches listed above. (Note that you actually download all 3 branches; you can switch between them at any time using “git checkout <branch name>”.)

---

### Saving time and disk space when using git clone

The complete git history of the LAMMPS project is quite large because it contains the entire commit history of the project since fall 2006, which includes the time when LAMMPS was managed with subversion. This includes a few commits that have added and removed some large files (mostly by accident). If you do not need access to the entire commit history (most people don’t), you can speed up the “cloning” process and reduce local disk space requirements by using the `-depth` git command line flag. That will create a “shallow clone” of the repository containing only a subset of the git history. Using a depth of 1000 is usually sufficient to include the head commits of the *develop* and the *release* branches. To include the head commit of the *stable* branch you may need a depth of up to 10000. If you later need more of the git history, you can always convert the shallow clone into a “full clone”.

---

Once the command completes, your directory will contain the same files as if you unpacked a current LAMMPS tarball, with the exception, that the HTML documentation files are not included. They can be fetched from the LAMMPS website by typing `make fetch` in the doc directory. Or they can be generated from the content provided in `doc/src` by typing `make html` from the doc directory.

After initial cloning, as bug fixes and new features are added to LAMMPS you can stay up-to-date by typing the following git commands from within the “mylammps” directory:

```
$ git checkout release      # not needed if you always stay in this branch
$ git checkout stable      # use one of these 3 checkout commands
$ git checkout develop     # to choose the branch to follow
$ git pull
```

Doing a “pull” will not change any files you have added to the LAMMPS directory structure. It will also not change any existing LAMMPS files you have edited, unless those files have changed in the repository. In that case, git will attempt to merge the new repository file with your version of the file and tell you if there are any conflicts. See the git documentation for details.

If you want to access a particular previous release version of LAMMPS, you can instead “check out” any version with a published tag. See the output of `git tag -l` for the list of tags. The git command to do this is as follows.

```
$ git checkout tagID
```

Stable versions and what tagID to use for a particular stable version are discussed on [this page](#). Note that this command will print some warnings, because in order to get back to the latest revision and to be able to update with `git pull` again, you will need to do `git checkout release` (or check out any other desired branch) first.

Once you have updated your local files with a `git pull` (or `git checkout`), you still need to re-build LAMMPS if any source files have changed. How to do this depends on the build system you are using.

---

### CMake build

Change to your build folder and type:

```
cmake . --build
```

CMake should auto-detect whether it needs to re-run the CMake configuration step and otherwise redo the build for all files that have been changed or files that depend on changed files. In case some build options have been changed or renamed, you may have to update those by running:

```
cmake .
```

and then rebuild.

---

### Traditional make

Switch to the src directory and type:

```
$ make purge      # remove any deprecated src files
$ make package-update # sync package files with src files
$ make foo        # re-build for your machine (mpi, serial, etc)
```

to enforce consistency of the source between the src folder and package directories. This is OK to do even if you don’t use any packages. The “make purge” command removes any deprecated src files if they were removed by the patch from a package sub-directory.

**Warning:** If you wish to edit/change a src file that is from a package, you should edit the version of the file inside the package sub-directory with src, then re-install the package. The version in the source directory is merely a copy and will be wiped out if you type “make package-update”.

---

## Git protocols

The servers at github.com support the “https://” access protocol for anonymous, read-only access. If you have a suitably configured GitHub account, you may also use SSH protocol with the URL “git@github.com:lammmps/lammmps.git”.

---

The LAMMPS GitHub project is currently managed by Axel Kohlmeyer (Temple U, akohlmey at gmail.com).

These are the files and sub-directories in the LAMMPS distribution:

README	Short description of the LAMMPS package
LICENSE	GNU General Public License (GPL)
SECURITY.md	Security Policy for the LAMMPS package
bench	benchmark problems
cmake	CMake build files
doc	documentation
examples	simple test problems
fortran	Fortran wrapper for LAMMPS
lib	additional provided or external libraries
potentials	interatomic potential files
python	Python wrappers for LAMMPS
src	source files
tools	pre- and post-processing tools
unittest	sources and inputs for testing LAMMPS

You will have all of these if you download source. You will only have some of them if you download executables, as explained on the pages listed above.

## BUILD LAMMPS

LAMMPS is built as a library and an executable from source code using either traditional makefiles for use with GNU make (which may require manual editing), or using a build environment generated by CMake (Unix Makefiles, Ninja, Xcode, Visual Studio, KDevelop, CodeBlocks and more).

As an alternative you can download a package with pre-built executables or automated build trees as described on the [Install](#) page.

### 3.1 Build LAMMPS with CMake

This page describes how to use CMake in general to build LAMMPS. Details for specific compile time settings and options to enable and configure add-on packages are discussed with those packages. Links to those pages on the [Build overview](#) page.

The following text assumes some familiarity with CMake and focuses on using the command line tool `cmake` and what settings are supported for building LAMMPS. A more detailed tutorial on how to use `cmake` itself, the text mode or graphical user interface, change the generated output files for different build tools and development environments is on a [separate page](#).

---

**Note:** LAMMPS currently requires that CMake version 3.10 or later is available; version 3.12 or later is preferred.

---

**Warning:** You must not mix the *traditional make based* LAMMPS build procedure with using CMake. Thus no packages may be installed or a build been previously attempted in the LAMMPS source directory by using `make <machine>`. CMake will detect if this is the case and generate an error. To remove conflicting files from the `src` you can use the command `make no-all purge` which will un-install all packages and delete all auto-generated files.

#### 3.1.1 Advantages of using CMake

CMake is an alternative to compiling LAMMPS in the traditional way through (*manually customized*) *makefiles* and a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (Temple U). Using CMake has multiple advantages that are specifically helpful for people with limited experience in compiling software or for people that want to modify or extend LAMMPS.

- CMake can detect available hardware, tools, features, and libraries and adapt the LAMMPS default build configuration accordingly.
- CMake can generate files for different build tools and integrated development environments (IDE).

- CMake supports customization of settings with a text mode or graphical user interface. No knowledge of file formats or and complex command line syntax required.
- All enabled components are compiled in a single build operation.
- Automated dependency tracking for all files and configuration options.
- Support for true out-of-source compilation. Multiple configurations and settings with different choices of LAMMPS packages, settings, or compilers can be configured and built concurrently from the same source tree.
- Simplified packaging of LAMMPS for Linux distributions, environment modules, or automated build tools like [Homebrew](#).
- Integration of automated regression testing (the LAMMPS side for that is still under development).

### 3.1.2 Getting started

Building LAMMPS with CMake is a two-step process. First you use CMake to generate a build environment in a new directory. For that purpose you can use either the command-line utility `cmake` (or `cmake3`), the text-mode UI utility `ccmake` (or `ccmake3`) or the graphical utility `cmake-gui`, or use them interchangeably. The second step is then the compilation and linking of all objects, libraries, and executables. Here is a minimal example using the command line version of CMake to build LAMMPS with no add-on packages enabled and no customization:

```
cd lammps           # change to the LAMMPS distribution directory
mkdir build; cd build # create and use a build directory
cmake ../cmake      # configuration reading CMake scripts from ../cmake
cmake --build .     # compilation (or type "make")
```

This will create and change into a folder called `build`, then run the configuration step to generate build files for the default build command and then launch that build command to compile LAMMPS. During the configuration step CMake will try to detect whether support for MPI, OpenMP, FFTW, gzip, JPEG, PNG, and ffmpeg are available and enable the corresponding configuration settings. The progress of this configuration can be followed on the screen and a summary of selected options and settings will be printed at the end. The `cmake --build .` command will launch the compilation, which, if successful, will ultimately produce a library `liblammps.a` and the LAMMPS executable `lmp` inside the `build` folder.

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with `make -j N` (with `N` being the maximum number of concurrently executed tasks). Also installation of the `ccache` (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development.

After the initial build, whenever you edit LAMMPS source files, enable or disable packages, change compiler flags or build options, you must re-compile and relink the LAMMPS executable with `cmake --build .` (or `make`). If the compilation fails for some reason, try running `cmake .` and then compile again. The included dependency tracking should make certain that only the necessary subset of files are re-compiled. You can also delete compiled objects, libraries and executables with `cmake --build . --target clean` (or `make clean`).

After compilation, you may optionally install the LAMMPS executable into your system with:

```
make install # optional, copy compiled files into installation location
```

This will install the LAMMPS executable and library, some tools (if configured) and additional files like LAMMPS API headers, manpages, potential and force field files. The location of the installation tree defaults to `${HOME}/.local`.

### 3.1.3 Configuration and build options

The CMake commands have one mandatory argument: a folder containing a file called `CMakeLists.txt` (for LAMMPS it is located in the `cmake` folder) or a build folder containing a file called `CMakeCache.txt`, which is generated at the end of the CMake configuration step. The cache file contains all current CMake settings.

To modify settings, enable or disable features, you need to set *variables* with either the `-D` command line flag (`-D VARIABLE1_NAME=value`) or change them in the text mode of graphical user interface. The `-D` flag can be used several times in one command.

For your convenience we provide *CMake presets* that combine multiple settings to enable optional LAMMPS packages or use a different compiler tool chain. Those are loaded with the `-C` flag (`-C ../cmake/presets/basic.cmake`). This step would only be needed once, as the settings from the preset files are stored in the `CMakeCache.txt` file. It is also possible to customize the build by adding one or more `-D` flags to the CMake command line.

Generating files for alternate build tools (e.g. Ninja) and project files for IDEs like Eclipse, CodeBlocks, or Kate can be selected using the `-G` command line flag. A list of available generator settings for your specific CMake version is given when running `cmake --help`.

### 3.1.4 Multi-configuration build systems

Throughout this manual it is mostly assumed that LAMMPS is being built on a Unix-like operating system with “make” as the underlying “builder”, since this is the most common case. In this case the build “configuration” is chose using `-D CMAKE_BUILD_TYPE=<configuration>` with `<configuration>` being one of “Release”, “Debug”, “RelWithDebInfo”, or “MinSizeRel”. Some build tools, however, can also use or even require to have a so-called multi-configuration build system setup. For those the built type (or configuration) is chosen at compile time using the same build files. E.g. with:

```
cmake --build build-multi --config Release
```

In that case the resulting binaries are not in the build folder directly but in sub-directories corresponding to the build type (i.e. Release in the example from above). Similarly, for running unit tests the configuration is selected with the `-C` flag:

```
ctest -C Debug
```

The CMake scripts in LAMMPS have basic support for being compiled using a multi-config build system, but not all of it has been ported. This is in particular applicable to compiling packages that require additional libraries that would be downloaded and compiled by CMake. The “windows” preset file tries to keep track of which packages can be compiled natively with the MSVC compilers out-of-the box. Not all of those external libraries are portable to Windows either.

### 3.1.5 Installing CMake

Check if your machine already has CMake installed:

```
which cmake           # do you have it?
which cmake3          # version 3 may have this name
cmake --version       # what specific version you have
```

On clusters or supercomputers which use environment modules to manage software packages, do this:

```
module list           # is a module for cmake already loaded?
module avail          # is a module for cmake available?
module load cmake     # load cmake module with appropriate name
```

Most Linux distributions offer pre-compiled cmake packages through their package management system. If you do not have CMake or a recent enough version (Note: for CentOS 7.x you need to enable the EPEL repository), you can download the latest version from <https://cmake.org/download/>. Instructions on how to install it on various platforms can be found [on this page](#).

## 3.2 Build LAMMPS with make

Building LAMMPS with traditional makefiles requires that you have a `Makefile.<machine>` file appropriate for your system in either the `src/MAKE`, `src/MAKE/MACHINES`, `src/MAKE/OPTIONS`, or `src/MAKE/MINE` directory (see below). It can include various options for customizing your LAMMPS build with a number of global compilation options and features.

### 3.2.1 Requirements

Those makefiles are written for and tested with GNU make and may not be compatible with other make programs. In most cases, if the “make” program is not GNU make, then there will be a GNU make program available under the name “gmake”. If GNU make or a compatible make is not available, you may have to first install it or switch to building with *CMake*. The makefiles of the traditional make based build process and the scripts they are calling expect a few additional tools to be available and functioning.

- a working C/C++ compiler toolchain supporting the C++11 standard; on Linux these are often the GNU compilers. Some older compilers require adding flags like `-std=c++11` to enable the C++11 mode.
- a Bourne shell compatible “Unix” shell program (often this is `bash`)
- a few shell utilities: `ls`, `mv`, `ln`, `rm`, `grep`, `sed`, `tr`, `cat`, `touch`, `diff`, `dirname`
- python (optional, required for `make lib-<pkg>` in the `src` folder). python scripts are currently tested with python 2.7 and 3.6. The procedure for *building the documentation* requires python 3.5 or later.

### 3.2.2 Getting started

To include LAMMPS packages (i.e. optional commands and styles) you must enable (or “install”) them first, as discussed on the *Build package* page. If a packages requires (provided or external) libraries, you must configure and build those libraries **before** building LAMMPS itself and especially **before** enabling such a package with `make yes-<package>`. *Building LAMMPS with CMake* can automate much of this for many types of machines, especially workstations, desktops, and laptops, so we suggest you try it first when building LAMMPS in those cases.

The commands below perform a default LAMMPS build, producing the LAMMPS executable `lmp_serial` and `lmp_mpi` in `lammps/src`:

```
cd lammps/src    # change to main LAMMPS source folder
make serial      # build a serial LAMMPS executable using GNU g++
make mpi         # build a parallel LAMMPS executable with MPI
make             # see a variety of make options
```

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with `make -j N` (with `N` being the maximum number of concurrently executed tasks). Also installation of the `ccache` (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development.

After the initial build, whenever you edit LAMMPS source files, or add or remove new files to the source directory (e.g. by installing or uninstalling packages), you must re-compile and relink the LAMMPS executable with the same `make <machine>` command. The makefile’s dependency tracking should insure that only the necessary subset of files

are re-compiled. If you change settings in the makefile, you have to recompile *everything*. To delete all objects you can use `make clean-<machine>`.

**Note:** Before the actual compilation starts, LAMMPS will perform several steps to collect information from the configuration and setup that is then embedded into the executable. When you build LAMMPS for the first time, it will also compile a tool to quickly assemble a list of dependencies, that are required for the make program to correctly detect which parts need to be recompiled after changes were made to the sources.

### 3.2.3 Customized builds and alternate makefiles

The `src/MAKE` directory tree contains the `Makefile.<machine>` files included in the LAMMPS distribution. Typing `make example` uses `Makefile.example` from one of those folders, if available. Thus the `make serial` and `make mpi` lines above use `src/MAKE/Makefile.serial` and `src/MAKE/Makefile.mpi`, respectively. Other makefiles are in these directories:

```
OPTIONS      # Makefiles which enable specific options
MACHINES     # Makefiles for specific machines
MINE         # customized Makefiles you create (you may need to create this folder)
```

Simply typing `make` lists all the available `Makefile.<machine>` files with a single line description toward the end of the output. A file with the same name can appear in multiple folders (not a good idea). The order the directories are searched is as follows: `src/MAKE/MINE`, `src/MAKE`, `src/MAKE/OPTIONS`, `src/MAKE/MACHINES`. This gives preference to a customized file you put in `src/MAKE/MINE`. If you create your own custom makefile under a new name, please edit the first line with the description and machine name, so you will not confuse yourself, when looking at the machine summary.

Makefiles you may wish to try include these (some require a package first be installed). Many of these include specific compiler flags for optimized performance. Please note, however, that some of these customized machine Makefile are contributed by users. Since both compilers, OS configurations, and LAMMPS itself keep changing, their settings may become outdated:

```
make mac      # build serial LAMMPS on a Mac
make mac_mpi  # build parallel LAMMPS on a Mac
make intel_cpu # build with the INTEL package optimized for CPUs
make knl      # build with the INTEL package optimized for KNLs
make opt      # build with the OPT package optimized for CPUs
make omp      # build with the OPENMP package optimized for OpenMP
make kokkos_omp # build with the KOKKOS package for OpenMP
make kokkos_cuda_mpi # build with the KOKKOS package for GPUs
make kokkos_phi # build with the KOKKOS package for KNLs
```

## 3.3 Link LAMMPS as a library to another code

LAMMPS is designed as a library of C++ objects that can be integrated into other applications including Python scripts. The files `src/library.cpp` and `src/library.h` define a C-style API for using LAMMPS as a library. See the [Library interface to LAMMPS](#) page for a description of the interface and how to use it for your needs.

The [Basic build options](#) page explains how to build LAMMPS as either a shared or static library. This results in a file in the compilation folder called `liblammps.a` or `liblammps_<name>.a` in case of building a static library. In case of a shared library the name is the same only that the suffix is going to be either `.so` or `.dylib` or `.dll` instead of `.a`

depending on the OS. In some cases the `.so` file may be a symbolic link to a file with the suffix `.so.0` (or some other number).

---

**Note:** Care should be taken to use the same MPI library for the calling code and the LAMMPS library unless LAMMPS is to be compiled without (real) MPI support using the include STUBS MPI library.

---

### 3.3.1 Link with LAMMPS as a static library

The calling application can link to LAMMPS as a static library with compilation and link commands as in the examples shown below. These are examples for a code written in C in the file `caller.c`. The benefit of linking to a static library is, that the resulting executable is independent of that library since all required executable code from the library is copied into the calling executable.

---

#### CMake build

This assumes that LAMMPS has been configured without setting a `LAMMPS_MACHINE` name, installed with “make install”, and the `PKG_CONFIG_PATH` environment variable has been updated to include the `liblammps.pc` file installed into the configured destination folder. The commands to compile and link a coupled executable are then:

```
mpicc -c -O $(pkgconf liblammps --cflags) caller.c
mpicxx -o caller caller.o -$(pkgconf liblammps --libs)
```

---

#### Traditional make

This assumes that LAMMPS has been compiled in the folder `/${HOME}/lammps/src` with “make mpi”. The commands to compile and link a coupled executable are then:

```
mpicc -c -O -I${HOME}/lammps/src caller.c
mpicxx -o caller caller.o -L${HOME}/lammps/src -llammps_mpi
```

The `-I` argument is the path to the location of the `library.h` header file containing the interface to the LAMMPS C-style library interface. The `-L` argument is the path to where the `liblammps_mpi.a` file is located. The `-llammps_mpi` argument is shorthand for telling the compiler to link the file `liblammps_mpi.a`. If LAMMPS has been built as a shared library, then the linker will use `liblammps_mpi.so` instead. If both files are available, the linker will usually prefer the shared library. In case of a shared library, you may need to update the `LD_LIBRARY_PATH` environment variable or running the `caller` executable will fail since it cannot find the shared library at runtime.

---

However, it is only as simple as shown above for the case of a plain LAMMPS library without any optional packages that depend on libraries (bundled or external) or when using a shared library. Otherwise, you need to include all flags, libraries, and paths for the coupled executable, that are also required to link the LAMMPS executable.

---

#### CMake build

When using CMake, additional libraries with sources in the `lib` folder are built, but not included in `liblammps.a` and (currently) not installed with `make install` and not included in the `pkgconfig` configuration file. They can be found in the top level build folder, but you have to determine the necessary

link flags manually. It is therefore recommended to either use the traditional make procedure to build and link with a static library or build and link with a shared library instead.

### Traditional make

After you have compiled a static LAMMPS library using the conventional build system for example with “make mode=static serial”. And you also have installed the POEMS package after building its bundled library in lib/poems. Then the commands to build and link the coupled executable change to:

```
gcc -c -O -I${HOME}/lammps/src -caller.c
g++ -o caller caller.o -L${HOME}/lammps/lib/poems \
    -L${HOME}/lammps/src/STUBS -L${HOME}/lammps/src \
    -llammps_serial -lpoems -lmpi_stubs
```

Note, that you need to link with g++ instead of gcc even if you have written your code in C, since LAMMPS itself is C++ code. You can display the currently applied settings for building LAMMPS for the “serial” machine target by using the command:

```
make mode=print serial
```

Which should output something like:

```
# Compiler:
CXX=g++
# Linker:
LD=g++
# Compilation:
CXXFLAGS=-g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I${HOME}/compile/lammps/
↪lib/poems -I${HOME}/compile/lammps/src/STUBS
# Linking:
LDFLAGS=-g -O
# Libraries:
LDLIBS=-L${HOME}/compile/lammps/src -llammps_serial -L${HOME}/compile/lammps/
↪lib/poems -L${HOME}/compile/lammps/src/STUBS -lpoems -lmpi_stubs
```

From this you can gather the necessary paths and flags. With makefiles for other *machine* configurations you need to do the equivalent and replace “serial” with the corresponding “machine” name of the makefile.

## 3.3.2 Link with LAMMPS as a shared library

When linking to LAMMPS built as a shared library, the situation becomes much simpler, as all dependent libraries and objects are either included in the shared library or registered as a dependent library in the shared library file. Thus those libraries need not to be specified when linking the calling executable. Only the *-l* flags are needed. So the example case from above of the serial version static LAMMPS library with the POEMS package installed becomes:

### CMake build

The commands with a shared LAMMPS library compiled with the CMake build process are the same as for the static library.

```
mpicxx -c -O $(pkgconf liblammps --cflags) caller.c
mpicxx -o caller caller.o -$(pkgconf --libs)
```

---

### Traditional make

The commands with a shared LAMMPS library compiled with the traditional make build using `make mode=shared serial` becomes:

```
gcc -c -O -I${HOME}/lammps/src -caller.c
g++ -o caller caller.o -L${HOME}/lammps/src -llammps_serial
```

---

### Locating liblammps.so at runtime

Unlike with a static link, now the `liblammps.so` file is required at runtime and needs to be in a folder, where the shared linker program of the operating system can find it. This would be either a folder like `/usr/local/lib64` or `${HOME}/.local/lib64` or a folder pointed to by the `LD_LIBRARY_PATH` environment variable. You can type

```
printenv LD_LIBRARY_PATH
```

to see what directories are in that list.

Or you can add the LAMMPS `src` directory or the directory you performed a CMake style build in to your `LD_LIBRARY_PATH` environment variable, so that the current version of the shared library is always available to programs that use it.

For the Bourne or Korn shells (`/bin/sh`, `/bin/ksh`, `/bin/bash` etc.), you would add something like this to your `${HOME}/.profile` file:

```
LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:/usr/lib64}:${HOME}/lammps/src
export LD_LIBRARY_PATH
```

For the `csh` or `tsh` shells, you would equivalently add something like this to your `${HOME}/.cshrc` file:

```
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

You can verify whether all required shared libraries are found with the `ldd` tool. Example:

```
$ LD_LIBRARY_PATH=/home/user/lammps/src ldd caller
linux-vdso.so.1 (0x00007ffe729e0000)
liblammps.so => /home/user/lammps/src/liblammps.so (0x00007fc91bb9e000)
libstdc++.so.6 => /lib64/libstdc++.so.6 (0x00007fc91b984000)
libm.so.6 => /lib64/libm.so.6 (0x00007fc91b83e000)
libgcc_s.so.1 => /lib64/libgcc_s.so.1 (0x00007fc91b824000)
libc.so.6 => /lib64/libc.so.6 (0x00007fc91b65b000)
/lib64/ld-linux-x86-64.so.2 (0x00007fc91c094000)
```

If a required library is missing, you would get a ‘not found’ entry:

```
$ ldd caller
linux-vdso.so.1 (0x00007ffd672fe000)
liblammps.so => not found
libstdc++.so.6 => /usr/lib64/libstdc++.so.6 (0x00007fb7c7e86000)
libm.so.6 => /usr/lib64/libm.so.6 (0x00007fb7c7d40000)
libgcc_s.so.1 => /usr/lib64/libgcc_s.so.1 (0x00007fb7c7d26000)
```

(continues on next page)

(continued from previous page)

```
libc.so.6 => /usr/lib64/libc.so.6 (0x00007fb7c7b5d000)
/lib64/ld-linux-x86-64.so.2 (0x00007fb7c80a2000)
```

## 3.4 Basic build options

The following topics are covered on this page, for building with both CMake and make:

- *Serial vs parallel build*
- *Choice of compiler and compile/link options*
- *Build the LAMMPS executable and library*
- *Including and removing debug support*
- *Install LAMMPS after a build*

### 3.4.1 Serial vs parallel build

LAMMPS is written to use the ubiquitous [MPI \(Message Passing Interface\)](#) library API for distributed memory parallel computation. You need to have such a library installed for building and running LAMMPS in parallel using a domain decomposition parallelization. It is compatible with the MPI standard version 2.x and later. LAMMPS can also be built into a “serial” executable for use with a single processor using the bundled MPI STUBS library.

Independent of the distributed memory MPI parallelization, parts of LAMMPS are also written with support for shared memory parallelization using the [OpenMP](#) threading standard. A more detailed discussion of that is below.

#### CMake build

```
-D BUILD_MPI=value      # yes or no, default is yes if CMake finds MPI, else
↳no
-D BUILD_OMP=value      # yes or no, default is yes if a compatible compiler
↳is detected
-D LAMMPS_MACHINE=name  # name = mpi, serial, mybox, titan, laptop, etc
                        # no default value
```

The executable created by CMake (after running make) is named `lmp` unless the `LAMMPS_MACHINE` option is set. When setting `LAMMPS_MACHINE=name` the executable will be called `lmp_name`. Using `BUILD_MPI=no` will enforce building a serial executable using the MPI STUBS library.

#### Traditional make

The build with traditional makefiles has to be done inside the source folder `src`.

```
make mpi                # parallel build, produces lmp_mpi using Makefile.mpi
make serial             # serial build, produces lmp_serial using Makefile/
↳serial
make mybox              # uses Makefile.mybox to produce lmp_mybox
```

Any `make machine` command will look up the make settings from a file `Makefile.machine` in the folder `src/MAKE` or one of its sub-directories `MINE`, `MACHINES`, or `OPTIONS`, create a folder `Obj_machine` with all objects and generated files and an executable called `lmp_machine`. The standard parallel build with `make mpi` assumes a standard MPI installation with MPI compiler wrappers where all necessary compiler and linker flags to get access and link with the suitable MPI headers and libraries are set by the wrapper programs. For other cases or the serial build, you have to adjust the make file variables `MPI_INC`, `MPI_PATH`, `MPI_LIB` as well as `CC` and `LINK`. To enable OpenMP threading usually a compiler specific flag needs to be added to the compile and link commands. For the GNU compilers, this is `-fopenmp`, which can be added to the `CC` and `LINK` makefile variables.

For the serial build the following make variables are set (see `src/MAKE/Makefile.serial`):

<code>CC =</code>	<code>g++</code>
<code>LINK =</code>	<code>g++</code>
<code>MPI_INC =</code>	<code>-I../STUBS</code>
<code>MPI_PATH =</code>	<code>-L../STUBS</code>
<code>MPI_LIB =</code>	<code>-lmpi_stubs</code>

You also need to build the `STUBS` library for your platform before making LAMMPS itself. A `make serial` build does this for you automatically, otherwise, type `make mpi-stubs` from the `src` directory, or `make` from the `src/STUBS` dir. If the build fails, you may need to edit the `STUBS/Makefile` for your platform. The stubs library does not provide MPI/IO functions required by some LAMMPS packages, e.g. `MPIIO` or `LATBOLTZ`, and thus is not compatible with those packages.

---

**Note:** The file `src/STUBS/mpi.cpp` provides a CPU timer function called `MPI_Wtime()` that calls `gettimeofday()`. If your operating system does not support `gettimeofday()`, you will need to insert code to call another timer. Note that the ANSI-standard function `clock()` rolls over after an hour or so, and is therefore insufficient for timing long LAMMPS simulations.

---

## MPI and OpenMP support in LAMMPS

If you are installing MPI yourself to build a parallel LAMMPS executable, we recommend either `MPICH` or `OpenMPI` which are regularly used and tested with LAMMPS by the LAMMPS developers. `MPICH` can be downloaded from the [MPICH home page](#) and `OpenMPI` can be downloaded correspondingly from the [OpenMPI home page](#). Other MPI packages should also work. No specific vendor provided and standard compliant MPI library is currently known to be incompatible with LAMMPS. If you are running on a large parallel machine, your system admins or the vendor should have already installed a version of MPI, which is likely to be faster than a self-installed `MPICH` or `OpenMPI`, so you should study the provided documentation to find out how to build and link with it.

The majority of OpenMP (threading) support in LAMMPS is provided by the `OPENMP` package; see the [OPENMP package](#) page for details. The `INTEL` package also includes OpenMP threading (it is compatible with `OPENMP` and will usually fall back on styles from that package, if a `INTEL` does not exist) and adds vectorization support when compiled with compatible compilers, in particular the Intel compilers on top of OpenMP. Also, the `KOKKOS` package can be compiled to include OpenMP threading.

In addition, there are a few commands in LAMMPS that have native OpenMP support included as well. These are commands in the `MPIIO`, `ML-SNAP`, `DIFFRACTION`, and `DPD-REACT` packages. In addition some packages support OpenMP threading indirectly through the libraries they interface to: e.g. `LATTE`, `KSPACE`, and `COLVARS`. See the [Packages details](#) page for more info on these packages and the pages for their respective commands for OpenMP threading info.

For CMake, if you use `BUILD_OMP=yes`, you can use these packages and turn on their native OpenMP support and turn on their native OpenMP support at run time, by setting the `OMP_NUM_THREADS` environment variable before you

launch LAMMPS.

For building via conventional make, the CCFLAGS and LINKFLAGS variables in Makefile.machine need to include the compiler flag that enables OpenMP. For GNU compilers it is `-fopenmp`. For (recent) Intel compilers it is `-qopenmp`. If you are using a different compiler, please refer to its documentation.

### OpenMP Compiler compatibility

Some compilers do not fully support the `default(none)` directive and others (e.g. GCC version 9 and beyond, Clang version 10 and later) may implement strict OpenMP 4.0 and later semantics, which are incompatible with the OpenMP 3.1 semantics used in LAMMPS for maximal compatibility with compiler versions in use. If compilation with OpenMP enabled fails because of your compiler requiring strict OpenMP 4.0 semantics, you can change the behavior by adding `-D LAMMPS_OMP_COMPAT=4` to the `LMP_INC` variable in your makefile, or add it to the command line while configuring with CMake. LAMMPS will auto-detect a suitable setting for most GNU, Clang, and Intel compilers.

## 3.4.2 Choice of compiler and compile/link options

The choice of compiler and compiler flags can be important for maximum performance. Vendor provided compilers for a specific hardware can produce faster code than open-source compilers like the GNU compilers. On the most common x86 hardware most popular C++ compilers are quite similar in performance of C/C++ code at high optimization levels. When using the INTEL package, there is a distinct advantage in using the [Intel C++ compiler](#) due to much improved vectorization through SSE and AVX instructions on compatible hardware as the source code includes changes and Intel compiler specific directives to enable high degrees of vectorization. This may change over time as equivalent vectorization directives are included into OpenMP standard revisions and other compilers adopt them.

On parallel clusters or supercomputers which use “environment modules” for their compile/link environments, you can often access different compilers by simply loading the appropriate module before building LAMMPS.

### CMake build

By default CMake will use the compiler it finds according to internal preferences and it will add optimization flags appropriate to that compiler and any *accelerator packages* you have included in the build. CMake will check if the detected or selected compiler is compatible with the C++ support requirements of LAMMPS and stop with an error, if this is not the case.

You can tell CMake to look for a specific compiler with setting CMake variables (listed below) during configuration. For a few common choices, there are also presets in the `cmake/presets` folder. For convenience, there is a `CMAKE_TUNE_FLAGS` variable that can be set to apply global compiler options (applied to compilation only), to be used for adding compiler or host specific optimization flags in addition to the “flags” variables listed below. You may also specify the corresponding `CMAKE_*_FLAGS` variables individually, if you want to experiment with alternate optimization flags. You should specify all 3 compilers, so that the (few) LAMMPS source files written in C or Fortran are built with a compiler consistent with the one used for the C++ files:

```
-D CMAKE_CXX_COMPILER=name           # name of C++ compiler
-D CMAKE_C_COMPILER=name            # name of C compiler
-D CMAKE_Fortran_COMPILER=name       # name of Fortran compiler

-D CMAKE_CXX_FLAGS=string            # flags to use with C++ compiler
-D CMAKE_C_FLAGS=string              # flags to use with C compiler
-D CMAKE_Fortran_FLAGS=string        # flags to use with Fortran compiler
```

A few example command lines are:

```
# Building with GNU Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=gcc -DCMAKE_CXX_COMPILER=g++ -DCMAKE_Fortran_
↪COMPILER=gfortran
# Building with Intel Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=icc -DCMAKE_CXX_COMPILER=icpc -DCMAKE_
↪Fortran_COMPILER=ifort
# Building with Intel oneAPI Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=icx -DCMAKE_CXX_COMPILER=icpx -DCMAKE_
↪Fortran_COMPILER=ifx
# Building with LLVM/Clang Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=clang -DCMAKE_CXX_COMPILER=clang++ -DCMAKE_
↪Fortran_COMPILER=flang
# Building with PGI/Nvidia Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=pgcc -DCMAKE_CXX_COMPILER=pgc++ -DCMAKE_
↪Fortran_COMPILER=pgfortran
```

For compiling with the Clang/LLVM compilers a CMake preset is provided that can be loaded with `-C ../cmake/presets/clang.cmake`. Similarly, `-C ../cmake/presets/intel.cmake` should switch the compiler toolchain to the legacy Intel compilers, `-C ../cmake/presets/oneapi.cmake` will switch to the LLVM based oneAPI Intel compilers, and `-C ../cmake/presets/pgi.cmake` will switch the compiler to the PGI compilers.

In addition you can set `CMAKE_TUNE_FLAGS` to specifically add compiler flags to tune for optimal performance on given hosts. By default this variable is empty.

---

**Note:** When the `cmake` command completes, it prints a summary to the screen which compilers it is using and what flags and settings will be used for the compilation. Note that if the top-level compiler is `mpicxx`, it is simply a wrapper on a real compiler. The underlying compiler info is what CMake will try to determine and report. You should check to confirm you are using the compiler and optimization flags you want.

---

---

### Makefile.machine settings for traditional make

The “compiler/linker settings” section of a `Makefile.machine` lists compiler and linker settings for your C++ compiler, including optimization flags. For a parallel build it is recommended to use `mpicxx` or `mpiCC`, since these compiler wrappers will include a variety of settings appropriate for your MPI installation and thus avoiding the guesswork of finding the right flags.

Parallel build (see `src/MAKE/Makefile.mpi`):

```
CC =          mpicxx
CCFLAGS =     -g -O3
LINK =        mpicxx
LINKFLAGS =   -g -O
```

Serial build with GNU `gcc` (see `src/MAKE/Makefile.serial`):

```
CC =          g++
CCFLAGS =     -g -O3
LINK =        g++
LINKFLAGS =   -g -O
```

**Note:** If compilation stops with a message like the following:

```
g++ -g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I../STUBS -c ../main.cpp
In file included from ../pointers.h:24:0,
      from ../input.h:17,
      from ../main.cpp:16:
../lmptype.h:34:2: error: #error LAMMPS requires a C++11 (or later) compliant
↪ compiler. Enable C++11 compatibility or upgrade the compiler.
```

then you have either an unsupported (old) compiler or you have to turn on C++11 mode. The latter applies to GCC 4.8.x shipped with RHEL 7.x and CentOS 7.x or GCC 5.4.x shipped with Ubuntu16.04. For those compilers, you need to add the `-std=c++11` flag. If there is no compiler that supports this flag (or equivalent), you would have to install a newer compiler that supports C++11; either as a binary package or through compiling from source.

If you build LAMMPS with any *Accelerator packages* included, there may be specific compiler or linker flags that are either required or recommended to enable required features and to achieve optimal performance. You need to include these in the `CCFLAGS` and `LINKFLAGS` settings above. For details, see the documentation for the individual packages listed on the *Accelerator packages* page. Or examine these files in the `src/MAKE/OPTIONS` directory. They correspond to each of the 5 accelerator packages and their hardware variants:

```
Makefile.opt           # OPT package
Makefile.omp           # OPENMP package
Makefile.intel_cpu     # INTEL package for CPUs
Makefile.intel_coprocessor # INTEL package for KNLs
Makefile.gpu           # GPU package
Makefile.kokkos_cuda_mpi # KOKKOS package for GPUs
Makefile.kokkos_omp    # KOKKOS package for CPUs (OpenMP)
Makefile.kokkos_phi    # KOKKOS package for KNLs (OpenMP)
```

### 3.4.3 Build the LAMMPS executable and library

LAMMPS is always built as a library of C++ classes plus an executable. The executable is a simple `main()` function that sets up MPI and then creates a LAMMPS class instance from the LAMMPS library, which will then process commands provided via a file or from the console input. The LAMMPS library can also be called from another application or a scripting language. See the *Howto couple* doc page for more info on coupling LAMMPS to other codes. See the *Python* page for more info on wrapping and running LAMMPS from Python via its library interface.

#### CMake build

For CMake builds, you can select through setting CMake variables between building a shared or a static LAMMPS library and what kind of suffix is added to them (in case you want to concurrently install multiple variants of binaries with different settings). If none are set, defaults are applied.

```
-D BUILD_SHARED_LIBS=value # yes or no (default)
-D LAMMPS_MACHINE=name    # name = mpi, serial, mybox, titan, laptop, etc
                          # no default value
```

The compilation will always produce a LAMMPS library and an executable linked to it. By default this will be a static library named `liblammps.a` and an executable named `lmp`. Setting `BUILD_SHARED_LIBS=yes` will instead produce a shared library called `liblammps.so` (or `liblammps.dylib` or `liblammps.dll` depending on the platform). If `LAMMPS_MACHINE=name` is set in addition, the name of the generated libraries will be changed to either `liblammps_name.a` or `liblammps_name.so`, respectively and the executable will be called `lmp_name`.

---

### Traditional make

With the traditional makefile based build process, the choice of the generated executable or library depends on the “mode” setting. Several options are available and `mode=static` is the default.

```
make machine           # build LAMMPS executable lmp_machine
make mode=static machine # same as "make machine"
make mode=shared machine # build LAMMPS shared lib liblammps_machine.so
↳instead
```

The “static” build will generate a static library called `liblammps_machine.a` and an executable named `lmp_machine`, while the “shared” build will generate a shared library `liblammps_machine.so` instead and `lmp_machine` will be linked to it. The build step will also create generic soft links, named `liblammps.a` and `liblammps.so`, which point to the specific `liblammps_machine.a/so` files.

---

### Additional information

Note that for creating a shared library, all the libraries it depends on must be compiled to be compatible with shared libraries. This should be the case for libraries included with LAMMPS, such as the dummy MPI library in `src/STUBS` or any package libraries in the `lib` directory, since they are always built in a shared library compatible way using the `-fPIC` compiler switch. However, if an auxiliary library (like MPI or FFTW) does not exist as a compatible format, the shared library linking step may generate an error. This means you will need to install a compatible version of the auxiliary library. The build instructions for that library should tell you how to do this.

As an example, here is how to build and install the [MPICH library](#), a popular open-source version of MPI, as a shared library in the default `/usr/local/lib` location:

```
./configure --enable-shared
make
make install
```

You may need to use `sudo make install` in place of the last line if you do not have write privileges for `/usr/local/lib` or use the `--prefix` configuration option to select an installation folder, where you do have write access. The end result should be the file `/usr/local/lib/libmpich.so`. On many Linux installations the folder `/${HOME}/.local` is an alternative to using `/usr/local` and does not require superuser or `sudo` access. In that case the configuration step becomes:

```
./configure --enable-shared --prefix=${HOME}/.local
```

Avoiding to use “`sudo`” for custom software installation (i.e. from source and not through a package manager tool provided by the OS) is generally recommended to ensure the integrity of the system software installation.

---

### 3.4.4 Including or removing debug support

By default the compilation settings will include the `-g` flag which instructs the compiler to include debug information (e.g. which line of source code a particular instruction correspond to). This can be extremely useful in case LAMMPS crashes and can help to provide crucial information in *tracking down the origin of a crash* and help the LAMMPS developers fix bugs in the source code. However, this increases the storage requirements for object files, libraries, and the executable 3-5 fold.

If this is a concern, you can change the compilation settings or remove the debug information from the LAMMPS executable:

- **Traditional make:** edit your Makefile.<machine> to remove the `-g` flag from the `CCFLAGS` and `LINKFLAGS` definitions
- **CMake:** use `-D CMAKE_BUILD_TYPE=Release` or explicitly reset the applicable compiler flags (best done using the text mode or graphical user interface).
- **Remove debug info:** If you are only concerned about the executable being too large, you can use the `strip` tool (e.g. `strip lmp_serial`) to remove the debug information from the executable file. Do not strip libraries or object files, as that will render them unusable.

### 3.4.5 Build LAMMPS tools

Some tools described in *Auxiliary tools* can be built directly using CMake or Make.

#### CMake build

```
-D BUILD_TOOLS=value          # yes or no (default)
-D BUILD_LAMMPS_SHELL=value  # yes or no (default)
```

The generated binaries will also become part of the LAMMPS installation (see below).

#### Traditional make

```
cd lammps/tools
make all           # build all binaries of tools
make binary2txt   # build only binary2txt tool
make chain        # build only chain tool
make micelle2d    # build only micelle2d tool
make thermo_extract # build only thermo_extract tool

cd lammps/tools/lammps-shell
make              # build LAMMPS shell
```

### 3.4.6 Install LAMMPS after a build

After building LAMMPS, you may wish to copy the LAMMPS executable or library, along with other LAMMPS files (library header, doc files) to a globally visible place on your system, for others to access. Note that you may need super-user privileges (e.g. `sudo`) if the directory you want to copy files to is protected.

---

#### CMake build

```
cmake -D CMAKE_INSTALL_PREFIX=path [options ...] ../cmake
make                                     # perform make after CMake command
make install                             # perform the installation into prefix
```

During the installation process CMake will by default remove any runtime path settings for loading shared libraries. Because of this you may have to set or modify the `LD_LIBRARY_PATH` (or `DYLD_LIBRARY_PATH`) environment variable, if you are installing LAMMPS into a non-system location and/or are linking to libraries in a non-system location that depend on such runtime path settings. As an alternative you may set the CMake variable `LAMMPS_INSTALL_RPATH` to `on` and then the runtime paths for any linked shared libraries and the library installation folder for the LAMMPS library will be embedded and thus the requirement to set environment variables is avoided. The `off` setting is usually preferred for packaged binaries or when setting up environment modules, the `on` setting is more convenient for installing software into a non-system or personal folder.

---

---

#### Traditional make

There is no “install” option in the `src/Makefile` for LAMMPS. If you wish to do this you will need to first build LAMMPS, then manually copy the desired LAMMPS files to the appropriate system directories.

---

## 3.5 Optional build settings

LAMMPS can be built with several optional settings. Each sub-section explain how to do this for building both with CMake and make.

- *C++11 standard compliance* when building all of LAMMPS
  - *FFT library* for use with the `kpace_style ppm` command
  - *Size of LAMMPS integer types and size limits*
  - *Read or write compressed files*
  - *Output of JPG, PNG, and movie files* via the `dump image` or `dump movie` commands
  - *Memory allocation alignment*
  - *Workaround for long long integers*
  - *Exception handling when using LAMMPS as a library* to capture errors
  - *Trigger selected floating-point exceptions*
-

### 3.5.1 C++11 standard compliance

A C++11 standard compatible compiler is a requirement for compiling LAMMPS. LAMMPS version 3 March 2020 is the last version compatible with the previous C++98 standard for the core code and most packages. Most currently used C++ compilers are compatible with C++11, but some older ones may need extra flags to enable C++11 compliance. Example for GNU c++ 4.8.x:

```
CCFLAGS = -g -O3 -std=c++11
```

### 3.5.2 FFT library

When the KSPACE package is included in a LAMMPS build, the *kspace\_style ppm* command performs 3d FFTs which require use of an FFT library to compute 1d FFTs. The KISS FFT library is included with LAMMPS but other libraries can be faster. LAMMPS can use them if they are available on your system.

#### CMake build

```
-D FFT=value           # FFTW3 or MKL or KISS, default is FFTW3 if found,
↳ else KISS
-D FFT_SINGLE=value    # yes or no (default), no = double precision
-D FFT_PACK=value      # array (default) or pointer or memcpy
```

**Note:** The values for the FFT variable must be in upper-case. This is an exception to the rule that all CMake variables can be specified with lower-case values.

Usually these settings are all that is needed. If FFTW3 is selected, then CMake will try to detect, if threaded FFTW libraries are available and enable them by default. This setting is independent of whether OpenMP threads are enabled and a packages like KOKKOS or OPENMP is used. If CMake cannot detect the FFT library, you can set these variables to assist:

```
-D FFTW3_INCLUDE_DIR=path # path to FFTW3 include files
-D FFTW3_LIBRARY=path     # path to FFTW3 libraries
-D FFTW3_OMP_LIBRARY=path # path to FFTW3 OpenMP wrapper libraries
-D FFT_FFTW_THREADS=on    # enable using OpenMP threaded FFTW3 libraries
-D MKL_INCLUDE_DIR=path   # ditto for Intel MKL library
-D FFT_MKL_THREADS=on     # enable using threaded FFTs with MKL libraries
-D MKL_LIBRARY=path       # path to MKL libraries
```

#### Traditional make

To change the FFT library to be used and its options, you have to edit your machine Makefile. Below are examples how the makefile variables could be changed.

```
FFT_INC = -DFFT_FFTW3      # -DFFT_FFTW3, -DFFT_FFTW (same as -DFFT_FFTW3),
↳ -DFFT_MKL, or -DFFT_KISS
                                # default is KISS if not specified
FFT_INC = -DFFT_SINGLE    # do not specify for double precision
```

(continues on next page)

(continued from previous page)

```

FFT_INC = -DFFT_FFTW_THREADS # enable using threaded FFTW3 libraries
FFT_INC = -DFFT_MKL_THREADS  # enable using threaded FFTs with MKL libraries
FFT_INC = -DFFT_PACK_ARRAY   # or -DFFT_PACK_POINTER or -DFFT_PACK_MEMCPY
                               # default is FFT_PACK_ARRAY if not specified

```

```

FFT_INC = -I/usr/local/include
FFT_PATH = -L/usr/local/lib
FFT_LIB = -lfftw3 # FFTW3 double precision
FFT_LIB = -lfftw3 -lfftw3_omp # FFTW3 double precision with threads
↳ (needs -DFFT_FFTW_THREADS)
FFT_LIB = -lfftw3 -lfftw3f # FFTW3 single precision
FFT_LIB = -lmkl_intel_lp64 -lmkl_sequential -lmkl_core # MKL with
↳ Intel compiler, serial interface
FFT_LIB = -lmkl_gf_lp64 -lmkl_sequential -lmkl_core # MKL with GNU
↳ compiler, serial interface
FFT_LIB = -lmkl_intel_lp64 -lmkl_intel_thread -lmkl_core # MKL with
↳ Intel compiler, threaded interface
FFT_LIB = -lmkl_gf_lp64 -lmkl_gnu_thread -lmkl_core # MKL with GNU
↳ compiler, threaded interface
FFT_LIB = -lmkl_rt # MKL with automatic runtime selection of
↳ interface libs

```

As with CMake, you do not need to set paths in `FFT_INC` or `FFT_PATH`, if the compiler can find the FFT header and library files in its default search path. You must specify `FFT_LIB` with the appropriate FFT libraries to include in the link.

The **KISS FFT library** is included in the LAMMPS distribution. It is portable across all platforms. Depending on the size of the FFTs and the number of processors used, the other libraries listed here can be faster.

However, note that long-range Coulombics are only a portion of the per-timestep CPU cost, FFTs are only a portion of long-range Coulombics, and 1d FFTs are only a portion of the FFT cost (parallel communication can be costly). A breakdown of these timings is printed to the screen at the end of a run when using the `kpace_style ppm` command. The [Screen and logfile output](#) page gives more details. A more detailed (and time consuming) report of the FFT performance is generated with the `kpace_modify fftbench yes` command.

FFTW is a fast, portable FFT library that should also work on any platform and can be faster than the KISS FFT library. You can download it from [www.fftw.org](http://www.fftw.org). LAMMPS requires version 3.X; the legacy version 2.1.X is no longer supported.

Building FFTW for your box should be as simple as `./configure; make; make install`. The `install` command typically requires root privileges (e.g. invoke it via `sudo`), unless you specify a local directory with the “`-prefix`” option of `configure`. Type `./configure --help` to see various options.

The Intel MKL math library is part of the Intel compiler suite. It can be used with the Intel or GNU compiler (see the `FFT_LIB` setting above).

Performing 3d FFTs in parallel can be time consuming due to data access and required communication. This cost can be reduced by performing single-precision FFTs instead of double precision. Single precision means the real and imaginary parts of a complex datum are 4-byte floats. Double precision means they are 8-byte doubles. Note that Fourier transform and related PPM operations are somewhat less sensitive to floating point truncation errors and thus the resulting error is less than the difference in precision. Using the `-DFFT_SINGLE` setting trades off a little accuracy for reduced memory use and parallel communication costs for transposing 3d FFT data.

When using `-DFFT_SINGLE` with FFTW3 you may need to build the FFTW library a second time with support for single-precision.

For FFTW3, do the following, which should produce the additional library `libfftw3f.a` or `libfftw3f.so`.

```
make clean
./configure --enable-single; make; make install
```

Performing 3d FFTs requires communication to transpose the 3d FFT grid. The data packing/unpacking for this can be done in one of 3 modes (ARRAY, POINTER, MEMCPY) as set by the `FFT_PACK` syntax above. Depending on the machine, the size of the FFT grid, the number of processors used, one option may be slightly faster. The default is ARRAY mode.

### 3.5.3 Size of LAMMPS integer types and size limits

LAMMPS has a few integer data types which can be defined as either 4-byte (= 32-bit) or 8-byte (= 64-bit) integers at compile time. This has an impact on the size of a system that can be simulated or how large counters can become before “rolling over”. The default setting of “smallbig” is almost always adequate.

#### CMake build

With CMake the choice of integer types is made via setting a variable during configuration.

```
-D LAMMPS_SIZES=value # smallbig (default) or bigbig or smallsmall
```

If the variable is not set explicitly, “smallbig” is used.

#### Traditional build

If you want a setting different from the default, you need to edit the `LMP_INC` variable setting your machine Makefile.

```
LMP_INC = -DLAMMPS_SMALLBIG # or -DLAMMPS_BIGBIG or -DLAMMPS_SMALLSMALL
```

The default setting is `-DLAMMPS_SMALLBIG` if nothing is specified

### LAMMPS system size restrictions

	smallbig	bigbig	smallsmall
Total atom count	$2^{63}$ atoms (= $9.223 \cdot 10^{18}$ )	$2^{63}$ atoms (= $9.223 \cdot 10^{18}$ )	$2^{31}$ atoms (= $2.147 \cdot 10^9$ )
Total timesteps	$2^{63}$ steps (= $9.223 \cdot 10^{18}$ )	$2^{63}$ steps (= $9.223 \cdot 10^{18}$ )	$2^{31}$ steps (= $2.147 \cdot 10^9$ )
Atom ID values	$1 \leq i \leq 2^{31}$ (= $2.147 \cdot 10^9$ )	$1 \leq i \leq 2^{63}$ (= $9.223 \cdot 10^{18}$ )	$1 \leq i \leq 2^{31}$ (= $2.147 \cdot 10^9$ )
Image flag values	$-512 \leq i \leq 511$	$-1\,048\,576 \leq i \leq 1\,048\,575$	$-512 \leq i \leq 511$

The “bigbig” setting increases the size of image flags and atom IDs over “smallbig” and the “smallsmall” setting is only needed if your machine does not support 64-bit integers or incurs performance penalties when using them.

These are limits for the core of the LAMMPS code, specific features or some styles may impose additional limits. The *ATC* package cannot be compiled with the “bigbig” setting. Also, there are limitations when using the library interface where some functions with known issues have been replaced by dummy calls printing a corresponding error message rather than crashing randomly or corrupting data.

Atom IDs are not required for atomic systems which do not store bond topology information, though IDs are enabled by default. The `atom_modify id no` command will turn them off. Atom IDs are required for molecular systems with bond topology (bonds, angles, dihedrals, etc). Similarly, some force or compute or fix styles require atom IDs. Thus if you model a molecular system or use one of those styles with more than 2 billion atoms, you need the “bigbig” setting.

Regardless of the total system size limits, the maximum number of atoms per MPI rank (local + ghost atoms) is limited to 2 billion for atomic systems and 500 million for systems with bonds (the additional restriction is due to using the 2 upper bits of the local atom index in neighbor lists for storing special bonds info).

Image flags store 3 values per atom in a single integer which count the number of times an atom has moved through the periodic box in each dimension. See the `dump` manual page for a discussion. If an atom moves through the periodic box more than this limit, the value will “roll over”, e.g. from 511 to -512, which can cause diagnostics like the mean-squared displacement, as calculated by the `compute msd` command, to be faulty.

Also note that the GPU package requires its `lib/gpu` library to be compiled with the same size setting, or the link will fail. A CMake build does this automatically. When building with make, the setting in whichever `lib/gpu/Makefile` is used must be the same as above.

---

### 3.5.4 Output of JPG, PNG, and movie files

The `dump image` command has options to output JPEG or PNG image files. Likewise the `dump movie` command outputs movie files in a variety of movie formats. Using these options requires the following settings:

---

#### CMake build

```
-D WITH_JPEG=value      # yes or no
                        # default = yes if CMake finds JPEG files, else no
-D WITH_PNG=value       # yes or no
                        # default = yes if CMake finds PNG and ZLIB files,
↳ else no
-D WITH_FFMPEG=value    # yes or no
                        # default = yes if CMake can find ffmpeg, else no
```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```
-D JPEG_INCLUDE_DIR=path # path to jpeglib.h header file
-D JPEG_LIBRARY=path     # path to libjpeg.a (.so) file
-D PNG_INCLUDE_DIR=path  # path to png.h header file
-D PNG_LIBRARY=path     # path to libpng.a (.so) file
-D ZLIB_INCLUDE_DIR=path # path to zlib.h header file
-D ZLIB_LIBRARY=path    # path to libz.a (.so) file
-D FFMPEG_EXECUTABLE=path # path to ffmpeg executable
```

---

#### Traditional make

```
LMP_INC = -DLAMMPS_JPEG -DLAMMPS_PNG -DLAMMPS_FFMPEG <other LMP_INC settings>

JPG_INC = -I/usr/local/include # path to jpeglib.h, png.h, zlib.h header
↳ files if make cannot find them
```

(continues on next page)

(continued from previous page)

```
JPG_PATH = -L/usr/lib          # paths to libjpeg.a, libpng.a, libz.a (.so)
↪files if make cannot find them
JPG_LIB = -ljpeg -lpng -lz     # library names
```

As with CMake, you do not need to set `JPG_INC` or `JPG_PATH`, if `make` can find the graphics header and library files in their default system locations. You must specify `JPG_LIB` with a list of graphics libraries to include in the link. You must make certain that the `ffmpeg` executable (or `ffmpeg.exe` on Windows) is in a directory where LAMMPS can find it at runtime; that is usually a directory list in your `PATH` environment variable.

Using `ffmpeg` to output movie files requires that your machine supports the “`popen`” function in the standard runtime library.

**Note:** On some clusters with high-speed networks, using the `fork()` library call (required by `popen()`) can interfere with the fast communication library and lead to simulations using `ffmpeg` to hang or crash.

### 3.5.5 Read or write compressed files

If this option is enabled, large files can be read or written with compression by `gzip` or similar tools by several LAMMPS commands, including `read_data`, `rerun`, and `dump`. Currently supported compression tools are: `gzip`, `bzip2`, `zstd`, and `lzma`.

#### CMake build

```
-D WITH_GZIP=value           # yes or no
                             # default is yes if CMake can find the gzip program,
↪else no
```

#### Traditional make

```
LMP_INC = -DLAMMPS_GZIP <other LMP_INC settings>
```

This option requires that your operating system fully supports the “`popen()`” function in the standard runtime library and that a `gzip` or other executable can be found by LAMMPS in the standard search path during a run.

**Note:** On clusters with high-speed networks, using the “`fork()`” library call (required by “`popen()`”) can interfere with the fast communication library and lead to simulations using compressed output or input to hang or crash. For selected operations, compressed file I/O is also available using a compression library instead, which is what the `COMPRESS` package enables.

### 3.5.6 Memory allocation alignment

This setting enables the use of the “`posix_memalign()`” call instead of “`malloc()`” when LAMMPS allocates large chunks of memory. Vector instructions on CPUs may become more efficient, if dynamically allocated memory is aligned on larger-than-default byte boundaries. On most current operating systems, the “`malloc()`” implementation returns pointers that are aligned to 16-byte boundaries. Using SSE vector instructions efficiently, however, requires memory blocks being aligned on 64-byte boundaries.

---

#### CMake build

```
-D LAMMPS_MEMALIGN=value           # 0, 8, 16, 32, 64 (default)
```

Use a LAMMPS\_MEMALIGN value of 0 to disable using “`posix_memalign()`” and revert to using the “`malloc()`” C-library function instead. When compiling LAMMPS for Windows systems, “`malloc()`” will always be used and this setting is ignored.

---

#### Traditional make

```
LMP_INC = -DLAMMPS_MEMALIGN=value  # 8, 16, 32, 64
```

Do not set `-DLAMMPS_MEMALIGN`, if you want to have memory allocated with the “`malloc()`” function call instead. `-DLAMMPS_MEMALIGN` **cannot** be used on Windows, as Windows different function calls with different semantics for allocating aligned memory, that are not compatible with how LAMMPS manages its dynamical memory.

---

### 3.5.7 Workaround for long long integers

If your system or MPI version does not recognize “long long” data types, the following setting will be needed. It converts “long long” to a “long” data type, which should be the desired 8-byte integer on those systems:

---

#### CMake build

```
-D LAMMPS_LONGLONG_TO_LONG=value    # yes or no (default)
```

---

#### Traditional make

```
LMP_INC = -DLAMMPS_LONGLONG_TO_LONG <other LMP_INC settings>
```

---

### 3.5.8 Exception handling when using LAMMPS as a library

This setting is useful when external codes drive LAMMPS as a library. With this option enabled, LAMMPS errors do not kill the calling code. Instead, the call stack is unwound and control returns to the caller, e.g. to Python. Of course, the calling code has to be set up to *catch* exceptions thrown from within LAMMPS.

---

#### CMake build

```
-D LAMMPS_EXCEPTIONS=value      # yes or no (default)
```

---

---

#### Traditional make

```
LMP_INC = -DLAMMPS_EXCEPTIONS  <other LMP_INC settings>
```

---

---

**Note:** When LAMMPS is running in parallel, it is not always possible to cleanly recover from an exception since not all parallel ranks may throw an exception and thus other MPI ranks may get stuck waiting for messages from the ones with errors.

---

### 3.5.9 Trigger selected floating-point exceptions

Many kinds of CPUs have the capability to detect when a calculation results in an invalid math operation like a division by zero or calling the square root with a negative argument. The default behavior on most operating systems is to continue and have values for NaN (= not a number) or Inf (= infinity). This allows software to detect and recover from such conditions. This behavior can be changed, however, often through use of compiler flags. On Linux systems (or more general on systems using the GNU C library), these so-called floating-point traps can also be selectively enabled through library calls. LAMMPS supports that by setting the `-DLAMMPS_TRAP_FPE` pre-processor define. As it is done in the `main()` function, this applies only to the standalone executable, not the library.

---

#### CMake build

```
-D CMAKE_TUNE_FLAGS--DLAMMPS_TRAP_FPE
```

---

---

#### Traditional make

```
LMP_INC = -DLAMMPS_TRAP_FPE  <other LMP_INC settings>
```

---

After compilation with this flag set, the LAMMPS executable will stop and produce a core dump when a division by zero, overflow, illegal math function argument or other invalid floating point operation is encountered.

## 3.6 Include packages in build

In LAMMPS, a package is a group of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. In the `src` directory, each package is a sub-directory with the package name in capital letters.

An overview of packages is given on the [Packages](#) doc page. Brief overviews of each package are on the [Packages details](#) page.

When building LAMMPS, you can choose to include or exclude each package. In general there is no need to include a package if you never plan to use its features.

If you get a run-time error that a LAMMPS command or style is “unknown”, it is often because the command is contained in a package, and your build did not include that package. If the command or style *is* available in a package included in the LAMMPS distribution, the error message will indicate which package would be needed. Running LAMMPS with the `-h` *command-line switch* will print *all* optional commands and packages that were enabled when building that executable.

For the majority of packages, if you follow the single step below to include it, you can then build LAMMPS exactly the same as you would without any packages installed. A few packages may require additional steps, as explained on the [Build extras](#) page.

These links take you to the extra instructions for those select packages:

<a href="#">ADIOS</a>	<a href="#">ATC</a>	<a href="#">AWPMD</a>	<a href="#">COLVARS</a>	<a href="#">COMPRESS</a>	<a href="#">GPU</a>
<a href="#">H5MD</a>	<a href="#">INTEL</a>	<a href="#">KIM</a>	<a href="#">KOKKOS</a>	<a href="#">LATTE</a>	<a href="#">MACHDYN</a>
<a href="#">ML-HDNNP</a>	<a href="#">ML-PACE</a>	<a href="#">ML-QUIP</a>	<a href="#">MOLFILE</a>	<a href="#">MSCG</a>	<a href="#">NETCDF</a>
<a href="#">OPENMP</a>	<a href="#">OPT</a>	<a href="#">PLUMED</a>	<a href="#">POEMS</a>	<a href="#">PYTHON</a>	<a href="#">QMMM</a>
<a href="#">SCAFACOS</a>	<a href="#">VORONOI</a>	<a href="#">VTK</a>			

The mechanism for including packages is simple but different for CMake versus make.

---

### CMake build

```
-D PKG_NAME=value           # yes or no (default)
```

Examples:

```
-D PKG_MANYBODY=yes
-D PKG_INTEL=yes
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with CMake.

---

**Note:** If you switch between building with CMake and make builds, no packages in the `src` directory can be installed when you invoke `cmake`. CMake will give an error if that is not the case, indicating how you can un-install all packages in the `src` dir.

---

---

---

### Traditional make

```
cd lammps/src
make ps           # check which packages are currently installed
make yes-name    # install a package with name
make no-name     # un-install a package with name
make mpi         # build LAMMPS with whatever packages are now
↳ installed
```

Examples:

```
make no-rigid
make yes-intel
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with make.

---

**Note:** You must always re-build LAMMPS (via make) after installing or un-installing a package, for the action to take effect. The included dependency tracking will make certain only files that are required to be rebuilt are recompiled.

---

---

**Note:** You cannot install or un-install packages and build LAMMPS in a single make command with multiple targets, e.g. `make yes-colloid mpi`. This is because the make procedure creates a list of source files that will be out-of-date for the build if the package configuration changes within the same command. You can include or exclude multiple packages in a single make command, e.g. `make yes-colloid no-manybody`.

---

### 3.6.1 Information for both build systems

Almost all packages can be included or excluded in a LAMMPS build, independent of the other packages. However, some packages include files derived from files in other packages. LAMMPS checks for this and does the right thing. Individual files are only included if their dependencies are already included. Likewise, if a package is excluded, other files dependent on that package are also excluded.

---

**Note:** By default no packages are installed. Prior to August 2018, however, if you downloaded a tarball, 3 packages (KSPACE, MANYBODY, MOLECULE) were pre-installed via the traditional make procedure in the `src` directory. That is no longer the case, so that CMake will build as-is without needing to un-install those packages.

---

### 3.6.2 CMake presets for installing many packages

Instead of specifying all the CMake options via the command-line, CMake allows initializing its settings cache using script files. These are regular CMake files which can manipulate and set CMake variables (which represent selected options), and can also contain control flow constructs for more complex operations.

LAMMPS includes several of these files to define configuration “presets”, similar to the options that exist for the Make based system. Using these files you can enable/disable portions of the available packages in LAMMPS. If you need a custom preset you can take one of them as a starting point and customize it to your needs.

```

cmake -C ../cmake/presets/basic.cmake [OPTIONS] ../cmake # enable just a few core_
↳packages
cmake -C ../cmake/presets/most.cmake [OPTIONS] ../cmake # enable most packages
cmake -C ../cmake/presets/download.cmake [OPTIONS] ../cmake # enable packages which_
↳download sources or potential files
cmake -C ../cmake/presets/nolib.cmake [OPTIONS] ../cmake # disable packages that do_
↳require extra libraries or tools
cmake -C ../cmake/presets/clang.cmake [OPTIONS] ../cmake # change settings to use_
↳the Clang compilers by default
cmake -C ../cmake/presets/gcc.cmake [OPTIONS] ../cmake # change settings to use_
↳the GNU compilers by default
cmake -C ../cmake/presets/intel.cmake [OPTIONS] ../cmake # change settings to use_
↳the Intel compilers by default
cmake -C ../cmake/presets/pgi.cmake [OPTIONS] ../cmake # change settings to use_
↳the PGI compilers by default
cmake -C ../cmake/presets/all_on.cmake [OPTIONS] ../cmake # enable all packages
cmake -C ../cmake/presets/all_off.cmake [OPTIONS] ../cmake # disable all packages
mingw64-cmake -C ../cmake/presets/mingw-cross.cmake [OPTIONS] ../cmake # compile with_
↳MinGW cross compilers

```

Presets that have names starting with “windows” are specifically for compiling LAMMPS *natively on Windows* and presets that have names starting with “kokkos” are specifically for selecting configurations for compiling LAMMPS with *KOKKOS*.

**Note:** Running cmake this way manipulates the CMake settings cache in your current build directory. You can combine multiple presets and options in a single cmake run, or change settings incrementally by running cmake with new flags. If you use a preset for selecting a set of compilers, it will reset all settings from previous CMake runs.

#### Example

```

# build LAMMPS with most commonly used packages, but then remove
# those requiring additional library or tools, but still enable
# GPU package and configure it for using CUDA. You can run.
mkdir build
cd build
cmake -C ../cmake/presets/most.cmake -C ../cmake/presets/nolib.cmake -D PKG_GPU=on -D_
↳GPU_API=cuda ../cmake

# to add another package, say BODY to the previous configuration you can run:
cmake -D PKG_BODY=on .

```

(continues on next page)

(continued from previous page)

```
# to reset the package selection from above to the default of no packages
# but leaving all other settings untouched. You can run:
cmake -C ../cmake/presets/all_off.cmake .
```

### 3.6.3 Make shortcuts for installing many packages

The following commands are useful for managing package source files and their installation when building LAMMPS via traditional make. Just type make in lammmps/src to see a one-line summary.

These commands install/un-install sets of packages:

```
make yes-all           # install all packages
make no-all           # check for changes and uninstall all packages
make no-installed     # only check and uninstall installed packages
make yes-basic         # install a few commonly used packages'
make no-basic         # remove a few commonly used packages'
make yes-most         # install most packages w/o libs'
make no-most         # remove most packages w/o libs'
make yes-lib          # install packages that require extra libraries
make no-lib          # uninstall packages that require extra libraries
make yes-ext          # install packages that require external libraries
make no-ext          # uninstall packages that require external libraries
```

which install/un-install various sets of packages. Typing make package will list all the these commands.

**Note:** Installing or un-installing a package for the make based build process works by simply copying files back and forth between the main source directory src and the sub-directories with the package name (e.g. src/KSPACE, src/ATC), so that the files are included or excluded when LAMMPS is built. Only source files in the src folder will be compiled.

The following make commands help manage files that exist in both the src directory and in package sub-directories. You do not normally need to use these commands unless you are editing LAMMPS files or are updating LAMMPS via git.

Type make package-status or make ps to show which packages are currently installed. For those that are installed, it will list any files that are different in the src directory and package sub-directory.

Type make package-installed or make pi to show which packages are currently installed, without listing the status of packages that are not installed.

Type make package-update or make pu to overwrite src files with files from the package sub-directories if the package is installed. It should be used after the checkout has been *updated or changed withy git*, this will only update the files in the package sub-directories, but not the copies in the src folder.

Type make package-overwrite to overwrite files in the package sub-directories with src files.

Type make package-diff to list all differences between pairs of files in both the source directory and the package directory.

## 3.7 Packages with extra build options

When building with some packages, additional steps may be required, in addition to

CMake build	Traditional make
<pre>\$ cmake -D PKG_NAME=yes</pre>	<pre>\$ make yes-name</pre>

as described on the [Build\\_package](#) page.

For a CMake build there may be additional optional or required variables to set. For a build with make, a provided library under the lammps/lib directory may need to be built first. Or an external library may need to exist on your system or be downloaded and built. You may need to tell LAMMPS where it is found on your system.

This is the list of packages that may require additional steps.

<i>ADIOS</i>	<i>ATC</i>	<i>AWPMD</i>	<i>COLVARS</i>	<i>COMPRESS</i>	<i>GPU</i>
<i>H5MD</i>	<i>INTEL</i>	<i>KIM</i>	<i>KOKKOS</i>	<i>LATTE</i>	<i>MACHDYN</i>
<i>MDI</i>	<i>MESONT</i>	<i>ML-HDNNP</i>	<i>ML-IAP</i>	<i>ML-PACE</i>	<i>ML-QUIP</i>
<i>MOLFILE</i>	<i>MSCG</i>	<i>NETCDF</i>	<i>OPENMP</i>	<i>OPT</i>	<i>PLUMED</i>
<i>POEMS</i>	<i>PYTHON</i>	<i>QMMM</i>	<i>SCAFACOS</i>	<i>VORONOI</i>	<i>VTK</i>

---

### 3.7.1 COMPRESS package

To build with this package you must have the [zlib compression library](#) available on your system to build dump styles with a ‘gz’ suffix. There are also styles using the [Zstandard library](#) which have a ‘zstd’ suffix. The zstd library version must be at least 1.4. Older versions use an incompatible API and thus LAMMPS will fail to compile.

---

#### CMake build

If CMake cannot find the zlib library or include files, you can set these variables:

```
-D ZLIB_INCLUDE_DIR=path    # path to zlib.h header file
-D ZLIB_LIBRARY=path        # path to libz.a (.so) file
```

Support for Zstandard compression is auto-detected and for that CMake depends on the [pkg-config](#) tool to identify the necessary flags to compile with this library, so the corresponding `libzstandard.pc` file must be in a folder where `pkg-config` can find it, which may require adding it to the `PKG_CONFIG_PATH` environment variable.

---

#### Traditional make

To include support for Zstandard compression, `-DLAMMPS_ZSTD` must be added to the compiler flags. If make cannot find the libraries, you can edit the file `lib/compress/Makefile.lammps` to specify the paths and library names. This must be done **before** the package is installed.

---

### 3.7.2 GPU package

To build with this package, you must choose options for precision and which GPU hardware to build for. The GPU package currently supports three different types of backends: OpenCL, CUDA and HIP.

#### CMake build

```
-D GPU_API=value           # value = opencl (default) or cuda or hip
-D GPU_PREC=value         # precision setting
                           # value = double or mixed (default) or single
-D HIP_PATH               # path to HIP installation. Must be set if GPU_API=HIP
-D GPU_ARCH=value        # primary GPU hardware choice for GPU_API=cuda
                           # value = sm_XX, see below
                           # default is sm_50
-D HIP_ARCH=value        # primary GPU hardware choice for GPU_API=hip
                           # value depends on selected HIP_PLATFORM
                           # default is 'gfx906' for HIP_PLATFORM=amd and 'sm_50' for HIP_
↳ PLATFORM=nvcc
-D HIP_USE_DEVICE_SORT=value # enables GPU sorting
                           # value = yes (default) or no
-D CUDPP_OPT=value       # use GPU binning on with CUDA (should be off for modern
↳ GPUs)
                           # enables CUDA Performance Primitives, must be "no" for
↳ CUDA_MPS_SUPPORT=yes
                           # value = yes or no (default)
-D CUDA_MPS_SUPPORT=value # enables some tweaks required to run with active nvidia-
↳ cuda-mps daemon
                           # value = yes or no (default)
-D USE_STATIC_OPENCL_LOADER=value # downloads/includes OpenCL ICD loader library, no
↳ local OpenCL headers/libs needed
                           # value = yes (default) or no
```

GPU\_ARCH settings for different GPU hardware is as follows:

- sm\_30 for Kepler (supported since CUDA 5 and until CUDA 10.x)
- sm\_35 or sm\_37 for Kepler (supported since CUDA 5 and until CUDA 11.x)
- sm\_50 or sm\_52 for Maxwell (supported since CUDA 6)
- sm\_60 or sm\_61 for Pascal (supported since CUDA 8)
- sm\_70 for Volta (supported since CUDA 9)
- sm\_75 for Turing (supported since CUDA 10)
- sm\_80 for Ampere (supported since CUDA 11)

A more detailed list can be found, for example, at [Wikipedia's CUDA article](#)

CMake can detect which version of the CUDA toolkit is used and thus will try to include support for **all** major GPU architectures supported by this toolkit. Thus the GPU\_ARCH setting is merely an optimization, to have code for the preferred GPU architecture directly included rather than having to wait for the JIT compiler of the CUDA driver to translate it.

When compiling for CUDA or HIP with CUDA, version 8.0 or later of the CUDA toolkit is required and a GPU architecture of Kepler or later, which must *also* be supported by the CUDA toolkit in use **and** the CUDA driver in use.

When compiling for OpenCL, OpenCL version 1.2 or later is required and the GPU must be supported by the GPU driver and OpenCL runtime bundled with the driver.

When building with CMake, you **must NOT** build the GPU library in `lib/gpu` using the traditional build procedure. CMake will detect files generated by that process and will terminate with an error and a suggestion for how to remove them.

If you are compiling for OpenCL, the default setting is to download, build, and link with a static OpenCL ICD loader library and standard OpenCL headers. This way no local OpenCL development headers or library needs to be present and only OpenCL compatible drivers need to be installed to use OpenCL. If this is not desired, you can set `USE_STATIC_OPENCL_LOADER` to `no`.

If you are compiling with HIP, note that before running CMake you will have to set appropriate environment variables. Some variables such as `HCC_AMDGPU_TARGET` (for ROCm <= 4.0) or `CUDA_PATH` are necessary for `hipcc` and the linker to work correctly.

Using CHIP-SPV implementation of HIP is now supported. It allows one to run HIP code on Intel GPUs via the OpenCL or Level Zero backends. To use CHIP-SPV, you must set `-DHIP_USE_DEVICE_SORT=OFF` in your CMake command line as CHIP-SPV does not yet support `hipCUB`. The use of HIP for Intel GPUs is still experimental so you should only use this option in preparations to run on Aurora system at ANL.

```
# AMDGPU target (ROCm <= 4.0)
export HIP_PLATFORM=hcc
export HIP_PATH=/path/to/HIP/install
export HCC_AMDGPU_TARGET=gfx906
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```
# AMDGPU target (ROCm >= 4.1)
export HIP_PLATFORM=amd
export HIP_PATH=/path/to/HIP/install
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```
# CUDA target (not recommended, use GPU_ARCH=cuda)
# !!! DO NOT set CMAKE_CXX_COMPILER !!!
export HIP_PLATFORM=nvcc
export HIP_PATH=/path/to/HIP/install
export CUDA_PATH=/usr/local/cuda
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=sm_70 ..
make -j 4
```

```
# SPIR-V target (Intel GPUs)
export HIP_PLATFORM=spirv
export HIP_PATH=/path/to/HIP/install
export CMAKE_CXX_COMPILER=<hipcc/clang++>
cmake -D PKG_GPU=on -D GPU_API=HIP ..
make -j 4
```

## Traditional make

Before building LAMMPS, you must build the GPU library in `lib/gpu`. You can do this manually if you prefer; follow the instructions in `lib/gpu/README`. Note that the GPU library uses MPI calls, so you must use the same MPI library (or the STUBS library) settings as the main LAMMPS code. This also applies to the `-DLAMMPS_BIGBIG`, `-DLAMMPS_SMALLBIG`, or `-DLAMMPS_SMALLSMALL` settings in whichever Makefile you use.

You can also build the library in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/gpu/Install.py` script with the specified args:

```
$ make lib-gpu                # print help message
$ make lib-gpu args="-b"      # build GPU library with default Makefile.linux
$ make lib-gpu args="-m xk7 -p single -o xk7.single" # create new Makefile.xk7.single,
↳altered for single-precision
$ make lib-gpu args="-m mpi -a sm_60 -p mixed -b" # build GPU library with mixed,
↳precision and P100 using other settings in Makefile.mpi
```

Note that this procedure starts with a `Makefile.machine` in `lib/gpu`, as specified by the “-m” switch. For your convenience, machine makefiles for “mpi” and “serial” are provided, which have the same settings as the corresponding machine makefiles in the main LAMMPS source folder. In addition you can alter 4 important settings in the `Makefile.machine` you start from via the corresponding `-c`, `-a`, `-p`, `-e` switches (as in the examples above), and also save a copy of the new `Makefile` if desired:

- `CUDA_HOME` = where NVIDIA CUDA software is installed on your system
- `CUDA_ARCH` = `sm_XX`, what GPU hardware you have, same as CMake `GPU_ARCH` above
- `CUDA_PRECISION` = precision (double, mixed, single)
- `EXTRAMAKE` = which `Makefile.lammps.*` file to copy to `Makefile.lammps`

The file `Makefile.cuda` is set up to include support for multiple GPU architectures as supported by the CUDA toolkit in use. This is done through using the “-gencode” flag, which can be used multiple times and thus support all GPU architectures supported by your CUDA compiler.

To enable GPU binning via CUDA performance primitives set the Makefile variable `CUDPP_OPT = -DUSE_CUDPP -Icudpp_mini`. This should **not** be used with most modern GPUs.

To support the CUDA multiprocessor server you can set the define `-DCUDA_PROXY`. Please note that in this case you must **not** use the CUDA performance primitives and thus set the variable `CUDPP_OPT` to empty.

If the library build is successful, 3 files should be created: `lib/gpu/libgpu.a`, `lib/gpu/nvc_get_devices`, and `lib/gpu/Makefile.lammps`. The latter has settings that enable LAMMPS to link with CUDA libraries. If the settings in `Makefile.lammps` for your machine are not correct, the LAMMPS build will fail, and `lib/gpu/Makefile.lammps` may need to be edited.

---

**Note:** If you re-build the GPU library in `lib/gpu`, you should always un-install the GPU package in `lammps/src`, then re-install it and re-build LAMMPS. This is because the compilation of files in the GPU package uses the library settings from the `lib/gpu/Makefile.machine` used to build the GPU library.

---

### 3.7.3 KIM package

To build with this package, the KIM library with API v2 must be downloaded and built on your system. It must include the KIM models that you want to use with LAMMPS.

If you would like to use the *kim query* command, you also need to have libcurl installed with the matching development headers and the curl-config tool.

If you would like to use the *kim property* command, you need to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this. After successfully building LAMMPS with Python, you also need to install the *kim-property* Python package, which can be easily done using *pip* as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).

In addition to installing the KIM API, it is also necessary to install the library of KIM models (interatomic potentials). See [Obtaining KIM Models](#) to learn how to install a pre-build binary of the OpenKIM Repository of Models. See the list of all KIM models here: <https://openkim.org/browse/models>

(Also note that when downloading and installing from source the KIM API library with all its models, may take a long time (tens of minutes to hours) to build. Of course you only need to do that once.)

---

#### CMake build

```
-D DOWNLOAD_KIM=value           # download OpenKIM API v2 for build, value = no
↳no (default) or yes
-D LMP_DEBUG_CURL=value         # set libcurl verbose mode on/off, value = off
↳(default) or on
-D LMP_NO_SSL_CHECK=value       # tell libcurl to not verify the peer, value = no
↳no (default) or yes
-D KIM_EXTRA_UNITTESTS=value    # enables extra unit tests, value = no
↳(default) or yes
```

If `DOWNLOAD_KIM` is set to *yes* (or *on*), the KIM API library will be downloaded and built inside the CMake build directory. If the KIM library is already installed on your system (in a location where CMake cannot find it), you may need to set the `PKG_CONFIG_PATH` environment variable so that `libkim-api` can be found, or run the command `source kim-api-activate`.

Extra unit tests can only be available if they are explicitly requested (`KIM_EXTRA_UNITTESTS` is set to *yes* (or *on*)) and the prerequisites are met. See *KIM Extra unit tests* for more details on this.

---

#### Traditional make

You can download and build the KIM library manually if you prefer; follow the instructions in `lib/kim/README`. You can also do this in one step from the `lammps/src` directory, using a command like these, which simply invoke the `lib/kim/Install.py` script with the specified args.

```
$ make lib-kim                  # print help message
$ make lib-kim args="-b "       # (re-)install KIM API lib with only example models
$ make lib-kim args="-b -a Glue_Ercolessi_Adams_Al__MO_324507536345_001" #_
↳ditto plus one model
$ make lib-kim args="-b -a everything" # install KIM API lib with all_
↳models
$ make lib-kim args="-n -a EAM_Dynamo_Ackland_W__MO_141627196590_002" #_
↳add one model or model driver
```

(continues on next page)

(continued from previous page)

```
$ make lib-kim args="-p /usr/local" # use an existing KIM API installation at
↳ the provided location
$ make lib-kim args="-p /usr/local -a EAM_Dynamo_Ackland_W__MO_141627196590_002
↳ " # ditto but add one model or driver
```

When using the “-b” option, the KIM library is built using its native cmake build system. The lib/kim/Install.py script supports a CMAKE environment variable if the cmake executable is named other than cmake on your system. Additional environment variables may be provided on the command line for use by cmake. For example, to use the cmake3 executable and tell it to use the gnu version 11 compilers to build KIM, one could use the following command line.

```
$ CMAKE=cmake3 CXX=g++-11 CC=gcc-11 FC=gfortran-11 make lib-kim args="-b " #
↳ (re-)install KIM API lib using cmake3 and gnu v11 compilers with only
↳ example models
```

Settings for debugging OpenKIM web queries discussed below need to be applied by adding them to the LMP\_INC variable through editing the Makefile.machine you are using. For example:

```
LMP_INC = -DLMP_NO_SSL_CHECK
```

## Debugging OpenKIM web queries in LAMMPS

If LMP\_DEBUG\_CURL is set, the libcurl verbose mode will be turned on, and any libcurl calls within the KIM web query display a lot of information about libcurl operations. You hardly ever want this set in production use, you will almost always want this when you debug or report problems.

The libcurl library performs peer SSL certificate verification by default. This verification is done using a CA certificate store that the SSL library can use to make sure the peer’s server certificate is valid. If SSL reports an error (“certificate verify failed”) during the handshake and thus refuses further communicate with that server, you can set LMP\_NO\_SSL\_CHECK to override that behavior. When LAMMPS is compiled with LMP\_NO\_SSL\_CHECK set, libcurl does not verify the peer and connection attempts will succeed regardless of the names in the certificate. This option is insecure. As an alternative, you can specify your own CA cert path by setting the environment variable CURL\_CA\_BUNDLE to the path of your choice. A call to the KIM web query would get this value from the environment variable.

## KIM Extra unit tests (CMake only)

During development, testing, or debugging, if *unit testing* is enabled in LAMMPS, one can also enable extra tests on *KIM commands* by setting the KIM\_EXTRA\_UNITTESTS to *yes* (or *on*).

Enabling the extra unit tests have some requirements,

- It requires to have internet access.
- It requires to have libcurl installed with the matching development headers and the curl-config tool.
- It requires to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this.
- It requires to have kim-property Python package installed, which can be easily done using *pip* as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).
- It is also necessary to install `EAM_Dynamo_MendeleevAckland_2007v3_Zr__MO_004835508849_000`, `EAM_Dynamo_ErcolessiAdams_1994_A1__MO_123629422045_005`, and `LennardJones612_UniversalShifted__MO_9592`

KIM models. See [Obtaining KIM Models](#) to learn how to install a pre-built binary of the OpenKIM Repository of Models or see [Installing KIM Models](#) to learn how to install the specific KIM models.

### 3.7.4 KOKKOS package

Using the KOKKOS package requires choosing several settings. You have to select whether you want to compile with parallelization on the host and whether you want to include offloading of calculations to a device (e.g. a GPU). The default setting is to have no host parallelization and no device offloading. In addition, you can select the hardware architecture to select the instruction set. Since most hardware is backward compatible, you may choose settings for an older architecture to have an executable that will run on this and newer architectures.

**Note:** If you run Kokkos on a different GPU architecture than what LAMMPS was compiled with, there will be a delay during device initialization while the just-in-time compiler is recompiling all GPU kernels for the new hardware. This is, however, only supported for GPUs of the **same** major hardware version and different minor hardware versions, e.g. 5.0 and 5.2 but not 5.2 and 6.0. LAMMPS will abort with an error message indicating a mismatch, if that happens.

The settings discussed below have been tested with LAMMPS and are confirmed to work. Kokkos is an active project with ongoing improvements and projects working on including support for additional architectures. More information on Kokkos can be found on the [Kokkos GitHub project](#).

#### Available Architecture settings

These are the possible choices for the Kokkos architecture ID. They must be specified in uppercase.

Arch-ID	HOST or GPU	Description
AMDAVX	HOST	AMD 64-bit x86 CPU (AVX 1)
ZEN	HOST	AMD Zen class CPU (AVX 2)
ZEN2	HOST	AMD Zen2 class CPU (AVX 2)
ZEN3	HOST	AMD Zen3 class CPU (AVX 2)
ARMV80	HOST	ARMv8.0 Compatible CPU
ARMV81	HOST	ARMv8.1 Compatible CPU
ARMV8_THUNDERX	HOST	ARMv8 Cavium ThunderX CPU
ARMV8_THUNDERX2	HOST	ARMv8 Cavium ThunderX2 CPU
A64FX	HOST	ARMv8.2 with SVE Support
WSM	HOST	Intel Westmere CPU (SSE 4.2)
SNB	HOST	Intel Sandy/Ivy Bridge CPU (AVX 1)
HSW	HOST	Intel Haswell CPU (AVX 2)
BDW	HOST	Intel Broadwell Xeon E-class CPU (AVX 2 + transactional mem)
SKX	HOST	Intel Sky Lake Xeon E-class HPC CPU (AVX512 + transactional mem)
KNC	HOST	Intel Knights Corner Xeon Phi
KNL	HOST	Intel Knights Landing Xeon Phi
BGQ	HOST	IBM Blue Gene/Q CPU
POWER7	HOST	IBM POWER7 CPU
POWER8	HOST	IBM POWER8 CPU
POWER9	HOST	IBM POWER9 CPU
KEPLER30	GPU	NVIDIA Kepler generation CC 3.0 GPU
KEPLER32	GPU	NVIDIA Kepler generation CC 3.2 GPU
KEPLER35	GPU	NVIDIA Kepler generation CC 3.5 GPU

continues on next page

Table 1 – continued from previous page

KEPLER37	GPU	NVIDIA Kepler generation CC 3.7 GPU
MAXWELL50	GPU	NVIDIA Maxwell generation CC 5.0 GPU
MAXWELL52	GPU	NVIDIA Maxwell generation CC 5.2 GPU
MAXWELL53	GPU	NVIDIA Maxwell generation CC 5.3 GPU
PASCAL60	GPU	NVIDIA Pascal generation CC 6.0 GPU
PASCAL61	GPU	NVIDIA Pascal generation CC 6.1 GPU
VOLTA70	GPU	NVIDIA Volta generation CC 7.0 GPU
VOLTA72	GPU	NVIDIA Volta generation CC 7.2 GPU
TURING75	GPU	NVIDIA Turing generation CC 7.5 GPU
AMPERE80	GPU	NVIDIA Ampere generation CC 8.0 GPU
AMPERE86	GPU	NVIDIA Ampere generation CC 8.6 GPU
VEGA900	GPU	AMD GPU MI25 GFX900
VEGA906	GPU	AMD GPU MI50/MI60 GFX906
VEGA908	GPU	AMD GPU MI100 GFX908
VEGA90A	GPU	AMD GPU
INTEL_DG1	GPU	Intel Iris XeMAX GPU
INTEL_GEN9	GPU	Intel GPU Gen9
INTEL_GEN11	GPU	Intel GPU Gen11
INTEL_GEN12LP	GPU	Intel GPU Gen12LP
INTEL_XEHP	GPU	Intel GPUs Xe-HP

This list was last updated for version 3.5.0 of the Kokkos library.

---

#### Basic CMake build settings:

For multicore CPUs using OpenMP, set these 2 variables.

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ENABLE_OPENMP=yes
-D BUILD_OMP=yes
```

Please note that enabling OpenMP for KOKKOS requires that OpenMP is also *enabled for the rest of LAMMPS*.

For Intel KNLs using OpenMP, set these variables:

```
-D Kokkos_ARCH_KNL=yes
-D Kokkos_ENABLE_OPENMP=yes
```

For NVIDIA GPUs using CUDA, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes # GPUARCH = GPU from list above
-D Kokkos_ENABLE_CUDA=yes
-D Kokkos_ENABLE_OPENMP=yes
-D CMAKE_CXX_COMPILER=wrapper # wrapper = full path to Cuda nvcc wrapper
```

This will also enable executing FFTs on the GPU, either via the internal KISSFFT library, or - by preference - with the cuFFT library bundled with the CUDA toolkit, depending on whether CMake can identify its location. The *wrapper* value for CMAKE\_CXX\_COMPILER variable is the path to the CUDA nvcc compiler wrapper provided in the Kokkos library: `lib/kokkos/bin/nvcc_wrapper`. The setting should include the full path name to the wrapper, e.g.

```
-D CMAKE_CXX_COMPILER=${HOME}/lammps/lib/kokkos/bin/nvcc_wrapper
```

For AMD or NVIDIA GPUs using HIP, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes # GPUARCH = GPU from list above
-D Kokkos_ENABLE_HIP=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will enable FFTs on the GPU, either by the internal KISSFFT library or with the hipFFT wrapper library, which will call out to the platform-appropriate vendor library: rocFFT on AMD GPUs or cuFFT on NVIDIA GPUs.

To simplify compilation, five preset files are included in the `cmake/presets` folder, `kokkos-serial.cmake`, `kokkos-openmp.cmake`, `kokkos-cuda.cmake`, `kokkos-hip.cmake`, and `kokkos-sycl.cmake`. They will enable the KOKKOS package and enable some hardware choice. So to compile with CUDA device parallelization (for GPUs with CC 5.0 and up) with some common packages enabled, you can do the following:

```
mkdir build-kokkos-cuda
cd build-kokkos-cuda
cmake -C ../cmake/presets/basic.cmake -C ../cmake/presets/kokkos-cuda.cmake ../
↪cmake
cmake --build .
```

---

#### Basic traditional make settings:

Choose which hardware to support in `Makefile.machine` via `KOKKOS_DEVICES` and `KOKKOS_ARCH` settings. See the `src/MAKE/OPTIONS/Makefile.kokkos*` files for examples.

For multicore CPUs using OpenMP:

```
KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = HOSTARCH # HOSTARCH = HOST from list above
```

For Intel KNLs using OpenMP:

```
KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = KNL
```

For NVIDIA GPUs using CUDA:

```
KOKKOS_DEVICES = Cuda
KOKKOS_ARCH = HOSTARCH,GPUARCH # HOSTARCH = HOST from list above that is,
↪hosting the GPU
KOKKOS_CUDA_OPTIONS = "enable_lambda"
# GPUARCH = GPU from list above
FFT_INC = -DFFT_CUFFT # enable use of cuFFT (optional)
FFT_LIB = -lcufft # link to cuFFT library
```

For GPUs, you also need the following lines in your `Makefile.machine` before the `CC` line is defined. They tell `mpicxx` to use an `nvcc` compiler wrapper, which will use `nvcc` for compiling CUDA files and a C++ compiler for non-Kokkos, non-CUDA files.

```
# For OpenMPI
KOKKOS_ABSOLUTE_PATH = $(shell cd $(KOKKOS_PATH); pwd)
export OMPI_CXX = $(KOKKOS_ABSOLUTE_PATH)/config/nvcc_wrapper
CC = mpicxx
```

```
# For MPICH and derivatives
KOKKOS_ABSOLUTE_PATH = $(shell cd $(KOKKOS_PATH); pwd)
CC = mpicxx -cxx=$(KOKKOS_ABSOLUTE_PATH)/config/nvcc_wrapper
```

For AMD or NVIDIA GPUs using HIP:

```
KOKKOS_DEVICES = HIP
KOKKOS_ARCH = HOSTARCH,GPUARCH # HOSTARCH = HOST from list above that is
↪hosting the GPU
                                # GPUARCH = GPU from list above
FFT_INC = -DFFT_HIPFFT          # enable use of hipFFT (optional)
FFT_LIB = -lhipfft              # link to hipFFT library
```

### Advanced KOKKOS compilation settings

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. Below are some examples that may be useful in combination with LAMMPS. For the full list (which keeps changing as the Kokkos package itself evolves), please consult the Kokkos library documentation.

As alternative to using multi-threading via OpenMP (`-DKokkos_ENABLE_OPENMP=on` or `KOKKOS_DEVICES=OpenMP`) it is also possible to use Posix threads directly (`-DKokkos_ENABLE_PTHREAD=on` or `KOKKOS_DEVICES=Pthread`). While binding of threads to individual or groups of CPU cores is managed in OpenMP with environment variables, you need assistance from either the “hwloc” or “libnuma” library for the Pthread thread parallelization option. To enable use with CMake: `-DKokkos_ENABLE_HWLOC=on` or `-DKokkos_ENABLE_LIBNUMA=on`; and with conventional make: `KOKKOS_USE_TPLS=hwloc` or `KOKKOS_USE_TPLS=libnuma`.

The CMake option `-DKokkos_ENABLE_LIBRT=on` or the makefile setting `KOKKOS_USE_TPLS=librt` enables the use of a more accurate timer mechanism on many Unix-like platforms for internal profiling.

The CMake option `-DKokkos_ENABLE_DEBUG=on` or the makefile setting `KOKKOS_DEBUG=yes` enables printing of runtime debugging information that can be useful. It also enables runtime bounds checking on Kokkos data structures. As to be expected, enabling this option will negatively impact the performance and thus is only recommended when developing a Kokkos-enabled style in LAMMPS.

The CMake option `-DKokkos_ENABLE_CUDA_UVM=on` or the makefile setting `KOKKOS_CUDA_OPTIONS=enable_lambda,force_uvm` enables the use of CUDA “Unified Virtual Memory” (UVM) in Kokkos. UVM allows to transparently use RAM on the host to supplement the memory used on the GPU (with some performance penalty) and thus enables running larger problems that would otherwise not fit into the RAM on the GPU.

Please note, that the LAMMPS KOKKOS package must **always** be compiled with the `enable_lambda` option when using GPUs. The CMake configuration will thus always enable it.

### 3.7.5 LATTE package

To build with this package, you must download and build the LATTE library.

---

#### CMake build

```
-D DOWNLOAD_LATTE=value      # download LATTE for build, value = no (default)
↪ or yes
-D LATTE_LIBRARY=path        # LATTE library file (only needed if a custom
↪ location)
-D USE_INTERNAL_LINALG=value # Use the internal linear algebra library instead
↪ of LAPACK
                               # value = no (default) or yes
```

If `DOWNLOAD_LATTE` is set, the LATTE library will be downloaded and built inside the CMake build directory. If the LATTE library is already on your system (in a location CMake cannot find it), `LATTE_LIBRARY` is the filename (plus path) of the LATTE library file, not the directory the library file is in.

The LATTE library requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the LATTE build script. But on some systems this triggers a (current) limitation of CMake and the configuration will fail. Try enabling `USE_INTERNAL_LINALG` in those cases to use the bundled linear algebra library and work around the limitation.

---

#### Traditional make

You can download and build the LATTE library manually if you prefer; follow the instructions in `lib/latte/README`. You can also do it in one step from the `lammops/src` dir, using a command like these, which simply invokes the `lib/latte/Install.py` script with the specified args:

```
$ make lib-latte                # print help message
$ make lib-latte args="-b"      # download and build in lib/latte/
↪ LATTE-master
$ make lib-latte args="-p $HOME/latte" # use existing LATTE installation in
↪ $HOME/latte
$ make lib-latte args="-b -m gfortran" # download and build in lib/latte and
↪ copy Makefile.lammops.gfortran to
↪ Makefile.lammops
```

Note that 3 symbolic (soft) links, `includelink` and `liblink` and `filelink.o`, are created in `lib/latte` to point to required folders and files in the LATTE home directory. When LAMMPS itself is built it will use these links. You should also check that the `Makefile.lammops` file you create is appropriate for the compiler you use on your system to build LATTE.

---

### 3.7.6 ML-IAP package

Building the ML-IAP package requires including the *ML-SNAP* package. There will be an error message if this requirement is not satisfied. Using the *mliappy* model also requires enabling Python support, which in turn requires to include the *PYTHON* package **and** requires to have the *cython* software installed and with it a working *cythonize* command. This feature requires compiling LAMMPS with Python version 3.6 or later.

---

#### CMake build

```
-D MLIAP_ENABLE_PYTHON=value # enable mliappy model (default is autodetect)
```

Without this setting, CMake will check whether it can find a suitable Python version and the *cythonize* command and choose the default accordingly. During the build procedure the provided .pyx file(s) will be automatically translated to C++ code and compiled. Please do **not** run *cythonize* manually in the *src/ML-IAP* folder, as that can lead to compilation errors if Python support is not enabled. If you did it by accident, please remove the generated .cpp and .h files.

---

#### Traditional make

The build uses the *lib/python/Makefile.mliap\_python* file in the compile/link process to add a rule to update the files generated by the *cythonize* command in case the corresponding .pyx file(s) were modified. You may need to modify *lib/python/Makefile.lammps* if the LAMMPS build fails.

To enable building the ML-IAP package with Python support enabled, you need to add *-DMLIAP\_PYTHON* to the *LMP\_INC* variable in your machine makefile. You may have to manually run the *cythonize* command on .pyx file(s) in the *src* folder, if this is not automatically done during installing the ML-IAP package. Please do **not** run *cythonize* in the *src/ML-IAP* folder, as that can lead to compilation errors if Python support is not enabled. If you did this by accident, please remove the generated .cpp and .h files.

---

### 3.7.7 MSCG package

To build with this package, you must download and build the MS-CG library. Building the MS-CG library requires that the GSL (GNU Scientific Library) headers and libraries are installed on your machine. See the *lib/mscg/README* and *MSCG/Install* files for more details.

---

#### CMake build

```
-D DOWNLOAD_MSCG=value # download MSCG for build, value = no (default) or ↵
↵yes
-D MSCG_LIBRARY=path # MSCG library file (only needed if a custom ↵
↵location)
-D MSCG_INCLUDE_DIR=path # MSCG include directory (only needed if a custom ↵
↵location)
```

If *DOWNLOAD\_MSCG* is set, the MSCG library will be downloaded and built inside the CMake build directory. If the MSCG library is already on your system (in a location CMake cannot find it), *MSCG\_LIBRARY* is the filename (plus path) of the MSCG library file, not the directory the library file is in. *MSCG\_INCLUDE\_DIR* is the directory the MSCG include file is in.

---

---

**Traditional make**

You can download and build the MS-CG library manually if you prefer; follow the instructions in `lib/mscg/README`. You can also do it in one step from the `lammops/src` dir, using a command like these, which simply invoke the `lib/mscg/Install.py` script with the specified args:

```
$ make lib-mscg           # print help message
$ make lib-mscg args="-b -m serial" # download and build in lib/mscg/MSCG-
↪release-master
                               # with the settings compatible with
↪"make serial"
$ make lib-mscg args="-b -m mpi"   # download and build in lib/mscg/MSCG-
↪release-master
                               # with the settings compatible with
↪"make mpi"
$ make lib-mscg args="-p /usr/local/mscg-release" # use the existing MS-CG_
↪installation in /usr/local/mscg-release
```

Note that 2 symbolic (soft) links, `includelink` and `liblink`, will be created in `lib/mscg` to point to the MS-CG `src/installation` dir. When LAMMPS is built in `src` it will use these links. You should not need to edit the `lib/mscg/Makefile.lammops` file.

---

---

### 3.7.8 OPT package

---

**CMake build**

No additional settings are needed besides `-D PKG_OPT=yes`

---

---

**Traditional make**

The compiler flag `-restrict` must be used to build LAMMPS with the OPT package when using Intel compilers. It should be added to the `CCFLAGS` line of your `Makefile.machine`. See `src/MAKE/OPTIONS/Makefile.opt` for an example.

---

---

### 3.7.9 POEMS package

---

**CMake build**

No additional settings are needed besides `-D PKG_OPT=yes`

---

---

**Traditional make**

Before building LAMMPS, you must build the POEMS library in `lib/poems`. You can do this manually if you prefer; follow the instructions in `lib/poems/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/poems/Install.py` script with the specified args:

```
$ make lib-poems           # print help message
$ make lib-poems args="-m serial" # build with GNU g++ compiler (settings as
↪with "make serial")
$ make lib-poems args="-m mpi"   # build with default MPI C++ compiler
↪(settings as with "make mpi")
$ make lib-poems args="-m icc"   # build with Intel icc compiler
```

The build should produce two files: `lib/poems/libpoems.a` and `lib/poems/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the POEMS library (though typically the settings are just blank). If necessary, you can edit/create a new `lib/poems/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.machine` file.

---

### 3.7.10 PYTHON package

Building with the PYTHON package requires you have a the Python development headers and library available on your system, which needs to be a Python 2.7 version or a Python 3.x version. Since support for Python 2.x has ended, using Python 3.x is strongly recommended. See `lib/python/README` for additional details.

---

#### CMake build

```
-D PYTHON_EXECUTABLE=path # path to Python executable to use
```

Without this setting, CMake will guess the default Python version on your system. To use a different Python version, you can either create a virtualenv, activate it and then run `cmake`. Or you can set the `PYTHON_EXECUTABLE` variable to specify which Python interpreter should be used. Note note that you will also need to have the development headers installed for this version, e.g. `python2-devel`.

---

---

#### Traditional make

The build uses the `lib/python/Makefile.lammps` file in the compile/link process to find Python. You should only need to create a new `Makefile.lammps.*` file (and copy it to `Makefile.lammps`) if the LAMMPS build fails.

---

### 3.7.11 VORONOI package

To build with this package, you must download and build the [Voro++ library](#) or install a binary package provided by your operating system.

---

#### CMake build

```
-D DOWNLOAD_VORO=value      # download Voro++ for build, value = no (default) or ↵  
↵yes  
-D VORO_LIBRARY=path        # Voro++ library file (only needed if at custom ↵  
↵location)  
-D VORO_INCLUDE_DIR=path    # Voro++ include directory (only needed if at custom ↵  
↵location)
```

If `DOWNLOAD_VORO` is set, the Voro++ library will be downloaded and built inside the CMake build directory. If the Voro++ library is already on your system (in a location CMake cannot find it), `VORO_LIBRARY` is the filename (plus path) of the Voro++ library file, not the directory the library file is in. `VORO_INCLUDE_DIR` is the directory the Voro++ include file is in.

---

---

#### Traditional make

You can download and build the Voro++ library manually if you prefer; follow the instructions in `lib/voronoi/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/voronoi/Install.py` script with the specified args:

```
$ make lib-voronoi          # print help message  
$ make lib-voronoi args="-b" # download and build the default ↵  
↵version in lib/voronoi/voro++-<version>  
$ make lib-voronoi args="-p $HOME/voro++" # use existing Voro++ installation ↵  
↵in $HOME/voro++  
$ make lib-voronoi args="-b -v voro++0.4.6" # download and build the 0.4.6 ↵  
↵version in lib/voronoi/voro++-0.4.6
```

Note that 2 symbolic (soft) links, `includelink` and `liblink`, are created in `lib/voronoi` to point to the Voro++ source dir. When LAMMPS builds in `src` it will use these links. You should not need to edit the `lib/voronoi/Makefile.lammps` file.

---

### 3.7.12 ADIOS package

The ADIOS package requires the [ADIOS I/O library](#), version 2.3.1 or newer. Make sure that you have ADIOS built either with or without MPI to match if you build LAMMPS with or without MPI. ADIOS compilation settings for LAMMPS are automatically detected, if the `PATH` and `LD_LIBRARY_PATH` environment variables have been updated for the local ADIOS installation and the instructions below are followed for the respective build systems.

---

#### CMake build

```
-D ADIOS2_DIR=path          # path is where ADIOS 2.x is installed  
-D PKG_ADIOS=yes
```

---

**Traditional make**

Turn on the ADIOS package before building LAMMPS. If the ADIOS 2.x software is installed in PATH, there is nothing else to do:

```
$ make yes-adios
```

otherwise, set ADIOS2\_DIR environment variable when turning on the package:

```
$ ADIOS2_DIR=path make yes-adios # path is where ADIOS 2.x is installed
```

---

### 3.7.13 ATC package

The ATC package requires the MANYBODY package also be installed.

---

**CMake build**

No additional settings are needed besides `-D PKG_ATC=yes` and `-D PKG_MANYBODY=yes`.

---

---

**Traditional make**

Before building LAMMPS, you must build the ATC library in `lib/atc`. You can do this manually if you prefer; follow the instructions in `lib/atc/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/atc/Install.py` script with the specified args:

```
$ make lib-atc # print help message
$ make lib-atc args="-m serial" # build with GNU g++ compiler and MPI
↪(settings as with "make serial")
$ make lib-atc args="-m mpi" # build with default MPI compiler
↪(settings as with "make mpi")
$ make lib-atc args="-m icc" # build with Intel icc compiler
```

The build should produce two files: `lib/atc/libatc.a` and `lib/atc/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the ATC library. If necessary, you can edit/create a new `lib/atc/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

Note that the `Makefile.lammps` file has settings for the BLAS and LAPACK linear algebra libraries. As explained in `lib/atc/README` these can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
$ make lib-linalg # print help message
$ make lib-linalg args="-m serial" # build with GNU Fortran compiler
↪(settings as with "make serial")
$ make lib-linalg args="-m mpi" # build with default MPI Fortran
```

(continues on next page)

(continued from previous page)

```
↪ compiler (settings as with "make mpi")
$ make lib-linalg args="-m gfortran" # build with GNU Fortran compiler
```

---

### 3.7.14 AWPMD package

---

#### CMake build

No additional settings are needed besides `-D PKG_AQPM=yes`.

---

#### Traditional make

Before building LAMMPS, you must build the AWPMD library in `lib/awpmd`. You can do this manually if you prefer; follow the instructions in `lib/awpmd/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/awpmd/Install.py` script with the specified args:

```
$ make lib-awpmd # print help message
$ make lib-awpmd args="-m serial" # build with GNU g++ compiler and MPI STUBS
↪ (settings as with "make serial")
$ make lib-awpmd args="-m mpi" # build with default MPI compiler (settings
↪ as with "make mpi")
$ make lib-awpmd args="-m icc" # build with Intel icc compiler
```

The build should produce two files: `lib/awpmd/libawpmd.a` and `lib/awpmd/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the AWPMD library. If necessary, you can edit/create a new `lib/awpmd/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

Note that the `Makefile.lammps` file has settings for the BLAS and LAPACK linear algebra libraries. As explained in `lib/awpmd/README` these can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
$ make lib-linalg # print help message
$ make lib-linalg args="-m serial" # build with GNU Fortran compiler
↪ (settings as with "make serial")
$ make lib-linalg args="-m mpi" # build with default MPI Fortran
↪ compiler (settings as with "make mpi")
$ make lib-linalg args="-m gfortran" # build with GNU Fortran compiler
```

---

### 3.7.15 COLVARS package

This package includes the [Colvars library](#) into the LAMMPS distribution, which can be built for the most part with all major versions of the C++ language.

---

#### CMake build

This is the recommended build procedure for using Colvars in LAMMPS. No additional settings are normally needed besides `-D PKG_COLVARS=yes`.

---

#### Traditional make

Before building LAMMPS, one must build the Colvars library in `lib/colvars`.

This can be done manually in the same folder by using or adapting one of the provided Makefiles: for example, `Makefile.g++` for the GNU C++ compiler. C++11 compatibility may need to be enabled for some older compilers (as is done in the example makefile).

In general, it is safer to use build setting consistent with the rest of LAMMPS. This is best carried out from the LAMMPS `src` directory using a command like these, which simply invoke the `lib/colvars/Install.py` script with the specified args:

```
$ make lib-colvars           # print help message
$ make lib-colvars args="-m serial" # build with GNU g++ compiler
↪(settings as with "make serial")
$ make lib-colvars args="-m mpi"   # build with default MPI compiler
↪(settings as with "make mpi")
$ make lib-colvars args="-m g++-debug" # build with GNU g++ compiler and
↪colvars debugging enabled
```

The “machine” argument of the “-m” flag is used to find a `Makefile.machine` to use as build recipe. If it does not already exist in `lib/colvars`, it will be auto-generated by using compiler flags consistent with those parsed from the core LAMMPS makefiles.

Optional flags may be specified as environment variables:

```
$ COLVARS_DEBUG=yes make lib-colvars args="-m machine" # Build with debug
↪code (much slower)
$ COLVARS_LEPTON=no make lib-colvars args="-m machine" # Build without Lepton
↪(included otherwise)
```

The build should produce two files: the library `lib/colvars/libcolvars.a` (which also includes Lepton objects if enabled) and the specification file `lib/colvars/Makefile.lammps`. The latter is auto-generated, and normally does not need to be edited.

---

### 3.7.16 ELECTRODE package

This package depends on the KSPACE package.

---

#### CMake build

No additional settings are needed besides `-D PKG_KSPACE=yes` and `-D PKG_ELECTRODE=yes`.

---

#### Traditional make

The package is activated with `make yes-KSPACE` and `make yes-ELECTRODE`

Note that the `Makefile.lammps` file has settings for the BLAS and LAPACK linear algebra libraries. As explained in `lib/awpmd/README` these can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
$ make lib-linalg           # print help message
$ make lib-linalg args="-m serial" # build with GNU Fortran compiler
↪(settings as with "make serial")
$ make lib-linalg args="-m mpi"   # build with default MPI Fortran
↪compiler (settings as with "make mpi")
$ make lib-linalg args="-m gfortran" # build with GNU Fortran compiler
```

---

### 3.7.17 ML-PACE package

This package requires a library that can be downloaded and built in `lib/pace` or somewhere else, which must be done before building LAMMPS with this package. The code for the library can be found at: <https://github.com/ICAMS/lammps-user-pace/>

---

#### CMake build

By default the library will be downloaded from the git repository and built automatically when the ML-PACE package is enabled with `-D PKG_ML-PACE=yes`. The location for the sources may be customized by setting the variable `PACELIB_URL` when configuring with CMake (e.g. to use a local archive on machines without internet access). Since CMake checks the validity of the archive with `md5sum` you may also need to set `PACELIB_MD5` if you provide a different library version than what is downloaded automatically.

---

#### Traditional make

You can download and build the ML-PACE library in one step from the `lammps/src` dir, using these commands, which invoke the `lib/pace/Install.py` script.

```
$ make lib-pace           # print help message
$ make lib-pace args="-b" # download and build the default
↪version in lib/pace
```

---

You should not need to edit the `lib/pace/Makefile.lammps` file.

---

### 3.7.18 PLUMED package

Before building LAMMPS with this package, you must first build PLUMED. PLUMED can be built as part of the LAMMPS build or installed separately from LAMMPS using the generic [PLUMED installation instructions](#). The PLUMED package has been tested to work with Plumed versions 2.4.x, 2.5.x, and 2.6.x and will error out, when trying to run calculations with a different version of the Plumed kernel.

PLUMED can be linked into MD codes in three different modes: static, shared, and runtime. With the “static” mode, all the code that PLUMED requires is linked statically into LAMMPS. LAMMPS is then fully independent from the PLUMED installation, but you have to rebuild/relink it in order to update the PLUMED code inside it. With the “shared” linkage mode, LAMMPS is linked to a shared library that contains the PLUMED code. This library should preferably be installed in a globally accessible location. When PLUMED is linked in this way the same library can be used by multiple MD packages. Furthermore, the PLUMED library LAMMPS uses can be updated without the need for a recompile of LAMMPS for as long as the shared PLUMED library is ABI-compatible.

The third linkage mode is “runtime” which allows the user to specify which PLUMED kernel should be used at runtime by using the `PLUMED_KERNEL` environment variable. This variable should point to the location of the `libplumed-Kernel.so` dynamical shared object, which is then loaded at runtime. This mode of linking is particularly convenient for doing PLUMED development and comparing multiple PLUMED versions as these sorts of comparisons can be done without recompiling the hosting MD code. All three linkage modes are supported by LAMMPS on selected operating systems (e.g. Linux) and using either CMake or traditional make build. The “static” mode should be the most portable, while the “runtime” mode support in LAMMPS makes the most assumptions about operating system and compiler environment. If one mode does not work, try a different one, switch to a different build system, consider a global PLUMED installation or consider downloading PLUMED during the LAMMPS build.

---

#### CMake build

When the `-D PKG_PLUMED=yes` flag is included in the `cmake` command you must ensure that GSL is installed in locations that are specified in your environment. There are then two additional variables that control the manner in which PLUMED is obtained and linked into LAMMPS.

```
-D DOWNLOAD_PLUMED=value    # download PLUMED for build, value = no (default),  
→ or yes  
-D PLUMED_MODE=value       # Linkage mode for PLUMED, value = static (default),  
→ shared, or runtime
```

If `DOWNLOAD_PLUMED` is set to “yes”, the PLUMED library will be downloaded (the version of PLUMED that will be downloaded is hard-coded to a vetted version of PLUMED, usually a recent stable release version) and built inside the CMake build directory. If `DOWNLOAD_PLUMED` is set to “no” (the default), CMake will try to detect and link to an installed version of PLUMED. For this to work, the PLUMED library has to be installed into a location where the `pkg-config` tool can find it or the `PKG_CONFIG_PATH` environment variable has to be set up accordingly. PLUMED should be installed in such a location if you compile it using the default `make`; `make install` commands.

The `PLUMED_MODE` setting determines the linkage mode for the PLUMED library. The allowed values for this flag are “static” (default), “shared”, or “runtime”. If you want to switch the linkage mode, just re-run CMake with a different setting. For a discussion of PLUMED linkage modes, please see above. When `DOWNLOAD_PLUMED` is enabled the static linkage mode is recommended.

---

#### Traditional make

PLUMED needs to be installed before the PLUMED package is installed so that LAMMPS can find the right settings when compiling and linking the LAMMPS executable. You can either download and build PLUMED inside the LAMMPS plumed library folder or use a previously installed PLUMED library and point LAMMPS to its location. You also have to choose the linkage mode: “static” (default), “shared” or “runtime”. For a discussion of PLUMED linkage modes, please see above.

Download/compilation/configuration of the plumed library can be done from the src folder through the following make args:

```
$ make lib-plumed # print help message
$ make lib-plumed args="-b" # download and build PLUMED in lib/
  →plumed/plumed2
$ make lib-plumed args="-p $HOME/.local" # use existing PLUMED installation
  →in $HOME/.local
$ make lib-plumed args="-p /usr/local -m shared" # use existing PLUMED
  →installation in # /usr/local and use shared
  →linkage mode
```

Note that 2 symbolic (soft) links, `includelink` and `liblink` are created in `lib/plumed` that point to the location of the PLUMED build to use. A new file `lib/plumed/Makefile.lammps` is also created with settings suitable for LAMMPS to compile and link PLUMED using the desired linkage mode. After this step is completed, you can install the PLUMED package and compile LAMMPS in the usual manner:

```
$ make yes-plumed
$ make machine
```

Once this compilation completes you should be able to run LAMMPS in the usual way. For shared linkage mode, `libplumed.so` must be found by the LAMMPS executable, which on many operating systems means, you have to set the `LD_LIBRARY_PATH` environment variable accordingly.

Support for the different linkage modes in LAMMPS varies for different operating systems, using the static linkage is expected to be the most portable, and thus set to be the default.

If you want to change the linkage mode, you have to re-run “make lib-plumed” with the desired settings **and** do a re-install if the PLUMED package with “make yes-plumed” to update the required makefile settings with the changes in the `lib/plumed` folder.

---

### 3.7.19 H5MD package

To build with this package you must have the HDF5 software package installed on your system, which should include the `h5cc` compiler and the HDF5 library.

---

#### CMake build

No additional settings are needed besides `-D PKG_H5MD=yes`.

This should auto-detect the H5MD library on your system. Several advanced CMake H5MD options exist if you need to specify where it is installed. Use the `cmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

---

---

#### Traditional make

Before building LAMMPS, you must build the CH5MD library in `lib/h5md`. You can do this manually if you prefer; follow the instructions in `lib/h5md/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/h5md/Install.py` script with the specified args:

```
$ make lib-h5md           # print help message
$ make lib-h5md args="-m h5cc" # build with h5cc compiler
```

The build should produce two files: `lib/h5md/libch5md.a` and `lib/h5md/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the system HDF5 library. If necessary, you can edit/create a new `lib/h5md/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

### 3.7.20 ML-HDNNP package

To build with the ML-HDNNP package it is required to download and build the external `n2p2` library v2.1.4 (or higher). The LAMMPS build process offers an automatic download and compilation of `n2p2` or allows you to choose the installation directory of `n2p2` manually. Please see the boxes below for the CMake and traditional build system for detailed information.

In case of a manual installation of `n2p2` you only need to build the `n2p2` core library `libnnp` and interface library `libnnpif`. When using GCC it should suffice to execute `make libnnpif` in the `n2p2` src directory. For more details please see `lib/hdnnp/README` and the `n2p2` build documentation.

#### CMake build

```
-D DOWNLOAD_N2P2=value    # download n2p2 for build, value = no (default) or
↪yes
-D N2P2_DIR=path          # n2p2 base directory (only needed if a custom
↪location)
```

If `DOWNLOAD_N2P2` is set, the `n2p2` library will be downloaded and built inside the CMake build directory. If the `n2p2` library is already on your system (in a location CMake cannot find it), set the `N2P2_DIR` path where `n2p2` is located. If `n2p2` is located directly in `lib/hdnnp/n2p2` it will be automatically found by CMake.

#### Traditional make

You can download and build the `n2p2` library manually if you prefer; follow the instructions in `lib/hdnnp/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/hdnnp/Install.py` script with the specified args:

```
$ make lib-hdnnp          # print help message
$ make lib-hdnnp args="-b" # download and build in lib/hdnnp/n2p2-...
$ make lib-hdnnp args="-b -v 2.1.4" # download and build specific version
$ make lib-hdnnp args="-p /usr/local/n2p2" # use the existing n2p2
↪installation in /usr/local/n2p2
```

Note that 3 symbolic (soft) links, `includelink`, `liblink` and `Makefile.lammps`, will be created in `lib/hdnp` to point to `n2p2/include`, `n2p2/lib` and `n2p2/lib/Makefile.lammps-extra`, respectively. When LAMMPS is built in `src` it will use these links.

---

### 3.7.21 INTEL package

To build with this package, you must choose which hardware you want to build for, either x86 CPUs or Intel KNLs in offload mode. You should also typically *install the OPENMP package*, as it can be used in tandem with the INTEL package to good effect, as explained on the *INTEL package* page.

When using Intel compilers version 16.0 or later is required. You can also use the GNU or Clang compilers and they will provide performance improvements over regular styles and OPENMP styles, but less so than with the Intel compilers. Please also note, that some compilers have been found to apply memory alignment constraints incompletely or incorrectly and thus can cause segmentation faults in otherwise correct code when using features from the INTEL package.

---

#### CMake build

```
-D INTEL_ARCH=value      # value = cpu (default) or knl
-D INTEL_LRT_MODE=value # value = threads, none, or c++11
```

---

---

#### Traditional make

Choose which hardware to compile for in `Makefile.machine` via the following settings. See `src/MAKE/OPTIONS/Makefile.intel_cpu*` and `Makefile.knl` files for examples. and `src/INTEL/README` for additional information.

For CPUs:

```
OPTFLAGS =      -xHost -O2 -fp-model fast=2 -no-prec-div -qoverride-limits -
↳qopt-zmm-usage=high
CCFLAGS =      -g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -ansi-
↳alias -restrict $(OPTFLAGS)
LINKFLAGS =    -g -qopenmp $(OPTFLAGS)
LIB =          -ltbbmalloc
```

For KNLs:

```
OPTFLAGS =      -xMIC-AVX512 -O2 -fp-model fast=2 -no-prec-div -qoverride-
↳limits
CCFLAGS =      -g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -ansi-
↳alias -restrict $(OPTFLAGS)
LINKFLAGS =    -g -qopenmp $(OPTFLAGS)
LIB =          -ltbbmalloc
```

---

In Long-range thread mode (LRT) a modified verlet style is used, that operates the Kspace calculation in a separate thread concurrently to other calculations. This has to be enabled in the *package intel* command at runtime. With the setting “threads” it used the `pthread` library, while “c++11” will use the built-in thread support of C++11 compilers.

The option “none” skips compilation of this feature. The default is to use “threads” if pthreads is available and otherwise “none”.

Best performance is achieved with Intel hardware, Intel compilers, as well as the Intel TBB and MKL libraries. However, the code also compiles, links, and runs with other compilers / hardware and without TBB and MKL.

### 3.7.22 MDI package

#### CMake build

```
-D DOWNLOAD_MDI=value      # download MDI Library for build, value = no,
↪(default) or yes
```

#### Traditional make

Before building LAMMPS, you must build the MDI Library in `lib/mdi`. You can do this by executing a command like one of the following from the `lib/mdi` directory:

```
$ python Install.py -m gcc      # build using gcc compiler
$ python Install.py -m icc      # build using icc compiler
```

The build should produce two files: `lib/mdi/includelink/mdi.h` and `lib/mdi/liblink/libmdi.so`.

### 3.7.23 MESONT package

This package includes a library written in Fortran 90 in the `lib/mesont` folder, so a working Fortran 90 compiler is required to compile it. Also, the files with the force field data for running the bundled examples are not included in the source distribution. Instead they will be downloaded the first time this package is installed.

#### CMake build

No additional settings are needed besides `-D PKG_MESONT=yes`

#### Traditional make

Before building LAMMPS, you must build the `mesont` library in `lib/mesont`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/mesont/Install.py` script with the specified args:

```
$ make lib-mesont           # print help message
$ make lib-mesont args="-m gfortran" # build with GNU g++ compiler (settings,
↪as with "make serial")
$ make lib-mesont args="-m ifort"   # build with Intel icc compiler
```

The build should produce two files: `lib/mesont/libmesont.a` and `lib/mesont/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the `mesont` library (though typically the settings contain only the Fortran runtime library). If necessary, you can edit/create a new `lib/mesont/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.machine` file.

---

### 3.7.24 MOLFILE package

---

#### CMake build

```
-D MOLFILE_INCLUDE_DIR=path # (optional) path where VMD molfile plugin
->headers are installed
-D PKG_MOLFILE=yes
```

Using `-D PKG_MOLFILE=yes` enables the package, and setting `-D MOLFILE_INCLUDE_DIR` allows to provide a custom location for the molfile plugin header files. These should match the ABI of the plugin files used, and thus one typically sets them to include folder of the local VMD installation in use. LAMMPS ships with a couple of default header files that correspond to a popular VMD version, usually the latest release.

---

---

#### Traditional make

The `lib/molfile/Makefile.lammps` file has a setting for a dynamic loading library `libdl.a` that is typically present on all systems. It is required for LAMMPS to link with this package. If the setting is not valid for your system, you will need to edit the `Makefile.lammps` file. See `lib/molfile/README` and `lib/molfile/Makefile.lammps` for details. It is also possible to configure a different folder with the VMD molfile plugin header files. LAMMPS ships with a couple of default headers, but these are not compatible with all VMD versions, so it is often best to change this setting to the location of the same include files of the local VMD installation in use.

---

### 3.7.25 NETCDF package

To build with this package you must have the NetCDF library installed on your system.

---

#### CMake build

No additional settings are needed besides `-D PKG_NETCDF=yes`.

This should auto-detect the NETCDF library if it is installed on your system at standard locations. Several advanced CMake NETCDF options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

---

---

#### Traditional make

The `lib/netcdf/Makefile.lammps` file has settings for NetCDF include and library files which LAMMPS needs to build with this package. If the settings are not valid for your system, you will need to edit the `Makefile.lammps` file. See `lib/netcdf/README` for details.

### 3.7.26 OPENMP package

#### CMake build

No additional settings are required besides `-D PKG_OPENMP=yes`. If CMake detects OpenMP compiler support, the OPENMP code will be compiled with multi-threading support enabled, otherwise as optimized serial code.

#### Traditional make

To enable multi-threading support in the OPENMP package (and other styles supporting OpenMP) the following compile and link flags must be added to your `Makefile.machine` file. See `src/MAKE/OPTIONS/Makefile.omp` for an example.

```
CCFLAGS: -fopenmp          # for GNU and Clang Compilers
CCFLAGS: -qopenmp -restrict # for Intel compilers on Linux
LINKFLAGS: -fopenmp       # for GNU and Clang Compilers
LINKFLAGS: -qopenmp       # for Intel compilers on Linux
```

For other platforms and compilers, please consult the documentation about OpenMP support for your compiler.

### 3.7.27 QMMM package

For using LAMMPS to do QM/MM simulations via the QMMM package you need to build LAMMPS as a library. A LAMMPS executable with *fix qmmm* included can be built, but will not be able to do a QM/MM simulation on as such. You must also build a QM code - currently only Quantum ESPRESSO (QE) is supported - and create a new executable which links LAMMPS and the QM code together. Details are given in the `lib/qmmm/README` file. It is also recommended to read the instructions for *linking with LAMMPS as a library* for background information. This requires compatible Quantum Espresso and LAMMPS versions. The current interface and makefiles have last been verified to work in February 2020 with Quantum Espresso versions 6.3 to 6.5.

#### CMake build

When using CMake, building a LAMMPS library is required and it is recommended to build a shared library, since any libraries built from the sources in the `lib` folder (including the essential `libqmmm.a`) are not included in the static LAMMPS library and (currently) not installed, while their code is included in the shared LAMMPS library. Thus a typical command line to configure building LAMMPS for QMMM would be:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_QMMM=yes \
-D BUILD_LIB=yes -DBUILD_SHARED_LIBS=yes ../cmake
```

After completing the LAMMPS build and also configuring and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the `lib/qmmm` folder and follow the instructions on the README file to build the combined LAMMPS/QE QM/MM executable (`pwqmmm.x`) in the `lib/qmmm` folder.

---

### Traditional make

Before building LAMMPS, you must build the QMMM library in `lib/qmmm`. You can do this manually if you prefer; follow the first two steps explained in `lib/qmmm/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/qmmm/Install.py` script with the specified args:

```
$ make lib-qmmm                # print help message
$ make lib-qmmm args="-m serial" # build with GNU Fortran compiler
↪(settings as in "make serial")
$ make lib-qmmm args="-m mpi"   # build with default MPI compiler
↪(settings as in "make mpi")
$ make lib-qmmm args="-m gfortran" # build with GNU Fortran compiler
```

The build should produce two files: `lib/qmmm/libqmmm.a` and `lib/qmmm/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the QMMM library (though typically the settings are just blank). If necessary, you can edit/create a new `lib/qmmm/Makefile.<machine>` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

You can then install QMMM package and build LAMMPS in the usual manner. After completing the LAMMPS build and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the `lib/qmmm` folder and follow the instructions in the README file to build the combined LAMMPS/QE QM/MM executable (`pwqmmm.x`) in the `lib/qmmm` folder.

---

## 3.7.28 ML-QUIP package

To build with this package, you must download and build the QUIP library. It can be obtained from GitHub. For support of GAP potentials, additional files with specific licensing conditions need to be downloaded and configured. The automatic download will from within CMake will download the non-commercial use version.

---

### CMake build

```
-D DOWNLOAD_QUIP=value      # download QUIP library for build, value = no
↪(default) or yes
-D QUIP_LIBRARY=path       # path to libquip.a (only needed if a custom
↪location)
-D USE_INTERNAL_LINALG=value # Use the internal linear algebra library instead
↪of LAPACK
                           # value = no (default) or yes
```

CMake will try to download and build the QUIP library from GitHub, if it is not found on the local machine. This requires to have git installed. It will use the same compilers and flags as used for compiling LAMMPS. Currently this is only supported for the GNU and the Intel compilers. Set the `QUIP_LIBRARY` variable if you want to use a previously compiled and installed QUIP library and CMake cannot find it.

The QUIP library requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the QUIP build script. But on some systems this triggers a (current) limitation of CMake and the configuration will fail. Try enabling `USE_INTERNAL_LINALG` in those cases to use the bundled linear algebra library and work around the limitation.

---

### Traditional make

The download/build procedure for the QUIP library, described in `lib/quip/README` file requires setting two environment variables, `QUIP_ROOT` and `QUIP_ARCH`. These are accessed by the `lib/quip/Makefile.lammps` file which is used when you compile and link LAMMPS with this package. You should only need to edit `Makefile.lammps` if the LAMMPS build can not use its settings to successfully build on your system.

---

## 3.7.29 SCAFACOS package

To build with this package, you must download and build the [ScaFaCoS Coulomb solver library](#)

---

### CMake build

```
-D DOWNLOAD_SCAFACOS=value      # download ScaFaCoS for build, value = no_
↪(default) or yes
-D SCAFACOS_LIBRARY=path       # ScaFaCos library file (only needed if at_
↪custom location)
-D SCAFACOS_INCLUDE_DIR=path   # ScaFaCoS include directory (only needed if at_
↪custom location)
```

If `DOWNLOAD_SCAFACOS` is set, the ScaFaCoS library will be downloaded and built inside the CMake build directory. If the ScaFaCoS library is already on your system (in a location CMake cannot find it), `SCAFACOS_LIBRARY` is the filename (plus path) of the ScaFaCoS library file, not the directory the library file is in. `SCAFACOS_INCLUDE_DIR` is the directory the ScaFaCoS include file is in.

---

### Traditional make

You can download and build the ScaFaCoS library manually if you prefer; follow the instructions in `lib/scafacos/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/scafacos/Install.py` script with the specified args:

```
make lib-scafacos                # print help message
make lib-scafacos args="-b"      # download and build in lib/scafacos/
↪scafacos-<version>
make lib-scafacos args="-p $HOME/scafacos # use existing ScaFaCoS_
↪installation in $HOME/scafacos
```

Note that 2 symbolic (soft) links, `includelink` and `liblink`, are created in `lib/scafacos` to point to the ScaFaCoS src dir. When LAMMPS builds in `src` it will use these links. You should not need to edit the `lib/scafacos/Makefile.lammps` file.

---

### 3.7.30 MACHDYN package

To build with this package, you must download the Eigen3 library. Eigen3 is a template library, so you do not need to build it.

---

#### CMake build

```
-D DOWNLOAD_EIGEN3           # download Eigen3, value = no (default) or yes
-D EIGEN3_INCLUDE_DIR=path   # path to Eigen library (only needed if a custom
↪location)
```

If `DOWNLOAD_EIGEN3` is set, the Eigen3 library will be downloaded and inside the CMake build directory. If the Eigen3 library is already on your system (in a location where CMake cannot find it), set `EIGEN3_INCLUDE_DIR` to the directory the Eigen3 include file is in.

---

---

#### Traditional make

You can download the Eigen3 library manually if you prefer; follow the instructions in `lib/smd/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invoke the `lib/smd/Install.py` script with the specified args:

```
$ make lib-smd                # print help message
$ make lib-smd args="-b"      # download to lib/smd/eigen3
$ make lib-smd args="-p /usr/include/eigen3" # use existing Eigen
↪installation in /usr/include/eigen3
```

Note that a symbolic (soft) link named `includeLink` is created in `lib/smd` to point to the Eigen dir. When LAMMPS builds it will use this link. You should not need to edit the `lib/smd/Makefile.lammps` file.

---

### 3.7.31 VTK package

To build with this package you must have the VTK library installed on your system.

---

#### CMake build

No additional settings are needed besides `-D PKG_VTK=yes`.

This should auto-detect the VTK library if it is installed on your system at standard locations. Several advanced VTK options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

---

---

#### Traditional make

The `lib/vtk/Makefile.lammps` file has settings for accessing VTK files and its library, which LAMMPS needs to build with this package. If the settings are not valid for your system, check if one of the other `lib/vtk/Makefile.lammps.*` files is compatible and copy it to `Makefile.lammps`. If none of the provided files work, you will need to edit the `Makefile.lammps` file. See `lib/vtk/README` for details.

---

## 3.8 Build the LAMMPS documentation

Depending on how you obtained LAMMPS and whether you have built the manual yourself, this directory has a number of sub-directories and files. Here is a list with descriptions:

```

README           # brief info about the documentation
src              # content files for LAMMPS documentation
html            # HTML version of the LAMMPS manual (see html/Manual.html)
utils           # tools and settings for building the documentation
lammmps.1       # man page for the lammmps command
msi2lmp.1       # man page for the msi2lmp command
Manual.pdf      # large PDF version of entire manual
LAMMPS.epub     # Manual in ePUB e-book format
LAMMPS.mobi     # Manual in MOBI e-book format
docenv          # virtualenv folder for processing the manual sources
doctrees        # temporary data from processing the manual
doxygen         # doxygen configuration and output
.gitignore      # list of files and folders to be ignored by git
doxygen-warn.log # logfile with warnings from running doxygen
github-development-workflow.md # notes on the LAMMPS development workflow

```

If you downloaded LAMMPS as a tarball from the [LAMMPS website](https://www.lammps.org/), the html folder and the PDF files should be included.

If you downloaded LAMMPS from the public git repository, then the HTML and PDF files are not included. You can build the HTML or PDF files yourself, by typing `make html` or `make pdf` in the doc folder. This requires various tools and files. Some of them have to be installed (see below). For the rest the build process will attempt to download and install them into a python virtual environment and local folders.

A current version of the manual (latest patch release, that is the state of the *release* branch) is available online at: <https://docs.lammps.org/>. A version of the manual corresponding to the ongoing development (that is the state of the *develop* branch) is available online at: <https://docs.lammps.org/latest/>. A version of the manual corresponding to the latest stable LAMMPS release (that is the state of the *stable* branch) is available online at: <https://docs.lammps.org/stable/>

### 3.8.1 Build using GNU make

The LAMMPS manual is written in `reStructuredText` format which can be translated to different output format using the `Sphinx` document generator tool. It also incorporates programmer documentation extracted from the LAMMPS C++ sources through the `Doxygen` program. Currently the translation to HTML, PDF (via LaTeX), ePUB (for many e-book readers) and MOBI (for Amazon Kindle readers) are supported. For that to work a Python 3 interpreter, the `doxygen` tools and internet access to download additional files and tools are required. This download is usually only required once or after the documentation folder is returned to a pristine state with `make clean-all`.

For the documentation build a python virtual environment is set up in the folder `doc/docenv` and various python packages are installed into that virtual environment via the `pip` tool. For rendering embedded LaTeX code also the `MathJax` JavaScript engine needs to be downloaded. If you need to pass additional options to the pip commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the `PIP_OPTIONS` environment variable or uncomment and edit the `PIP_OPTIONS` setting at beginning of the makefile.

The actual translation is then done via `make` commands in the doc folder. The following `make` commands are available:

```

make html       # generate HTML in html dir using Sphinx
make pdf        # generate PDF as Manual.pdf using Sphinx and PDFLaTeX
make epub       # generate LAMMPS.epub in ePUB format using Sphinx

```

(continues on next page)

(continued from previous page)

```
make mobi          # generate LAMMPS.mobi in MOBI format using ebook-convert
make fasthtml     # generate approximate HTML in fasthtml dir using Sphinx
                  # some Sphinx extensions do not work correctly with this
make clean        # remove intermediate RST files created by HTML build
make clean-all   # remove entire build folder and any cached data
make anchor_check # check for duplicate anchor labels
make style_check  # check for complete and consistent style lists
make package_check # check for complete and consistent package lists
make spelling     # spell-check the manual
```

---

### 3.8.2 Build using CMake

It is also possible to create the HTML version (and **only** the HTML version) of the manual within the *CMake build directory*. The reason for this option is to include the installation of the HTML manual pages into the “install” step when installing LAMMPS after the CMake build via `cmake --build . --target install`. The documentation build is included in the default build target, but can also be requested independently with `cmake --build . --target doc`. If you need to pass additional options to the pip commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the `PIP_OPTIONS` environment variable.

```
-D BUILD_DOC=value      # yes or no (default)
```

---

### 3.8.3 Prerequisites for HTML

To run the HTML documentation build toolchain, python 3, git, doxygen, and virtualenv have to be installed locally. Here are instructions for common setups:

---

#### Ubuntu

```
sudo apt-get install python-virtualenv git doxygen
```

---

#### RHEL or CentOS (Version 7.x)

```
sudo yum install python3-virtualenv git doxygen
```

---

#### Fedora or RHEL/CentOS (8.x or later)

```
sudo dnf install python3-virtualenv git doxygen
```

---

---

## MacOS X

### *Python 3*

Download the latest Python 3 MacOS X package from <https://www.python.org> and install it. This will install both Python 3 and pip3.

### *virtualenv*

Once Python 3 is installed, open a Terminal and type

```
pip3 install virtualenv
```

This will install virtualenv from the Python Package Index.

---

## 3.8.4 Prerequisites for PDF

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with support for PDFLaTeX and a selection of LaTeX styles/packages are required. To run the PDFLaTeX translation the `latexmk` script needs to be installed as well.

## 3.8.5 Prerequisites for ePUB and MOBI

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with a few add-on LaTeX packages as well as the `dvi.png` tool are required to convert embedded math expressions transparently into embedded images.

For converting the generated ePUB file to a MOBI format file (for e-book readers, like Kindle, that cannot read ePUB), you also need to have the `ebook-convert` tool from the “calibre” software installed. <http://calibre-ebook.com/> Typing `make mobi` will first create the ePUB file and then convert it. On the Kindle readers in particular, you also have support for PDF files, so you could download and view the PDF version as an alternative.

## 3.8.6 Instructions for Developers

When adding new styles or options to the LAMMPS code, corresponding documentation is required and either existing files in the `src` folder need to be updated or new files added. These files are written in `reStructuredText` markup for translation with the Sphinx tool.

Before contributing any documentation, please check that both the HTML and the PDF format documentation can translate without errors. During testing the html translation, you may use the `make fasthtml` command which does an approximate translation (i.e. not all Sphinx features and extensions will work), but runs very fast because it will only translate files that have been changed since the last `make fasthtml` command.

Please also check the output to the console for any warnings or problems. There will be multiple tests run automatically:

- A test for correctness of all anchor labels and their references
- A test that all LAMMPS packages (= folders with sources in `lammeps/src`) are documented and listed. A typical warning shows the name of the folder with the suspected new package code and the documentation files where they need to be listed:

```
Found 88 packages
Package NEWPACKAGE missing in Packages_list.rst
Package NEWPACKAGE missing in Packages_details.rst
```

- A test that only standard, printable ASCII text characters are used. This runs the command `env LC_ALL=C grep -n '[^ -~]' src/*.rst` and thus prints all offending lines with filename and line number prepended to the screen. Special characters like the Angstrom Å should be typeset with embedded math (like this `:math:\`\).`
- A test whether all styles are documented and listed in their respective overview pages. A typical output with warnings looks like this:

```
Parsed style names w/o suffixes from C++ tree in ../src:
  Angle styles:      21   Atom styles:      24
  Body styles:       3   Bond styles:      17
  Command styles:   41   Compute styles:  143
  Dihedral styles:  16   Dump styles:     26
  Fix styles:       223  Improper styles:  13
  Integrate styles:  4   Kspace styles:   15
  Minimize styles:  9   Pair styles:     234
  Reader styles:    4   Region styles:   8
Compute style entry newcomp is missing or incomplete in Commands_compute.rst
Compute style entry newcomp is missing or incomplete in compute.rst
Fix style entry newfix is missing or incomplete in Commands_fix.rst
Fix style entry newfix is missing or incomplete in fix.rst
Pair style entry new is missing or incomplete in Commands_pair.rst
Pair style entry new is missing or incomplete in pair_style.rst
Found 6 issue(s) with style lists
```

In addition, there is the option to run a spellcheck on the entire manual with `make spelling`. This requires a library called `enchant`. To avoid printing out *false positives* (e.g. keywords, names, abbreviations) those can be added to the file `lammps/doc/utils/sphinx-config/false_positives.txt`.

## 3.9 Notes for building LAMMPS on Windows

- *General remarks*
  - *Running Linux on Windows*
  - *Using GNU GCC ported to Windows*
  - *Using Visual Studio*
  - *Using Intel oneAPI compilers and libraries*
  - *Using a cross-compiler*
-

### 3.9.1 General remarks

LAMMPS is developed and tested primarily on Linux machines. The vast majority of HPC clusters and supercomputers today run on Linux as well. While portability to other platforms is desired, it is not always achieved. That is sometimes due to non-portable code in LAMMPS itself, but more often due to portability limitations of external libraries and tools required to build a specific feature or package. The LAMMPS developers are dependent on LAMMPS users giving feedback and providing assistance in resolving portability issues. This is particularly true for compiling LAMMPS on Windows, since this platform has significant differences in some low-level functionality. As of LAMMPS version 14 December 2021, large parts of LAMMPS can be compiled natively with the Microsoft Visual C++ Compilers. As of LAMMPS version 31 May 2022, also the Intel oneAPI compilers can compile large parts of LAMMPS natively on Windows. This is mostly facilitated by using the *Platform abstraction functions* in the `platform` namespace and CMake.

Before trying to build LAMMPS on Windows yourself, please consider the [pre-compiled Windows installer packages](#) and see if they are sufficient for your needs.

### 3.9.2 Running Linux on Windows

If it is necessary for you to compile LAMMPS on a Windows machine (e.g. because it is your main desktop), please also consider using a virtual machine software and compile and run LAMMPS in a Linux virtual machine, or - if you have a sufficiently up-to-date Windows 10 or Windows 11 installation - consider using the Windows subsystem for Linux. This optional Windows feature allows you to run the bash shell of a Linux system (Ubuntu by default) from within Windows and from there on, you can pretty much use that shell like you are running on a regular Ubuntu Linux machine (e.g. installing software via apt-get and more). For more details on that, please see [this tutorial](#).

### 3.9.3 Using a GNU GCC ported to Windows

One option for compiling LAMMPS on Windows natively is to install a Bash shell, Unix shell utilities, Perl, Python, GNU make, and a GNU compiler ported to Windows. The Cygwin package provides a unix/linux interface to low-level Windows functions, so LAMMPS can be compiled on Windows. The necessary (minor) modifications to LAMMPS are included, but may not always be up-to-date for recently added functionality and the corresponding new code. A machine makefile for using cygwin for the old build system is provided. Using CMake for this mode of compilation is untested and not likely to work.

When compiling for Windows do **not** set the `-DLAMMPS_MEMALIGN` define in the `LMP_INC` makefile variable and add `-lwsck32 -lpsapi` to the linker flags in `LIB` makefile variable. Try adding `-static-libgcc` or `-static` or both to the linker flags when your resulting LAMMPS Windows executable complains about missing `.dll` files. The CMake configuration should set this up automatically, but is untested.

In case of problems, you are recommended to contact somebody with experience in using Cygwin. If you do come across portability problems requiring changes to the LAMMPS source code, or figure out corrections yourself, please report them on the [LAMMPS forum at MatSci](#), or file them as an issue or pull request on the LAMMPS GitHub project.

### 3.9.4 Using Microsoft Visual Studio

Following the integration of the *platform namespace* into the LAMMPS code base, portability of LAMMPS for native compilation on Windows using Visual Studio has been significantly improved. This has been tested with Visual Studio 2019 (aka version 16) and Visual Studio 2022 (aka version 17). We strongly recommend using Visual Studio 2022 version 17.1 or later. Not all features and packages in LAMMPS are currently supported out of the box, but a preset `cmake/presets/windows.cmake` is provided that contains the packages that have been compiled successfully so far. You **must** use the CMake based build procedure, since there is no support for GNU make or the Unix shell utilities required for the GNU make build procedure.

It is possible to use both the integrated CMake support of the Visual Studio IDE or use an external CMake installation (e.g. downloaded from [cmake.org](http://cmake.org)) to create build files and compile LAMMPS from the command line.

Compilation via command line and unit tests are checked automatically for the LAMMPS development branch through [GitHub Actions](#).

---

**Note:** Versions of Visual Studio before version 17.1 may scan the entire LAMMPS source tree and likely miss the correct master `CMakeLists.txt` and get confused since there are multiple files of that name in different folders but none in top level folder.

---

Please note, that for either approach CMake will create a so-called “*multi-configuration*” *build environment*, and the command lines for building and testing LAMMPS must be adjusted accordingly.

The LAMMPS `cmake` folder contains a `CMakeSettings.json` file with build configurations for MSVC compilers and the MS provided Clang compiler package in Debug and Release mode.

To support running in parallel you can compile with OpenMP enabled using the OPENMP package or install Microsoft MPI (including the SDK) and compile LAMMPS with MPI enabled.

---

**Note:** This is work in progress and you should contact the LAMMPS developers via [GitHub](#) or the [LAMMPS forum at MatSci](#), if you have questions or LAMMPS specific problems.

---

### 3.9.5 Using Intel oneAPI Compilers and Libraries

New in version 31May2022.

After installing the [Intel oneAPI](#) base toolkit and the HPC toolkit, it is also possible to compile large parts of LAMMPS natively on Windows using Intel compilers. The HPC toolkit provides two sets of C/C++ and Fortran compilers: the so-called “classic” compilers (`icl.exe` and `ifort.exe`) and newer, LLVM based compilers (`icx.exe` and `ifx.exe`). In addition to the compilers and their dependent modules, also the thread building blocks (TBB) and the math kernel library (MKL) need to be installed. Two presets (`cmake/presets/windows-intel-llvm.cmake` and `cmake/presets/windows-intel-classic.cmake`) are provided for selecting the LLVM based or classic compilers, respectively. The preset `cmake/presets/windows.cmake` enables compatible packages that are not dependent on additional features or libraries. You **must** use the CMake based build procedure and use Ninja as build tool. For compiling from the command prompt, thus both `CMake` and `Ninja-build` binaries must be installed. It is also possible to use Visual Studio, if it is started (`devenv.exe`) from a command prompt that has the Intel oneAPI compilers enabled. The Visual Studio settings file in the `cmake` folder contains configurations for both compiler variants in debug and release settings. Those will use the CMake and Ninja binaries bundled with Visual Studio, thus a separate installation is not required.

---

#### Known Limitations

In addition to portability issues with several packages and external libraries, the classic Intel compilers are currently not able to compile the googletest libraries and thus enabling the `-DENABLE_TESTING` option will result in compilation failure. The LLVM based compilers are compatible.

---

---

**Note:** This is work in progress and you should contact the LAMMPS developers via [GitHub](#) or the [LAMMPS forum at MatSci](#), if you have questions or LAMMPS specific problems.

---

### 3.9.6 Using a cross-compiler

If you need to provide custom LAMMPS binaries for Windows, but do not need to do the compilation on Windows, please consider using a Linux to Windows cross-compiler. This is how currently the Windows binary packages are created by the LAMMPS developers. Because of that, this is probably the currently best tested and supported way to build LAMMPS executables for Windows. A CMake preset selecting all packages compatible with this cross-compilation build is provided. The GPU package can only be compiled with OpenCL support. To compile with MPI support, a pre-compiled library and the corresponding header files are required. When building with CMake the matching package will be downloaded automatically, but MPI support has to be explicitly enabled with `-DBUILD_MPI=on`.

Please keep in mind, though, that this only applies to **compiling** LAMMPS. Whether the resulting binaries do work correctly is rarely tested by the LAMMPS developers. We instead rely on the feedback of the users of these pre-compiled LAMMPS packages for Windows. We will try to resolve issues to the best of our abilities if we become aware of them. However this is subject to time constraints and focus on HPC platforms.

## 3.10 Notes for saving disk space when building LAMMPS from source

LAMMPS is a large software project with a large number of source files, extensive documentation, and a large collection of example files. When downloading LAMMPS by cloning the [git repository from GitHub](#) this will by default also download the entire commit history since September 2006. Compiling LAMMPS will add the storage requirements of the compiled object files and libraries to the tally.

In a user account on an HPC cluster with filesystem quotas or in other environments with restricted disk space capacity it may be needed to reduce the storage requirements. Here are some suggestions:

- Create a so-called shallow repository by cloning only the last commit instead of the full project history by using `git clone git@github.com:lammops/lammops --depth=1 --branch=develop`. This reduces the downloaded size to about half. With `--depth=1` it is not possible to check out different versions/branches of LAMMPS, using `--depth=1000` will make multiple recent versions available at little extra storage needs (the entire git history had nearly 30,000 commits in fall 2021).
- Download a tar archive from either the [download section on the LAMMPS homepage](#) or from the [LAMMPS releases page on GitHub](#) these will not contain the git history at all.
- Build LAMMPS without the debug flag (remove `-g` from the machine makefile or use `-DCMAKE_BUILD_TYPE=Release`) or use the `strip` command on the LAMMPS executable when no more debugging would be needed. The `strip` command may also be applied to the LAMMPS shared library. The static library may be deleted entirely.
- Delete compiled object files and libraries after copying the LAMMPS executable to a permanent location. When using the traditional build process, one may use `make clean-<machine>` or `make clean-all` to delete object files in the `src` folder. For CMake based builds, one may use `make clean` or just delete the entire build folder.
- The folders containing the documentation tree (`doc`), the examples (`examples`) are not needed to build and run LAMMPS and can be safely deleted. Some files in the `potentials` folder are large and may be deleted, if not needed. The largest of those files (occupying about 120 MBytes combined) will only be downloaded on demand, when the corresponding package is installed.
- When using the CMake build procedure, the compilation can be done on a (local) scratch storage that will not count toward the quota. A local scratch file system may offer the additional benefit of speeding up creating object files and linking with libraries compared to a networked file system. Also with CMake (and unlike with the traditional `make`) it is possible to compile LAMMPS executables with different settings and packages included from the same source tree since all the configuration information is stored in the build folder. So it is not necessary to have multiple copies of LAMMPS.

## 3.11 Development build options

The build procedures in LAMMPS offers a few extra options which are useful during development, testing or debugging.

---

### 3.11.1 Monitor compilation flags (CMake only)

Sometimes it is necessary to verify the complete sequence of compilation flags generated by the CMake build. To enable a more verbose output during compilation you can use the following option.

```
-D CMAKE_VERBOSE_MAKEFILE=value    # value = no (default) or yes
```

Another way of doing this without reconfiguration is calling make with variable VERBOSE set to 1:

```
make VERBOSE=1
```

---

### 3.11.2 Enable static code analysis with clang-tidy (CMake only)

The `clang-tidy` tool is a static code analysis tool to diagnose (and potentially fix) typical programming errors or coding style violations. It has a modular framework of tests that can be adjusted to help identifying problems before they become bugs and also assist in modernizing large code bases (like LAMMPS). It can be enabled for all C++ code with the following CMake flag

```
-D ENABLE_CLANG_TIDY=value    # value = no (default) or yes
```

With this flag enabled all source files will be processed twice, first to be compiled and then to be analyzed. Please note that the analysis can be significantly more time consuming than the compilation itself.

---

### 3.11.3 Report missing and unneeded '#include' statements (CMake only)

The conventions for how and when to use and order include statements in LAMMPS are documented in *LAMMPS programming style and requirements for contributions*. To assist with following these conventions one can use the `Include What You Use` tool. This tool is still under development and for large and complex projects like LAMMPS there are some false positives, so suggested changes need to be verified manually. It is recommended to use at least version 0.16, which has much fewer incorrect reports than earlier versions. To install the IWYU toolkit, you need to have the clang compiler **and** its development package installed. Download the IWYU version that matches the version of the clang compiler, configure, build, and install it.

The necessary steps to generate the report can be enabled via a CMake variable during CMake configuration.

```
-D ENABLE_IWYU=value    # value = no (default) or yes
```

This will check if the required binary (`include-what-you-use` or `iwyu`) and python script (`iwyu-tool` or `iwyu_tool.py`) can be found in the path. The analysis can then be started with:

```
make iwyu
```

---

This may first run some compilation, as the analysis is dependent on recording all commands required to do the compilation.

### 3.11.4 Address, Undefined Behavior, and Thread Sanitizer Support (CMake only)

Compilers such as GCC and Clang support generating instrumented binaries which use different sanitizer libraries to detect problems in the code during run-time. They can detect issues like:

- memory leaks
- undefined behavior
- data races

Please note that this kind of instrumentation usually comes with a performance hit (but much less than using tools like Valgrind with a more low level approach). To enable these features, additional compiler flags need to be added to the compilation and linking stages. This is done through setting the `ENABLE_SANITIZER` variable during configuration. Examples:

```
-D ENABLE_SANITIZER=none      # no sanitizer active (default)
-D ENABLE_SANITIZER=address  # enable address sanitizer / memory leak checker
-D ENABLE_SANITIZER=leak     # enable memory leak checker (only)
-D ENABLE_SANITIZER=undefined # enable undefined behavior sanitizer
-D ENABLE_SANITIZER=thread   # enable thread sanitizer
```

### 3.11.5 Code Coverage and Unit Testing (CMake only)

The LAMMPS code is subject to multiple levels of automated testing during development: integration testing (i.e. whether the code compiles on various platforms and with a variety of settings), unit testing (i.e. whether certain individual parts of the code produce the expected results for given inputs), run testing (whether selected complete input decks run without crashing for multiple configurations), and regression testing (i.e. whether selected input examples reproduce the same results over a given number of steps and operations within a given error margin). The status of this automated testing can be viewed on <https://ci.lammps.org>.

The scripts and inputs for integration, run, and regression testing are maintained in a [separate repository](#) of the LAMMPS project on GitHub.

The unit testing facility is integrated into the CMake build process of the LAMMPS source code distribution itself. It can be enabled by setting `-D ENABLE_TESTING=on` during the CMake configuration step. It requires the [YAML](#) library and development headers (if those are not found locally a recent version will be downloaded and compiled along with LAMMPS and the test program) to compile and will download and compile a specific recent version of the [Googletest](#) C++ test framework for implementing the tests.

After compilation is complete, the unit testing is started in the build folder using the `ctest` command, which is part of the CMake software. The output of this command will be looking something like this:

```
[...]$ ctest
Test project /home/akohlmeier/compile/lammps/build-testing
   Start  1: MolPairStyle:hybrid-overlay
1/109 Test  #1: MolPairStyle:hybrid-overlay ..... Passed    0.02 sec
   Start  2: MolPairStyle:hybrid
```

(continues on next page)

(continued from previous page)

```

2/109 Test #2: MolPairStyle:hybrid ..... Passed 0.01 sec
      Start 3: MolPairStyle:lj_class2
      [...]
      Start 107: PotentialFileReader
107/109 Test #107: PotentialFileReader ..... Passed 0.04 sec
      Start 108: EIMPotentialFileReader
108/109 Test #108: EIMPotentialFileReader ..... Passed 0.03 sec
      Start 109: TestSimpleCommands
109/109 Test #109: TestSimpleCommands ..... Passed 0.02 sec

100% tests passed, 0 tests failed out of 26

Total Test time (real) = 25.57 sec

```

The ctest command has many options, the most important ones are:

Option	Function
-V	verbose output: display output of individual test runs
-j <num>	parallel run: run <num> tests in parallel
-R <regex>	run subset of tests matching the regular expression <regex>
-E <regex>	exclude subset of tests matching the regular expression <regex>
-L <regex>	run subset of tests with a label matching the regular expression <regex>
-LE <regex>	exclude subset of tests with a label matching the regular expression <regex>
-N	dry-run: display list of tests without running them
-T memcheck	run tests with valgrind memory checker (if available)

In its full implementation, the unit test framework will consist of multiple kinds of tests implemented in different programming languages (C++, C, Python, Fortran) and testing different aspects of the LAMMPS software and its features. The tests will adapt to the compilation settings of LAMMPS, so that tests will be skipped if prerequisite features are not available in LAMMPS.

---

**Note:** The unit test framework was added in spring 2020 and is under active development. The coverage is not complete and will be expanded over time.

---

Tests for styles of the same kind of style (e.g. pair styles or bond styles) are performed with the same test executable using different input files in YAML format. So to add a test for another style of the same kind it may be sufficient to add a suitable YAML file. *Detailed instructions for adding tests* are provided in the Programmer Guide part of the manual.

### Unit tests for force styles

A large part of LAMMPS are different “styles” for computing non-bonded and bonded interactions selected through the *pair\_style command*, *bond\_style command*, *angle\_style command*, *dihedral\_style command*, *improper\_style command*, and *kpace\_style command*. Since these all share common interfaces, it is possible to write generic test programs that will call those common interfaces for small test systems with less than 100 atoms and compare the results with pre-recorded reference results. A test run is then a collection multiple individual test runs each with many comparisons to reference results based on template input files, individual command settings, relative error margins, and reference data stored in a YAML format file with *.yaml* suffix. Currently the programs *test\_pair\_style*, *test\_bond\_style*, and *test\_angle\_style* are implemented. They will compare forces, energies and (global) stress for all atoms after a run 0 calculation and after a few steps of MD with *fix nve*, each in multiple variants with different settings and also for multiple accelerated styles. If a prerequisite style or package is missing, the individual tests are skipped. All tests

will be executed on a single MPI process, so using the CMake option `-D BUILD_MPI=off` can significantly speed up testing, since this will skip the MPI initialization for each test run. Below is an example command and output:

```
[tests]$ test_pair_style mol-pair-lj_cut.yaml
[=====  
[-----] Global test environment set-up.  
[-----] 6 tests from PairStyle  
[ RUN      ] PairStyle.plain  
[      OK ] PairStyle.plain (24 ms)  
[ RUN      ] PairStyle.omp  
[      OK ] PairStyle.omp (18 ms)  
[ RUN      ] PairStyle.intel  
[      OK ] PairStyle.intel (6 ms)  
[ RUN      ] PairStyle.opt  
[ SKIPPED ] PairStyle.opt (0 ms)  
[ RUN      ] PairStyle.single  
[      OK ] PairStyle.single (7 ms)  
[ RUN      ] PairStyle.extract  
[      OK ] PairStyle.extract (6 ms)  
[-----] 6 tests from PairStyle (62 ms total)  
  
[-----] Global test environment tear-down  
[=====  
[ PASSED ] 5 tests.  
[ SKIPPED ] 1 test, listed below:  
[ SKIPPED ] PairStyle.opt
```

In this particular case, 5 out of 6 sets of tests were conducted, the tests for the `lj/cut/opt` pair style was skipped, since the tests executable did not include it. To learn what individual tests are performed, you (currently) need to read the source code. You can use code coverage recording (see next section) to confirm how well the tests cover the code paths in the individual source files.

The force style test programs have a common set of options:

Option	Function
<code>-g &lt;newfile&gt;</code>	regenerate reference data in new YAML file
<code>-u</code>	update reference data in the original YAML file
<code>-s</code>	print error statistics for each group of comparisons
<code>-v</code>	verbose output: also print the executed LAMMPS commands

The `ctest` tool has no mechanism to directly pass flags to the individual test programs, but a workaround has been implemented where these flags can be set in an environment variable `TEST_ARGS`. Example:

```
env TEST_ARGS=-s ctest -V -R BondStyle
```

To add a test for a style that is not yet covered, it is usually best to copy a YAML file for a similar style to a new file, edit the details of the style (how to call it, how to set its coefficients) and then run test command with either the `-g` and the replace the initial test file with the regenerated one or the `-u` option. The `-u` option will destroy the original file, if the generation run does not complete, so using `-g` is recommended unless the YAML file is fully tested and working.

Some of the force style tests are rather slow to run and some are very sensitive to small differences like CPU architecture, compiler toolchain, compiler optimization. Those tests are flagged with a “slow” and/or “unstable” label, and thus those tests can be selectively excluded with the `-LE` flag or selected with the `-L` flag.

### Recommendations and notes for YAML files

- The reference results should be recorded without any code optimization or related compiler flags enabled.
  - The `epsilon` parameter defines the relative precision with which the reference results must be met. The test geometries often have high and low energy parts and thus a significant impact from floating-point math truncation errors is to be expected. Some functional forms and potentials are more noisy than others, so this parameter needs to be adjusted. Typically a value around  $1.0e-13$  can be used, but it may need to be as large as  $1.0e-8$  in some cases.
  - The tests for pair styles from OPT, OPENMP and INTEL are performed with automatically rescaled epsilon to account for additional loss of precision from code optimizations and different summation orders.
  - When compiling with (aggressive) compiler optimization, some tests are likely to fail. It is recommended to inspect the individual tests in detail to decide, whether the specific error for a specific property is acceptable (it often is), or this may be an indication of mis-compiled code (or an undesired large loss of precision due to significant reordering of operations and thus less error cancellation).
- 

### Unit tests for timestepping related fixes

A substantial subset of *fix styles* are invoked regularly during MD timestepping and manipulate per-atom properties like positions, velocities, and forces. For those fix styles, testing can be done in a very similar fashion as for force fields and thus there is a test program `test_fix_timestep` that shares a lot of code, properties, and command line flags with the force field style testers described in the previous section.

This tester will set up a small molecular system run with verlet run style for 4 MD steps, then write a binary restart and continue for another 4 MD steps. At this point coordinates and velocities are recorded and compared to reference data. Then the system is cleared, restarted and running the second 4 MD steps again and the data is compared to the same reference. That is followed by another restart after which per atom type masses are replaced with per-atom masses and the second 4 MD steps are repeated again and compared to the same reference. Also global scalar and vector data of the fix is recorded and compared. If the fix is a thermostat and thus the internal property `t_target` can be extracted, then this is compared to the reference data. The tests are repeated with the respa run style.

If the fix has a multi-threaded version in the OPENMP package, then the entire set of tests is repeated for that version as well.

For this to work, some additional conditions have to be met by the YAML format test inputs.

- The fix to be tested (and only this fix), should be listed in the `prerequisites:` section
- The fix to be tested must be specified in the `post_commands:` section with the fix-ID test. This section may contain other commands and other fixes (e.g. an instance of `fix nve` for testing a thermostat or force manipulation fix)
- For fixes that can tally contributions to the global virial, the line `fix_modify test virial yes` should be included in the `post_commands:` section of the test input.
- For thermostat fixes the target temperature should be ramped from an arbitrary value (e.g. 50K) to a pre-defined target temperature entered as `${t_target}`.
- For fixes that have thermostatting support included, but do not have it enabled in the input (e.g. `fix rigid` with default settings), the `post_commands:` section should contain the line `variable t_target delete` to disable the target temperature ramp check to avoid false positives.

## Use custom linker for faster link times when ENABLE\_TESTING is active

When compiling LAMMPS with enabled tests, most test executables will need to be linked against the LAMMPS library. Since this can be a very large library with many C++ objects when many packages are enabled, link times can become very long on machines that use the GNU BFD linker (e.g. Linux systems). Alternatives like the lld linker of the LLVM project or the gold linker available with GNU binutils can speed up this step substantially. CMake will by default test if any of the two can be enabled and use it when ENABLE\_TESTING is active. It can also be selected manually through the CMAKE\_CUSTOM\_LINKER CMake variable. Allowed values are lld, gold, bfd, or default. The default option will use the system default linker otherwise, the linker is chosen explicitly. This option is only available for the GNU or Clang C++ compiler.

## Tests for other components and utility functions

Additional tests that validate utility functions or specific components of LAMMPS are implemented as standalone executable which may, or may not require creating a suitable LAMMPS instance. These tests are more specific and do not require YAML format input files. To add a test, either an existing source file needs to be extended or a new file added, which in turn requires additions to the CMakeLists.txt file in the source folder.

## Collect and visualize code coverage metrics

You can also collect code coverage metrics while running LAMMPS or the tests by enabling code coverage support during the CMake configuration:

```
-D ENABLE_COVERAGE=on # enable coverage measurements (off by default)
```

This will instrument all object files to write information about which lines of code were accessed during execution in files next to the corresponding object files. These can be post-processed to visually show the degree of coverage and which code paths are accessed and which are not taken. When working on unit tests (see above), this can be extremely helpful to determine which parts of the code are not executed and thus what kind of tests are still missing. The coverage data is cumulative, i.e. new data is added with each new run.

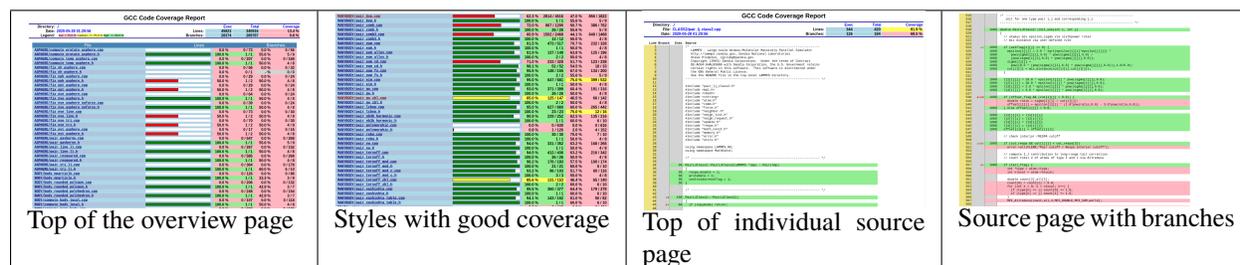

Enabling code coverage will also add the following build targets to generate coverage reports after running the LAMMPS executable or the unit tests:

```
make gen_coverage_html # generate coverage report in HTML format
make gen_coverage_xml # generate coverage report in XML format
make clean_coverage_html # delete folder with HTML format coverage report
make reset_coverage # delete all collected coverage data and HTML output
```

These reports require GCOVR to be installed. The easiest way to do this to install it via pip:

```
pip install git+https://github.com/gcovr/gcovr.git
```

After post-processing with gen\_coverage\_html the results are in a folder coverage\_html and can be viewed with a web browser. The images below illustrate how the data is presented.

### 3.11.6 Coding style utilities

To aid with enforcing some of the coding style conventions in LAMMPS some additional build targets have been added. These require Python 3.5 or later and will only work properly on Unix-like operating and file systems.

The following options are available.

```
make check-whitespace  # search for files with whitespace issues
make fix-whitespace    # correct whitespace issues in files
make check-homepage    # search for files with old LAMMPS homepage URLs
make fix-homepage      # correct LAMMPS homepage URLs in files
make check-errordocs   # search for deprecated error docs in header files
make fix-errordocs     # remove error docs in header files
make check-permissions # search for files with permissions issues
make fix-permissions   # correct permissions issues in files
make check             # run all check targets from above
```

These should help to make source and documentation files conforming to some the coding style preferences of the LAMMPS developers.

### 3.11.7 Clang-format support

For the code in the `unittest` and `src` trees we are transitioning to use the `clang-format` tool to assist with having a consistent source code formatting style. The `clang-format` command bundled with Clang version 8.0 or later is required. The configuration is in files called `.clang-format` in the respective folders. Since the modifications from `clang-format` can be significant and - especially for “legacy style code” - they are not always improving readability, a large number of files currently have a `// clang-format off` at the top, which will disable the processing. As of fall 2021 all files have been either “protected” this way or are enabled for full or partial `clang-format` processing. Over time, the “protected” files will be refactored and updated so that `clang-format` may be applied to them as well.

It is recommended for all newly contributed files to use the `clang-format` processing while writing the code or do the coding style processing (including the scripts mentioned in the previous paragraph)

If `clang-format` is available, files can be updated individually with commands like the following:

```
$ clang-format -i some_file.cpp
```

The following target are available for both, GNU make and CMake:

```
make format-src      # apply clang-format to all files in src and the package folders
make format-tests    # apply clang-format to all files in the unittest tree
```

## RUN LAMMPS

These pages explain how to run LAMMPS once you have *installed an executable* or *downloaded the source code and built an executable*. The *Commands* doc page describes how input scripts are structured and the commands they can contain.

### 4.1 Basics of running LAMMPS

LAMMPS is run from the command line, reading commands from a file via the `-in` command line flag, or from standard input. Using the “`-in in.file`” variant is recommended (see note below). The name of the LAMMPS executable is either `lmp` or `lmp_<machine>` with `<machine>` being the machine string used when compiling LAMMPS. This is required when compiling LAMMPS with the traditional build system (e.g. with `make mpi`), but optional when using CMake to configure and build LAMMPS:

```
$ lmp_serial -in in.file
$ lmp_serial < in.file
$ lmp -in in.file
$ lmp < in.file
$ /path/to/lammps/src/lmp_serial -i in.file
$ mpirun -np 4 lmp_mpi -in in.file
$ mpiexec -np 4 lmp -in in.file
$ mpirun -np 8 /path/to/lammps/src/lmp_mpi -in in.file
$ mpiexec -n 6 /usr/local/bin/lmp -in in.file
```

You normally run the LAMMPS command in the directory where your input script is located. That is also where output files are produced by default, unless you provide specific other paths in your input script or on the command line. As in some of the examples above, the LAMMPS executable itself can be placed elsewhere.

---

**Note:** The redirection operator “`<`” will not always work when running in parallel with `mpirun` or `mpiexec`; for those systems the `-in` form is required.

---

As LAMMPS runs it prints info to the screen and a logfile named `log.lammps`. More info about output is given on the [screen and logfile output](#) page.

If LAMMPS encounters errors in the input script or while running a simulation it will print an ERROR message and stop or a WARNING message and continue. See the [Common Problems](#) page for a discussion of the various kinds of errors LAMMPS can or can’t detect, a list of all ERROR and WARNING messages, and what to do about them.

---

LAMMPS can run the same problem on any number of processors, including a single processor. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off due to using

floating-point math can cause slight differences and an eventual divergence of molecular dynamics trajectories. See the *Errors common* page for discussion of this.

LAMMPS can run as large a problem as will fit in the physical memory of one or more processors. If you run out of memory, you must run on more processors or define a smaller problem. The amount of memory needed and how well it can be distributed across processors may vary based on the models and settings and commands used.

If you run LAMMPS in parallel via `mpirun`, you should be aware of the *processors* command, which controls how MPI tasks are mapped to the simulation box, as well as `mpirun` options that control how MPI tasks are assigned to physical cores of the node(s) of the machine you are running on. These settings can improve performance, though the defaults are often adequate.

For example, it is often important to bind MPI tasks (processes) to physical cores (processor affinity), so that the operating system does not migrate them during a simulation. If this is not the default behavior on your machine, the `mpirun` option “`-bind-to core`” (OpenMPI) or “`-bind-to core`” (MPICH) can be used.

If the LAMMPS command(s) you are using support multi-threading, you can set the number of threads per MPI task via the environment variable `OMP_NUM_THREADS`, before you launch LAMMPS:

```
$ export OMP_NUM_THREADS=2      # bash
$ setenv OMP_NUM_THREADS 2      # csh or tcsh
```

This can also be done via the *package* command or via the *-pk command-line switch* which invokes the package command. See the *package* command or *Speed* doc pages for more details about which accelerator packages and which commands support multi-threading.

---

You can experiment with running LAMMPS using any of the input scripts provided in the examples or bench directory. Input scripts are named `in.*` and sample outputs are named `log.*.P` where P is the number of processors it was run on.

Some of the examples or benchmarks require LAMMPS to be built with optional packages.

## 4.2 Command-line options

At run time, LAMMPS recognizes several optional command-line switches which may be used in any order. Either the full word or a one or two letter abbreviation can be used:

- *-e or -echo*
- *-h or -help*
- *-i or -in*
- *-k or -kokkos*
- *-l or -log*
- *-mdi*
- *-m or -mpicolor*
- *-c or -cite*
- *-nc or -nocite*
- *-nb or -nonbuf*
- *-pk or -package*
- *-p or -partition*

- *-pl or -plog*
- *-ps or -pscreen*
- *-ro or -reorder*
- *-r2data or -restart2data*
- *-r2dump or -restart2dump*
- *-sc or -screen*
- *-sr or skiprun*
- *-sf or -suffix*
- *-v or -var*

For example, the `lmp_mpi` executable might be launched as follows:

```
$ mpirun -np 16 lmp_mpi -v f tmp.out -l my.log -sc none -i in.alloy
$ mpirun -np 16 lmp_mpi -var f tmp.out -log my.log -screen none -in in.alloy
```

---

### **-echo style**

Set the style of command echoing. The style can be *none* or *screen* or *log* or *both*. Depending on the style, each command read from the input script will be echoed to the screen and/or logfile. This can be useful to figure out which line of your script is causing an input error. The default value is *log*. The echo style can also be set by using the *echo* command in the input script itself.

---

### **-help**

Print a brief help summary and a list of options compiled into this executable for each LAMMPS style (*atom\_style*, *fix*, *compute*, *pair\_style*, *bond\_style*, etc). This can tell you if the command you want to use was included via I/O redirection; e.g. `lmp_linux < in.run`. With many MPI implementations I/O redirection also works in parallel, but using the `-in` flag will always work.

---

### **-in file**

Specify a file to use as an input script. This is an optional but recommended switch when running LAMMPS in one-partition mode. If it is not specified, LAMMPS reads its script from standard input, typically from a script via I/O redirection; e.g. `lmp_linux < in.run`. With many MPI implementations I/O redirection also works in parallel, but using the `-in` flag will always work.

Note that this is a required switch when running LAMMPS in multi-partition mode, since multiple processors cannot all read from stdin concurrently. The file name may be “none” for starting multi-partition calculations without reading an initial input file from the library interface.

---

### **-kokkos on/off keyword/value ...**

Explicitly enable or disable KOKKOS support, as provided by the KOKKOS package. Even if LAMMPS is built with this package, as described in the *the KOKKOS package page*, this switch must be set to enable running with KOKKOS-enabled styles the package provides. If the switch is not set (the default), LAMMPS will operate as if the KOKKOS package were not installed; i.e. you can run standard LAMMPS or with the GPU or OPENMP packages, for testing or benchmarking purposes.

Additional optional keyword/value pairs can be specified which determine how Kokkos will use the underlying hardware on your platform. These settings apply to each MPI task you launch via the “`mpirun`” or “`mpiexec`” command. You

may choose to run one or more MPI tasks per physical node. Note that if you are running on a desktop machine, you typically have one physical node. On a cluster or supercomputer there may be dozens or 1000s of physical nodes.

Either the full word or an abbreviation can be used for the keywords. Note that the keywords do not use a leading minus sign. I.e. the keyword is “t”, not “-t”. Also note that each of the keywords has a default setting. Examples of when to use these options and what settings to use on different platforms is given on the *KOKKOS package* doc page.

- d or device
- g or gpus
- t or threads
- n or numa

device Nd

This option is only relevant if you built LAMMPS with CUDA=yes, you have more than one GPU per node, and if you are running with only one MPI task per node. The Nd setting is the ID of the GPU on the node to run on. By default Nd = 0. If you have multiple GPUs per node, they have consecutive IDs numbered as 0,1,2,etc. This setting allows you to launch multiple independent jobs on the node, each with a single MPI task per node, and assign each job to run on a different GPU.

gpus Ng Ns

This option is only relevant if you built LAMMPS with CUDA=yes, you have more than one GPU per node, and you are running with multiple MPI tasks per node (up to one per GPU). The Ng setting is how many GPUs you will use. The Ns setting is optional. If set, it is the ID of a GPU to skip when assigning MPI tasks to GPUs. This may be useful if your desktop system reserves one GPU to drive the screen and the rest are intended for computational work like running LAMMPS. By default Ng = 1 and Ns is not set.

Depending on which flavor of MPI you are running, LAMMPS will look for one of these 4 environment variables

SLURM\_LOCALID (various MPI variants compiled with SLURM support)  
MPT\_LRANK (HPE MPI)  
MV2\_COMM\_WORLD\_LOCAL\_RANK (Mvapich)  
OMPI\_COMM\_WORLD\_LOCAL\_RANK (OpenMPI)

which are initialized by the “srun”, “mpirun” or “mpiexec” commands. The environment variable setting for each MPI rank is used to assign a unique GPU ID to the MPI task.

threads Nt

This option assigns Nt number of threads to each MPI task for performing work when Kokkos is executing in OpenMP or pthreads mode. The default is Nt = 1, which essentially runs in MPI-only mode. If there are Np MPI tasks per physical node, you generally want Np\*Nt = the number of physical cores per node, to use your available hardware optimally. This also sets the number of threads used by the host when LAMMPS is compiled with CUDA=yes.

numa Nm

This option is only relevant when using pthreads with hwloc support. In this case Nm defines the number of NUMA regions (typically sockets) on a node which will be utilized by a single MPI rank. By default Nm = 1. If this option is used the total number of worker-threads per MPI rank is threads\*numa. Currently it is always almost better to assign at least one MPI rank per NUMA region, and leave numa set to its default value of 1. This is because letting a single process span multiple NUMA regions induces a significant amount of cross NUMA data traffic which is slow.

---

**-log file**

Specify a log file for LAMMPS to write status information to. In one-partition mode, if the switch is not used, LAMMPS writes to the file `log.lammps`. If this switch is used, LAMMPS writes to the specified file. In multi-partition mode, if the switch is not used, a `log.lammps` file is created with high-level status information. Each partition also writes to a `log.lammps.N` file where `N` is the partition ID. If the switch is specified in multi-partition mode, the high-level logfile is named “file” and each partition also logs information to a `file.N`. For both one-partition and multi-partition mode, if the specified file is “none”, then no log files are created. Using a *log* command in the input script will override this setting. Option `-plog` will override the name of the partition log files `file.N`.

---

#### **-mdi ‘multiple flags’**

This flag is only recognized and used when LAMMPS has support for the MolSSI Driver Interface (MDI) included as part of the *MDI* package. This flag is specific to the MDI library and controls how LAMMPS interacts with MDI. There are usually multiple flags that have to follow it and those have to be placed in quotation marks. For more information about how to launch LAMMPS in MDI client/server mode please refer to the *MDI Howto*.

---

#### **-mpicolor color**

If used, this must be the first command-line argument after the LAMMPS executable name. It is only used when LAMMPS is launched by an `mpirun` command which also launches another executable(s) at the same time. (The other executable could be LAMMPS as well.) The color is an integer value which should be different for each executable (another application may set this value in a different way). LAMMPS and the other executable(s) perform an `MPI_Comm_split()` with their own colors to shrink the `MPI_COMM_WORLD` communication to be the subset of processors they are actually running on.

---

#### **-cite style or file name**

Select how and where to output a reminder about citing contributions to the LAMMPS code that were used during the run. Available keywords for styles are “both”, “none”, “screen”, or “log”. Any other keyword will be considered a file name to write the detailed citation info to instead of logfile or screen. Default is the “log” style where there is a short summary in the screen output and detailed citations in BibTeX format in the logfile. The option “both” selects the detailed output for both, “none”, the short output for both, and “screen” will write the detailed info to the screen and the short version to the log file. If a dedicated citation info file is requested, the screen and log file output will be in the short format (same as with “none”).

See the *citation page* for more details on how to correctly reference and cite LAMMPS.

---

#### **-nocite**

Disable generating a citation reminder (see above) at all.

---

#### **-nonbuf**

Turn off buffering for screen and logfile output. For performance reasons, output to the screen and logfile is usually buffered, i.e. output is only written to a file if its buffer - typically 4096 bytes - has been filled. When LAMMPS crashes for some reason, however, that can mean that there is important output missing. With this flag the buffering can be turned off (only for screen and logfile output) and any output will be committed immediately. Note that when running in parallel with MPI, the screen output may still be buffered by the MPI library and this cannot be changed by LAMMPS. This flag should only be used for debugging and not for production simulations as the performance impact can be significant, especially for large parallel runs.

---

### **-package style args ....**

Invoke the *package* command with style and args. The syntax is the same as if the command appeared at the top of the input script. For example “-package gpu 2” or “-pk gpu 2” is the same as *package gpu 2* in the input script. The possible styles and args are documented on the *package* doc page. This switch can be used multiple times, e.g. to set options for the INTEL and OPENMP packages which can be used together.

Along with the “-suffix” command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

---

### **-partition 8x2 4 5 ...**

Invoke LAMMPS in multi-partition mode. When LAMMPS is run on P processors and this switch is not used, LAMMPS runs in one partition, i.e. all P processors run a single simulation. If this switch is used, the P processors are split into separate partitions and each partition runs its own simulation. The arguments to the switch specify the number of processors in each partition. Arguments of the form MxN mean M partitions, each with N processors. Arguments of the form N mean a single partition with N processors. The sum of processors in all partitions must equal P. Thus the command “-partition 8x2 4 5” has 10 partitions and runs on a total of 25 processors.

Running with multiple partitions can be useful for running *multi-replica simulations*, where each replica runs on one or a few processors. Note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors.

To run multiple independent simulations from one input script, using multiple partitions, see the *Howto multiple* page. World- and universe-style *variables* are useful in this context.

---

### **-plog file**

Specify the base name for the partition log files, so partition N writes log information to file.N. If file is none, then no partition log files are created. This overrides the filename specified in the -log command-line option. This option is useful when working with large numbers of partitions, allowing the partition log files to be suppressed (-plog none) or placed in a sub-directory (-plog replica\_files/log.lammps) If this option is not used the log file for partition N is log.lammps.N or whatever is specified by the -log command-line option.

---

### **-pscreen file**

Specify the base name for the partition screen file, so partition N writes screen information to file.N. If file is “none”, then no partition screen files are created. This overrides the filename specified in the -screen command-line option. This option is useful when working with large numbers of partitions, allowing the partition screen files to be suppressed (-pscreen none) or placed in a sub-directory (-pscreen replica\_files/screen). If this option is not used the screen file for partition N is screen.N or whatever is specified by the -screen command-line option.

---

### **-reorder**

This option has 2 forms:

```
-reorder nth N
-reorder custom filename
```

Reorder the processors in the MPI communicator used to instantiate LAMMPS, in one of several ways. The original MPI communicator ranks all P processors from 0 to P-1. The mapping of these ranks to physical processors is done by MPI before LAMMPS begins. It may be useful in some cases to alter the rank order. E.g. to insure that cores within each node are ranked in a desired order. Or when using the *run\_style verlet/split* command with 2 partitions to insure

---

that a specific Kspace processor (in the second partition) is matched up with a specific set of processors in the first partition. See the *General tips* page for more details.

If the keyword *nth* is used with a setting *N*, then it means every *N*th processor will be moved to the end of the ranking. This is useful when using the *run\_style verlet/split* command with 2 partitions via the *-partition* command-line switch. The first set of processors will be in the first partition, the second set in the second partition. The *-reorder* command-line switch can alter this so that the first *N* procs in the first partition and one proc in the second partition will be ordered consecutively, e.g. as the cores on one physical node. This can boost performance. For example, if you use “*-reorder nth 4*” and “*-partition 9 3*” and you are running on 12 processors, the processors will be reordered from

```
0 1 2 3 4 5 6 7 8 9 10 11
```

to

```
0 1 2 4 5 6 8 9 10 3 7 11
```

so that the processors in each partition will be

```
0 1 2 4 5 6 8 9 10
3 7 11
```

See the “processors” command for how to insure processors from each partition could then be grouped optimally for quad-core nodes.

If the keyword is *custom*, then a file that specifies a permutation of the processor ranks is also specified. The format of the reorder file is as follows. Any number of initial blank or comment lines (starting with a “#” character) can be present. These should be followed by *P* lines of the form:

```
I J
```

where *P* is the number of processors LAMMPS was launched with. Note that if running in multi-partition mode (see the *-partition* switch above) *P* is the total number of processors in all partitions. The *I* and *J* values describe a permutation of the *P* processors. Every *I* and *J* should be values from 0 to *P*-1 inclusive. In the set of *P* *I* values, every proc ID should appear exactly once. Ditto for the set of *P* *J* values. A single *I,J* pairing means that the physical processor with rank *I* in the original MPI communicator will have rank *J* in the reordered communicator.

Note that rank ordering can also be specified by many MPI implementations, either by environment variables that specify how to order physical processors, or by config files that specify what physical processors to assign to each MPI rank. The *-reorder* switch simply gives you a portable way to do this without relying on MPI itself. See the *processors file* command for how to output info on the final assignment of physical processors to the LAMMPS simulation domain.

#### **-restart2data restartfile [remap] datafile keyword value ...**

Convert the restart file into a data file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile [remap]
write_data datafile keyword value ...
```

The specified restartfile and/or datafile name may contain the wild-card character “\*”. The restartfile name may also contain the wild-card character “%”. The meaning of these characters is explained on the *read\_restart* and *write\_data* doc pages. The use of “%” means that a parallel restart file can be read. Note that a filename such as file.\* may need to be enclosed in quotes or the “\*” character prefixed with a backslash (“\”) to avoid shell expansion of the “\*” character.

Following restartfile argument, the optional word “remap” may be used. This has the same effect like adding it to a *read\_restart* command, and operates as explained on its doc page. This is useful if reading the restart file triggers an error that atoms have been lost. In that case, use of the remap flag should allow the data file to still be produced.

The syntax following restartfile (or remap), namely

```
datafile keyword value ...
```

is identical to the arguments of the *write\_data* command. See its page for details. This includes its optional keyword/value settings.

---

#### **-restart2dump restartfile [remap] group-ID dumpstyle dumpfile arg1 arg2 ...**

Convert the restart file into a dump file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile [remap]
write_dump group-ID dumpstyle dumpfile arg1 arg2 ...
```

Note that the specified restartfile and dumpfile names may contain wild-card characters (“\*” or “%”) as explained on the *read\_restart* and *write\_dump* doc pages. The use of “%” means that a parallel restart file and/or parallel dump file can be read and/or written. Note that a filename such as file.\* may need to be enclosed in quotes or the “\*” character prefixed with a backslash (“\”) to avoid shell expansion of the “\*” character.

Note that following the restartfile argument, the optional word “remap” can be used. This has the effect as adding it to the *read\_restart* command, as explained on its doc page. This is useful if reading the restart file triggers an error that atoms have been lost. In that case, use of the remap flag should allow the dump file to still be produced.

The syntax following restartfile (or remap), namely

```
group-ID dumpstyle dumpfile arg1 arg2 ...
```

is identical to the arguments of the *write\_dump* command. See its page for details. This includes what per-atom fields are written to the dump file and optional dump\_modify settings, including ones that affect how parallel dump files are written, e.g. the *nfile* and *fileper* keywords. See the *dump\_modify* page for details.

---

#### **-screen file**

Specify a file for LAMMPS to write its screen information to. In one-partition mode, if the switch is not used, LAMMPS writes to the screen. If this switch is used, LAMMPS writes to the specified file instead and you will see no screen output. In multi-partition mode, if the switch is not used, high-level status information is written to the screen. Each partition also writes to a screen.N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level screen dump is named “file” and each partition also writes screen information to a file.N. For both one-partition and multi-partition mode, if the specified file is “none”, then no screen output is performed. Option -pscreen will override the name of the partition screen files file.N.

---

#### **-skiprun**

Insert the command *timer timeout 0 every 1* at the beginning of an input file or after a *clear* command. This has the effect that the entire LAMMPS input script is processed without executing actual *run* or *minimize* and similar commands (their main loops are skipped). This can be helpful and convenient to test input scripts of long running calculations for correctness to avoid having them crash after a long time due to a typo or syntax error in the middle or at the end.

---

#### **-suffix style args**

Use variants of various styles if they exist. The specified style can be *gpu*, *intel*, *kk*, *omp*, *opt*, or *hybrid*. These refer to optional packages that LAMMPS can be built with, as described in *Accelerate performance*. The “gpu” style

---

corresponds to the GPU package, the “intel” style to the INTEL package, the “kk” style to the KOKKOS package, the “opt” style to the OPT package, and the “omp” style to the OPENMP package. The hybrid style is the only style that accepts arguments. It allows for two packages to be specified. The first package specified is the default and will be used if it is available. If no style is available for the first package, the style for the second package will be used if available. For example, “-suffix hybrid intel omp” will use styles from the INTEL package if they are installed and available, but styles for the OPENMP package otherwise.

Along with the “-package” command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

As an example, all of the packages provide a *pair\_style lj/cut* variant, with style names `lj/cut/gpu`, `lj/cut/intel`, `lj/cut/kk`, `lj/cut/omp`, and `lj/cut/opt`. A variant style can be specified explicitly in your input script, e.g. `pair_style lj/cut/gpu`. If the `-suffix` switch is used the specified suffix (`gpu,intel,kk,omp,opt`) is automatically appended whenever your input script command creates a new *atom style*, *pair style*, *fix*, *compute*, or *run style*. If the variant version does not exist, the standard version is created.

For the GPU package, using this command-line switch also invokes the default GPU settings, as if the command “package gpu 1” were used at the top of your input script. These settings can be changed by using the “-package gpu” command-line switch or the *package gpu* command in your script.

For the INTEL package, using this command-line switch also invokes the default INTEL settings, as if the command “package intel 1” were used at the top of your input script. These settings can be changed by using the “-package intel” command-line switch or the *package intel* command in your script. If the OPENMP package is also installed, the hybrid style with “intel omp” arguments can be used to make the omp suffix a second choice, if a requested style is not available in the INTEL package. It will also invoke the default OPENMP settings, as if the command “package omp 0” were used at the top of your input script. These settings can be changed by using the “-package omp” command-line switch or the *package omp* command in your script.

For the KOKKOS package, using this command-line switch also invokes the default KOKKOS settings, as if the command “package kokkos” were used at the top of your input script. These settings can be changed by using the “-package kokkos” command-line switch or the *package kokkos* command in your script.

For the OMP package, using this command-line switch also invokes the default OMP settings, as if the command “package omp 0” were used at the top of your input script. These settings can be changed by using the “-package omp” command-line switch or the *package omp* command in your script.

The *suffix* command can also be used within an input script to set a suffix, or to turn off or back on any suffix setting made via the command line.

---

### **-var name value1 value2 ...**

Specify a variable that will be defined for substitution purposes when the input script is read. This switch can be used multiple times to define multiple variables. “Name” is the variable name which can be a single character (referenced as `$x` in the input script) or a full string (referenced as `${abc}`). An *index-style variable* will be created and populated with the subsequent values, e.g. a set of filenames. Using this command-line option is equivalent to putting the line “variable name index value1 value2 ...” at the beginning of the input script. Defining an index variable as a command-line argument overrides any setting for the same index variable in the input script, since index variables cannot be re-defined.

See the *variable* command for more info on defining index and other kinds of variables and the *Parsing rules* page for more info on using variables in input scripts.

---

**Note:** Currently, the command-line parser looks for arguments that start with “-” to indicate new switches. Thus you cannot specify multiple variable values if any of them start with a “-”, e.g. a negative numeric value. It is OK if the first value1 starts with a “-”, since it is automatically skipped.

---

### 4.3 Screen and logfile output

As LAMMPS reads an input script, it prints information to both the screen and a log file about significant actions it takes to setup a simulation. When the simulation is ready to begin, LAMMPS performs various initializations, and prints info about the run it is about to perform, including the amount of memory (in MBytes per processor) that the simulation requires. It also prints details of the initial thermodynamic state of the system. During the run itself, thermodynamic information is printed periodically, every few timesteps. When the run concludes, LAMMPS prints the final thermodynamic state and a total run time for the simulation. It also appends statistics about the CPU time and storage requirements for the simulation. An example set of statistics is shown here:

```
Loop time of 2.81192 on 4 procs for 300 steps with 2004 atoms

Performance: 18.436 ns/day  1.302 hours/ns  106.689 timesteps/s
97.0% CPU use with 4 MPI tasks x no OpenMP threads
```

MPI task timings breakdown:

Section	min time	avg time	max time	%varavg	%total
Pair	1.9808	2.0134	2.0318	1.4	71.60
Bond	0.0021894	0.0060319	0.010058	4.7	0.21
Kspace	0.3207	0.3366	0.36616	3.1	11.97
Neigh	0.28411	0.28464	0.28516	0.1	10.12
Comm	0.075732	0.077018	0.07883	0.4	2.74
Output	0.00030518	0.00042665	0.00078821	1.0	0.02
Modify	0.086606	0.086631	0.086668	0.0	3.08
Other		0.007178			0.26

```
Nlocal: 501 ave 508 max 490 min
Histogram: 1 0 0 0 0 0 1 1 0 1
Nghost: 6586.25 ave 6628 max 6548 min
Histogram: 1 0 1 0 0 0 1 0 0 1
Neighs: 177007 ave 180562 max 170212 min
Histogram: 1 0 0 0 0 0 0 1 1 1
```

```
Total # of neighbors = 708028
Ave neighs/atom = 353.307
Ave special neighs/atom = 2.34032
Neighbor list builds = 26
Dangerous builds = 0
```

The first section provides a global loop timing summary. The *loop time* is the total wall-clock time for the simulation to run. The *Performance* line is provided for convenience to help predict how long it will take to run a desired physical simulation. The *CPU use* line provides the CPU utilization per MPI task; it should be close to 100% times the number of OpenMP threads (or 1 of not using OpenMP). Lower numbers correspond to delays due to file I/O or insufficient thread utilization.

The *MPI task* section gives the breakdown of the CPU run time (in seconds) into major categories:

- *Pair* = non-bonded force computations
- *Bond* = bonded interactions: bonds, angles, dihedrals, impropers
- *Kspace* = long-range interactions: Ewald, PPPM, MSM

- *Neigh* = neighbor list construction
- *Comm* = inter-processor communication of atoms and their properties
- *Output* = output of thermodynamic info and dump files
- *Modify* = fixes and computes invoked by fixes
- *Other* = all the remaining time

For each category, there is a breakdown of the least, average and most amount of wall time any processor spent on this category of computation. The “%varavg” is the percentage by which the max or min varies from the average. This is an indication of load imbalance. A percentage close to 0 is perfect load balance. A large percentage is imbalance. The final “%total” column is the percentage of the total loop time is spent in this category.

When using the *timer full* setting, an additional column is added that also prints the CPU utilization in percent. In addition, when using *timer full* and the *package omp* command are active, a similar timing summary of time spent in threaded regions to monitor thread utilization and load balance is provided. A new *Thread timings* section is also added, which lists the time spent in reducing the per-thread data elements to the storage for non-threaded computation. These thread timings are measured for the first MPI rank only and thus, because the breakdown for MPI tasks can change from MPI rank to MPI rank, this breakdown can be very different for individual ranks. Here is an example output for this section:

```
Thread timings breakdown (MPI rank 0):
Total threaded time 0.6846 / 90.6%
Section | min time | avg time | max time | %varavg | %total
-----|-----|-----|-----|-----|-----
Pair    | 0.5127   | 0.5147   | 0.5167   | 0.3    | 75.18
Bond    | 0.0043139 | 0.0046779 | 0.0050418 | 0.5    | 0.68
Kspace  | 0.070572  | 0.074541  | 0.07851  | 1.5    | 10.89
Neigh   | 0.084778  | 0.086969  | 0.089161  | 0.7    | 12.70
Reduce  | 0.0036485 | 0.003737  | 0.0038254 | 0.1    | 0.55
```

The third section above lists the number of owned atoms (Nlocal), ghost atoms (Nghost), and pairwise neighbors stored per processor. The max and min values give the spread of these values across processors with a 10-bin histogram showing the distribution. The total number of histogram counts is equal to the number of processors.

The last section gives aggregate statistics (across all processors) for pairwise neighbors and special neighbors that LAMMPS keeps track of (see the *special\_bonds* command). The number of times neighbor lists were rebuilt is tallied, as is the number of potentially *dangerous* rebuilds. If atom movement triggered neighbor list rebuilding (see the *neigh\_modify* command), then dangerous reneighborings are those that were triggered on the first timestep atom movement was checked for. If this count is non-zero you may wish to reduce the delay factor to insure no force interactions are missed by atoms moving beyond the neighbor skin distance before a rebuild takes place.

If an energy minimization was performed via the *minimize* command, additional information is printed, e.g.

```
Minimization stats:
Stopping criterion = linesearch alpha is zero
Energy initial, next-to-last, final =
    -6372.3765206    -8328.46998942    -8328.46998942
Force two-norm initial, final = 1059.36 5.36874
Force max component initial, final = 58.6026 1.46872
Final line search alpha, max atom move = 2.7842e-10 4.0892e-10
Iterations, force evaluations = 701 1516
```

The first line prints the criterion that determined minimization was converged. The next line lists the initial and final energy, as well as the energy on the next-to-last iteration. The next 2 lines give a measure of the gradient of the energy (force on all atoms). The 2-norm is the “length” of this 3N-component force vector; the largest component (x, y, or z) of force (infinity-norm) is also given. Then information is provided about the line search and statistics on how many iterations and force-evaluations the minimizer required. Multiple force evaluations are typically done at each iteration to perform a 1d line minimization in the search direction. See the [minimize](#) page for more details.

---

If a *kspc* long-range Coulombics solver that performs FFTs was used during the run (PPPM, Ewald), then additional information is printed, e.g.

```
FFT time (% of Kspce) = 0.200313 (8.34477)
FFT Gflps 3d 1d-only = 2.31074 9.19989
```

The first line is the time spent doing 3d FFTs (several per timestep) and the fraction it represents of the total KSpace time (listed above). Each 3d FFT requires computation (3 sets of 1d FFTs) and communication (transposes). The total flops performed is  $5N\log_2(N)$ , where N is the number of points in the 3d grid. The FFTs are timed with and without the communication and a Gflop rate is computed. The 3d rate is with communication; the 1d rate is without (just the 1d FFTs). Thus you can estimate what fraction of your FFT time was spent in communication, roughly 75% in the example above.

## 4.4 Running LAMMPS on Windows

To run a serial (non-MPI) executable, follow these steps:

- Get a command prompt by going to Start->Run... , then typing “cmd”.
- Move to the directory where you have your input script, (e.g. by typing: cd “Documents”).
- At the command prompt, type “lmp -in in.file”, where in.file is the name of your LAMMPS input script.

Note that the serial executable includes support for multi-threading parallelization from the styles in the OPENMP packages. To run with 4 threads, you can type this:

```
lmp -in in.lj -pk omp 4 -sf omp
```

---

For the MPI executable, which allows you to run LAMMPS under Windows in parallel, follow these steps.

Download and install a compatible MPI library binary package:

- for 32-bit Windows: [mpich2-1.4.1p1-win-ia32.msi](#)
- for 64-bit Windows: [mpich2-1.4.1p1-win-x86-64.msi](#)

The LAMMPS Windows installer packages will automatically adjust your path for the default location of this MPI package. After the installation of the MPICH2 software, it needs to be integrated into the system. For this you need to start a Command Prompt in *Administrator Mode* (right click on the icon and select it). Change into the MPICH2 installation directory, then into the sub-directory **bin** and execute **smpd.exe -install**. Exit the command window.

- Get a new, regular command prompt by going to Start->Run... , then typing “cmd”.
- Move to the directory where you have your input file (e.g. by typing: cd “Documents”).

Then you can run the executable in serial like in the example above or in parallel using MPI with one of the following commands:

```
mpiexec -localonly 4 lmp -in in.file  
mpiexec -np 4 lmp -in in.file
```

where `in.file` is the name of your LAMMPS input script. For the latter case, you may be prompted to enter the password that you set during installation of the MPI library software.

In this mode, output may not immediately show up on the screen, so if your input script takes a long time to execute, you may need to be patient before the output shows up.

The parallel executable can also run on a single processor by typing something like this:

```
lmp -in in.lj
```

Note that the parallel executable also includes OpenMP multi-threading, which can be combined with MPI using something like:

```
mpiexec -localonly 2 lmp -in in.lj -pk omp 2 -sf omp
```

## COMMANDS

These pages describe how a LAMMPS input script is formatted and the commands in it are used to define a LAMMPS simulation.

### 5.1 LAMMPS input scripts

LAMMPS executes calculations by reading commands from an input script (text file), one line at a time. When the input script ends, LAMMPS exits. This is different from programs that read and process the entire input before starting a calculation.

Each command causes LAMMPS to take some immediate action without regard for any commands that may be processed later. Commands may set an internal variable, read in a file, or run a simulation. These actions can be grouped into three categories:

- a) commands that change a global setting (examples: `timestep`, `newton`, `echo`, `log`, `thermo`, `restart`),
- b) commands that add, modify, remove, or replace “styles” that are executed during a “run” (examples: `pair_style`, `fix`, `compute`, `dump`, `thermo_style`, `pair_modify`), and
- c) commands that execute a “run” or perform some other computation or operation (examples: `print`, `run`, `minimize`, `temper`, `write_dump`, `rerun`, `read_data`, `read_restart`)

Commands in category a) have default settings, which means you only need to use the command if you wish to change the defaults.

In many cases, the ordering of commands in an input script is not important, but can have consequences when the global state is changed between commands in the c) category. The following rules apply:

- (1) LAMMPS does not read your entire input script and then perform a simulation with all the settings. Rather, the input script is read one line at a time and each command takes effect when it is read. Thus this sequence of commands:

```
timestep 0.5
run      100
run      100
```

does something different than this sequence:

```
run      100
timestep 0.5
run      100
```

In the first case, the specified timestep (0.5 fs) is used for two simulations of 100 timesteps each. In the second case, the default timestep (1.0 fs) is used for the first 100 step simulation and a 0.5 fs timestep is used for the second one.

- (2) Some commands are only valid when they follow other commands. For example you cannot set the temperature of a group of atoms until atoms have been defined and a group command is used to define which atoms belong to the group.
- (3) Sometimes command B will use values that can be set by command A. This means command A must precede command B in the input script if it is to have the desired effect. For example, the `read_data` command initializes the system by setting up the simulation box and assigning atoms to processors. If default values are not desired, the `processors` and `boundary` commands need to be used before `read_data` to tell LAMMPS how to map processors to the simulation box.

Many input script errors are detected by LAMMPS and an ERROR or WARNING message is printed. The [Errors](#) page gives more information on what errors mean. The documentation for each command lists restrictions on how the command can be used.

You can use the `-skiprun` command line flag to have LAMMPS skip the execution of any “run”, “minimize”, or similar commands to check the entire input for correct syntax to avoid crashes on typos or syntax errors in long runs.

## 5.2 Parsing rules for input scripts

Each non-blank line in the input script is treated as a command. LAMMPS commands are case sensitive. Command names are lower-case, as are specified command arguments. Upper case letters may be used in file names or user-chosen ID strings.

Here are 6 rules for how each line in the input script is parsed by LAMMPS:

1. If the last printable character on the line is a “&” character, the command is assumed to continue on the next line. The next line is concatenated to the previous line by removing the “&” character and line break. This allows long commands to be continued across two or more lines. See the discussion of triple quotes in [6](#) for how to continue a command across multiple line without using “&” characters.
2. All characters from the first “#” character onward are treated as comment and discarded. The exception to this rule is described in [6](#). Note that a comment after a trailing “&” character will prevent the command from continuing on the next line. Also note that for multi-line commands a single leading “#” will comment out the entire command.

```
# this is a comment
timestep 1.0 # this is also a comment
```

3. The line is searched repeatedly for \$ characters, which indicate variables that are replaced with a text string. The exception to this rule is described in [6](#).

If the \$ is followed by text in curly brackets ‘{}’, then the variable name is the text inside the curly brackets. If no curly brackets follow the \$, then the variable name is the single character immediately following the \$. Thus  `${myTemp}` and  `$x` refer to variables named “myTemp” and “x”, while “\$xx” will be interpreted as a variable named “x” followed by an “x” character.

How the variable is converted to a text string depends on what style of variable it is; see the [variable](#) page for details. It can be a variable that stores multiple text strings, and return one of them. The returned text string can be multiple “words” (space separated) which will then be interpreted as multiple arguments in the input command. The variable can also store a numeric formula which will be evaluated and its numeric result returned as a string.

As a special case, if the \$ is followed by parenthesis “()”, then the text inside the parenthesis is treated as an “immediate” variable and evaluated as an *equal-style variable*. This is a way to use numeric formulas in an input script without having to assign them to variable names. For example, these 3 input script lines:

```
variable X equal (xlo+xhi)/2+sqrt(v_area)
region 1 block $X 2 INF INF EDGE EDGE
variable X delete
```

can be replaced by:

```
region 1 block $((xlo+xhi)/2+sqrt(v_area)) 2 INF INF EDGE EDGE
```

so that you do not have to define (or discard) a temporary variable, “X” in this case.

Additionally, the entire “immediate” variable expression may be followed by a colon, followed by a C-style format string, e.g. “:%f” or “:%.10g”. The format string must be appropriate for a double-precision floating-point value. The format string is used to output the result of the variable expression evaluation. If a format string is not specified, a high-precision “%.20g” is used as the default format.

This can be useful for formatting print output to a desired precision:

```
print "Final energy per atom: $(v_ke_per_atom+v_pe_per_atom:%10.3f) eV/atom"
```

Note that neither the curly-bracket or immediate form of variables can contain nested \$ characters for other variables to substitute for. Thus you may **NOT** do this:

```
variable a equal 2
variable b2 equal 4
print "B2 = ${b$a}"
```

Nor can you specify an expression like “\$(x-1.0)” for an immediate variable, but you could use \$(v\_x-1.0), since the latter is valid syntax for an *equal-style variable*.

See the *variable* command for more details of how strings are assigned to variables and evaluated, and how they can be used in input script commands.

4. The line is broken into “words” separated by white-space (tabs, spaces). Note that words can thus contain letters, digits, underscores, or punctuation characters.
5. The first word is the command name. All successive words in the line are arguments.
6. If you want text with spaces to be treated as a single argument, it can be enclosed in either single (') or double (") or triple (""") quotes. A long single argument enclosed in single or double quotes can span multiple lines if the “&” character is used, as described in 1 above. When the lines are concatenated together by LAMMPS (and the “&” characters and line breaks removed), the combined text will become a single line. If you want multiple lines of an argument to retain their line breaks, the text can be enclosed in triple quotes, in which case “&” characters are not needed and do not function as line continuation character. For example:

```
print "Volume = $v"
print 'Volume = $v'
if "${steps} > 1000" then quit
variable a string "red green blue &
                  purple orange cyan"
print """"
System volume = $v
System temperature = $t
""""
```

In each of these cases, the single, double, or triple quotes are removed and the enclosed text stored internally as a single argument.

See the *dump modify format, print, if, and python* commands for examples.

A “#” or “\$” character that is between quotes will not be treated as a comment indicator in 2 or substituted for as a variable in 3.

---

**Note:** If the argument is itself a command that requires a quoted argument (e.g. using a *print* command as part of an *if* or *run every* command), then single, double, or triple quotes can be nested in the usual manner. See the doc pages for those commands for examples. Only one of level of nesting is allowed, but that should be sufficient for most use cases.

---

---

### ASCII versus UTF-8

LAMMPS expects and processes 7-bit ASCII format text internally. Many modern environments use UTF-8 encoding, which is a superset of the 7-bit ASCII character table and thus mostly compatible. However, there are several non-ASCII characters that can look very similar to their ASCII equivalents or are invisible (so they look like a blank), but are encoded differently. Web browsers, PDF viewers, document editors are known to sometimes replace one with the other for a better looking output. However, that can lead to problems, for instance, when using cut-n-paste of input file examples from web pages, or when using a document editor (not a dedicated plain text editor) for writing LAMMPS inputs. LAMMPS will try to detect this and substitute the non-ASCII characters with their ASCII equivalents where known. There also is going to be a warning printed, if this occurs. It is recommended to avoid such characters altogether in LAMMPS input, data and potential files. The replacement tables are likely incomplete and dependent on users reporting problems processing correctly looking input containing UTF-8 encoded non-ASCII characters.

---

## 5.3 Input script structure

This page describes the structure of a typical LAMMPS input script. The examples directory in the LAMMPS distribution contains many sample input scripts; it is discussed on the *Examples* doc page.

A LAMMPS input script typically has 4 parts:

1. *Initialization*
2. *System definition*
3. *Simulation settings*
4. *Run a simulation*

The last 2 parts can be repeated as many times as desired. I.e. run a simulation, change some settings, run some more, etc. Each of the 4 parts is now described in more detail. Remember that almost all commands need only be used if a non-default value is desired.

### 5.3.1 Initialization

Set parameters that need to be defined before atoms are created or read-in from a file.

The relevant commands are *units*, *dimension*, *newton*, *processors*, *boundary*, *atom\_style*, *atom\_modify*.

If force-field parameters appear in the files that will be read, these commands tell LAMMPS what kinds of force fields are being used: *pair\_style*, *bond\_style*, *angle\_style*, *dihedral\_style*, *improper\_style*.

### 5.3.2 System definition

There are 3 ways to define the simulation cell and reserve space for force field info and fill it with atoms in LAMMPS. Read them in from (1) a data file or (2) a restart file via the *read\_data* or *read\_restart* commands, respectively. These files can also contain molecular topology information. Or (3) create a simulation cell and fill it with atoms on a lattice (with no molecular topology), using these commands: *lattice*, *region*, *create\_box*, *create\_atoms* or *read\_dump*.

The entire set of atoms can be duplicated to make a larger simulation using the *replicate* command.

### 5.3.3 Simulation settings

Once atoms and molecular topology are defined, a variety of settings can be specified: force field coefficients, simulation parameters, output options, and more.

Force field coefficients are set by these commands (they can also be set in the read-in files): *pair\_coeff*, *bond\_coeff*, *angle\_coeff*, *dihedral\_coeff*, *improper\_coeff*, *kspace\_style*, *dielectric*, *special\_bonds*.

Various simulation parameters are set by these commands: *neighbor*, *neigh\_modify*, *group*, *timestep*, *reset\_timestep*, *run\_style*, *min\_style*, *min\_modify*.

Fixes impose a variety of boundary conditions, time integration, and diagnostic options. The *fix* command comes in many flavors.

Various computations can be specified for execution during a simulation using the *compute*, *compute\_modify*, and *variable* commands.

Output options are set by the *thermo*, *dump*, and *restart* commands.

### 5.3.4 Run a simulation

A molecular dynamics simulation is run using the *run* command. Energy minimization (molecular statics) is performed using the *minimize* command. A parallel tempering (replica-exchange) simulation can be run using the *temper* command.

## 5.4 Commands by category

This page lists most of the LAMMPS commands, grouped by category. The *General commands* page lists all general commands alphabetically. Style options for entries like *fix*, *compute*, *pair* etc. have their own pages where they are listed alphabetically.

### 5.4.1 Initialization:

<i>newton</i>	<i>package</i>	<i>processors</i>	<i>suffix</i>	<i>units</i>
---------------	----------------	-------------------	---------------	--------------

### 5.4.2 Setup simulation box:

<i>boundary</i>	<i>box</i>	<i>change_box</i>	<i>create_box</i>
<i>dimension</i>	<i>lattice</i>	<i>region</i>	

### 5.4.3 Setup atoms:

<i>atom_modify</i>	<i>atom_style</i>	<i>balance</i>	<i>create_atoms</i>
<i>create_bonds</i>	<i>delete_atoms</i>	<i>delete_bonds</i>	<i>displace_atoms</i>
<i>group</i>	<i>mass</i>	<i>molecule</i>	<i>read_data</i>
<i>read_dump</i>	<i>read_restart</i>	<i>replicate</i>	<i>set</i>
<i>velocity</i>			

### 5.4.4 Force fields:

<i>angle_coeff</i>	<i>angle_style</i>	<i>bond_coeff</i>	<i>bond_style</i>
<i>bond_write</i>	<i>dielectric</i>	<i>dihedral_coeff</i>	<i>dihedral_style</i>
<i>improper_coeff</i>	<i>improper_style</i>	<i>kspace_modify</i>	<i>kspace_style</i>
<i>pair_coeff</i>	<i>pair_modify</i>	<i>pair_style</i>	<i>pair_write</i>
<i>special_bonds</i>			

### 5.4.5 Settings:

<i>comm_modify</i>	<i>comm_style</i>	<i>info</i>	<i>min_modify</i>
<i>min_style</i>	<i>neigh_modify</i>	<i>neighbor</i>	<i>partition</i>
<i>reset_timestep</i>	<i>run_style</i>	<i>timer</i>	<i>timestep</i>

### 5.4.6 Operations within timestepping (fixes) and diagnostics (computes):

<i>compute</i>	<i>compute_modify</i>	<i>fix</i>	<i>fix_modify</i>
<i>uncompute</i>	<i>unfix</i>		

### 5.4.7 Output:

<i>dump image</i>	<i>dump movie</i>	<i>dump</i>	<i>dump_modify</i>
<i>restart</i>	<i>thermo</i>	<i>thermo_modify</i>	<i>thermo_style</i>
<i>undump</i>	<i>write_coeff</i>	<i>write_data</i>	<i>write_dump</i>
<i>write_restart</i>			

### 5.4.8 Actions:

<i>minimize</i>	<i>neb</i>	<i>neb_spin</i>	<i>prd</i>	<i>rerun</i>	<i>run</i>
<i>tad</i>	<i>temper</i>				

### 5.4.9 Input script control:

<i>clear</i>	<i>echo</i>	<i>if</i>	<i>include</i>	<i>info</i>	<i>jump</i>	<i>label</i>
<i>log</i>	<i>next</i>	<i>print</i>	<i>python</i>	<i>quit</i>	<i>shell</i>	<i>variable</i>

<i>General commands</i>	<i>Fix styles</i>	<i>Compute styles</i>
<i>Pair styles</i>	<i>Bond styles</i>	<i>Angle styles</i>
<i>Dihedral styles</i>	<i>Improper styles</i>	<i>KSpace styles</i>
<i>Dump styles</i>		

## 5.5 General commands

An alphabetic list of general LAMMPS commands. Note that style commands with many variants, can be more easily accessed via the small table above.

<i>angle_coeff</i>	<i>angle_style</i>	<i>atom_modify</i>	<i>atom_style</i>	<i>balance</i>
<i>bond_coeff</i>	<i>bond_style</i>	<i>bond_write</i>	<i>boundary</i>	<i>box</i>
<i>change_box</i>	<i>clear</i>	<i>comm_modify</i>	<i>comm_style</i>	<i>compute</i>
<i>compute_modify</i>	<i>create_atoms</i>	<i>create_bonds</i>	<i>create_box</i>	<i>delete_atoms</i>
<i>delete_bonds</i>	<i>dielectric</i>	<i>dihedral_coeff</i>	<i>dihedral_style</i>	<i>dimension</i>
<i>displace_atoms</i>	<i>dump</i>	<i>dump_modify</i>	<i>echo</i>	<i>fix</i>
<i>fix_modify</i>	<i>group</i>	<i>if</i>	<i>improper_coeff</i>	<i>improper_style</i>
<i>include</i>	<i>info</i>	<i>jump</i>	<i>kspace_modify</i>	<i>kspace_style</i>
<i>label</i>	<i>labelmap</i>	<i>lattice</i>	<i>log</i>	<i>mass</i>
<i>minimize</i>	<i>min_modify</i>	<i>min_style</i>	<i>molecule</i>	<i>neigh_modify</i>
<i>neighbor</i>	<i>newton</i>	<i>next</i>	<i>package</i>	<i>pair_coeff</i>
<i>pair_modify</i>	<i>pair_style</i>	<i>pair_write</i>	<i>partition</i>	<i>print</i>
<i>processors</i>	<i>quit</i>	<i>read_data</i>	<i>read_dump</i>	<i>read_restart</i>
<i>region</i>	<i>replicate</i>	<i>rerun</i>	<i>reset_atom_ids</i>	<i>reset_mol_ids</i>
<i>reset_timestep</i>	<i>restart</i>	<i>run</i>	<i>run_style</i>	<i>set</i>
<i>shell</i>	<i>special_bonds</i>	<i>suffix</i>	<i>thermo</i>	<i>thermo_modify</i>
<i>thermo_style</i>	<i>timer</i>	<i>timestep</i>	<i>uncompute</i>	<i>undump</i>
<i>unfix</i>	<i>units</i>	<i>variable</i>	<i>velocity</i>	<i>write_coeff</i>
<i>write_data</i>	<i>write_dump</i>	<i>write_restart</i>		

Additional general LAMMPS commands provided by packages. A few commands have accelerated versions. This is indicated by an additional letter in parenthesis: k = KOKKOS.

<i>dynamical_matrix (k)</i>	<i>group2ndx</i>	<i>hyper</i>	<i>kim</i>	<i>mdi</i>
<i>ndx2group</i>	<i>neb</i>	<i>neb/spin</i>	<i>plugin</i>	<i>prd</i>
<i>python</i>	<i>tad</i>	<i>temper</i>	<i>temper/grem</i>	<i>temper/npt</i>
<i>third_order (k)</i>				

<i>General commands</i>	<i>Fix styles</i>	<i>Compute styles</i>
<i>Pair styles</i>	<i>Bond styles</i>	<i>Angle styles</i>
<i>Dihedral styles</i>	<i>Improper styles</i>	<i>KSpace styles</i>
<i>Dump styles</i>		

## 5.6 Fix commands

An alphabetic list of all LAMMPS *fix* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>accelerate/cos</i>	<i>acks2/reaxff (k)</i>	<i>adapt</i>	<i>adapt/fep</i>	<i>addforce</i>
<i>addtorque</i>	<i>amoeba/bitorsion</i>	<i>amoeba/pitorsion</i>	<i>append/atoms</i>	<i>atc</i>
<i>atom/swap</i>	<i>ave/atom</i>	<i>ave/chunk</i>	<i>ave/correlate</i>	<i>ave/correlate/long</i>
<i>ave/histo</i>	<i>ave/histo/weight</i>	<i>ave/time</i>	<i>aveforce</i>	<i>balance</i>
<i>brownian</i>	<i>brownian/asphere</i>	<i>brownian/sphere</i>	<i>bocs</i>	<i>bond/break</i>
<i>bond/create</i>	<i>bond/create/angle</i>	<i>bond/react</i>	<i>bond/swap</i>	<i>box/relax</i>
<i>charge/regulation</i>	<i>cmap</i>	<i>colvars</i>	<i>controller</i>	<i>damping/cundall</i>
<i>deform (k)</i>	<i>deposit</i>	<i>dpd/energy (k)</i>	<i>drag</i>	<i>drude</i>
<i>drude/transform/direct</i>	<i>drude/transform/inverse</i>	<i>dt/reset</i>	<i>edpd/source</i>	<i>efield</i>
<i>ehex</i>	<i>electrode/conp (i)</i>	<i>electrode/conq (i)</i>	<i>electrode/thermo (i)</i>	<i>electron/stopping</i>
<i>electron/stopping/fit</i>	<i>enforce2d (k)</i>	<i>eos/cv</i>	<i>eos/table</i>	<i>eos/table/rx (k)</i>
<i>evaporate</i>	<i>external</i>	<i>ffl</i>	<i>filter/corotate</i>	<i>flow/gauss</i>
<i>freeze (k)</i>	<i>gcmc</i>	<i>gld</i>	<i>gle</i>	<i>gravity (ko)</i>
<i>grem</i>	<i>halt</i>	<i>heat</i>	<i>hyper/global</i>	<i>hyper/local</i>
<i>imd</i>	<i>indent</i>	<i>ipi</i>	<i>langevin (k)</i>	<i>langevin/drude</i>
<i>langevin/eff</i>	<i>langevin/spin</i>	<i>latte</i>	<i>lb/fluid</i>	<i>lb/momentum</i>
<i>lb/viscous</i>	<i>lineforce</i>	<i>manifoldforce</i>	<i>mdi/qm</i>	<i>meso/move</i>
<i>mol/swap</i>	<i>momentum (k)</i>	<i>momentum/chunk</i>	<i>move</i>	<i>mscg</i>
<i>msst</i>	<i>mvv/dpd</i>	<i>mvv/edpd</i>	<i>mvv/tdpd</i>	<i>neb</i>
<i>neb/spin</i>	<i>nph (ko)</i>	<i>nph/asphere (o)</i>	<i>nph/body</i>	<i>nph/eff</i>
<i>nph/sphere (o)</i>	<i>nphug</i>	<i>npt (giko)</i>	<i>npt/asphere (o)</i>	<i>npt/body</i>
<i>npt/cauchy</i>	<i>npt/eff</i>	<i>npt/sphere (o)</i>	<i>npt/uef</i>	<i>numdiff</i>
<i>numdiff/virial</i>	<i>nve (giko)</i>	<i>nve/asphere (gi)</i>	<i>nve/asphere/noforce</i>	<i>nve/awpmd</i>
<i>nve/body</i>	<i>nve/dot</i>	<i>nve/dotc/langevin</i>	<i>nve/eff</i>	<i>nve/limit</i>
<i>nve/line</i>	<i>nve/manifold/rattle</i>	<i>nve/noforce</i>	<i>nve/sphere (ko)</i>	<i>nve/bpm/sphere</i>
<i>nve/spin</i>	<i>nve/tri</i>	<i>nvk</i>	<i>nvt (giko)</i>	<i>nvt/asphere (o)</i>
<i>nvt/body</i>	<i>nvt/eff</i>	<i>nvt/manifold/rattle</i>	<i>nvt/sllod (iko)</i>	<i>nvt/sllod/eff</i>
<i>nvt/sphere (o)</i>	<i>nvt/uef</i>	<i>oneway</i>	<i>orient/bcc</i>	<i>orient/fcc</i>
<i>orient/eco</i>	<i>pafi</i>	<i>pair</i>	<i>phonon</i>	<i>pimd</i>
<i>planeforce</i>	<i>plumed</i>	<i>poems</i>	<i>polarize/bem/gmres</i>	<i>polarize/bem/icc</i>

<i>Dump styles</i>		

## 5.9 Bond\_style potentials

All LAMMPS *bond\_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid</i>	
<i>bpm/rotational</i>	<i>bpm/spring</i>	<i>class2 (ko)</i>	<i>fene (iko)</i>
<i>fene/expand (o)</i>	<i>fene/nm</i>	<i>gaussian</i>	<i>gromos (o)</i>
<i>harmonic (iko)</i>	<i>harmonic/shift (o)</i>	<i>harmonic/shift/cut (o)</i>	<i>mesocnt</i>
<i>mm3</i>	<i>morse (o)</i>	<i>nonlinear (o)</i>	<i>oxdna/fene</i>
<i>oxdna2/fene</i>	<i>oxrna2/fene</i>	<i>quartic (o)</i>	<i>special</i>
<i>table (o)</i>			

## 5.10 Angle\_style potentials

All LAMMPS *angle\_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid</i>	
<i>amoeba</i>	<i>charmm (iko)</i>	<i>class2 (ko)</i>	<i>class2/p6</i>
<i>cosine (ko)</i>	<i>cosine/buck6d</i>	<i>cosine/delta (o)</i>	<i>cosine/periodic (o)</i>
<i>cosine/shift (o)</i>	<i>cosine/shift/exp (o)</i>	<i>cosine/squared (o)</i>	<i>cross</i>
<i>dipole (o)</i>	<i>fourier (o)</i>	<i>fourier/simple (o)</i>	<i>gaussian</i>
<i>harmonic (iko)</i>	<i>mesocnt</i>	<i>mm3</i>	<i>quartic (o)</i>
<i>spica (o)</i>	<i>table (o)</i>		

## 5.11 Dihedral\_style potentials

All LAMMPS *dihedral\_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid</i>	
<i>charmm (iko)</i>	<i>charmmfsw</i>	<i>class2 (ko)</i>	<i>cosine/shift/exp (o)</i>
<i>fourier (io)</i>	<i>harmonic (iko)</i>	<i>helix (o)</i>	<i>multi/harmonic (o)</i>
<i>nharmonic (o)</i>	<i>opls (iko)</i>	<i>quadratic (o)</i>	<i>spherical</i>
<i>table (o)</i>	<i>table/cut</i>		

## 5.12 Improper\_style potentials

All LAMMPS *improper\_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid</i>	
<i>amoeba</i>	<i>class2 (ko)</i>	<i>cossq (o)</i>	<i>cvff (io)</i>
<i>distance</i>	<i>distharm</i>	<i>fourier (o)</i>	<i>harmonic (iko)</i>
<i>inversion/harmonic</i>	<i>ring (o)</i>	<i>sqdistharm</i>	<i>umbrella (o)</i>

<i>General commands</i>	<i>Fix styles</i>	<i>Compute styles</i>
<i>Pair styles</i>	<i>Bond styles</i>	<i>Angle styles</i>
<i>Dihedral styles</i>	<i>Improper styles</i>	<i>KSpace styles</i>
<i>Dump styles</i>		

## 5.13 KSpace solvers

All LAMMPS *kpace\_style* solvers. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>ewald (o)</i>	<i>ewald/disp</i>	<i>ewald/disp/dipole</i>	<i>ewald/dipole</i>
<i>ewald/dipole/spin</i>	<i>ewald/electrode</i>	<i>msm (o)</i>	<i>msm/cg (o)</i>
<i>msm/dielectric</i>	<i>pppm (giko)</i>	<i>pppm/cg (o)</i>	<i>pppm/dipole</i>
<i>pppm/dipole/spin</i>	<i>pppm/dielectric</i>	<i>pppm/disp (io)</i>	<i>pppm/disp/tip4p (o)</i>
<i>pppm/disp/dielectric</i>	<i>pppm/stagger</i>	<i>pppm/tip4p (o)</i>	<i>pppm/dielectric</i>
<i>pppm/electrode (i)</i>	<i>scafacos</i>		

<i>General commands</i>	<i>Fix styles</i>	<i>Compute styles</i>
<i>Pair styles</i>	<i>Bond styles</i>	<i>Angle styles</i>
<i>Dihedral styles</i>	<i>Improper styles</i>	<i>KSpace styles</i>
<i>Dump styles</i>		

## 5.14 Dump commands

An alphabetic list of all LAMMPS *dump* commands.

<i>atom</i>	<i>atom/adios</i>	<i>atom/gz</i>	<i>atom/mpiio</i>	<i>atom/zstd</i>
<i>cfg</i>	<i>cfg/gz</i>	<i>cfg/mpiio</i>	<i>cfg/uef</i>	<i>cfg/zstd</i>
<i>custom</i>	<i>custom/adios</i>	<i>custom/gz</i>	<i>custom/mpiio</i>	<i>custom/zstd</i>
<i>dcd</i>	<i>deprecated</i>	<i>h5md</i>	<i>image</i>	<i>local</i>
<i>local/gz</i>	<i>local/zstd</i>	<i>molfile</i>	<i>movie</i>	<i>netcdf</i>
<i>netcdf/mpiio</i>	<i>vtk</i>	<i>xtc</i>	<i>xyz</i>	<i>xyz/gz</i>
<i>xyz/mpiio</i>	<i>xyz/zstd</i>	<i>yaml</i>		

## 5.15 Removed commands and packages

This page lists LAMMPS commands and packages that have been removed from the distribution and provides suggestions for alternatives or replacements. LAMMPS has special dummy styles implemented, that will stop LAMMPS and print a suitable error message in most cases, when a style/command is used that has been removed.

### 5.15.1 Fix ave/spatial and fix ave/spatial/sphere

The fixes `ave/spatial` and `ave/spatial/sphere` have been removed from LAMMPS since they were superseded by the more general and extensible “chunk infrastructure”. Here the system is partitioned in one of many possible ways through the `compute chunk/atom` command and then averaging is done using `fix ave/chunk`. Please refer to the `chunk HOWTO` section for an overview.

### 5.15.2 Reset\_ids command

The `reset_ids` command has been renamed to `reset_atom_ids`.

### 5.15.3 MEAM package

The MEAM package in Fortran has been replaced by a C++ implementation. The code in the `MEAM package` is a translation of the Fortran code of MEAM into C++, which removes several restrictions (e.g. there can be multiple instances in hybrid pair styles) and allows for some optimizations leading to better performance. The pair style `meam` has the exact same syntax.

### 5.15.4 REAX package

The REAX package has been removed since it was superseded by the `REAXFF package`. The REAXFF package has been tested to yield equivalent results to the REAX package, offers better performance, supports OpenMP multi-threading via OPENMP, and GPU and threading parallelization through KOKKOS. The new pair styles are not syntax compatible with the removed `reax` pair style, so input files will have to be adapted.

### 5.15.5 USER-CUDA package

The USER-CUDA package had been removed, since it had been unmaintained for a long time and had known bugs and problems. Significant parts of the design were transferred to the `KOKKOS package`, which has similar performance characteristics on NVIDIA GPUs. Both, the KOKKOS and the `GPU package` are maintained and allow running LAMMPS with GPU acceleration.

### 5.15.6 restart2data tool

The functionality of the `restart2data` tool has been folded into the LAMMPS executable directly instead of having a separate tool. A combination of the commands `read_restart` and `write_data` can be used to the same effect. For added convenience this conversion can also be triggered by *command line flags*

## OPTIONAL PACKAGES

This section gives an overview of the optional packages that extend LAMMPS functionality. Packages are groups of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. You can see the list of all packages and “make” commands to manage them by typing “make package” from within the src directory of the LAMMPS distribution. The *Build package* page gives general info on how to install and un-install packages as part of the LAMMPS build process.

### 6.1 Available Packages

This is the list of packages included in LAMMPS. The link for each package name gives more details.

Packages are supported by either the LAMMPS developers or the contributing authors and written in a syntax and style consistent with the rest of LAMMPS.

The “Example” column is a sub-directory in the examples directory of the distribution which has an input script that uses the package. E.g. “peptide” refers to the examples/peptide directory; PACKAGES/atc refers to the examples/PACKAGES/atc directory. The “Library” column indicates whether an extra library is needed to build and use the package:

- no = no library
- sys = system library: you likely have it on your machine
- int = internal library: provided with LAMMPS, but you may need to build it
- ext = external library: you will need to download and install it on your machine

Package	Description	Doc page	Example
<i>ADIOS</i>	dump output via ADIOS	<i>dump adios</i>	PACKAGES,
<i>AMOEB</i> A	AMOEB A and HIPPO force fields	<i>AMOEB A and HIPPO howto</i>	amoeba
<i>ASPH</i> ERE	aspherical particle models	<i>Howto spherical</i>	ellipse
<i>ATC</i>	Atom-to-Continuum coupling	<i>fix atc</i>	PACKAGES,
<i>AWP</i> MD	wave packet MD	<i>pair_style awpmd/cut</i>	PACKAGES,
<i>BOCS</i>	BOCS bottom up coarse graining	<i>fix bocs</i>	PACKAGES,
<i>BOD</i> Y	body-style particles	<i>Howto body</i>	body
<i>BPM</i>	bonded particle models	<i>Howto bpm</i>	bpm
<i>BROW</i> NIAN	Brownian dynamics, self-propelled particles	<i>fix brownian, fix propel/self</i>	PACKAGES,
<i>CG-D</i> NA	coarse-grained DNA force fields	src/CG-DNA/README	PACKAGES,
<i>CG-S</i> PICA	SPICA (SDK) coarse-graining model	<i>pair_style lj/spica</i>	PACKAGES,
<i>CL</i> ASS2	class 2 force fields	<i>pair_style lj/class2</i>	n/a
<i>COL</i> LOID	colloidal particles	<i>atom_style colloid</i>	colloid
<i>COL</i> VARS	collective variables library	<i>fix colvars</i>	PACKAGES,

Table 1 – continued from previous page

Package	Description	Doc page	Example
<i>COMPRESS</i>	I/O compression	<i>dump */gz</i>	n/a
<i>CORESHELL</i>	adiabatic core/shell model	<i>Howto coreshell</i>	coreshell
<i>DIELECTRIC</i>	dielectric boundary solvers and force styles	<i>compute efield/atom</i>	PACKAGES,
<i>DIFFRACTION</i>	virtual x-ray and electron diffraction	<i>compute xrd</i>	PACKAGES,
<i>DIPOLE</i>	point dipole particles	<i>pair_style lj/.../dipole</i>	dipole
<i>DPD-BASIC</i>	basic DPD models	<i>pair_styles dpd dpd/tstat dpd/ext dpd/ext/tstat</i>	PACKAGES,
<i>DPD-MESO</i>	mesoscale DPD models	<i>pair_style edpd</i>	PACKAGES,
<i>DPD-REACT</i>	reactive dissipative particle dynamics	src/DPD-REACT/README	PACKAGES,
<i>DPD-SMOOTH</i>	smoothed dissipative particle dynamics	src/DPD-SMOOTH/README	PACKAGES,
<i>DRUDE</i>	Drude oscillators	<i>Howto drude</i>	PACKAGES,
<i>EFF</i>	electron force field	<i>pair_style eff/cut</i>	PACKAGES,
<i>ELECTRODE</i>	electrode charges to match potential	<i>fix electrode/comp</i>	PACKAGES,
<i>EXTRA-COMPUTE</i>	additional compute styles	<i>compute</i>	n/a
<i>EXTRA-DUMP</i>	additional dump styles	<i>dump</i>	n/a
<i>EXTRA-FIX</i>	additional fix styles	<i>fix</i>	n/a
<i>EXTRA-MOLECULE</i>	additional molecular styles	<i>molecular styles</i>	n/a
<i>EXTRA-PAIR</i>	additional pair styles	<i>pair_style</i>	n/a
<i>FEP</i>	free energy perturbation	<i>compute fep</i>	PACKAGES,
<i>GPU</i>	GPU-enabled styles	<i>Section gpu</i>	Benchmarks
<i>GRANULAR</i>	granular systems	<i>Howto granular</i>	pour
<i>H5MD</i>	dump output via HDF5	<i>dump h5md</i>	n/a
<i>INTEL</i>	optimized Intel CPU and KNL styles	<i>Speed intel</i>	Benchmarks
<i>INTERLAYER</i>	Inter-layer pair potentials	<i>several pair styles</i>	PACKAGES,
<i>KIM</i>	OpenKIM wrapper	<i>pair_style kim</i>	kim
<i>KOKKOS</i>	Kokkos-enabled styles	<i>Speed kokkos</i>	Benchmarks
<i>KSPACE</i>	long-range Coulombic solvers	<i>kpace_style</i>	peptide
<i>LATBOLTZ</i>	Lattice Boltzmann fluid	<i>fix lb/fluid</i>	PACKAGES,
<i>LATTE</i>	quantum DFTB forces via LATTE	<i>fix latte</i>	latte
<i>MACHDYN</i>	smoothed Mach dynamics	SMD User Guide	PACKAGES,
<i>MANIFOLD</i>	motion on 2d surfaces	<i>fix manifoldforce</i>	PACKAGES,
<i>MANYBODY</i>	many-body potentials	<i>pair_style tersoff</i>	shear
<i>MC</i>	Monte Carlo options	<i>fix gcmc</i>	n/a
<i>MDI</i>	client-server code coupling	<i>MDI Howto</i>	PACKAGES,
<i>MEAM</i>	modified EAM potential (C++)	<i>pair_style meam</i>	meam
<i>MESONT</i>	mesoscopic tubular potential model	<i>pair styles mesont/tpm, mesocnt</i>	PACKAGES,
<i>MGPT</i>	fast MGPT multi-ion potentials	<i>pair_style mgpt</i>	PACKAGES,
<i>MISC</i>	miscellaneous single-file commands	n/a	no
<i>ML-HDNNP</i>	High-dimensional neural network potentials	<i>pair_style hdnnp</i>	PACKAGES,
<i>ML-IAP</i>	multiple machine learning potentials	<i>pair_style mliap</i>	mliap
<i>ML-PACE</i>	Atomic Cluster Expansion potential	<i>pair pace</i>	PACKAGES,
<i>ML-QUIP</i>	QUIP/libatoms interface	<i>pair_style quip</i>	PACKAGES,
<i>ML-RANN</i>	Pair style for RANN potentials	<i>pair rann</i>	PACKAGES,
<i>ML-SNAP</i>	quantum-fitted potential	<i>pair_style snap</i>	snap
<i>MOFFF</i>	styles for MOF-FF force field	<i>pair_style buck6d/coul/gauss</i>	PACKAGES,
<i>MOLECULE</i>	molecular system force fields	<i>Howto bioFF</i>	peptide
<i>MOLFILE</i>	VMD molfile plug-ins	<i>dump molfile</i>	n/a
<i>MPIO</i>	MPI parallel I/O dump and restart	<i>dump</i>	n/a
<i>MSCG</i>	multi-scale coarse-graining wrapper	<i>fix mscg</i>	mscg
<i>NETCDF</i>	dump output via NetCDF	<i>dump netcdf</i>	n/a

CO

Table 1 – continued from previous page

Package	Description	Doc page	Example
<i>OPENMP</i>	OpenMP-enabled styles	<i>Speed omp</i>	Benchmarks
<i>OPT</i>	optimized pair styles	<i>Speed opt</i>	Benchmarks
<i>ORIENT</i>	fixes for orientation depended forces	<i>fix orient/*</i>	PACKAGES.
<i>PERI</i>	Peridynamics models	<i>pair_style peri</i>	peri
<i>PHONON</i>	phonon dynamical matrix	<i>fix phonon</i>	PACKAGES.
<i>PLUGIN</i>	Plugin loader command	<i>plugin</i>	plugins
<i>PLUMED</i>	<i>PLUMED</i> free energy library	<i>fix plumed</i>	PACKAGES.
<i>POEMS</i>	coupled rigid body motion	<i>fix poems</i>	rigid
<i>PTM</i>	Polyhedral Template Matching	<i>compute ptm/atom</i>	n/a
<i>PYTHON</i>	embed Python code in an input script	<i>python</i>	python
<i>QEQ</i>	QEq charge equilibration	<i>fix qeq</i>	qeq
<i>QMMM</i>	QM/MM coupling	<i>fix qmmm</i>	PACKAGES.
<i>QTB</i>	quantum nuclear effects	<i>fix qtb fix qbmsst</i>	qtb
<i>REACTION</i>	chemical reactions in classical MD	<i>fix bond/react</i>	PACKAGES.
<i>REAXFF</i>	ReaxFF potential (C/C++)	<i>pair_style reaxff</i>	reax
<i>REPLICA</i>	multi-replica methods	<i>Howto replica</i>	tad
<i>RIGID</i>	rigid bodies and constraints	<i>fix rigid</i>	rigid
<i>SCAFACOS</i>	wrapper for ScaFaCoS Kspace solver	<i>kpace_style scafacos</i>	PACKAGES.
<i>SHOCK</i>	shock loading methods	<i>fix msst</i>	n/a
<i>SMTBQ</i>	second moment tight binding potentials	<i>pair_style smtbq pair_style smatb</i>	PACKAGES.
<i>SPH</i>	smoothed particle hydrodynamics	SPH User Guide	PACKAGES.
<i>SPIN</i>	magnetic atomic spin dynamics	<i>Howto spins</i>	SPIN
<i>SRD</i>	stochastic rotation dynamics	<i>fix srd</i>	srd
<i>TALLY</i>	pairwise tally computes	<i>compute XXX/tally</i>	PACKAGES.
<i>UEF</i>	extensional flow	<i>fix nvt/uef</i>	PACKAGES.
<i>VORONOI</i>	Voronoi tessellation	<i>compute voronoi/atom</i>	n/a
<i>VTK</i>	dump output via VTK	<i>compute vtk</i>	n/a
<i>YAFF</i>	additional styles implemented in YAFF	<i>angle_style cross</i>	PACKAGES.

## 6.2 Package details

Here is a brief description of all packages in LAMMPS. It lists authors (if applicable) and summarizes the package contents. It has specific instructions on how to install the package, including, if necessary, info on how to download or build any extra library it requires. It also gives links to documentation, example scripts, and pictures/movies (if available) that illustrate use of the package.

The majority of packages can be included in a LAMMPS build with a single setting (`-D PKG_<NAME>=on` for CMake) or command (`make yes-<name>` for make). See the [Build package](#) page for more info. A few packages may require additional steps; this is indicated in the descriptions below. The [Build extras](#) page gives those details.

---

**Note:** To see the complete list of commands a package adds to LAMMPS, you can examine the files in its src directory, e.g. “`ls src/GRANULAR`”. Files with names that start with `fix`, `compute`, `atom`, `pair`, `bond`, `angle`, etc correspond to commands with the same style name as contained in the file name.

<i>YAFF</i>					

## 6.2.1 ADIOS package

### Contents:

ADIOS is a high-performance I/O library. This package implements the *dump atom/adios*, *dump custom/adios* and *read\_dump ... format adios* commands to write and read data using the ADIOS library.

**Authors:** Norbert Podhorszki (ORNL) from the ADIOS developer team.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/ADIOS: filenames -> commands
- src/ADIOS/README
- examples/PACKAGES/adios
- <https://github.com/ornladios/ADIOS2>
- *dump atom/adios*
- *dump custom/adios*
- *read\_dump*

## 6.2.2 AMOEBA package

### Contents:

Implementation of the AMOEBA and HIPPO polarized force fields originally developed by Jay Ponder's group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their [Tinker MD](#) software.

**Authors:** Josh Rackers and Steve Plimpton (Sandia), Trung Nguyen (U Chicago)

### Supporting info:

- `src/AMOEBA`: filenames -> commands
  - *AMOEBA and HIPPO howto*
  - *pair\_style amoeba*
  - *pair\_style hippo*
  - *atom\_style amoeba*
  - *angle\_style amoeba*
  - *improper\_style amoeba*
  - *fix amoeba/bitorsion*
  - *fix amoeba/pitorsion*
  - `tools/tinker/tinker2Imp.py`
  - `examples/amoeba`
- 

## 6.2.3 ASPHERE package

### Contents:

Computes, time-integration fixes, and pair styles for aspherical particle models including ellipsoids, 2d lines, and 3d triangles.

### Supporting info:

- `src/ASPHERE`: filenames -> commands
  - *Howto spherical*
  - *pair\_style gayberne*

## 6.2.4 ATC package

### Contents:

ATC stands for atoms-to-continuum. This package implements a *fix atc* command to either couple molecular dynamics with continuum finite element equations or perform on-the-fly conversion of atomic information to continuum fields.

**Authors:** Reese Jones, Jeremy Templeton, Jon Zimmerman (Sandia).

### Install:

This package has *specific installation instructions* on the *Build extras* page. The ATC package requires that also the **MANYBODY** package is installed.

### Supporting info:

- src/ATC: filenames -> commands
  - src/ATC/README
  - *fix atc*
  - examples/PACKAGES/atc
  - <https://www.lammps.org/pictures.html#atc>
- 

## 6.2.5 AWPMD package

### Contents:

AWPMD stands for Antisymmetrized Wave Packet Molecular Dynamics. This package implements an atom, pair, and fix style which allows electrons to be treated as explicit particles in a classical molecular dynamics model.

**Author:** Ilya Valuev (JIHT, Russia).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/AWPMD: filenames -> commands
  - src/AWPMD/README
  - *pair\_style awpmd/cut*
  - examples/PACKAGES/awpmd
- 

## 6.2.6 BOCS package

### Contents:

This package provides *fix bocs*, a modified version of *fix npt* which includes the pressure correction to the barostat as outlined in:

N. J. H. Dunn and W. G. Noid, “Bottom-up coarse-grained models that accurately describe the structure, pressure, and compressibility of molecular liquids”, J. Chem. Phys. 143, 243148 (2015).

**Authors:** Nicholas J. H. Dunn and Michael R. DeLyser (The Pennsylvania State University)

**Supporting info:**

The BOCS package for LAMMPS is part of the BOCS software package: <https://github.com/noid-group/BOCS>

See the following reference for information about the entire package:

Dunn, NJH; Lebold, KM; DeLyser, MR; Rudzinski, JF; Noid, WG. “BOCS: Bottom-Up Open-Source Coarse-Graining Software.” J. Phys. Chem. B. 122, 13, 3363-3377 (2018).

Example inputs are in the examples/PACKAGES/bocs folder.

---

## 6.2.7 BODY package

**Contents:**

Body-style particles with internal structure. Computes, time-integration fixes, pair styles, as well as the body styles themselves. See the *Howto body* page for an overview.

**Supporting info:**

- src/BODY filenames -> commands
  - *Howto\_body*
  - *atom\_style body*
  - *fix nve/body*
  - *pair\_style body/nparticle*
  - examples/body
- 

## 6.2.8 BPM package

**Contents:**

Pair styles, bond styles, fixes, and computes for bonded particle models for mesoscale simulations of solids and fracture. See the *Howto bpm* page for an overview.

**Authors:** Joel T. Clemmer (Sandia National Labs)

New in version 4May2022.

**Supporting info:**

- src/BPM filenames -> commands
  - *Howto\_bpm*
  - *atom\_style bpm/sphere*
  - *bond\_style bpm/rotational*
  - *bond\_style bpm/spring*
  - *compute nbond/atom*
  - *fix nve/bpm/sphere*
  - *pair\_style bpm/spring*
-

- examples/bpm
- 

## 6.2.9 BROWNIAN package

### Contents:

This package provides *fix brownian*, *fix brownian/sphere*, and *fix brownian/asphere* as well as *fix propel/self* which allow to do Brownian Dynamics time integration of point, spherical and aspherical particles and also support self-propelled particles.

**Authors:** Sam Cameron (University of Bristol), Stefan Paquay (while at Brandeis University) (initial version of *fix propel/self*)

Example inputs are in the examples/PACKAGES/brownian folder.

---

## 6.2.10 CG-DNA package

### Contents:

Several pair styles, bond styles, and integration fixes for coarse-grained modelling of single- and double-stranded DNA and RNA based on the oxDNA and oxRNA model of Doye, Louis and Ouldridge. The package includes Langevin-type rigid-body integrators with improved stability.

**Author:** Oliver Henrich (University of Strathclyde, Glasgow).

### Install:

The CG-DNA package requires that also the [MOLECULE](#) and [ASPHERE](#) packages are installed.

### Supporting info:

- src/CG-DNA: filenames -> commands
  - /src/CG-DNA/README
  - *pair\_style oxdna/\**
  - *pair\_style oxdna2/\**
  - *pair\_style oxrna2/\**
  - *bond\_style oxdna/\**
  - *bond\_style oxdna2/\**
  - *bond\_style oxrna2/\**
  - *fix nve/dotc/langevin*
-

### 6.2.11 CG-SPICA package

**Contents:**

Several pair styles and an angle style which implement the coarse-grained SPICA (formerly called SDK) model which enables simulation of biological or soft material systems.

**Original Author:** Axel Kohlmeyer (Temple U).

**Maintainers:** Yusuke Miyazaki and Wataru Shinoda (Okayama U).

**Supporting info:**

- src/CG-SPICA: filenames -> commands
  - src/CG-SPICA/README
  - *pair\_style lj/spica/\**
  - *angle\_style spica*
  - examples/PACKAGES/cgspica
  - <https://www.lammps.org/pictures.html#cg>
  - <https://www.spica-ff.org/>
- 

### 6.2.12 CLASS2 package

**Contents:**

Bond, angle, dihedral, improper, and pair styles for the COMPASS CLASS2 molecular force field.

**Supporting info:**

- src/CLASS2: filenames -> commands
  - *bond\_style class2*
  - *angle\_style class2*
  - *dihedral\_style class2*
  - *improper\_style class2*
  - *pair\_style lj/class2*
- 

### 6.2.13 COLLOID package

**Contents:**

Coarse-grained finite-size colloidal particles. Pair styles and fix wall styles for colloidal interactions. Includes the Fast Lubrication Dynamics (FLD) method for hydrodynamic interactions, which is a simplified approximation to Stokesian dynamics.

**Authors:** This package includes Fast Lubrication Dynamics pair styles which were created by Amit Kumar and Michael Bybee from Jonathan Higdon's group at UIUC.

**Supporting info:**

- src/COLLOID: filenames -> commands
  - *fix wall/colloid*
  - *pair\_style colloid*
  - *pair\_style yukawa/colloid*
  - *pair\_style brownian*
  - *pair\_style lubricate*
  - *pair\_style lubricateU*
  - examples/colloid
  - examples/srd
- 

## 6.2.14 COLVARS package

### Contents:

COLVARS stands for collective variables, which can be used to implement various enhanced sampling methods, including Adaptive Biasing Force, Metadynamics, Steered MD, Umbrella Sampling and Restraints. A *fix colvars* command is implemented which wraps a COLVARS library, which implements these methods. simulations.

**Authors:** The COLVARS library is written and maintained by Giacomo Fiorin (ICMS, Temple University, Philadelphia, PA, USA) and Jerome Henin (LISM, CNRS, Marseille, France), originally for the NAMD MD code, but with portability in mind. Axel Kohlmeyer (Temple U) provided the interface to LAMMPS.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/COLVARS: filenames -> commands
  - doc/PDF/colvars-refman-lammps.pdf
  - src/COLVARS/README
  - lib/colvars/README
  - *fix colvars*
  - examples/PACKAGES/colvars
- 

## 6.2.15 COMPRESS package

### Contents:

Compressed output of dump files via the zlib compression library, using dump styles with a “gz” in their style name.

To use this package you must have the zlib compression library available on your system.

**Author:** Axel Kohlmeyer (Temple U).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

---

**Supporting info:**

- src/COMPRESS: filenames -> commands
  - src/COMPRESS/README
  - lib/compress/README
  - *dump atom/gz*
  - *dump cfg/gz*
  - *dump custom/gz*
  - *dump xyz/gz*
- 

### 6.2.16 CORESHELL package

**Contents:**

Compute and pair styles that implement the adiabatic core/shell model for polarizability. The pair styles augment Born, Buckingham, and Lennard-Jones styles with core/shell capabilities. The *compute temp/cs* command calculates the temperature of a system with core/shell particles. See the *Howto coreshell* page for an overview of how to use this package.

**Author:** Hendrik Heenen (Technical U of Munich).

**Supporting info:**

- src/CORESHELL: filenames -> commands
  - *Howto coreshell*
  - *Howto polarizable*
  - *compute temp/cs*
  - *pair\_style born/coul/long/cs*
  - *pair\_style buck/coul/long/cs*
  - *pair\_style lj/cut/coul/long/cs*
  - *examples/coreshell*
- 

### 6.2.17 DIELECTRIC package

**Contents:**

An atom style, multiple pair styles, several fixes, Kspace styles and a compute for simulating systems using boundary element solvers for computing the induced charges at the interface between two media with different dielectric constants.

**Install:**

To use this package, also the *KSPACE* and *EXTRA-PAIR* packages need to be installed.

**Author:** Trung Nguyen and Monica Olvera de la Cruz (Northwestern U)

**Supporting info:**

- src/DIELECTRIC: filenames -> commands

- *atom\_style dielectric*
  - *pair\_style coul/cut/dielectric*
  - *pair\_style coul/long/dielectric*
  - *pair\_style lj/cut/coul/cut/dielectric*
  - *pair\_style lj/cut/coul/debye/dielectric*
  - *pair\_style lj/cut/coul/long/dielectric*
  - *pair\_style lj/cut/coul/msm/dielectric*
  - *pair\_style ppm/dielectric*
  - *pair\_style ppm/disp/dielectric*
  - *pair\_style msm/dielectric*
  - *fix\_style polarize/bem/icc*
  - *fix\_style polarize/bem/gmres*
  - *fix\_style polarize/functional*
  - *compute efield/atom*
  - examples/PACKAGES/dielectric
- 

## 6.2.18 DIFFRACTION package

### Contents:

Two computes and a fix for calculating x-ray and electron diffraction intensities based on kinematic diffraction theory.

**Author:** Shawn Coleman while at the U Arkansas.

### Supporting info:

- src/DIFFRACTION: filenames -> commands
  - *compute saed*
  - *compute xrd*
  - *fix saed/vtk*
  - examples/PACKAGES/diffraction
- 

## 6.2.19 DIPOLE package

### Contents:

An atom style and several pair styles for point dipole models with short-range or long-range interactions.

### Supporting info:

- src/DIPOLE: filenames -> commands
  - *atom\_style dipole*
-

- *pair\_style lj/cut/dipole/cut*
  - *pair\_style lj/cut/dipole/long*
  - *pair\_style lj/long/dipole/long*
  - *angle\_style dipole*
  - examples/dipole
- 

## 6.2.20 DPD-BASIC package

### Contents:

Pair styles for the basic dissipative particle dynamics (DPD) method and DPD thermostatting.

**Author:** Kurt Smith (U Pittsburgh), Martin Svoboda, Martin Lisal (ICPF and UJEP)

### Supporting info:

- src/DPD-BASIC: filenames -> commands
  - *pair\_style dpd*
  - *pair\_style dpd/tstat*
  - *pair\_style dpd/ext*
  - *pair\_style dpd/ext/tstat*
  - examples/PACKAGES/dpd-basic
- 

## 6.2.21 DPD-MESO package

### Contents:

Several extensions of the dissipative particle dynamics (DPD) method. Specifically, energy-conserving DPD (eDPD) that can model non-isothermal processes, many-body DPD (mDPD) for simulating vapor-liquid coexistence, and transport DPD (tDPD) for modeling advection-diffusion-reaction systems. The equations of motion of these DPD extensions are integrated through a modified velocity-Verlet (MVV) algorithm.

**Author:** Zhen Li (Department of Mechanical Engineering, Clemson University)

### Supporting info:

- src/DPD-MESO: filenames -> commands
- src/DPD-MESO/README
- *atom\_style edpd*
- *pair\_style edpd*
- *pair\_style mdpd*
- *pair\_style tdpd*
- *fix mvv/dpd*
- examples/PACKAGES/mesodpd

- <https://www.lammps.org/movies.html#mesodpd>
- 

## 6.2.22 DPD-REACT package

### Contents:

DPD stands for dissipative particle dynamics. This package implements coarse-grained DPD-based models for energetic, reactive molecular crystalline materials. It includes many pair styles specific to these systems, including for reactive DPD, where each particle has internal state for multiple species and a coupled set of chemical reaction ODEs are integrated each timestep. Highly accurate time integrators for isothermal, isoenergetic, isobaric and isenthalpic conditions are included. These enable long timesteps via the Shardlow splitting algorithm.

**Authors:** Jim Larentzos (ARL), Tim Mattox (Engility Corp), and John Brennan (ARL).

### Supporting info:

- src/DPD-REACT: filenames -> commands
  - /src/DPD-REACT/README
  - *compute dpd*
  - *compute dpd/atom*
  - *fix eos/cv*
  - *fix eos/table*
  - *fix eos/table/rx*
  - *fix shardlow*
  - *fix rx*
  - *pair\_style table/rx*
  - *pair\_style dpd/fdt*
  - *pair\_style dpd/fdt/energy*
  - *pair\_style exp6/rx*
  - *pair\_style multi/lucy*
  - *pair\_style multi/lucy/rx*
  - examples/PACKAGES/dpd-react
- 

## 6.2.23 DPD-SMOOTH package

### Contents:

A pair style for smoothed dissipative particle dynamics (SDPD), which is an extension of smoothed particle hydrodynamics (SPH) to mesoscale where thermal fluctuations are important (see the *SPH package*). Also two fixes for moving and rigid body integration of SPH/SDPD particles (particles of atom\_style meso).

**Author:** Morteza Jalalvand (Institute for Advanced Studies in Basic Sciences, Iran).

### Supporting info:

- src/DPD-SMOOTH: filenames -> commands
  - src/DPD-SMOOTH/README
  - *pair\_style sdpd/taitwater/isothermal*
  - *fix meso/move*
  - *fix rigid/meso*
  - examples/PACKAGES/dpd-smooth
- 

### 6.2.24 DRUDE package

#### Contents:

Fixes, pair styles, and a compute to simulate thermalized Drude oscillators as a model of polarization. See the *Howto drude* and *Howto drude2* pages for an overview of how to use the package. There are auxiliary tools for using this package in tools/drude.

**Authors:** Alain Dequidt (U Clermont Auvergne), Julien Devemy (CNRS), and Agilio Padua (ENS de Lyon).

#### Supporting info:

- src/DRUDE: filenames -> commands
  - *Howto drude*
  - *Howto drude2*
  - *Howto polarizable*
  - src/DRUDE/README
  - *fix drude*
  - *fix drude/transform/\**
  - *compute temp/drude*
  - *pair\_style thole*
  - *pair\_style lj/cut/thole/long*
  - examples/PACKAGES/drude
  - tools/drude
- 

### 6.2.25 EFF package

#### Contents:

EFF stands for electron force field which allows a classical MD code to model electrons as particles of variable radius. This package contains atom, pair, fix and compute styles which implement the eFF as described in A. Jaramillo-Botero, J. Su, Q. An, and W.A. Goddard III, JCC, 2010. The eFF potential was first introduced by Su and Goddard, in 2007. There are auxiliary tools for using this package in tools/eff; see its README file.

**Author:** Andres Jaramillo-Botero (CalTech).

#### Supporting info:

- src/EFF: filenames -> commands
  - src/EFF/README
  - *atom\_style electron*
  - *fix nve/eff*
  - *fix nvt/eff*
  - *fix npt/eff*
  - *fix langevin/eff*
  - *compute temp/eff*
  - *pair\_style eff/cut*
  - *pair\_style eff/inline*
  - examples/PACKAGES/eff
  - tools/eff/README
  - tools/eff
  - <https://www.lammps.org/movies.html#eff>
- 

## 6.2.26 ELECTRODE package

### Contents:

The ELECTRODE package allows the user to enforce a constant potential method for groups of atoms that interact with the remaining atoms as electrolyte.

**Authors:** The ELECTRODE library is written and maintained by Ludwig Ahrens-Iwers (TUHH, Hamburg, Germany), Shern Tee (UQ, Brisbane, Australia) and Robert Meissner (TUHH, Hamburg, Germany).

New in version 4May2022.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- *fix electrode/conp*
- 

## 6.2.27 EXTRA-COMPUTE package

### Contents:

Additional compute styles that are less commonly used.

### Supporting info:

- src/EXTRA-COMPUTE: filenames -> commands
  - *compute*
-

### 6.2.28 EXTRA-DUMP package

**Contents:**

Additional dump styles that are less commonly used.

**Supporting info:**

- src/EXTRA-DUMP: filenames -> commands
  - *dump*
- 

### 6.2.29 EXTRA-FIX package

**Contents:**

Additional fix styles that are less commonly used.

**Supporting info:**

- src/EXTRA-FIX: filenames -> commands
  - *fix*
- 

### 6.2.30 EXTRA-MOLECULE package

**Contents:**

Additional bond, angle, dihedral, and improper styles that are less commonly used.

**Install:**

To use this package, also the *MOLECULE* package needs to be installed.

**Supporting info:**

- src/EXTRA-MOLECULE: filenames -> commands
  - *molecular styles*
- 

### 6.2.31 EXTRA-PAIR package

**Contents:**

Additional pair styles that are less commonly used.

**Supporting info:**

- src/EXTRA-PAIR: filenames -> commands
  - *pair\_style*
-

## 6.2.32 FEP package

### Contents:

FEP stands for free energy perturbation. This package provides methods for performing FEP simulations by using a *fix adapt/fep* command with soft-core pair potentials, which have a “soft” in their style name. There are auxiliary tools for using this package in tools/fep; see its README file.

**Author:** Agilio Padua (ENS de Lyon)

### Supporting info:

- src/FEP: filenames -> commands
  - src/FEP/README
  - *fix adapt/fep*
  - *compute fep*
  - *pair\_style \*/soft*
  - examples/PACKAGES/fep
  - tools/fep/README
  - tools/fep
- 

## 6.2.33 GPU package

### Contents:

Dozens of pair styles and a version of the PPPM long-range Coulombic solver optimized for GPUs. All such styles have a “gpu” as a suffix in their style name. The GPU code can be compiled with either CUDA or OpenCL, however the OpenCL variants are no longer actively maintained and only the CUDA versions are regularly tested. The *GPU package* page gives details of what hardware and GPU software is required on your system, and details on how to build and use this package. Its styles can be invoked at run time via the “-sf gpu” or “-suffix gpu” *command-line switches*. See also the *KOKKOS* package, which has GPU-enabled styles.

**Authors:** Mike Brown (Intel) while at Sandia and ORNL and Trung Nguyen (Northwestern U) while at ORNL and later. AMD HIP support by Evgeny Kuznetsov, Vladimir Stegailov, and Vsevolod Nikolskiy (HSE University).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/GPU: filenames -> commands
- src/GPU/README
- lib/gpu/README
- *Accelerator packages*
- *GPU package*
- *Section 2.6 -sf gpu*
- *Section 2.6 -pk gpu*
- *package gpu*

- *Commands* pages (*pair*, *kpace*) for styles followed by (g)
  - *Benchmarks* page of website
- 

### 6.2.34 GRANULAR package

#### Contents:

Pair styles and fixes for finite-size granular particles, which interact with each other and boundaries via frictional and dissipative potentials.

#### Supporting info:

- src/GRANULAR: filenames -> commands
  - *Howto granular*
  - *fix pour*
  - *fix wall/gran*
  - *pair\_style gran/hooke*
  - *pair\_style gran/hertz/history*
  - examples/granregion
  - examples/pour
  - bench/in.chute
  - <https://www.lammps.org/pictures.html#jamming>
  - <https://www.lammps.org/movies.html#hopper>
  - <https://www.lammps.org/movies.html#dem>
  - <https://www.lammps.org/movies.html#brazil>
  - <https://www.lammps.org/movies.html#granregion>
- 

### 6.2.35 H5MD package

#### Contents:

H5MD stands for HDF5 for MD. [HDF5](#) is a portable, binary, self-describing file format, used by many scientific simulations. H5MD is a format for molecular simulations, built on top of HDF5. This package implements a *dump h5md* command to output LAMMPS snapshots in this format.

To use this package you must have the HDF5 library available on your system.

**Author:** Pierre de Buyl (KU Leuven) created both the package and the H5MD format.

#### Install:

This package has *specific installation instructions* on the *Build extras* page.

#### Supporting info:

- src/H5MD: filenames -> commands

- [src/H5MD/README](#)
  - [lib/h5md/README](#)
  - [dump h5md](#)
- 

## 6.2.36 INTEL package

### Contents:

Dozens of pair, fix, bond, angle, dihedral, improper, and kspace styles which are optimized for Intel CPUs and KNLs (Knights Landing). All of them have an “intel” in their style name. The [INTEL package](#) page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf intel” or “-suffix intel” *command-line switches*. Also see the [KOKKOS](#), [OPT](#), and [OPENMP](#) packages, which have styles optimized for CPUs and KNLs.

You need to have an Intel compiler, version 14 or higher to take full advantage of this package. While compilation with GNU compilers is supported, performance will be sub-optimal.

---

**Note:** the INTEL package contains styles that require using the -restrict flag, when compiling with Intel compilers.

---

**Author:** Mike Brown (Intel).

### Install:

This package has *specific installation instructions* on the [Build extras](#) page.

### Supporting info:

- [src/INTEL: filenames -> commands](#)
  - [src/INTEL/README](#)
  - [Accelerator packages](#)
  - [INTEL package](#)
  - [Section 2.6 -sf intel](#)
  - [Section 2.6 -pk intel](#)
  - [package intel](#)
  - Search the [commands](#) pages ([fix](#), [compute](#), [pair](#), [bond](#), [angle](#), [dihedral](#), [improper](#), [kspace](#)) for styles followed by (i)
  - [src/INTEL/TEST](#)
  - [Benchmarks](#) page of website
-

## 6.2.37 INTERLAYER package

### Contents:

A collection of pair styles specifically to be used for modeling layered materials, most commonly graphene sheets (or equivalents).

### Supporting info:

- src/INTERLAYER: filenames -> commands
  - *Pair style* page
  - examples/PACKAGES/interlayer
- 

## 6.2.38 KIM package

### Contents:

This package contains a command with a set of sub-commands that serve as a wrapper on the [Open Knowledgebase of Interatomic Models \(OpenKIM\)](#) repository of interatomic models (IMs) enabling compatible ones to be used in LAMMPS simulations.

This includes *kim init*, and *kim interactions* commands to select, initialize and instantiate the IM, a *kim query* command to perform web queries for material property predictions of OpenKIM IMs, a *kim param* command to access KIM Model Parameters from LAMMPS, and a *kim property* command to write material properties computed in LAMMPS to standard KIM property instance format.

Support for KIM IMs that conform to the [KIM Application Programming Interface \(API\)](#) is provided by the *pair\_style kim* command.

---

**Note:** The command *pair\_style kim* is called by *kim interactions* and is not recommended to be directly used in input scripts.

---

To use this package you must have the KIM API library available on your system. The KIM API is available for download on the [OpenKIM website](#). When installing LAMMPS from binary, the kim-api package is a dependency that is automatically downloaded and installed.

Information about the KIM project can be found at its website: <https://openkim.org>. The KIM project is led by Ellad Tadmor and Ryan Elliott (U Minnesota) and is funded by the [National Science Foundation](#).

**Authors:** Ryan Elliott (U Minnesota) is the main developer for the KIM API and the *pair\_style kim* command. Yaser Afshar (U Minnesota), Axel Kohlmeyer (Temple U), Ellad Tadmor (U Minnesota), and Daniel Karls (U Minnesota) contributed to the *kim command* interface in close collaboration with Ryan Elliott.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- *kim command*
  - *pair\_style kim*
  - src/KIM: filenames -> commands
  - src/KIM/README
-

- [lib/kim/README](#)
  - [examples/kim](#)
- 

## 6.2.39 KOKKOS package

### Contents:

Dozens of atom, pair, bond, angle, dihedral, improper, fix, compute styles adapted to compile using the Kokkos library which can convert them to OpenMP or CUDA code so that they run efficiently on multicore CPUs, KNLs, or GPUs. All the styles have a “kk” as a suffix in their style name. The *KOKKOS package* page gives details of what hardware and software is required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf kk” or “-suffix kk” *command-line switches*. Also see the *GPU*, *OPT*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPUs, KNLs, and GPUs.

You must have a C++14 compatible compiler to use this package. KOKKOS makes extensive use of advanced C++ features, which can expose compiler bugs, especially when compiling for maximum performance at high optimization levels. Please see the file [lib/kokkos/README](#) for a list of compilers and their respective platforms, that are known to work.

**Authors:** The KOKKOS package was created primarily by Christian Trott and Stan Moore (Sandia), with contributions from other folks as well. It uses the open-source [Kokkos library](#) which was developed by Carter Edwards, Christian Trott, and others at Sandia, and which is included in the LAMMPS distribution in [lib/kokkos](#).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- [src/KOKKOS: filenames -> commands](#)
  - [src/KOKKOS/README](#)
  - [lib/kokkos/README](#)
  - *Accelerator packages*
  - *KOKKOS package*
  - *Section 2.6 -k on ...*
  - *Section 2.6 -sf kk*
  - *Section 2.6 -pk kokkos*
  - *package kokkos*
  - Search the *commands* pages (*fix, compute, pair, bond, angle, dihedral, improper, kspace*) for styles followed by (k)
  - [Benchmarks page of website](#)
-

## 6.2.40 KSPACE package

### Contents:

A variety of long-range Coulombic solvers, as well as pair styles which compute the corresponding short-range pairwise Coulombic interactions. These include Ewald, particle-particle particle-mesh (PPPM), and multilevel summation method (MSM) solvers.

### Install:

Building with this package requires a 1d FFT library be present on your system for use by the PPPM solvers. This can be the KISS FFT library provided with LAMMPS, third party libraries like FFTW, or a vendor-supplied FFT library. See the *Build settings* page for details on how to select different FFT options for your LAMPMS build.

### Supporting info:

- `src/KSPACE`: filenames -> commands
  - *kspace\_style*
  - `doc/PDF/kspace.pdf`
  - *Howto tip3p*
  - *Howto tip4p*
  - *Howto spc*
  - *pair\_style coul*
  - Search the *pair style* page for styles with “long” or “msm” in name
  - `examples/peptide`
  - `bench/in.rhodo`
- 

## 6.2.41 LATBOLTZ package

### Contents:

Fixes which implement a background Lattice-Boltzmann (LB) fluid, which can be used to model MD particles influenced by hydrodynamic forces.

**Authors:** Frances Mackay and Colin Denniston (University of Western Ontario).

### Install:

The LATBOLTZ package requires that LAMMPS is build in *MPI parallel mode*.

### Supporting info:

- `src/LATBOLTZ`: filenames -> commands
  - `src/LATBOLTZ/README`
  - *fix lb/fluid*
  - *fix lb/momentum*
  - *fix lb/viscous*
  - `examples/PACKAGES/latboltz`
-

## 6.2.42 LATTE package

### Contents:

A fix command which wraps the LATTE DFTB code, so that molecular dynamics can be run with LAMMPS using density-functional tight-binding quantum forces calculated by LATTE.

More information on LATTE can be found at this website: <https://github.com/lanl/LATTE>. A brief technical description is given with the *fix latte* command.

**Authors:** Christian Negre (LANL) and Steve Plimpton (Sandia). LATTE itself is developed at Los Alamos National Laboratory by Marc Cawkwell, Anders Niklasson, and Christian Negre.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/LATTE: filenames -> commands
  - src/LATTE/README
  - lib/latte/README
  - *fix latte*
  - examples/latte
  - LAMMPS-LATTE tutorial
- 

## 6.2.43 MACHDYN package

### Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed Mach dynamics (SMD) for solids, which is a model related to smoothed particle hydrodynamics (SPH) for liquids (see the *SPH package*).

This package solves solids mechanics problems via a state of the art stabilized meshless method with hourglass control. It can specify hydrostatic interactions independently from material strength models, i.e. pressure and deviatoric stresses are separated. It provides many material models (Johnson-Cook, plasticity with hardening, Mie-Grueneisen, Polynomial EOS) and allows new material models to be added. It implements rigid boundary conditions (walls) which can be specified as surface geometries from \*.STL files.

**Author:** Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/MACHDYN: filenames -> commands
  - src/MACHDYN/README
  - doc/PDF/MACHDYN\_LAMMPS\_userguide.pdf
  - examples/PACKAGES/machdyn
  - <https://www.lammps.org/movies.html#smd>
-

## 6.2.44 MANIFOLD package

### Contents:

Several fixes and a “manifold” class which enable simulations of particles constrained to a manifold (a 2D surface within the 3D simulation box). This is done by applying the RATTLE constraint algorithm to formulate single-particle constraint functions  $g(x_i, y_i, z_i) = 0$  and their derivative (i.e. the normal of the manifold)  $n = \text{grad}(g)$ .

**Author:** Stefan Paquay (until 2017: Eindhoven University of Technology (TU/e), The Netherlands; since 2017: Brandeis University, Waltham, MA, USA)

### Supporting info:

- src/MANIFOLD: filenames -> commands
  - src/MANIFOLD/README
  - *Howto manifold*
  - *fix manifoldforce*
  - *fix nve/manifold/rattle*
  - *fix nvt/manifold/rattle*
  - examples/PACKAGES/manifold
  - <https://www.lammps.org/movies.html#manifold>
- 

## 6.2.45 MANYBODY package

### Contents:

A variety of many-body and bond-order potentials. These include (AI)REBO, BOP, EAM, EIM, Stillinger-Weber, and Tersoff potentials.

### Supporting info:

- src/MANYBODY: filenames -> commands
  - *Pair style* page
  - examples/comb
  - examples/eim
  - examples/nb3d
  - examples/shear
  - examples/streitz
  - examples/vashishta
  - bench/in.eam
-

## 6.2.46 MC package

### Contents:

Several fixes and a pair style that have Monte Carlo (MC) or MC-like attributes. These include fixes for creating, breaking, and swapping bonds, for performing atomic swaps, and performing grand-canonical MC (GCMC) or similar processes in conjunction with dynamics.

### Supporting info:

- src/MC: filenames -> commands
  - *fix atom/swap*
  - *fix bond/break*
  - *fix bond/create*
  - *fix bond/create/angle*
  - *fix bond/swap*
  - *fix charge/regulation*
  - *fix gcmc*
  - *fix tfmc*
  - *fix widom*
  - *pair\_style dsmc*
  - <https://www.lammps.org/movies.html#gcmc>
- 

## 6.2.47 MDI package

### Contents:

A LAMMPS command and fixes to allow client-server coupling of LAMMPS to other atomic or molecular simulation codes or materials modeling workflows via the [MolSSI Driver Interface \(MDI\)](#) library.

**Author:** Taylor Barnes - MolSSI, [taylor.a.barnes at gmail.com](mailto:taylor.a.barnes@gmail.com)

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/MDI/README
  - lib/mdi/README
  - *Howto MDI*
  - *mdi*
  - *fix mdi/qm*
  - examples/PACKAGES/mdi
-

## 6.2.48 MEAM package

### Contents:

A pair style for the modified embedded atom (MEAM) potential translated from the Fortran version in the (obsolete) MEAM package to plain C++. The MEAM fully replaces the MEAM package, which has been removed from LAMMPS after the 12 December 2018 version.

**Author:** Sebastian Huetter, (Otto-von-Guericke University Magdeburg) based on the Fortran version of Greg Wagner (Northwestern U) while at Sandia.

### Supporting info:

- src/MEAM: filenames -> commands
  - src/MEAM/README
  - *pair\_style meam*
  - examples/meam
- 

## 6.2.49 MESONT package

### Contents:

MESONT is a LAMMPS package for simulation of nanomechanics of nanotubes (NTs). The model is based on a coarse-grained representation of NTs as “flexible cylinders” consisting of a variable number of segments. Internal interactions within a NT and the van der Waals interaction between the tubes are described by a mesoscopic force field designed and parameterized based on the results of atomic-level molecular dynamics simulations. The description of the force field is provided in the papers listed below.

This package contains two independent implementations of this model: *pair\_style mesont/tpm* is the original implementation of the model based on a Fortran library in the `lib/mesont` folder. The second implementation is provided by the *mesocnt* styles (*bond\_style mesocnt*, *angle\_style mesocnt* and *pair\_style mesocnt*). The *mesocnt* implementation has the same features as the original implementation with the addition of friction, but is directly implemented in C++, interfaces more cleanly with general LAMMPS functionality, and is typically faster. It also does not require its own atom style and can be installed without any external libraries.

### Download of potential files:

The potential files for these pair styles are *very* large and thus are not included in the regular downloaded packages of LAMMPS or the git repositories. Instead, they will be automatically downloaded from a web server when the package is installed for the first time.

### Authors of the \*mesont\* styles:

Maxim V. Shugaev (University of Virginia), Alexey N. Volkov (University of Alabama), Leonid V. Zhigilei (University of Virginia)

**Author of the \*mesocnt\* styles:** Philipp Kloza (U Cambridge)

### Supporting info:

- src/MESONT: filenames -> commands
- src/MESONT/README
- *atom\_style mesont*
- *pair\_style mesont/tpm*

- *compute mesont*
  - *bond\_style mesocnt*
  - *angle\_style mesocnt*
  - *pair\_style mesocnt*
  - examples/PACKAGES/mesont
  - tools/mesont
- 

### 6.2.50 MGPT package

#### Contents:

A pair style which provides a fast implementation of the quantum-based MGPT multi-ion potentials. The MGPT or model GPT method derives from first-principles DFT-based generalized pseudopotential theory (GPT) through a series of systematic approximations valid for mid-period transition metals with nearly half-filled d bands. The MGPT method was originally developed by John Moriarty at LLNL. The pair style in this package calculates forces and energies using an optimized matrix-MGPT algorithm due to Tomas Opperstrup at LLNL.

**Authors:** Tomas Opperstrup and John Moriarty (LLNL).

#### Supporting info:

- src/MGPT: filenames -> commands
  - src/MGPT/README
  - *pair\_style mgpt*
  - examples/PACKAGES/mgpt
- 

### 6.2.51 MISC package

#### Contents:

A variety of compute, fix, pair, bond styles with specialized capabilities that don't align with other packages. Do a directory listing, "ls src/MISC", to see the list of commands.

**Note:** the MISC package contains styles that require using the -restrict flag, when compiling with Intel compilers.

---

#### Supporting info:

- src/MISC: filenames -> commands
  - *bond\_style special*
  - *compute viscosity/cos*
  - *fix accelerate/cos*
  - *fix imd*
  - *fix ipi*
  - *pair\_style agni*
-

- *pair\_style list*
  - *pair\_style srp*
  - *pair\_style tracker*
- 

## 6.2.52 ML-HDNNP package

### Contents:

A *pair\_style hdnnp* command which allows to use high-dimensional neural network potentials (HDNNPs), a form of machine learning potentials. HDNNPs must be carefully trained prior to their application in a molecular dynamics simulation.

To use this package you must have the `n2p2` library installed and compiled on your system.

**Author:** Andreas Singraber

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/ML-HDNNP: filenames -> commands
  - src/ML-HDNNP/README
  - lib/hdnnp/README
  - *pair\_style hdnnp*
  - examples/PACKAGES/hdnnp
- 

## 6.2.53 ML-IAP package

### Contents:

A general interface for machine-learning interatomic potentials, including PyTorch.

### Install:

To use this package, also the *ML-SNAP* package needs to be installed. To make the *mliappy* model available, also the *PYTHON* package needs to be installed, the version of Python must be 3.6 or later, and the *cython* software must be installed.

**Author:** Aidan Thompson (Sandia), Nicholas Lubbers (LANL).

### Supporting info:

- src/ML-IAP: filenames -> commands
- src/ML-IAP/README.md
- *pair\_style mliap*
- *compute\_style mliap*
- examples/mliap (see README)

When built with the *mliappy* model this package includes an extension for coupling with Python models, including PyTorch. In this case, the Python interpreter linked to LAMMPS will need the *cython* and *numpy* modules installed. The provided examples build models with PyTorch, which would therefore also need to be installed to run those examples.

---

## 6.2.54 ML-PACE package

### Contents:

A pair style for the Atomic Cluster Expansion potential (ACE). ACE is a methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. The ML-PACE package provides an efficient implementation for running simulations with ACE potentials.

### Authors:

This package was written by Yury Lysogorskiy<sup>1</sup>, Cas van der Oord<sup>2</sup>, Anton Bochkarev<sup>1</sup>, Sarath Menon<sup>1</sup>, Matteo Rinaldi<sup>1</sup>, Thomas Hammerschmidt<sup>1</sup>, Matous Mrovec<sup>1</sup>, Aidan Thompson<sup>3</sup>, Gabor Csanyi<sup>2</sup>, Christoph Ortner<sup>4</sup>, Ralf Drautz<sup>1</sup>.

<sup>1</sup>: Ruhr-University Bochum, Bochum, Germany

<sup>2</sup>: University of Cambridge, Cambridge, United Kingdom

<sup>3</sup>: Sandia National Laboratories, Albuquerque, New Mexico, USA

<sup>4</sup>: University of British Columbia, Vancouver, BC, Canada

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- `src/ML-PACE: filenames -> commands`
  - *pair\_style pace*
  - `examples/PACKAGES/pace`
- 

## 6.2.55 ML-QUIP package

### Contents:

A *pair\_style quip* command which wraps the [QUIP libAtoms library](#), which includes a variety of interatomic potentials, including Gaussian Approximation Potential (GAP) models developed by the Cambridge University group.

To use this package you must have the QUIP libAtoms library available on your system.

**Author:** Albert Bartok (Cambridge University)

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- `src/ML-QUIP: filenames -> commands`
  - `src/ML-QUIP/README`
-

- *pair\_style quip*
  - examples/PACKAGES/quip
- 

### 6.2.56 ML-RANN package

#### Contents:

A pair style for using rapid atomistic neural network (RANN) potentials. These neural network potentials work by first generating a series of symmetry functions from the neighbor list and then using these values as the input layer of a neural network.

#### Authors:

This package was written by Christopher Barrett with contributions by Doyl Dickel, Mississippi State University.

#### Supporting info:

- src/ML-RANN: filenames -> commands
  - *pair\_style rann*
  - examples/PACKAGES/rann
- 

### 6.2.57 ML-SNAP package

#### Contents:

A pair style for the spectral neighbor analysis potential (SNAP). SNAP is methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. Also several computes which analyze attributes of the potential.

**Author:** Aidan Thompson (Sandia).

#### Supporting info:

- src/ML-SNAP: filenames -> commands
  - *pair\_style snap*
  - *compute sna/atom*
  - *compute sna/grid*
  - *compute sna/grid/local*
  - *compute snad/atom*
  - *compute snav/atom*
  - examples/snap
-

## 6.2.58 MOFFF package

### Contents:

Pair, angle and improper styles needed to employ the MOF-FF force field by Schmid and coworkers with LAMMPS. MOF-FF is a first principles derived force field with the primary aim to simulate MOFs and related porous framework materials, using spherical Gaussian charges. It is described in S. Bureekaew et al., Phys. Stat. Sol. B 2013, 250, 1128-1141. For the usage of MOF-FF see the example in the example directory as well as the [MOF+](#) website.

**Author:** Hendrik Heenen (Technical U of Munich), Rochus Schmid (Ruhr-University Bochum).

### Supporting info:

- src/MOFFF: filenames -> commands
  - src/MOFFF/README
  - *pair\_style buck6d/coul/gauss*
  - *angle\_style class2*
  - *angle\_style cosine/buck6d*
  - *improper\_style inversion/harmonic*
  - examples/PACKAGES/mofff
- 

## 6.2.59 MOLECULE package

### Contents:

A large number of atom, pair, bond, angle, dihedral, improper styles that are used to model molecular systems with fixed covalent bonds. The pair styles include the Dreiding (hydrogen-bonding) and CHARMM force fields, and a TIP4P water model.

### Supporting info:

- src/MOLECULE: filenames -> commands
- *atom\_style*
- *bond\_style*
- *angle\_style*
- *dihedral\_style*
- *improper\_style*
- *pair\_style hbond/dreiding/lj*
- *pair\_style lj/charmm/coul/charmm*
- *Howto bioFF*
- examples/cmap
- examples/dreiding
- examples/micelle,
- examples/peptide
- bench/in.chain

- [bench/in.rhodo](#)
- 

## 6.2.60 MOLFILE package

### Contents:

A *dump molfile* command which uses molfile plugins that are bundled with the VMD molecular visualization and analysis program, to enable LAMMPS to dump snapshots in formats compatible with various molecular simulation tools.

To use this package you must have the desired VMD plugins available on your system.

Note that this package only provides the interface code, not the plugins themselves, which will be accessed when requesting a specific plugin via the *dump molfile* command. Plugins can be obtained from a VMD installation which has to match the platform that you are using to compile LAMMPS for. By adding plugins to VMD, support for new file formats can be added to LAMMPS (or VMD or other programs that use them) without having to re-compile the application itself. More information about the VMD molfile plugins can be found at <http://www.ks.uiuc.edu/Research/vmd/plugins/molfile>.

**Author:** Axel Kohlmeyer (Temple U).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/MOLFILE: filenames -> commands
  - src/MOLFILE/README
  - lib/molfile/README
  - *dump molfile*
- 

## 6.2.61 MPIIO package

### Contents:

Support for parallel output/input of dump and restart files via the MPIIO library. It adds *dump styles* with a “mpio” in their style name. Restart files with an “.mpio” suffix are also written and read in parallel.

**Warning:** The MPIIO package is currently unmaintained and has become unreliable. Use with caution.

### Install:

The MPIIO package requires that LAMMPS is build in *MPI parallel mode*.

### Supporting info:

- src/MPIIO: filenames -> commands
  - *dump*
  - *restart*
  - *write\_restart*
-

- *read\_restart*
- 

## 6.2.62 MSCG package

### Contents:

A *fix mscg* command which can parameterize a Multi-Scale Coarse-Graining (MSCG) model using the open-source MS-CG library.

To use this package you must have the MS-CG library available on your system.

**Authors:** The fix was written by Lauren Abbott (Sandia). The MS-CG library was developed by Jacob Wagner in Greg Voth's group at the University of Chicago.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/MSCG: filenames -> commands
  - src/MSCG/README
  - lib/mscg/README
  - examples/mscg
- 

## 6.2.63 NETCDF package

### Contents:

Dump styles for writing NetCDF formatted dump files. NetCDF is a portable, binary, self-describing file format developed on top of HDF5. The file contents follow the AMBER NetCDF trajectory conventions (<http://ambermd.org/netcdf/nctraj.xhtml>), but include extensions.

To use this package you must have the NetCDF library available on your system.

Note that NetCDF files can be directly visualized with the following tools:

- **Ovito** (Ovito supports the AMBER convention and the extensions mentioned above)
- **VMD**

**Author:** Lars Pastewka (Karlsruhe Institute of Technology).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/NETCDF: filenames -> commands
  - src/NETCDF/README
  - lib/netcdf/README
  - *dump netcdf*
-

## 6.2.64 OPENMP package

### Contents:

Hundreds of pair, fix, compute, bond, angle, dihedral, improper, and kspace styles which are altered to enable threading on many-core CPUs via OpenMP directives. All of them have an “omp” in their style name. The *OPENMP package* page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf omp” or “-suffix omp” *command-line switches*. Also see the *KOKKOS*, *OPT*, and *INTEL* packages, which have styles optimized for CPUs.

**Author:** Axel Kohlmeyer (Temple U).

---

**Note:** To enable multi-threading support the compile flag “-fopenmp” and the link flag “-fopenmp” (for GNU compilers, you have to look up the equivalent flags for other compilers) must be used to build LAMMPS. When using Intel compilers, also the “-restrict” flag is required. The OPENMP package can be compiled without enabling OpenMP; then all code will be compiled as serial and the only improvement over the regular styles are some data access optimization. These flags should be added to the CCFLAGS and LINKFLAGS lines of your Makefile.machine. See src/MAKE/OPTIONS/Makefile.omp for an example.

---

Once you have an appropriate Makefile.machine, you can install/un-install the package and build LAMMPS in the usual manner:

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/OPENMP: filenames -> commands
  - src/OPENMP/README
  - *Accelerator packages*
  - *OPENMP package*
  - *Command line option -suffix/-sf omp*
  - *Command line option -package/-pk omp*
  - *package omp*
  - Search the *commands* pages (*fix*, *compute*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kspace*) for styles followed by (o)
  - *Benchmarks page of website*
- 

## 6.2.65 OPT package

### Contents:

A handful of pair styles which are optimized for improved CPU performance on single or multiple cores. These include EAM, LJ, CHARMM, and Morse potentials. The styles have an “opt” suffix in their style name. The *OPT package* page gives details of how to build and use this package. Its styles can be invoked at run time via the “-sf opt” or “-suffix opt” *command-line switches*. See also the *KOKKOS*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPU performance.

**Authors:** James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technology).

**Install:**

This package has *specific installation instructions* on the *Build extras* page.

**Supporting info:**

- src/OPT: filenames -> commands
- *Accelerator packages*
- *OPT package*
- *Section 2.6 -sf opt*
- Search the *pair style* page for styles followed by (t)
- *Benchmarks page* of website

## 6.2.66 ORIENT package

**Contents:**

A few fixes that apply orientation dependent forces for studying grain boundary migration.

**Supporting info:**

- src/ORIENT: filenames -> commands
  - *fix orient/bcc*
  - *fix orient/fcc*
  - *fix orient/eco*
- 

## 6.2.67 PERI package

**Contents:**

An atom style, several pair styles which implement different Peridynamics materials models, and several computes which calculate diagnostics. Peridynamics is a particle-based meshless continuum model.

**Authors:** The original package was created by Mike Parks (Sandia). Additional Peridynamics models were added by Rezwanur Rahman and John Foster (UTSA).

**Supporting info:**

- src/PERI: filenames -> commands
- doc/PDF/PDLammps\_overview.pdf
- doc/PDF/PDLammps\_EPS.pdf
- doc/PDF/PDLammps\_VES.pdf
- *atom\_style peri*
- *pair\_style peri/\**
- *compute damage/atom*

- *compute plasticity/atom*
  - *examples/peri*
  - <https://www.lammps.org/movies.html#peri>
- 

## 6.2.68 PHONON package

### Contents:

A *fix phonon* command that calculates dynamical matrices, which can then be used to compute phonon dispersion relations, directly from molecular dynamics simulations. And a *dynamical\_matrix* as well as a *third\_order* command to compute the dynamical matrix and third order tensor from finite differences.

### Install:

The PHONON package requires that also the **KSPACE** package is installed.

**Authors:** Ling-Ti Kong (Shanghai Jiao Tong University) for “fix phonon” and Charlie Sievers (UC Davis) for “dynamical\_matrix” and “third\_order”

### Supporting info:

- *src/PHONON*: filenames -> commands
  - *src/PHONON/README*
  - *fix phonon*
  - *dynamical\_matrix*
  - *third\_order*
  - *examples/PACKAGES/phonon*
- 

## 6.2.69 PLUGIN package

### Contents:

A *plugin* command that can load and unload several kind of styles in LAMMPS from shared object files at runtime without having to recompile and relink LAMMPS.

When the environment variable `LAMMPS_PLUGIN_PATH` is set, then LAMMPS will search the directory (or directories) listed in this path for files with names that end in `plugin.so` (e.g. `helloplugin.so`) and will try to load the contained plugins automatically at start-up.

**Authors:** Axel Kohlmeyer (Temple U)

### Supporting info:

- *src/PLUGIN*: filenames -> commands
  - *plugin command*
  - *Information on writing plugins*
  - *examples/plugin*
-

## 6.2.70 PLUMED package

### Contents:

The fix *plumed* command allows you to use the PLUMED free energy plugin for molecular dynamics to analyze and bias your LAMMPS trajectory on the fly. The PLUMED library is called from within the LAMMPS input script by using the *fix plumed* command.

**Authors:** The **PLUMED library** is written and maintained by Massimiliano Bonomi, Giovanni Bussi, Carlo Camilioni, and Gareth Tribello.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/PLUMED/README
  - lib/plumed/README
  - *fix plumed*
  - examples/PACKAGES/plumed
- 

## 6.2.71 POEMS package

### Contents:

A fix that wraps the Parallelizable Open source Efficient Multibody Software (POEMS) library, which is able to simulate the dynamics of articulated body systems. These are systems with multiple rigid bodies (collections of particles) whose motion is coupled by connections at hinge points.

**Author:** Rudra Mukherjee (JPL) while at RPI.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- src/POEMS: filenames -> commands
  - src/POEMS/README
  - lib/poems/README
  - *fix poems*
  - examples/rigid
-

### 6.2.72 PTM package

**Contents:**

A *compute ptm/atom* command that calculates local structure characterization using the Polyhedral Template Matching methodology.

**Author:** Peter Mahler Larsen (MIT).

**Supporting info:**

- src/PTM: filenames not starting with ptm\_ -> commands
  - src/PTM: filenames starting with ptm\_ -> supporting code
  - src/PTM/LICENSE
  - *compute ptm/atom*
- 

### 6.2.73 PYTHON package

**Contents:**

A *python* command which allow you to execute Python code from a LAMMPS input script. The code can be in a separate file or embedded in the input script itself. See the *Python call* page for an overview of using Python from LAMMPS in this manner and all the *Python* manual pages for other ways to use LAMMPS and Python together.

---

**Note:** Building with the PYTHON package assumes you have a Python development environment (headers and libraries) available on your system, which needs to be either Python version 2.7 or Python 3.5 and later.

---

**Install:**

This package has *specific installation instructions* on the *Build extras* page.

**Supporting info:**

- src/PYTHON: filenames -> commands
  - *Python call*
  - lib/python/README
  - examples/python
- 

### 6.2.74 QEQ package

**Contents:**

Several fixes for performing charge equilibration (QEq) via different algorithms. These can be used with pair styles that perform QEq as part of their formulation.

**Supporting info:**

- src/QEQ: filenames -> commands
  - *fix qeq\**
-

- [examples/qeq](#)
  - [examples/streitz](#)
- 

### 6.2.75 QMMM package

#### Contents:

A *fix qmmm* command which allows LAMMPS to be used as the MM code in a QM/MM simulation. This is currently only available in combination with the [Quantum ESPRESSO](#) package.

To use this package you must have Quantum ESPRESSO (QE) available on your system and include its coupling library in the compilation and then compile LAMMPS as a library. For QM/MM calculations you then build a custom binary with MPI support, that sets up 3 partitions with MPI sub-communicators (for inter- and intra-partition communication) and then calls the corresponding library interfaces on each partition (2x LAMMPS and 1x QE).

The current implementation supports an ONIOM style mechanical coupling and a multi-pole based electrostatic coupling to the Quantum ESPRESSO plane wave DFT package. The QM/MM interface has been written in a manner that coupling to other QM codes should be possible without changes to LAMMPS itself.

**Authors:** Axel Kohlmeyer (Temple U), Mariella Ippolito and Carlo Cavazzoni (CINECA, Italy)

#### Install:

This package has *specific installation instructions* on the [Build extras](#) page.

#### Supporting info:

- [src/QMMM: filenames -> commands](#)
  - [src/QMMM/README](#)
  - [lib/qmmm/README](#)
  - [fix phonon](#)
  - [lib/qmmm/example-ec/README](#)
  - [lib/qmmm/example-mc/README](#)
- 

### 6.2.76 QTB package

#### Contents:

Two fixes which provide a self-consistent quantum treatment of vibrational modes in a classical molecular dynamics simulation. By coupling the MD simulation to a colored thermostat, it introduces zero point energy into the system, altering the energy power spectrum and the heat capacity to account for their quantum nature. This is useful when modeling systems at temperatures lower than their classical limits or when temperatures ramp across the classical limits in a simulation.

**Author:** Yuan Shen (Stanford U).

#### Supporting info:

- [src/QTB: filenames -> commands](#)
  - [src/QTB/README](#)
  - [fix qtb](#)
-

- *fix qbmsst*
  - examples/PACKAGES/qtb
- 

### 6.2.77 REACTION package

#### Contents:

This package allows for complex bond topology changes (reactions) during a running MD simulation, when using classical force fields. Topology changes are defined in pre- and post-reaction molecule templates and can include creation and deletion of bonds, angles, dihedrals, impropers, atom types, bond types, angle types, dihedral types, improper types, and/or atomic charges. Other options currently available include reaction constraints (e.g. angle and Arrhenius constraints), deletion of reaction byproducts or other small molecules, and chiral-sensitive reactions.

**Author:** Jacob R. Gissinger (CU Boulder) while at NASA Langley Research Center.

### 6.2.78 REAXFF package

#### Contents:

A pair style which implements the ReaxFF potential in C/C++. ReaxFF is a universal reactive force field. See the src/REAXFF/README file for more info on differences between the two packages. Also two fixes for monitoring molecules as bonds are created and destroyed.

**Author:** Hasan Metin Aktulga (MSU) while at Purdue University.

#### Supporting info:

## 6.2.79 REPLICA package

### Contents:

A collection of multi-replica methods which can be used when running multiple LAMMPS simulations (replicas). See the *Howto replica* page for an overview of how to run multi-replica simulations in LAMMPS. Methods in the package include nudged elastic band (NEB), parallel replica dynamics (PRD), temperature accelerated dynamics (TAD), parallel tempering, and a verlet/split algorithm for performing long-range Coulombics on one set of processors, and the remainder of the force field calculation on another set.

### Supporting info:

- 

## 6.2.80 RIGID package

### Contents:

Fixes which enforce rigid constraints on collections of atoms or particles. This includes SHAKE and RATTLE, as well as various rigid-body integrators for a few large bodies or many small bodies. Also several computes which calculate properties of rigid bodies.

### Supporting info:

- src/RIGID: filenames -> commands
- *compute erotate/rigid*
- *fix shake*
- *fix rattle*
- *fix rigid/\**
- examples/ASPHERE
- examples/rigid
- bench/in.rhodo

### 6.2.81 SCAFACOS package

#### Contents:

A KSpace style which wraps the ScaFaCoS Coulomb solver library to compute long-range Coulombic interactions.

To use this package you must have the ScaFaCoS library available on your system.

**Author:** Rene Halver (JSC) wrote the scafacos LAMMPS command.

ScaFaCoS itself was developed by a consortium of German research facilities with a BMBF (German Ministry of Science and Education) funded project in 2009-2012. Participants of the consortium were the Universities of Bonn, Chemnitz, Stuttgart, and Wuppertal as well as the Forschungszentrum Juelich.

#### Install:

This package has *specific installation instructions* on the *Build extras* page. The SCAFACOS package requires that LAMMPS is build in *MPI parallel mode*.

#### Supporting info:

- src/SCAFACOS: filenames -> commands
  - src/SCAFACOS/README
  - *kpace\_style scafacos*
  - *kpace\_modify*
  - examples/PACKAGES/sfacos
- 

### 6.2.82 SHOCK package

#### Contents:

Fixes for running impact simulations where a shock-wave passes through a material.

#### Supporting info:

- src/SHOCK: filenames -> commands
  - *fix append/atoms*
  - *fix msst*
  - *fix nphug*
  - *fix wall/piston*
  - examples/hugonostat
  - examples/msst
-

### 6.2.83 SMTBQ package

**Contents:**

Pair styles which implement Second Moment Tight Binding models. One with QEq charge equilibration (SMTBQ) for the description of ionocovalent bonds in oxides, and two more as plain SMATB models.

**Authors:** SMTBQ: Nicolas Salles, Emile Maras, Olivier Politano, and Robert Tetot (LAAS-CNRS, France); SMATB: Daniele Rapetti (Politecnico di Torino)

**Supporting info:**

- src/SMTBQ: filenames -> commands
  - src/SMTBQ/README
  - *pair\_style smtbq*
  - *pair\_style smatb*, *pair\_style smatb/single*
  - examples/PACKAGES/smtbq
- 

### 6.2.84 SPH package

**Contents:**

An atom style, fixes, computes, and several pair styles which implements smoothed particle hydrodynamics (SPH) for liquids. See the related *MACHDYN package* for smooth Mach dynamics (SMD) for solids.

This package contains ideal gas, Lennard-Jones equation of states, Tait, and full support for complete (i.e. internal-energy dependent) equations of state. It allows for plain or Monaghans XSPH integration of the equations of motion. It has options for density continuity or density summation to propagate the density field. It has *set* command options to set the internal energy and density of particles from the input script and allows the same quantities to be output with thermodynamic output or to dump files via the *compute property/atom* command.

**Author:** Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

**Supporting info:**

- src/SPH: filenames -> commands
  - src/SPH/README
  - doc/PDF/SPH\_LAMMPS\_userguide.pdf
  - examples/PACKAGES/sph
  - <https://www.lammps.org/movies.html#sph>
-

## 6.2.85 SPIN package

### Contents:

Model atomic magnetic spins classically, coupled to atoms moving in the usual manner via MD. Various pair, fix, and compute styles.

**Author:** Julien Tranchida (Sandia).

### Supporting info:

- src/SPIN: filenames -> commands
  - *Howto spins*
  - *pair\_style spin/dipole/cut*
  - *pair\_style spin/dipole/long*
  - *pair\_style spin/dmi*
  - *pair\_style spin/exchange*
  - *pair\_style spin/exchange/biquadratic*
  - *pair\_style spin/magelec*
  - *pair\_style spin/neel*

  - *fix langevin/spin*
  - *fix precession/spin*
  - *compute spin*
  - *neb/spin*
  - examples/SPIN
- 

## 6.2.86 SRD package

### Contents:

A pair of fixes which implement the Stochastic Rotation Dynamics (SRD) method for coarse-graining of a solvent, typically around large colloidal particles.

### Supporting info:

- src/SRD: filenames -> commands
- *fix srd*
- *fix wall/srd*
- examples/srd
- examples/ASPHERE
- <https://www.lammps.org/movies.html#tri>
- <https://www.lammps.org/movies.html#line>
- <https://www.lammps.org/movies.html#poly>

## 6.2.87 TALLY package

### Contents:

Several compute styles that can be called when pairwise interactions are calculated to tally information (forces, heat flux, energy, stress, etc) about individual interactions.

**Author:** Axel Kohlmeyer (Temple U).

### Supporting info:

- src/TALLY: filenames -> commands
  - src/TALLY/README
  - *compute \*/tally*
  - examples/PACKAGES/tally
- 

## 6.2.88 UEF package

### Contents:

A fix style for the integration of the equations of motion under extensional flow with proper boundary conditions, as well as several supporting compute styles and an output option.

**Author:** David Nicholson (MIT).

### Supporting info:

- src/UEF: filenames -> commands
  - src/UEF/README
  - *fix nvt/uef*
  - *fix npt/uef*
  - *compute pressure/uef*
  - *compute temp/uef*
  - *dump cfg/uef*
  - examples/uef
-

## 6.2.89 VORONOI package

### Contents:

A `compute` command which calculates the Voronoi tessellation of a collection of atoms by wrapping the [Voro++ library](#). This can be used to calculate the local volume of each atom or its near neighbors.

To use this package you must have the Voro++ library available on your system.

**Author:** Daniel Schwen (INL) while at LANL. The open-source Voro++ library was written by Chris Rycroft (Harvard U) while at UC Berkeley and LBNL.

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- `src/VORONOI`: filenames -> commands
  - `src/VORONOI/README`
  - `lib/voronoi/README`
  - `compute voronoi/atom`
  - `examples/voronoi`
- 

## 6.2.90 VTK package

### Contents:

A `dump vtk` command which outputs snapshot info in the [VTK format](#), enabling visualization by [Paraview](#) or other visualization packages.

To use this package you must have VTK library available on your system.

**Authors:** Richard Berger (JKU) and Daniel Queteschiner (DCS Computing).

### Install:

This package has *specific installation instructions* on the *Build extras* page.

### Supporting info:

- `src/VTK`: filenames -> commands
  - `src/VTK/README`
  - `lib/vtk/README`
  - `dump vtk`
-

## 6.2.91 YAFF package

### Contents:

Some potentials that are also implemented in the Yet Another Force Field (YAFF) code. The expressions and their use are discussed in the following papers

- Vanduyfhuys et al., J. Comput. Chem., 36 (13), 1015-1027 (2015) [link](#)
- Vanduyfhuys et al., J. Comput. Chem., 39 (16), 999-1011 (2018) [link](#)

which discuss the QuickFF methodology.

**Author:** Steven Vandenbrande.

### Supporting info:

- *pair\_style lj/switch3/coulgauss/long*
- examples/PACKAGES/yaff

## ACCELERATE PERFORMANCE

This section describes various methods for improving LAMMPS performance for different classes of problems running on different kinds of machines.

There are two thrusts to the discussion that follows. The first is using code options that implement alternate algorithms that can speed-up a simulation. The second is to use one of the several accelerator packages provided with LAMMPS that contain code optimized for certain kinds of hardware, including multi-core CPUs, GPUs, and Intel Xeon Phi co-processors.

The [Benchmark page](#) of the LAMMPS website gives performance results for the various accelerator packages discussed on the [Accelerator packages](#) page, for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

### 7.1 Benchmarks

Current LAMMPS performance is discussed on the [Benchmarks page](#) of the [LAMMPS website](#) where timings and parallel efficiency are listed. The page has several sections, which are briefly described below:

- CPU performance on 5 standard problems, strong and weak scaling
- GPU and Xeon Phi performance on same and related problems
- Comparison of cost of interatomic potentials
- Performance of huge, billion-atom problems

The 5 standard problems are as follow:

1. LJ = atomic fluid, Lennard-Jones potential with 2.5 sigma cutoff (55 neighbors per atom), NVE integration
2. Chain = bead-spring polymer melt of 100-mer chains, FENE bonds and LJ pairwise interactions with a  $2^{1/6}$  sigma cutoff (5 neighbors per atom), NVE integration
3. EAM = metallic solid, Cu EAM potential with 4.95 Angstrom cutoff (45 neighbors per atom), NVE integration
4. Chute = granular chute flow, frictional history potential with 1.1 sigma cutoff (7 neighbors per atom), NVE integration
5. Rhodo = rhodopsin protein in solvated lipid bilayer, CHARMM force field with a 10 Angstrom LJ cutoff (440 neighbors per atom), particle-particle particle-mesh (PPPM) for long-range Coulombics, NPT integration

Input files for these 5 problems are provided in the bench directory of the LAMMPS distribution. Each has 32,000 atoms and runs for 100 timesteps. The size of the problem (number of atoms) can be varied using command-line switches as described in the bench/README file. This is an easy way to test performance and either strong or weak scalability on your machine.

The bench directory includes a few log.\* files that show performance of these 5 problems on 1 or 4 cores of Linux desktop. The bench/FERMI and bench/KEPLER directories have input files and scripts and instructions for running the same (or similar) problems using OpenMP or GPU or Xeon Phi acceleration options. See the README files in those directories and the *Accelerator packages* pages for instructions on how to build LAMMPS and run on that kind of hardware.

The bench/POTENTIALS directory has input files which correspond to the table of results on the [Potentials](#) section of the Benchmarks web page. So you can also run those test problems on your machine.

The [billion-atom](#) section of the Benchmarks web page has performance data for very large benchmark runs of simple Lennard-Jones (LJ) models, which use the bench/in.lj input script.

---

For all the benchmarks, a useful metric is the CPU cost per atom per timestep. Since performance scales roughly linearly with problem size and timesteps for all LAMMPS models (i.e. interatomic or coarse-grained potentials), the run time of any problem using the same model (atom style, force field, cutoff, etc) can then be estimated.

Performance on a parallel machine can also be predicted from one-core or one-node timings if the parallel efficiency can be estimated. The communication bandwidth and latency of a particular parallel machine affects the efficiency. On most machines LAMMPS will give a parallel efficiency on these benchmarks above 50% so long as the number of atoms/core is a few 100 or greater, and closer to 100% for large numbers of atoms/core. This is for all-MPI mode with one MPI task per core. For nodes with accelerator options or hardware (OpenMP, GPU, Phi), you should first measure single node performance. Then you can estimate parallel performance for multi-node runs using the same logic as for all-MPI mode, except that now you will typically need many more atoms/node to achieve good scalability.

## 7.2 Measuring performance

Before trying to make your simulation run faster, you should understand how it currently performs and where the bottlenecks are.

The best way to do this is run the your system (actual number of atoms) for a modest number of timesteps (say 100 steps) on several different processor counts, including a single processor if possible. Do this for an equilibrium version of your system, so that the 100-step timings are representative of a much longer run. There is typically no need to run for 1000s of timesteps to get accurate timings; you can simply extrapolate from short runs.

For the set of runs, look at the timing data printed to the screen and log file at the end of each LAMMPS run. The [screen and logfile output](#) page gives an overview.

Running on one (or a few processors) should give a good estimate of the serial performance and what portions of the timestep are taking the most time. Running the same problem on a few different processor counts should give an estimate of parallel scalability. I.e. if the simulation runs 16x faster on 16 processors, its 100% parallel efficient; if it runs 8x faster on 16 processors, it's 50% efficient.

The most important data to look at in the timing info is the timing breakdown and relative percentages. For example, trying different options for speeding up the long-range solvers will have little impact if they only consume 10% of the run time. If the pairwise time is dominating, you may want to look at GPU or OMP versions of the pair style, as discussed below. Comparing how the percentages change as you increase the processor count gives you a sense of how different operations within the timestep are scaling. Note that if you are running with a Kspace solver, there is additional output on the breakdown of the Kspace time. For PPPM, this includes the fraction spent on FFTs, which can be communication intensive.

Another important detail in the timing info are the histograms of atoms counts and neighbor counts. If these vary widely across processors, you have a load-imbalance issue. This often results in inaccurate relative timing data, because processors have to wait when communication occurs for other processors to catch up. Thus the reported times for “Communication” or “Other” may be higher than they really are, due to load-imbalance. If this is an issue, you can use the [timer sync](#) command to obtain synchronized timings.

## 7.3 General tips

---

**Note:** this page is still a work in progress

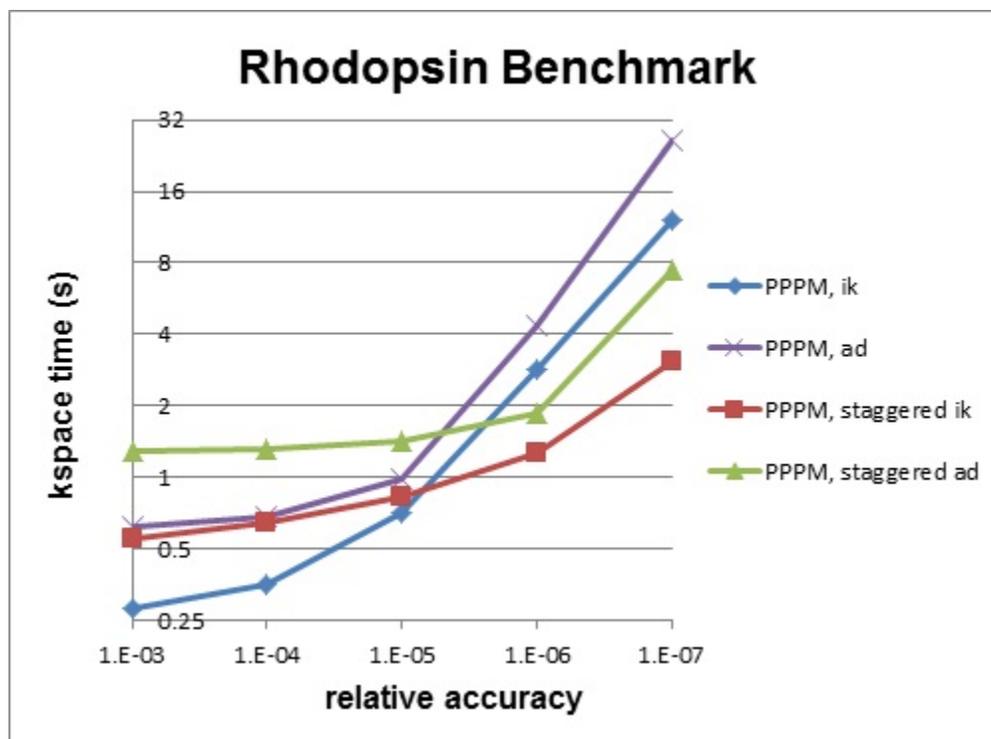

---

Here is a list of general ideas for improving simulation performance. Most of them are only applicable to certain models and certain bottlenecks in the current performance, so let the timing data you generate be your guide. It is hard, if not impossible, to predict how much difference these options will make, since it is a function of problem size, number of processors used, and your machine. There is no substitute for identifying performance bottlenecks, and trying out various options.

- rRESPA
- Two-FFT PPPM
- Staggered PPPM
- single vs double PPPM
- partial charge PPPM
- verlet/split run style
- processor command for proc layout and numa layout
- load-balancing: balance and fix balance

Two-FFT PPPM, also called *analytic differentiation* or *ad* PPPM, uses 2 FFTs instead of the 4 FFTs used by the default *ik differentiation* PPPM. However, 2-FFT PPPM also requires a slightly larger mesh size to achieve the same accuracy as 4-FFT PPPM. For problems where the FFT cost is the performance bottleneck (typically large problems running on many processors), 2-FFT PPPM may be faster than 4-FFT PPPM.

Staggered PPPM performs calculations using two different meshes, one shifted slightly with respect to the other. This can reduce force aliasing errors and increase the accuracy of the method, but also doubles the amount of work required. For high relative accuracy, using staggered PPPM allows one to half the mesh size in each dimension as compared to regular PPPM, which can give around a 4x speedup in the kspace time. However, for low relative accuracy, using staggered PPPM gives little benefit and can be up to 2x slower in the kspace time. For example, the rhodopsin benchmark was run on a single processor, and results for kspace time vs. relative accuracy for the different methods are shown in the figure below. For this system, staggered PPPM (using *ik differentiation*) becomes useful when using a relative accuracy of slightly greater than  $1e-5$  and above.

**Note:** Using staggered PPPM may not give the same increase in accuracy of energy and pressure as it does in forces, so some caution must be used if energy and/or pressure are quantities of interest, such as when using a barostat.

## 7.4 Accelerator packages

Accelerated versions of various *pair\_style*, *fixes*, *computes*, and other commands have been added to LAMMPS, which will typically run faster than the standard non-accelerated versions. Some require appropriate hardware to be present on your system, e.g. GPUs or Intel Xeon Phi co-processors.

All of these commands are in packages provided with LAMMPS. An overview of packages is give on the *Packages* doc pages.

These are the accelerator packages currently in LAMMPS:

<i>GPU Package</i>	for GPUs via CUDA, OpenCL, or ROCm HIP
<i>INTEL Package</i>	for Intel CPUs and Intel Xeon Phi
<i>KOKKOS Package</i>	for NVIDIA GPUs, Intel Xeon Phi, and OpenMP threading
<i>OPENMP Package</i>	for OpenMP threading and generic CPU optimizations
<i>OPT Package</i>	generic CPU optimizations

### 7.4.1 GPU package

The GPU package was developed by Mike Brown while at SNL and ORNL (now at Intel Corp.) and his collaborators, particularly Trung Nguyen (now at Northwestern). Support for AMD GPUs via HIP was added by Vsevolod Nikolskiy and coworkers at HSE University.

The GPU package provides GPU versions of many pair styles and for parts of the *k-space\_style pppm* for long-range Coulombics. It has the following general features:

- It is designed to exploit common GPU hardware configurations where one or more GPUs are coupled to many cores of one or more multi-core CPUs, e.g. within a node of a parallel machine.
- Atom-based data (e.g. coordinates, forces) are moved back-and-forth between the CPU(s) and GPU every timestep.
- Neighbor lists can be built on the CPU or on the GPU
- The charge assignment and force interpolation portions of PPPM can be run on the GPU. The FFT portion, which requires MPI communication between processors, runs on the CPU.
- Force computations of different style (pair vs. bond/angle/dihedral/improper) can be performed concurrently on the GPU and CPU(s), respectively.
- It allows for GPU computations to be performed in single or double precision, or in mixed-mode precision, where pairwise forces are computed in single precision, but accumulated into double-precision force vectors.
- LAMMPS-specific code is in the GPU package. It makes calls to a generic GPU library in the `lib/gpu` directory. This library provides either Nvidia support, AMD support, or more general OpenCL support (for Nvidia GPUs, AMD GPUs, Intel GPUs, and multi-core CPUs). so that the same functionality is supported on a variety of hardware.

#### Required hardware/software:

To compile and use this package in CUDA mode, you currently need to have an NVIDIA GPU and install the corresponding NVIDIA CUDA toolkit software on your system (this is only tested on Linux and unsupported on Windows):

- Check if you have an NVIDIA GPU: `cat /proc/driver/nvidia/gpus/*/information`
- Go to [http://www.nvidia.com/object/cuda\\_get.html](http://www.nvidia.com/object/cuda_get.html)
- Install a driver and toolkit appropriate for your system (SDK is not necessary)
- Run `lammmps/lib/gpu/nvc_get_devices` (after building the GPU library, see below) to list supported devices and properties

To compile and use this package in OpenCL mode, you currently need to have the OpenCL headers and the (vendor neutral) OpenCL library installed. In OpenCL mode, the acceleration depends on having an [OpenCL Installable Client Driver \(ICD\)](#) installed. There can be multiple of them for the same or different hardware (GPUs, CPUs, Accelerators) installed at the same time. OpenCL refers to those as ‘platforms’. The GPU library will try to auto-select the best suitable platform, but this can be overridden using the `platform` option of the `package` command. run `lammmps/lib/gpu/ocl_get_devices` to get a list of available platforms and devices with a suitable ICD available.

To compile and use this package for Intel GPUs, OpenCL or the Intel oneAPI HPC Toolkit can be installed using linux package managers. The latter also provides optimized C++, MPI, and many other libraries and tools. See:

- <https://software.intel.com/content/www/us/en/develop/tools/oneapi/hpc-toolkit/download.html>

If you do not have a discrete GPU card installed, this package can still provide significant speedups on some CPUs that include integrated GPUs. Additionally, for many macs, OpenCL is already included with the OS and Makefiles are available in the `lib/gpu` directory.

To compile and use this package in HIP mode, you have to have the AMD ROCm software installed. Versions of ROCm older than 3.5 are currently deprecated by AMD.

**Building LAMMPS with the GPU package:**

See the *Build extras* page for instructions.

**Run with the GPU package from the command line:**

The `mpirun` or `mpiexec` command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the `mpirun` command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npernode`.

When using the GPU package, you cannot assign more than one GPU to a single MPI task. However multiple MPI tasks can share the same GPU, and in many cases it will be more efficient to run this way. Likewise it may be more efficient to use less MPI tasks/node than the available # of CPU cores. Assignment of multiple MPI tasks to a GPU will happen automatically if you create more MPI tasks/node than there are GPUs/node. E.g. with 8 MPI tasks/node and 2 GPUs, each GPU will be shared by 4 MPI tasks.

The GPU package also has limited support for OpenMP for both multi-threading and vectorization of routines that are run on the CPUs. This requires that the GPU library and LAMMPS are built with flags to enable OpenMP support (e.g. `-fopenmp`). Some styles for time integration are also available in the GPU package. These run completely on the CPUs in full double precision, but exploit multi-threading and vectorization for faster performance.

Use the “`-sf gpu`” *command-line switch*, which will automatically append “`gpu`” to styles that support it. Use the “`-pk gpu Ng`” *command-line switch* to set `Ng` = # of GPUs/node to use. If `Ng` is 0, the number is selected automatically as the number of matching GPUs that have the highest number of compute cores.

```

mpirun -sf gpu -pk gpu 1 -in in.script           # 1 MPI task uses 1 GPU
mpirun -np 12 lmp_machine -sf gpu -pk gpu 2 -in in.script # 12 MPI tasks share 2 GPUs on a single 16-core (or whatever) node
mpirun -np 48 -ppn 12 lmp_machine -sf gpu -pk gpu 2 -in in.script # ditto on 4 16-core nodes

```

Note that if the “`-sf gpu`” switch is used, it also issues a default `package gpu 0` command, which will result in automatic selection of the number of GPUs to use.

Using the “`-pk`” switch explicitly allows for setting of the number of GPUs/node to use and additional options. Its syntax is the same as the “`package gpu`” command. See the *package* command page for details, including the default values used for all its options if it is not specified.

Note that the default for the `package gpu` command is to set the Newton flag to “off” pairwise interactions. It does not affect the setting for bonded interactions (LAMMPS default is “on”). The “off” setting for pairwise interaction is currently required for GPU package pair styles.

**Or run with the GPU package by editing an input script:**

The discussion above for the `mpirun/mpiexec` command, MPI tasks/node, and use of multiple MPI tasks/GPU is the same.

Use the *suffix gpu* command, or you can explicitly add an “`gpu`” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/gpu 2.5
```

You must also use the `package gpu` command to enable the GPU package, unless the “`-sf gpu`” or “`-pk gpu`” *command-line switches* were used. It specifies the number of GPUs/node to use, as well as other options.

**Speed-ups to expect:**

The performance of a GPU versus a multi-core CPU is a function of your hardware, which pair style is used, the number of atoms/GPU, and the precision used on the GPU (double, single, mixed). Using the GPU package in OpenCL mode on CPUs (which uses vectorization and multithreading) is usually resulting in inferior performance compared to using LAMMPS’ native threading and vectorization support in the OPENMP and INTEL packages.

See the [Benchmark page](#) of the LAMMPS website for performance of the GPU package on various hardware, including the Titan HPC platform at ORNL.

You should also experiment with how many MPI tasks per GPU to use to give the best performance for your problem and machine. This is also a function of the problem size and the pair style being using. Likewise, you should experiment with the precision setting for the GPU library to see if single or mixed precision will give accurate results, since they will typically be faster.

MPI parallelism typically outperforms OpenMP parallelism, but in some cases using fewer MPI tasks and multiple OpenMP threads with the GPU package can give better performance. 3-body potentials can often perform better with multiple OMP threads because the inter-process communication is higher for these styles with the GPU package in order to allow deterministic results.

#### **Guidelines for best performance:**

- Using multiple MPI tasks per GPU will often give the best performance, as allowed by most multi-core CPU/GPU configurations.
- If the number of particles per MPI task is small (e.g. 100s of particles), it can be more efficient to run with fewer MPI tasks per GPU, even if you do not use all the cores on the compute node.
- The *package gpu* command has several options for tuning performance. Neighbor lists can be built on the GPU or CPU. Force calculations can be dynamically balanced across the CPU cores and GPUs. GPU-specific settings can be made which can be optimized for different hardware. See the *package* command page for details.
- As described by the *package gpu* command, GPU accelerated pair styles can perform computations asynchronously with CPU computations. The “Pair” time reported by LAMMPS will be the maximum of the time required to complete the CPU pair style computations and the time required to complete the GPU pair style computations. Any time spent for GPU-enabled pair styles for computations that run simultaneously with *bond*, *angle*, *dihedral*, *improper*, and *long-range* calculations will not be included in the “Pair” time.
- Since only part of the *pppm kspace* style is GPU accelerated, it may be faster to only use GPU acceleration for Pair styles with long-range electrostatics. See the “pair/only” keyword of the *package* command for a shortcut to do that. The work between *kspace* on the CPU and non-bonded interactions on the GPU can be balanced through adjusting the coulomb cutoff without loss of accuracy.
- When the *mode* setting for the *package gpu* command is *force/neighbor*, the time for neighbor list calculations on the GPU will be added into the “Pair” time, not the “Neighbor” time. An additional breakdown of the times required for various tasks on the GPU (data copy, neighbor calculations, force computations, etc) are output only with the LAMMPS screen output (not in the log file) at the end of each run. These timings represent total time spent on the GPU for each routine, regardless of asynchronous CPU calculations.
- The output section “GPU Time Info (average)” reports “Max Mem / Proc”. This is the maximum memory used at one time on the GPU for data storage by a single MPI process.

## Restrictions

None.

### 7.4.2 INTEL package

The INTEL package is maintained by Mike Brown at Intel Corporation. It provides two methods for accelerating simulations, depending on the hardware you have. The first is acceleration on Intel CPUs by running in single, mixed, or double precision with vectorization. The second is acceleration on Intel Xeon Phi co-processors via offloading neighbor list and non-bonded force calculations to the Phi. The same C++ code is used in both cases. When offloading to a co-processor from a CPU, the same routine is run twice, once on the CPU and once with an offload flag. This allows LAMMPS to run on the CPU cores and co-processor cores simultaneously.

#### Currently Available INTEL Styles

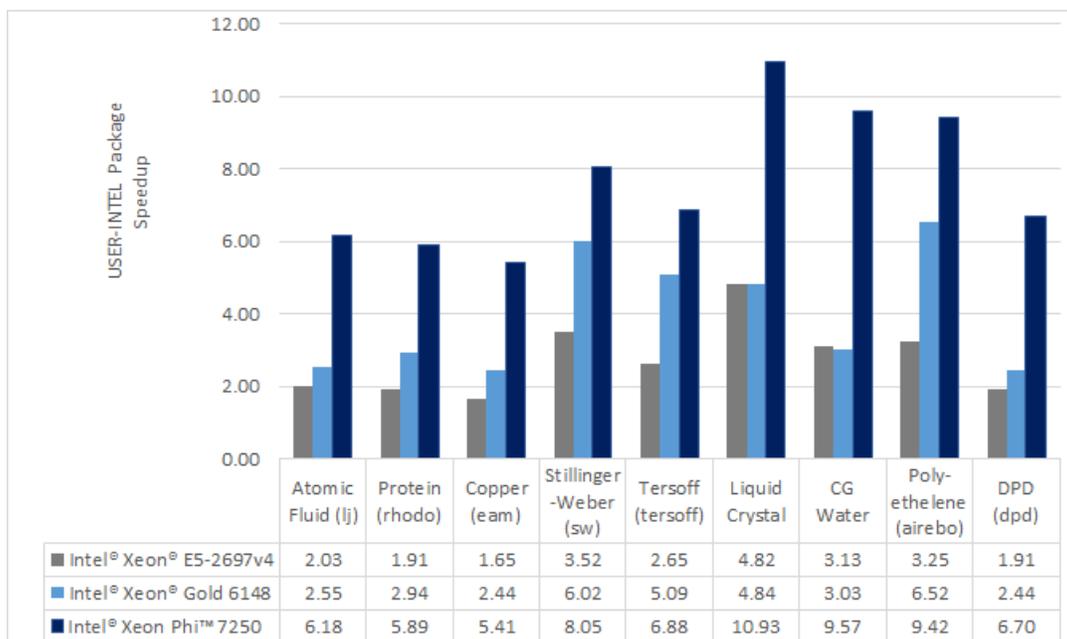

- Angle Styles: charmm, harmonic
- Bond Styles: fene, fourier, harmonic
- Dihedral Styles: charmm, fourier, harmonic, opl
- Fixes: nve, npt, nvt, nvt/sllod, nve/asphere
- Improper Styles: cvff, harmonic
- Pair Styles: airebo, airebo/morse, buck/coul/cut, buck/coul/long, buck, dpd, eam, eam/alloy, eam/fs, gayberne, lj/charmm/coul/charmm, lj/charmm/coul/long, lj/cut, lj/cut/coul/long, lj/long/coul/long, rebo, sw, tersoff
- K-Space Styles: pppm, pppm/disp

<p><b>Warning:</b> None of the styles in the INTEL package currently support computing per-atom stress. If any compute or fix in your input requires it, LAMMPS will abort with an error message.</p>
---

#### Speed-up to expect

The speedup will depend on your simulation, the hardware, which styles are used, the number of atoms, and the floating-point precision mode. Performance improvements are shown compared to LAMMPS *without using other acceleration packages* as these are under active development (and subject to performance changes). The measurements were performed using the input files available in the src/INTEL/TEST directory with the provided run script. These are scalable in size; the results given are with 512K particles (524K for Liquid Crystal). Most of the simulations are standard LAMMPS benchmarks (indicated by the filename extension in parenthesis) with modifications to the run length and to add a warm-up run (for use with offload benchmarks).

Results are speedups obtained on Intel Xeon E5-2697v4 processors (code-named Broadwell), Intel Xeon Phi 7250 processors (code-named Knights Landing), and Intel Xeon Gold 6148 processors (code-named Skylake) with “June 2017” LAMMPS built with Intel Parallel Studio 2017 update 2. Results are with 1 MPI task per physical core. See [src/INTEL/TEST/README](#) for the raw simulation rates and instructions to reproduce.

## Accuracy and order of operations

In most molecular dynamics software, parallelization parameters (# of MPI, OpenMP, and vectorization) can change the results due to changing the order of operations with finite-precision calculations. The INTEL package is deterministic. This means that the results should be reproducible from run to run with the *same* parallel configurations and when using deterministic libraries or library settings (MPI, OpenMP, FFT). However, there are differences in the INTEL package that can change the order of operations compared to LAMMPS without acceleration:

- Neighbor lists can be created in a different order
- Bins used for sorting atoms can be oriented differently
- The default stencil order for PPPM is 7. By default, LAMMPS will calculate other PPPM parameters to fit the desired accuracy with this order
- The *newton* setting applies to all atoms, not just atoms shared between MPI tasks
- Vectorization can change the order for adding pairwise forces
- When using the `-DLMP_USE_MKL_RNG` define (all included intel optimized makefiles do) at build time, the random number generator for dissipative particle dynamics (pair style dpd/intel) uses the Mersenne Twister generator included in the Intel MKL library (that should be more robust than the default Masaglia random number generator)

The precision mode (described below) used with the INTEL package can change the *accuracy* of the calculations. For the default *mixed* precision option, calculations between pairs or triplets of atoms are performed in single precision, intended to be within the inherent error of MD simulations. All accumulation is performed in double precision to prevent the error from growing with the number of atoms in the simulation. *Single* precision mode should not be used without appropriate validation.

## Quick Start for Experienced Users

LAMMPS should be built with the INTEL package installed. Simulations should be run with 1 MPI task per physical core, not *hardware thread*.

- Edit src/MAKE/OPTIONS/Makefile.intel\_cpu\_intelmpi as necessary.
- Set the environment variable KMP\_BLOCKTIME=0
- “-pk intel 0 omp \$t -sf intel” added to LAMMPS command-line
- \$t should be 2 for Intel Xeon CPUs and 2 or 4 for Intel Xeon Phi
- For some of the simple 2-body potentials without long-range electrostatics, performance and scalability can be better with the “newton off” setting added to the input script
- For simulations on higher node counts, add “processors \* \* \* grid numa” to the beginning of the input script for better scalability
- If using *kpace\_style pppm* in the input script, add “kpace\_modify diff ad” for better performance

For Intel Xeon Phi CPUs:

- Runs should be performed using MCDRAM.

For simulations using *kpace\_style pppm* on Intel CPUs supporting AVX-512:

- Add “kpace\_modify diff ad” to the input script
- The command-line option should be changed to “-pk intel 0 omp \$r lrt yes -sf intel” where \$r is the number of threads minus 1.
- Do not use thread affinity (set KMP\_AFFINITY=none)
- The “newton off” setting may provide better scalability

For Intel Xeon Phi co-processors (Offload):

- Edit src/MAKE/OPTIONS/Makefile.intel\_co-processor as necessary
- “-pk intel N omp 1” added to command-line where N is the number of co-processors per node.

---

## Required hardware/software

When using Intel compilers version 16.0 or later is required.

In order to use offload to co-processors, an Intel Xeon Phi co-processor and an Intel compiler are required.

Although any compiler can be used with the INTEL package, currently, vectorization directives are disabled by default when not using Intel compilers due to lack of standard support and observations of decreased performance. The OpenMP standard now supports directives for vectorization and we plan to transition the code to this standard once it is available in most compilers. We expect this to allow improved performance and support with other compilers.

For Intel Xeon Phi x200 series processors (code-named Knights Landing), there are multiple configuration options for the hardware. For best performance, we recommend that the MCDRAM is configured in “Flat” mode and with the cluster mode set to “Quadrant” or “SNC4”. “Cache” mode can also be used, although the performance might be slightly lower.

## Notes about Simultaneous Multithreading

Modern CPUs often support Simultaneous Multithreading (SMT). On Intel processors, this is called Hyper-Threading (HT) technology. SMT is hardware support for running multiple threads efficiently on a single core. *Hardware threads* or *logical cores* are often used to refer to the number of threads that are supported in hardware. For example, the Intel Xeon E5-2697v4 processor is described as having 36 cores and 72 threads. This means that 36 MPI processes or OpenMP threads can run simultaneously on separate cores, but that up to 72 MPI processes or OpenMP threads can be running on the CPU without costly operating system context switches.

Molecular dynamics simulations will often run faster when making use of SMT. If a thread becomes stalled, for example because it is waiting on data that has not yet arrived from memory, another thread can start running so that the CPU pipeline is still being used efficiently. Although benefits can be seen by launching a MPI task for every hardware thread, for multinode simulations, we recommend that OpenMP threads are used for SMT instead, either with the INTEL package, *OPENMP package*, or *KOKKOS package*. In the example above, up to 36X speedups can be observed by using all 36 physical cores with LAMMPS. By using all 72 hardware threads, an additional 10-30% performance gain can be achieved.

The BIOS on many platforms allows SMT to be disabled, however, we do not recommend this on modern processors as there is little to no benefit for any software package in most cases. The operating system will report every hardware thread as a separate core allowing one to determine the number of hardware threads available. On Linux systems, this information can normally be obtained with:

```
cat /proc/cpuinfo
```

## Building LAMMPS with the INTEL package

See the *Build extras* page for instructions. Some additional details are covered here.

For building with make, several example Makefiles for building with the Intel compiler are included with LAMMPS in the src/MAKE/OPTIONS/ directory:

```
Makefile.intel_cpu_intelmpi # Intel Compiler, Intel MPI, No Offload
Makefile.knl                # Intel Compiler, Intel MPI, No Offload
Makefile.intel_cpu_mpich   # Intel Compiler, MPICH, No Offload
Makefile.intel_cpu_openmpi # Intel Compiler, OpenMPI, No Offload
Makefile.intel_co-processor # Intel Compiler, Intel MPI, Offload
```

Makefile.knl is identical to Makefile.intel\_cpu\_intelmpi except that it explicitly specifies that vectorization should be for Intel Xeon Phi x200 processors making it easier to cross-compile. For users with recent installations of Intel Parallel Studio, the process can be as simple as:

```
make yes-intel
source /opt/intel/parallel_studio_xe_2016.3.067/psxevars.sh
# or psxevars.csh for C-shell
make intel_cpu_intelmpi
```

Note that if you build with support for a Phi co-processor, the same binary can be used on nodes with or without co-processors installed. However, if you do not have co-processors on your system, building without offload support will produce a smaller binary.

The general requirements for Makefiles with the INTEL package are as follows. When using Intel compilers, “-restrict” is required and “-qopenmp” is highly recommended for CCFLAGS and LINKFLAGS. CCFLAGS should include “-DLMP\_INTEL\_USELRT” (unless POSIX Threads are not supported in the build environment) and “-DLMP\_USE\_MKL\_RNG” (unless Intel Math Kernel Library (MKL) is not available in the build environment). For Intel compilers, LIB should include “-ltbbmalloc” or if the library is not available, “-DLMP\_INTEL\_NO\_TBB” can be

added to CCFLAGS. For builds supporting offload, “-DLMP\_INTEL\_OFFLOAD” is required for CCFLAGS and “-qoffload” is required for LINKFLAGS. Other recommended CCFLAG options for best performance are “-O2 -fno-alias -ansi-alias -qoverride-limits fp-model fast=2 -no-prec-div”.

---

**Note:** See the src/INTEL/README file for additional flags that might be needed for best performance on Intel server processors code-named “Skylake”.

---

---

**Note:** The vectorization and math capabilities can differ depending on the CPU. For Intel compilers, the “-x” flag specifies the type of processor for which to optimize. “-xHost” specifies that the compiler should build for the processor used for compiling. For Intel Xeon Phi x200 series processors, this option is “-xMIC-AVX512”. For fourth generation Intel Xeon (v4/Broadwell) processors, “-xCORE-AVX2” should be used. For older Intel Xeon processors, “-xAVX” will perform best in general for the different simulations in LAMMPS. The default in most of the example Makefiles is to use “-xHost”, however this should not be used when cross-compiling.

---

### Running LAMMPS with the INTEL package

Running LAMMPS with the INTEL package is similar to normal use with the exceptions that one should 1) specify that LAMMPS should use the INTEL package, 2) specify the number of OpenMP threads, and 3) optionally specify the specific LAMMPS styles that should use the INTEL package. 1) and 2) can be performed from the command-line or by editing the input script. 3) requires editing the input script. Advanced performance tuning options are also described below to get the best performance.

When running on a single node (including runs using offload to a co-processor), best performance is normally obtained by using 1 MPI task per physical core and additional OpenMP threads with SMT. For Intel Xeon processors, 2 OpenMP threads should be used for SMT. For Intel Xeon Phi CPUs, 2 or 4 OpenMP threads should be used (best choice depends on the simulation). In cases where the user specifies that LRT mode is used (described below), 1 or 3 OpenMP threads should be used. For multi-node runs, using 1 MPI task per physical core will often perform best, however, depending on the machine and scale, users might get better performance by decreasing the number of MPI tasks and using more OpenMP threads. For performance, the product of the number of MPI tasks and OpenMP threads should not exceed the number of available hardware threads in almost all cases.

---

**Note:** Setting core affinity is often used to pin MPI tasks and OpenMP threads to a core or group of cores so that memory access can be uniform. Unless disabled at build time, affinity for MPI tasks and OpenMP threads on the host (CPU) will be set by default on the host *when using offload to a co-processor*. In this case, it is unnecessary to use other methods to control affinity (e.g. taskset, numactl, I\_MPI\_PIN\_DOMAIN, etc.). This can be disabled with the *no\_affinity* option to the *package intel* command or by disabling the option at build time (by adding -DINTEL\_OFFLOAD\_NOAFFINITY to the CCFLAGS line of your Makefile). Disabling this option is not recommended, especially when running on a machine with Intel Hyper-Threading technology disabled.

---

## Run with the INTEL package from the command line

To enable INTEL optimizations for all available styles used in the input script, the “-sf intel” *command-line switch* can be used without any requirement for editing the input script. This switch will automatically append “intel” to styles that support it. It also invokes a default command: *package intel 1*. This package command is used to set options for the INTEL package. The default package command will specify that INTEL calculations are performed in mixed precision, that the number of OpenMP threads is specified by the OMP\_NUM\_THREADS environment variable, and that if co-processors are present and the binary was built with offload support, that 1 co-processor per node will be used with automatic balancing of work between the CPU and the co-processor.

You can specify different options for the INTEL package by using the “-pk intel Nphi” *command-line switch* with keyword/value pairs as specified in the documentation. Here, Nphi = # of Xeon Phi co-processors/node (ignored without offload support). Common options to the INTEL package include *omp* to override any OMP\_NUM\_THREADS setting and specify the number of OpenMP threads, *mode* to set the floating-point precision mode, and *lrt* to enable Long-Range Thread mode as described below. See the *package intel* command for details, including the default values used for all its options if not specified, and how to set the number of OpenMP threads via the OMP\_NUM\_THREADS environment variable if desired.

Examples (see documentation for your MPI/Machine for differences in launching MPI applications):

```
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script
↳ # 2 nodes, 36 MPI tasks/node, $OMP_NUM_THREADS OpenMP Threads
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script -pk intel 0 omp 2 mode double
↳ # Don't use any co-processors that might be available, use 2 OpenMP threads for each
↳ task, use double precision
```

## Or run with the INTEL package by editing an input script

As an alternative to adding command-line arguments, the input script can be edited to enable the INTEL package. This requires adding the *package intel* command to the top of the input script. For the second example above, this would be:

```
package intel 0 omp 2 mode double
```

To enable the INTEL package only for individual styles, you can add an “intel” suffix to the individual style, e.g.:

```
pair_style lj/cut/intel 2.5
```

Alternatively, the *suffix intel* command can be added to the input script to enable INTEL styles for the commands that follow in the input script.

## Tuning for Performance

**Note:** The INTEL package will perform better with modifications to the input script when *PPPM* is used: *k-space\_modify diff ad* should be added to the input script.

Long-Range Thread (LRT) mode is an option to the *package intel* command that can improve performance when using *PPPM* for long-range electrostatics on processors with SMT. It generates an extra pthread for each MPI task. The thread is dedicated to performing some of the PPPM calculations and MPI communications. This feature requires setting the pre-processor flag -DLMP\_INTEL\_USELRT in the makefile when compiling LAMMPS. It is unset in the default makefiles (*Makefile.mpi* and *Makefile.serial*) but it is set in all makefiles tuned for the INTEL package. On Intel Xeon Phi x200 series CPUs, the LRT feature will likely improve performance, even on a single node. On Intel Xeon processors, using this mode might result in better performance when using multiple nodes, depending on the

specific machine configuration. To enable LRT mode, specify that the number of OpenMP threads is one less than would normally be used for the run and add the “lrt yes” option to the “-pk” command-line suffix or “package intel” command. For example, if a run would normally perform best with “-pk intel 0 omp 4”, instead use “-pk intel 0 omp 3 lrt yes”. When using LRT, you should set the environment variable “KMP\_AFFINITY=none”. LRT mode is not supported when using offload.

---

**Note:** Changing the *newton* setting to off can improve performance and/or scalability for simple 2-body potentials such as lj/cut or when using LRT mode on processors supporting AVX-512.

---

Not all styles are supported in the INTEL package. You can mix the INTEL package with styles from the *OPT* package or the *OPENMP* package. Of course, this requires that these packages were installed at build time. This can be performed automatically by using “-sf hybrid intel opt” or “-sf hybrid intel omp” command-line options. Alternatively, the “opt” and “omp” suffixes can be appended manually in the input script. For the latter, the *package omp* command must be in the input script or the “-pk omp Nt” *command-line switch* must be used where Nt is the number of OpenMP threads. The number of OpenMP threads should not be set differently for the different packages. Note that the *suffix hybrid intel omp* command can also be used within the input script to automatically append the “omp” suffix to styles when INTEL styles are not available.

---

**Note:** For simulations on higher node counts, add *processors \* \* \* grid numa* to the beginning of the input script for better scalability.

---

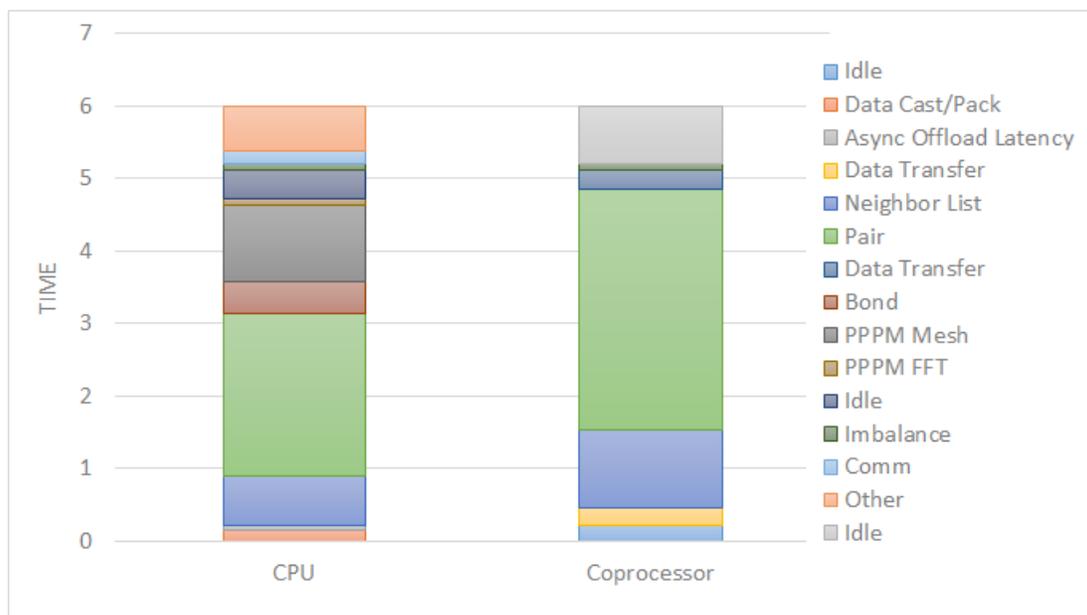

When running on many nodes, performance might be better when using fewer OpenMP threads and more MPI tasks. This will depend on the simulation and the machine. Using the *verlet/split* run style might also give better performance for simulations with *PPPM* electrostatics. Note that this is an alternative to LRT mode and the two cannot be used together.

Currently, when using Intel MPI with Intel Xeon Phi x200 series CPUs, better performance might be obtained by setting the environment variable “I\_MPI\_SHM\_LMT=shm” for Linux kernels that do not yet have full support for AVX-512. Runs on Intel Xeon Phi x200 series processors will always perform better using MCDRAM. Please consult your system documentation for the best approach to specify that MPI runs are performed in MCDRAM.

## Tuning for Offload Performance

The default settings for offload should give good performance.

When using LAMMPS with offload to Intel co-processors, best performance will typically be achieved with concurrent calculations performed on both the CPU and the co-processor. This is achieved by offloading only a fraction of the neighbor and pair computations to the co-processor or using *hybrid* pair styles where only one style uses the “intel” suffix. For simulations with long-range electrostatics or bond, angle, dihedral, improper calculations, computation and data transfer to the co-processor will run concurrently with computations and MPI communications for these calculations on the host CPU. This is illustrated in the figure below for the rhodopsin protein benchmark running on E5-2697v2 processors with a Intel Xeon Phi 7120p co-processor. In this plot, the vertical axis is time and routines running at the same time are running concurrently on both the host and the co-processor.

The fraction of the offloaded work is controlled by the *balance* keyword in the *package intel* command. A balance of 0 runs all calculations on the CPU. A balance of 1 runs all supported calculations on the co-processor. A balance of 0.5 runs half of the calculations on the co-processor. Setting the balance to -1 (the default) will enable dynamic load balancing that continuously adjusts the fraction of offloaded work throughout the simulation. Because data transfer cannot be timed, this option typically produces results within 5 to 10 percent of the optimal fixed balance.

If running short benchmark runs with dynamic load balancing, adding a short warm-up run (10-20 steps) will allow the load-balancer to find a near-optimal setting that will carry over to additional runs.

The default for the *package intel* command is to have all the MPI tasks on a given compute node use a single Xeon Phi co-processor. In general, running with a large number of MPI tasks on each node will perform best with offload. Each MPI task will automatically get affinity to a subset of the hardware threads available on the co-processor. For example, if your card has 61 cores, with 60 cores available for offload and 4 hardware threads per core (240 total threads), running with 24 MPI tasks per node will cause each MPI task to use a subset of 10 threads on the co-processor. Fine tuning of the number of threads to use per MPI task or the number of threads to use per core can be accomplished with keyword settings of the *package intel* command.

The INTEL package has two modes for deciding which atoms will be handled by the co-processor. This choice is controlled with the *ghost* keyword of the *package intel* command. When set to 0, ghost atoms (atoms at the borders between MPI tasks) are not offloaded to the card. This allows for overlap of MPI communication of forces with computation on the co-processor when the *newton* setting is “on”. The default is dependent on the style being used, however, better performance may be achieved by setting this option explicitly.

When using offload with CPU Hyper-Threading disabled, it may help performance to use fewer MPI tasks and OpenMP threads than available cores. This is due to the fact that additional threads are generated internally to handle the asynchronous offload tasks.

If pair computations are being offloaded to an Intel Xeon Phi co-processor, a diagnostic line is printed to the screen (not to the log file), during the setup phase of a run, indicating that offload mode is being used and indicating the number of co-processor threads per MPI task. Additionally, an offload timing summary is printed at the end of each run. When offloading, the frequency for *atom sorting* is changed to 1 so that the per-atom data is effectively sorted at every rebuild of the neighbor lists. All the available co-processor threads on each Phi will be divided among MPI tasks, unless the *tp task* option of the “-pk intel” *command-line switch* is used to limit the co-processor threads per MPI task.

## Restrictions

When offloading to a co-processor, *hybrid* styles that require skip lists for neighbor builds cannot be offloaded. Using *hybrid/overlay* is allowed. Only one intel accelerated style may be used with hybrid styles when offloading. *Special\_bonds* exclusion lists are not currently supported with offload, however, the same effect can often be accomplished by setting cutoffs for excluded atom types to 0. None of the pair styles in the INTEL package currently support the “inner”, “middle”, “outer” options for rRESPA integration via the *run\_style respa* command; only the “pair” option is supported.

### 7.4.3 KOKKOS package

Kokkos is a templated C++ library that provides abstractions to allow a single implementation of an application kernel (e.g. a pair style) to run efficiently on different kinds of hardware, such as GPUs, Intel Xeon Phis, or many-core CPUs. Kokkos maps the C++ kernel onto different back end languages such as CUDA, OpenMP, or Pthreads. The Kokkos library also provides data abstractions to adjust (at compile time) the memory layout of data structures like 2d and 3d arrays to optimize performance on different hardware. For more information on Kokkos, see [the Kokkos GitHub page](#).

The LAMMPS KOKKOS package contains versions of pair, fix, and atom styles that use data structures and macros provided by the Kokkos library, which is included with LAMMPS in `/lib/kokkos`. The KOKKOS package was developed primarily by Christian Trott (Sandia) and Stan Moore (Sandia) with contributions of various styles by others, including Sikandar Mashayak (UIUC), Ray Shan (Sandia), and Dan Ibanez (Sandia). For more information on developing using Kokkos abstractions see the Kokkos [Wiki](#).

Kokkos currently provides support for 4 modes of execution (per MPI task). These are Serial (MPI-only for CPUs and Intel Phi), OpenMP (threading for many-core CPUs and Intel Phi), CUDA (for NVIDIA GPUs) and HIP (for AMD GPUs). You choose the mode at build time to produce an executable compatible with a specific hardware.

---

#### C++14 support

Kokkos requires using a compiler that supports the c++14 standard. For some compilers, it may be necessary to add a flag to enable c++14 support. For example, the GNU compiler uses the `-std=c++14` flag. For a list of compilers that have been tested with the Kokkos library, see the Kokkos [README](#).

---

#### NVIDIA CUDA support

To build with Kokkos support for NVIDIA GPUs, the NVIDIA CUDA toolkit software version 9.0 or later must be installed on your system. See the discussion for the *GPU package* for details of how to check and do this.

---

---

### CUDA and MPI library compatibility

Kokkos with CUDA currently implicitly assumes that the MPI library is GPU-aware. This is not always the case, especially when using pre-compiled MPI libraries provided by a Linux distribution. This is not a problem when using only a single GPU with a single MPI rank. When running with multiple MPI ranks, you may see segmentation faults without GPU-aware MPI support. These can be avoided by adding the flags `-pk kokkos gpu/aware off` to the LAMMPS command line or by using the command `package kokkos gpu/aware off` in the input file.

---

### AMD GPU support

To build with Kokkos the HIPCC compiler from the AMD ROCm software version 3.5 or later is required. Supporting this Kokkos mode in LAMMPS is still work in progress. Please contact the LAMMPS developers if you run into problems.

---

### Building LAMMPS with the KOKKOS package

See the [Build extras](#) page for instructions.

### Running LAMMPS with the KOKKOS package

All Kokkos operations occur within the context of an individual MPI task running on a single node of the machine. The total number of MPI tasks used by LAMMPS (one or multiple per compute node) is set in the usual manner via the `mpirun` or `mpiexec` commands, and is independent of Kokkos. E.g. the `mpirun` command in OpenMPI does this via its `-np` and `-ppn` switches. Ditto for MPICH via `-np` and `-ppn`.

### Running on a multi-core CPU

Here is a quick overview of how to use the KOKKOS package for CPU acceleration, assuming one or more 16-core nodes.

```
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -in in.lj      # 1 node, 16 MPI tasks/
↳node, no multi-threading
mpirun -np 2 -ppn 1 lmp_kokkos_omp -k on t 16 -sf kk -in in.lj # 2 nodes, 1 MPI task/
↳node, 16 threads/task
mpirun -np 2 lmp_kokkos_omp -k on t 8 -sf kk -in in.lj      # 1 node, 2 MPI tasks/
↳node, 8 threads/task
mpirun -np 32 -ppn 4 lmp_kokkos_omp -k on t 4 -sf kk -in in.lj # 8 nodes, 4 MPI tasks/
↳node, 4 threads/task
```

To run using the KOKKOS package, use the “`-k on`”, “`-sf kk`” and “`-pk kokkos`” *command-line switches* in your `mpirun` command. You must use the “`-k on`” *command-line switch* to enable the KOKKOS package. It takes additional arguments for hardware settings appropriate to your system. For OpenMP use:

```
-k on t Nt
```

The “`t Nt`” option specifies how many OpenMP threads per MPI task to use with a node. The default is `Nt = 1`, which is MPI-only mode. Note that the product of MPI tasks \* OpenMP threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer. If Hyper-Threading (HT) is enabled, then the product of MPI tasks \* OpenMP threads/task should not exceed the physical number of cores \* hardware threads. The “`-k on`”

switch also issues a “package kokkos” command (with no additional arguments) which sets various KOKKOS options to default values, as discussed on the [package](#) command doc page.

The “-sf kk” *command-line switch* will automatically append the “/kk” suffix to styles that support it. In this manner no modification to the input script is needed. Alternatively, one can run with the KOKKOS package by editing the input script as described below.

---

**Note:** When using a single OpenMP thread, the Kokkos Serial back end (i.e. Makefile.kokkos\_mpi\_only) will give better performance than the OpenMP back end (i.e. Makefile.kokkos\_omp) because some of the overhead to make the code thread-safe is removed.

---

---

**Note:** Use the “-pk kokkos” *command-line switch* to change the default *package kokkos* options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

---

```
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -pk kokkos newton on neigh half comm no -  
↪ in in.lj          # Newton on, Half neighbor list, non-threaded comm
```

If the *newton* command is used in the input script, it can also override the Newton flag defaults.

For half neighbor lists and OpenMP, the KOKKOS package uses data duplication (i.e. thread-private arrays) by default to avoid thread-level write conflicts in the force arrays (and other data structures as necessary). Data duplication is typically fastest for small numbers of threads (i.e. 8 or less) but does increase memory footprint and is not scalable to large numbers of threads. An alternative to data duplication is to use thread-level atomic operations which do not require data duplication. The use of atomic operations can be enforced by compiling LAMMPS with the “-DLMP\_KOKKOS\_USE\_ATOMICS” pre-processor flag. Most but not all Kokkos-enabled pair\_styles support data duplication. Alternatively, full neighbor lists avoid the need for duplication or atomic operations but require more compute operations per atom. When using the Kokkos Serial back end or the OpenMP back end with a single thread, no duplication or atomic operations are used. For CUDA and half neighbor lists, the KOKKOS package always uses atomic operations.

## CPU Cores, Sockets and Thread Affinity

When using multi-threading, it is important for performance to bind both MPI tasks to physical cores, and threads to physical cores, so they do not migrate during a simulation.

If you are not certain MPI tasks are being bound (check the defaults for your MPI installation), binding can be forced with these flags:

```
OpenMPI 1.8: mpirun -np 2 --bind-to socket --map-by socket ./lmp_openmpi ...  
Mvapich2 2.0: mpiexec -np 2 --bind-to socket --map-by socket ./lmp_mvapich ...
```

For binding threads with KOKKOS OpenMP, use thread affinity environment variables to force binding. With OpenMP 3.1 (gcc 4.7 or later, intel 12 or later) setting the environment variable `OMP_PROC_BIND=true` should be sufficient. In general, for best performance with OpenMP 4.0 or later set `OMP_PROC_BIND=spread` and `OMP_PLACES=threads`. For binding threads with the KOKKOS pthreads option, compile LAMMPS with the hwloc or libnuma support enabled as described in the [extra build options page](#).

## Running on Knight’s Landing (KNL) Intel Xeon Phi

Here is a quick overview of how to use the KOKKOS package for the Intel Knight’s Landing (KNL) Xeon Phi:

KNL Intel Phi chips have 68 physical cores. Typically 1 to 4 cores are reserved for the OS, and only 64 or 66 cores are used. Each core has 4 Hyper-Threads, so there are effectively  $N = 256$  ( $4 \times 64$ ) or  $N = 264$  ( $4 \times 66$ ) cores to run on. The product of MPI tasks \* OpenMP threads/task should not exceed this limit, otherwise performance will suffer. Note that with the KOKKOS package you do not need to specify how many KNLs there are per node; each KNL is simply treated as running some number of MPI tasks.

Examples of mpirun commands that follow these rules are shown below.

```
# Running on an Intel KNL node with 68 cores (272 threads/node via 4x hardware
↳threading):
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj      # 1 node, 64 MPI tasks/node,
↳ 4 threads/task
mpirun -np 66 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj      # 1 node, 66 MPI tasks/node,
↳ 4 threads/task
mpirun -np 32 lmp_kokkos_phi -k on t 8 -sf kk -in in.lj      # 1 node, 32 MPI tasks/node,
↳ 8 threads/task
mpirun -np 512 -ppn 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj # 8 nodes, 64 MPI
↳tasks/node, 4 threads/task
```

The `-np` setting of the `mpirun` command sets the number of MPI tasks/node. The “`-k on t Nt`” command-line switch sets the number of threads/task as `Nt`. The product of these two values should be `N`, i.e. 256 or 264.

**Note:** The default for the *package kokkos* command when running on KNL is to use “half” neighbor lists and set the Newton flag to “on” for both pairwise and bonded interactions. This will typically be best for many-body potentials. For simpler pairwise potentials, it may be faster to use a “full” neighbor list with Newton flag to “off”. Use the “`-pk kokkos`” *command-line switch* to change the default *package kokkos* options. See its page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos comm host -in in.reax      #
↳Newton on, half neighbor list, threaded comm
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos newton off neigh full comm no -
↳in in.lj      # Newton off, full neighbor list, non-threaded comm
```

**Note:** MPI tasks and threads should be bound to cores as described above for CPUs.

**Note:** To build with Kokkos support for Intel Xeon Phi co-processors such as Knight’s Corner (KNC), your system must be configured to use them in “native” mode, not “offload” mode like the INTEL package supports.

## Running on GPUs

Use the “-k” *command-line switch* to specify the number of GPUs per node. Typically the -np setting of the mpirun command should set the number of MPI tasks/node to be equal to the number of physical GPUs on the node. You can assign multiple MPI tasks to the same GPU with the KOKKOS package, but this is usually only faster if some portions of the input script have not been ported to use Kokkos. In this case, also packing/unpacking communication buffers on the host may give speedup (see the KOKKOS *package* command). Using CUDA MPS is recommended in this scenario.

Using a GPU-aware MPI library is highly recommended. GPU-aware MPI use can be avoided by using *-pk kokkos gpu/aware off*. As above for multi-core CPUs (and no GPU), if N is the number of physical cores/node, then the number of MPI tasks/node should not exceed N.

```
-k on g Ng
```

Here are examples of how to use the KOKKOS package for GPUs, assuming one or more nodes, each with two GPUs:

```
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj # 1 node, 2
↳MPI tasks/node, 2 GPUs/node
mpirun -np 32 -ppn 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj # 16 nodes, 2
↳MPI tasks/node, 2 GPUs/node (32 GPUs total)
```

---

**Note:** The default for the *package kokkos* command when running on GPUs is to use “full” neighbor lists and set the Newton flag to “off” for both pairwise and bonded interactions, along with threaded communication. When running on Maxwell or Kepler GPUs, this will typically be best. For Pascal GPUs and beyond, using “half” neighbor lists and setting the Newton flag to “on” may be faster. For many pair styles, setting the neighbor binsize equal to twice the CPU default value will give speedup, which is the default when running on GPUs. Use the “-pk kokkos” *command-line switch* to change the default *package kokkos* options. See its page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -pk kokkos newton on neigh half
↳binsize 2.8 -in in.lj # Newton on, half neighbor list, set binsize = neighbor
↳ghost cutoff
```

---

**Note:** When using a GPU, you will achieve the best performance if your input script does not use fix or compute styles which are not yet Kokkos-enabled. This allows data to stay on the GPU for multiple timesteps, without being copied back to the host CPU. Invoking a non-Kokkos fix or compute, or performing I/O for *thermo* or *dump* output will cause data to be copied back to the CPU incurring a performance penalty.

---

**Note:** To get an accurate timing breakdown between time spend in pair, kspace, etc., you must set the environment variable CUDA\_LAUNCH\_BLOCKING=1. However, this will reduce performance and is not recommended for production runs.

---

## Run with the KOKKOS package by editing an input script

Alternatively the effect of the “-sf” or “-pk” switches can be duplicated by adding the *package kokkos* or *suffix kk* commands to your input script.

The discussion above for building LAMMPS with the KOKKOS package, the mpirun/mpiexec command, and setting appropriate thread are the same.

You must still use the “-k on” *command-line switch* to enable the KOKKOS package, and specify its additional arguments for hardware options appropriate to your system, as documented above.

You can use the *suffix kk* command, or you can explicitly add a “kk” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/kk 2.5
```

You only need to use the *package kokkos* command if you wish to change any of its option defaults, as set by the “-k on” *command-line switch*.

### Using OpenMP threading and CUDA together:

With the KOKKOS package, both OpenMP multi-threading and GPUs can be compiled and used together in a few special cases. In the makefile for the conventional build, the KOKKOS\_DEVICES variable must include both, “Cuda” and “OpenMP”, as is the case for /src/MAKE/OPTIONS/Makefile.kokkos\_cuda\_mpi.

```
KOKKOS_DEVICES=Cuda,OpenMP
```

When building with CMake you need to enable both features as it is done in the kokkos-cuda.cmake CMake preset file.

```
cmake ../cmake -DKokkos_ENABLE_CUDA=yes -DKokkos_ENABLE_OPENMP=yes
```

The suffix “/kk” is equivalent to “/kk/device”, and for Kokkos CUDA, using the “-sf kk” in the command line gives the default CUDA version everywhere. However, if the “/kk/host” suffix is added to a specific style in the input script, the Kokkos OpenMP (CPU) version of that specific style will be used instead. Set the number of OpenMP threads as “t Nt” and the number of GPUs as “g Ng”

```
-k on t Nt g Ng
```

For example, the command to run with 1 GPU and 8 OpenMP threads is then:

```
mpiexec -np 1 lmp_kokkos_cuda_openmpi -in in.lj -k on g 1 t 8 -sf kk
```

Conversely, if the “-sf kk/host” is used in the command line and then the “/kk” or “/kk/device” suffix is added to a specific style in your input script, then only that specific style will run on the GPU while everything else will run on the CPU in OpenMP mode. Note that the execution of the CPU and GPU styles will NOT overlap, except for a special case:

A kspace style and/or molecular topology (bonds, angles, etc.) running on the host CPU can overlap with a pair style running on the GPU. First compile with “-default-stream per-thread” added to CCFLAGS in the Kokkos CUDA Makefile. Then explicitly use the “/kk/host” suffix for kspace and bonds, angles, etc. in the input file and the “kk” suffix (equal to “kk/device”) on the command line. Also make sure the environment variable CUDA\_LAUNCH\_BLOCKING is not set to “1” so CPU/GPU overlap can occur.

## Performance to expect

The performance of KOKKOS running in different modes is a function of your hardware, which KOKKOS-enable styles are used, and the problem size.

Generally speaking, the following rules of thumb apply:

- When running on CPUs only, with a single thread per MPI task, performance of a KOKKOS style is somewhere between the standard (un-accelerated) styles (MPI-only mode), and those provided by the OPENMP package. However the difference between all 3 is small (less than 20%).
- When running on CPUs only, with multiple threads per MPI task, performance of a KOKKOS style is a bit slower than the OPENMP package.
- When running large number of atoms per GPU, KOKKOS is typically faster than the GPU package when compiled for double precision. The benefit of using single or mixed precision with the GPU package depends significantly on the hardware in use and the simulated system and pair style.
- When running on Intel hardware, KOKKOS is not as fast as the INTEL package, which is optimized for x86 hardware (not just from Intel) and compilation with the Intel compilers. The INTEL package also can increase the vector length of vector instructions by switching to single or mixed precision mode.

See the [Benchmark page](#) of the LAMMPS website for performance of the KOKKOS package on different hardware.

## Advanced Kokkos options

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. They are explained on the *KOKKOS section of the build extras* doc page,

## Restrictions

Currently, there are no precision options with the KOKKOS package. All compilation and computation is performed in double precision.

## 7.4.4 OPENMP package

The OPENMP package was developed by Axel Kohlmeyer at Temple University. It provides optimized and multi-threaded versions of many pair styles, nearly all bonded styles (bond, angle, dihedral, improper), several Kspace styles, and a few fix styles. It uses the OpenMP interface for multi-threading, but can also be compiled without OpenMP support, providing optimized serial styles in that case.

## Required hardware/software

To enable multi-threading, your compiler must support the OpenMP interface. You should have one or more multi-core CPUs, as multiple threads can only be launched by each MPI task on the local node (using shared memory).

## Building LAMMPS with the OPENMP package

See the *Build extras* page for instructions.

## Run with the OPENMP package from the command line

These examples assume one or more 16-core nodes.

```
env OMP_NUM_THREADS=16 lmp_omp -sf omp -in in.script           # 1 MPI task, 16 threads,
↳according to OMP_NUM_THREADS
lmp_mpi -sf omp -in in.script                                 # 1 MPI task, no threads,
↳optimized kernels
mpirun -np 4 lmp_omp -sf omp -pk omp 4 -in in.script         # 4 MPI tasks, 4 threads/
↳task
mpirun -np 32 -ppn 4 lmp_omp -sf omp -pk omp 4 -in in.script # 8 nodes, 4 MPI tasks/
↳node, 4 threads/task
```

The `mpirun` or `mpiexec` command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the `mpirun` command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npernode`.

You need to choose how many OpenMP threads per MPI task will be used by the OPENMP package. Note that the product of MPI tasks \* threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer.

As in the lines above, use the “`-sf omp`” *command-line switch*, which will automatically append “`omp`” to styles that support it. The “`-sf omp`” switch also issues a default *package omp 0* command, which will set the number of threads per MPI task via the `OMP_NUM_THREADS` environment variable.

You can also use the “`-pk omp Nt`” *command-line switch*, to explicitly set  $N_t = \#$  of OpenMP threads per MPI task to use, as well as additional options. Its syntax is the same as the *package omp* command whose page gives details, including the default values used if it is not specified. It also gives more details on how to set the number of threads via the `OMP_NUM_THREADS` environment variable.

## Or run with the OPENMP package by editing an input script

The discussion above for the `mpirun/mpiexec` command, MPI tasks/node, and threads/MPI task is the same.

Use the *suffix omp* command, or you can explicitly add an “`omp`” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/omp 2.5
```

You must also use the *package omp* command to enable the OPENMP package. When you do this you also specify how many threads per MPI task to use. The command page explains other options and how to set the number of threads via the `OMP_NUM_THREADS` environment variable.

## Speed-up to expect

Depending on which styles are accelerated, you should look for a reduction in the “Pair time”, “Bond time”, “KSpace time”, and “Loop time” values printed at the end of a run.

You may see a small performance advantage (5 to 20%) when running a OPENMP style (in serial or parallel) with a single thread per MPI task, versus running standard LAMMPS with its standard un-accelerated styles (in serial or all-MPI parallelization with 1 task/core). This is because many of the OPENMP styles contain similar optimizations to those used in the OPT package, described in *the OPT package* doc page.

With multiple threads/task, the optimal choice of number of MPI tasks/node and OpenMP threads/task can vary a lot and should always be tested via benchmark runs for a specific simulation running on a specific machine, paying attention to guidelines discussed in the next sub-section.

A description of the multi-threading strategy used in the OPENMP package and some performance examples are [presented here](#).

## Guidelines for best performance

For many problems on current generation CPUs, running the OPENMP package with a single thread/task is faster than running with multiple threads/task. This is because the MPI parallelization in LAMMPS is often more efficient than multi-threading as implemented in the OPENMP package. The parallel efficiency (in a threaded sense) also varies for different OPENMP styles.

Using multiple threads/task can be more effective under the following circumstances:

- Individual compute nodes have a significant number of CPU cores but the CPU itself has limited memory bandwidth, e.g. for Intel Xeon 53xx (Clovertown) and 54xx (Harpertown) quad-core processors. Running one MPI task per CPU core will result in significant performance degradation, so that running with 4 or even only 2 MPI tasks per node is faster. Running in hybrid MPI+OpenMP mode will reduce the inter-node communication bandwidth contention in the same way, but offers an additional speedup by utilizing the otherwise idle CPU cores.
- The interconnect used for MPI communication does not provide sufficient bandwidth for a large number of MPI tasks per node. For example, this applies to running over gigabit ethernet or on Cray XT4 or XT5 series supercomputers. As in the aforementioned case, this effect worsens when using an increasing number of nodes.
- The system has a spatially inhomogeneous particle density which does not map well to the *domain decomposition scheme* or *load-balancing* options that LAMMPS provides. This is because multi-threading achieves parallelism over the number of particles, not via their distribution in space.
- A machine is being used in “capability mode”, i.e. near the point where MPI parallelism is maxed out. For example, this can happen when using the *PPPM solver* for long-range electrostatics on large numbers of nodes. The scaling of the KSpace calculation (see the *kpace\_style* command) becomes the performance-limiting factor. Using multi-threading allows less MPI tasks to be invoked and can speed-up the long-range solver, while increasing overall performance by parallelizing the pairwise and bonded calculations via OpenMP. Likewise additional speedup can be sometimes be achieved by increasing the length of the Coulombic cutoff and thus reducing the work done by the long-range solver. Using the *run\_style verlet/split* command, which is compatible with the OPENMP package, is an alternative way to reduce the number of MPI tasks assigned to the KSpace calculation.

Additional performance tips are as follows:

- The best parallel efficiency from *omp* styles is typically achieved when there is at least one MPI task per physical CPU chip, i.e. socket or die.
- It is usually most efficient to restrict threading to a single socket, i.e. use one or more MPI task per socket.
- NOTE: By default, several current MPI implementations use a processor affinity setting that restricts each MPI task to a single CPU core. Using multi-threading in this mode will force all threads to share the one core and thus is likely to be counterproductive. Instead, binding MPI tasks to a (multi-core) socket, should solve this issue.

## Restrictions

None.

## 7.4.5 OPT package

The OPT package was developed by James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technologies). It contains a handful of pair styles whose compute() methods were rewritten in C++ templated form to reduce the overhead due to if tests and other conditional code.

### Required hardware/software

Any hardware. Any compiler.

### Building LAMMPS with the OPT package

See the *Build extras* page for instructions.

### Run with the OPT package from the command line

```
lmp_mpi -sf opt -in in.script           # run in serial
mpirun -np 4 lmp_mpi -sf opt -in in.script # run in parallel
```

Use the “-sf opt” *command-line switch*, which will automatically append “opt” to styles that support it.

### Or run with the OPT package by editing an input script

Use the *suffix opt* command, or you can explicitly add an “opt” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/opt 2.5
```

### Speed-up to expect

You should see a reduction in the “Pair time” value printed at the end of a run. On most machines for reasonable problem sizes, it will be a 5 to 20% savings.

### Guidelines for best performance

Just try out an OPT pair style to see how it performs.

## Restrictions

None.

Inverting this list, LAMMPS currently has acceleration support for three kinds of hardware, via the listed packages:

Many-core CPUs	<i>INTEL, KOKKOS, OPENMP, OPT</i> packages
GPUs	<i>GPU, KOKKOS</i> packages
Intel Phi/AVX	<i>INTEL, KOKKOS</i> packages

Which package is fastest for your hardware may depend on the size problem you are running and what commands (accelerated and non-accelerated) are invoked by your input script. While these doc pages include performance guidelines, there is no substitute for trying out the different packages appropriate to your hardware.

Any accelerated style has the same name as the corresponding standard style, except that a suffix is appended. Otherwise, the syntax for the command that uses the style is identical, their functionality is the same, and the numerical results it produces should also be the same, except for precision and round-off effects.

For example, all of these styles are accelerated variants of the Lennard-Jones *pair\_style lj/cut*:

- *pair\_style lj/cut/gpu*
- *pair\_style lj/cut/intel*
- *pair\_style lj/cut/kk*
- *pair\_style lj/cut/omp*
- *pair\_style lj/cut/opt*

To see what accelerate styles are currently available for a particular style, find the style name in the *Commands* style pages (*fix,compute,pair,etc*) and see what suffixes are listed (g,i,k,o,t) with it. The doc pages for individual commands (e.g. *pair lj/cut* or *fix nve*) also list any accelerated variants available for that style.

To use an accelerator package in LAMMPS, and one or more of the styles it provides, follow these general steps. Details vary from package to package and are explained in the individual accelerator doc pages, listed above:

build the accelerator library	only for GPU package
install the accelerator package	make yes-opt, make yes-intel, etc
add compile/link flags to Makefile.machine in src/MAKE	only for INTEL, KOKKOS, OPENMP, OPT packages
re-build LAMMPS	make machine
prepare and test a regular LAMMPS simulation	Imp_machine -in in.script; mpirun -np 32 Imp_machine -in in.script
enable specific accelerator support via ‘-k on’ <i>command-line switch</i> ,	only needed for KOKKOS package
set any needed options for the package via “-pk” <i>command-line switch</i> or <i>package</i> command,	only if defaults need to be changed
use accelerated styles in your input via “-sf” <i>command-line switch</i> or <i>suffix</i> command	Imp_machine -in in.script -sf gpu

Note that the first 4 steps can be done as a single command with suitable make command invocations. This is discussed on the *Packages* doc pages, and its use is illustrated in the individual accelerator sections. Typically these steps only need to be done once, to create an executable that uses one or more accelerator packages.

The last 4 steps can all be done from the command-line when LAMMPS is launched, without changing your input script, as illustrated in the individual accelerator sections. Or you can add *package* and *suffix* commands to your input script.

---

**Note:** With a few exceptions, you can build a single LAMMPS executable with all its accelerator packages installed. Note however that the INTEL and KOKKOS packages require you to choose one of their hardware options when building for a specific platform. I.e. CPU or Phi option for the INTEL package. Or the OpenMP, Cuda, or Phi option for the KOKKOS package.

---

These are the exceptions. You cannot build a single executable with:

- both the INTEL Phi and KOKKOS Phi options
- the INTEL Phi or Kokkos Phi option, and the GPU package

See the examples/accelerate/README and make.list files for sample Make.py commands that build LAMMPS with any or all of the accelerator packages. As an example, here is a command that builds with all the GPU related packages installed (GPU, KOKKOS with Cuda), including settings to build the needed auxiliary GPU libraries for Kepler GPUs:

```
Make.py -j 16 -p omp gpu kokkos -cc nvcc wrap=mpi -gpu mode=double arch=35 -kokkos_
↳ cuda arch=35 lib=all file mpi
```

The examples/accelerate directory also has input scripts that can be used with all of the accelerator packages. See its README file for details.

Likewise, the bench directory has FERMI and KEPLER and PHI sub-directories with Make.py commands and input scripts for using all the accelerator packages on various machines. See the README files in those directories.

As mentioned above, the [Benchmark page](#) of the LAMMPS website gives performance results for the various accelerator packages for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

Here is a brief summary of what the various packages provide. Details are in the individual accelerator sections.

- Styles with a “gpu” suffix are part of the GPU package and can be run on Intel, NVIDIA, or AMD GPUs. The speed-up on a GPU depends on a variety of factors, discussed in the accelerator sections.
- Styles with an “intel” suffix are part of the INTEL package. These styles support vectorized single and mixed precision calculations, in addition to full double precision. In extreme cases, this can provide speedups over 3.5x on CPUs. The package also supports acceleration in “offload” mode to Intel(R) Xeon Phi(TM) co-processors. This can result in additional speedup over 2x depending on the hardware configuration.
- Styles with a “kk” suffix are part of the KOKKOS package, and can be run using OpenMP on multicore CPUs, on an NVIDIA or AMD GPU, or on an Intel Xeon Phi in “native” mode. The speed-up depends on a variety of factors, as discussed on the KOKKOS accelerator page.
- Styles with an “omp” suffix are part of the OPENMP package and allow a pair-style to be run in multi-threaded mode using OpenMP. This can be useful on nodes with high-core counts when using less MPI processes than cores is advantageous, e.g. when running with PPPM so that FFTs are run on fewer MPI processors or when the many MPI tasks would overload the available bandwidth for communication.
- Styles with an “opt” suffix are part of the OPT package and typically speed-up the pairwise calculations of your simulation by 5-25% on a CPU.

The individual accelerator package doc pages explain:

- what hardware and software the accelerated package requires
- how to build LAMMPS with the accelerated package
- how to run with the accelerated package either via command-line switches or modifying the input script
- speed-ups to expect
- guidelines for best performance

- restrictions

## 7.5 Comparison of various accelerator packages

The next section compares and contrasts the various accelerator options, since there are multiple ways to perform OpenMP threading, run on GPUs, optimize for vector units on CPUs and run on Intel Xeon Phi (co-)processors.

All of these packages can accelerate a LAMMPS calculation taking advantage of hardware features, but they do it in different ways and acceleration is not always guaranteed.

As a consequence, for a particular simulation on specific hardware, one package may be faster than the other. We give some guidelines below, but the best way to determine which package is faster for your input script is to try multiple of them on your machine and experiment with available performance tuning settings. See the benchmarking section below for examples where this has been done.

### Guidelines for using each package optimally:

- Both, the GPU and the KOKKOS package allows you to assign multiple MPI ranks (= CPU cores) to the same GPU. For the GPU package, this can lead to a speedup through better utilization of the GPU (by overlapping computation and data transfer) and more efficient computation of the non-GPU accelerated parts of LAMMPS through MPI parallelization, as all system data is maintained and updated on the host. For KOKKOS, there is less to no benefit from this, due to its different memory management model, which tries to retain data on the GPU.
- The GPU package moves per-atom data (coordinates, forces, and (optionally) neighbor list data, if not computed on the GPU) between the CPU and GPU at every timestep. The KOKKOS/CUDA package only does this on timesteps when a CPU calculation is required (e.g. to invoke a fix or compute that is non-GPU-ized). Hence, if you can formulate your input script to only use GPU-ized fixes and computes, and avoid doing I/O too often (thermo output, dump file snapshots, restart files), then the data transfer cost of the KOKKOS/CUDA package can be very low, causing it to run faster than the GPU package.
- The GPU package is often faster than the KOKKOS/CUDA package, when the number of atoms per GPU is on the smaller side. The crossover point, in terms of atoms/GPU at which the KOKKOS/CUDA package becomes faster depends strongly on the pair style. For example, for a simple Lennard Jones system the crossover (in single precision) is often about 50K-100K atoms per GPU. When performing double precision calculations the crossover point can be significantly smaller.
- Both KOKKOS and GPU package compute bonded interactions (bonds, angles, etc) on the CPU. If the GPU package is running with several MPI processes assigned to one GPU, the cost of computing the bonded interactions is spread across more CPUs and hence the GPU package can run faster in these cases.
- When using LAMMPS with multiple MPI ranks assigned to the same GPU, its performance depends to some extent on the available bandwidth between the CPUs and the GPU. This can differ significantly based on the available bus technology, capability of the host CPU and mainboard, the wiring of the buses and whether switches are used to increase the number of available bus slots, or if GPUs are housed in an external enclosure. This can become quite complex.
- To achieve significant acceleration through GPUs, both KOKKOS and GPU package require capable GPUs with fast on-device memory and efficient data transfer rates. This requests capable upper mid-level to high-end (desktop) GPUs. Using lower performance GPUs (e.g. on laptops) may result in a slowdown instead.
- For the GPU package, specifically when running in parallel with MPI, it is often more efficient to exclude the PPPM kspace style from GPU acceleration and instead run it - concurrently with a GPU accelerated pair style - on the CPU. This can often be easily achieved with placing a *suffix off* command before and a *suffix on* command after the *kspace\_style pppm* command.
- The KOKKOS/OpenMP and OPENMP package have different thread management strategies, which should result in OPENMP being more efficient for a small number of threads with increasing overhead as the number of threads

per MPI rank grows. The KOKKOS/OpenMP kernels have less overhead in that case, but have lower performance with few threads.

- The INTEL package contains many options and settings for achieving additional performance on Intel hardware (CPU and accelerator cards), but to unlock this potential, an Intel compiler is required. The package code will compile with GNU gcc, but it will not be as efficient.

**Differences between the GPU and KOKKOS packages:**

- The GPU package accelerates only pair force, neighbor list, and (parts of) PPPM calculations. The KOKKOS package attempts to run most of the calculation on the GPU, but can transparently support non-accelerated code (with a performance penalty due to having data transfers between host and GPU).
- The GPU package requires neighbor lists to be built on the CPU when using exclusion lists, or a triclinic simulation box.
- The GPU package can be compiled for CUDA or OpenCL and thus supports both, NVIDIA and AMD GPUs well. On NVIDIA hardware, using CUDA is typically resulting in equal or better performance over OpenCL.
- OpenCL in the GPU package does theoretically also support Intel CPUs or Intel Xeon Phi, but the native support for those in KOKKOS (or INTEL) is superior.

## HOWTO DISCUSSIONS

These doc pages describe how to perform various tasks with LAMMPS, both for users and developers. The [glossary](#) website page also lists MD terminology with links to corresponding LAMMPS manual pages. The example input scripts included in the examples directory of the LAMMPS distribution and highlighted on the [Examples](#) doc page also show how to setup and run various kinds of simulations.

### 8.1 General howto

#### 8.1.1 Restart a simulation

There are 3 ways to continue a long LAMMPS simulation. Multiple `run` commands can be used in the same input script. Each run will continue from where the previous run left off. Or binary restart files can be saved to disk using the `restart` command. At a later time, these binary files can be read via a `read_restart` command in a new script. Or they can be converted to text data files using the `-r` *command-line switch* and read by a `read_data` command in a new script.

Here we give examples of 2 scripts that read either a binary restart file or a converted data file and then issue a new run command to continue where the previous run left off. They illustrate what settings must be made in the new script. Details are discussed in the documentation for the `read_restart` and `read_data` commands.

Look at the `in.chain` input script provided in the `bench` directory of the LAMMPS distribution to see the original script that these 2 scripts are based on. If that script had the line

```
restart          50 tmp.restart
```

added to it, it would produce 2 binary restart files (`tmp.restart.50` and `tmp.restart.100`) as it ran.

This script could be used to read the first restart file and re-run the last 50 timesteps:

```
read_restart     tmp.restart.50

neighbor        0.4 bin
neigh_modify    every 1 delay 1

fix             1 all nve
fix             2 all langevin 1.0 1.0 10.0 904297

timestep        0.012

run             50
```

Note that the following commands do not need to be repeated because their settings are included in the restart file: *units*, *atom\_style*, *special\_bonds*, *pair\_style*, *bond\_style*. However these commands do need to be used, since their settings are not in the restart file: *neighbor*, *fix*, *timestep*.

If you actually use this script to perform a restarted run, you will notice that the thermodynamic data match at step 50 (if you also put a “thermo 50” command in the original script), but do not match at step 100. This is because the *fix langevin* command uses random numbers in a way that does not allow for perfect restarts.

As an alternate approach, the restart file could be converted to a data file as follows:

```
lmp_g++ -r tmp.restart.50 tmp.restart.data
```

Then, this script could be used to re-run the last 50 steps:

```
units          lj
atom_style     bond
pair_style     lj/cut 1.12
pair_modify    shift yes
bond_style     fene
special_bonds  0.0 1.0 1.0

read_data      tmp.restart.data

neighbor       0.4 bin
neigh_modify   every 1 delay 1

fix           1 all nve
fix           2 all langevin 1.0 1.0 10.0 904297

timestep       0.012

reset_timestep 50
run           50
```

Note that nearly all the settings specified in the original *in.chain* script must be repeated, except the *pair\_coeff* and *bond\_coeff* commands since the new data file lists the force field coefficients. Also, the *reset\_timestep* command is used to tell LAMMPS the current timestep. This value is stored in restart files, but not in data files.

## 8.1.2 Visualize LAMMPS snapshots

LAMMPS itself does not do visualization, but snapshots from LAMMPS simulations can be visualized (and analyzed) in a variety of ways.

Mention *dump image* and *dump movie*.

LAMMPS snapshots are created by the *dump* command which can create files in several formats. The native LAMMPS dump format is a text file (see “*dump atom*” or “*dump custom*”) which can be visualized by several popular visualization tools. The *dump image* and *dump movie* styles can output internally rendered images and convert a sequence of them to a movie during the MD run. Several programs included with LAMMPS as auxiliary tools can convert between LAMMPS format files and other formats. See the *Tools* page for details.

A Python-based toolkit distributed by our group can read native LAMMPS dump files, including custom dump files with additional columns of user-specified atom information, and convert them to various formats or pipe them into visualization software directly. See the [Pizza.py WWW site](#) for details. Specifically, *Pizza.py* can convert LAMMPS dump files into PDB, XYZ, *EnSight*, and VTK formats. *Pizza.py* can pipe LAMMPS dump files directly into the

Raster3d and RasMol visualization programs. Pizza.py has tools that do interactive 3d OpenGL visualization and one that creates SVG images of dump file snapshots.

### 8.1.3 Run multiple simulations from one input script

This can be done in several ways. See the documentation for individual commands for more details on how these examples work.

If “multiple simulations” means continue a previous simulation for more timesteps, then you simply use the `run` command multiple times. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
run 10000
run 10000
run 10000
run 10000
```

would run 5 successive simulations of the same system for a total of 50,000 timesteps.

If you wish to run totally different simulations, one after the other, the `clear` command can be used in between them to re-initialize LAMMPS. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
clear
units lj
atom_style atomic
read_data data.lj.new
run 10000
```

would run 2 independent simulations, one after the other.

For large numbers of independent simulations, you can use `variables` and the `next` and `jump` commands to loop over the same input script multiple times with different settings. For example, this script, named `in.polymer`

```
variable d index run1 run2 run3 run4 run5 run6 run7 run8
shell cd $d
read_data data.polymer
run 10000
shell cd ..
clear
next d
jump in.polymer
```

would run 8 simulations in different directories, using a `data.polymer` file in each directory. The same concept could be used to run the same system at 8 different temperatures, using a temperature variable and storing the output in different log and dump files, for example

```
variable a loop 8
variable t index 0.8 0.85 0.9 0.95 1.0 1.05 1.1 1.15
```

(continues on next page)

(continued from previous page)

```
log log.$a
read data.polymer
velocity all create $t 352839
fix 1 all nvt $t $t 100.0
dump 1 all atom 1000 dump.$a
run 100000
clear
next t
next a
jump in.polymer
```

All of the above examples work whether you are running on 1 or multiple processors, but assumed you are running LAMMPS on a single partition of processors. LAMMPS can be run on multiple partitions via the *-partition command-line switch*.

In the last 2 examples, if LAMMPS were run on 3 partitions, the same scripts could be used if the “index” and “loop” variables were replaced with *universe*-style variables, as described in the *variable* command. Also, the “next t” and “next a” commands would need to be replaced with a single “next a t” command. With these modifications, the 8 simulations of each script would run on the 3 partitions one after the other until all were finished. Initially, 3 simulations would be started simultaneously, one on each partition. When one finished, that partition would then start the fourth simulation, and so forth, until all 8 were completed.

## 8.1.4 Multi-replica simulations

Several commands in LAMMPS run multi-replica simulations, meaning that multiple instances (replicas) of your simulation are run simultaneously, with small amounts of data exchanged between replicas periodically.

These are the relevant commands:

- *hyper* for bond boost hyperdynamics (HD)
- *neb* for nudged elastic band calculations (NEB)
- *neb\_spin* for magnetic nudged elastic band calculations
- *prd* for parallel replica dynamics (PRD)
- *tad* for temperature accelerated dynamics (TAD)
- *temper* for parallel tempering with fixed volume
- *temper/npt* for parallel tempering extended for NPT
- *temper/grem* for parallel tempering with generalized replica exchange (gREM)
- *fix pimd* for path-integral molecular dynamics (PIMD)

NEB is a method for finding transition states and barrier potential energies. HD, PRD, and TAD are methods for performing accelerated dynamics to find and perform infrequent events. Parallel tempering or replica exchange runs different replicas at a series of temperature to facilitate rare-event sampling. PIMD runs different replicas whose individual particles in different replicas are coupled together by springs to model a system of ring-polymers which can represent the quantum nature of atom cores.

These commands can only be used if LAMMPS was built with the REPLICA package. See the *Build package* page for more info.

In all these cases, you must run with one or more processors per replica. The processors assigned to each replica are determined at run-time by using the *-partition command-line switch* to launch LAMMPS on multiple partitions, which in this context are the same as replicas. E.g. these commands:

```
mpirun -np 16 lmp_linux -partition 8x2 -in in.temper
mpirun -np 8 lmp_linux -partition 8x1 -in in.neb
```

would each run 8 replicas, on either 16 or 8 processors. Note the use of the *-in command-line switch* to specify the input script which is required when running in multi-replica mode.

Also note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors. Thus the above commands could be run on a single-processor (or few-processor) desktop so that you can run a multi-replica simulation on more replicas than you have physical processors. This is useful for testing and debugging, since with most modern processors and MPI libraries the efficiency of a calculation can severely diminish when oversubscribing processors.

## 8.1.5 Library interface to LAMMPS

As described on the *Build basics* doc page, LAMMPS can be built as a static or shared library, so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python interface*.

At the core of LAMMPS is the LAMMPS class which encapsulates the state of the simulation program through the state of the various class instances that it is composed of. So a calculation using LAMMPS requires to create an instance of the LAMMPS class and then send it (text) commands, either individually or from a file, or perform other operations that modify the state stored inside that instance or drive simulations. This is essentially what the `src/main.cpp` file does as well for the standalone LAMMPS executable with reading commands either from an input file or stdin.

Creating a LAMMPS instance can be done by using C++ code directly or through a C-style interface library to LAMMPS that is provided in the files `src/library.cpp` and `library.h`. This *C language API*, can be used from C and C++, and is also the basis for the *Python* and *Fortran* interfaces or wrappers included in the LAMMPS source code.

The `examples/COUPLE` and `python/examples` directories contain some example programs written in C++, C, Fortran, and Python, which show how a driver code can link to LAMMPS as a library, run LAMMPS on a subset of processors (so the others are available to run some other code concurrently), grab data from LAMMPS, change it, and send it back into LAMMPS.

A detailed documentation of the available APIs and examples of how to use them can be found in the *Programmer Guide* section of this manual.

## 8.1.6 Coupling LAMMPS to other codes

LAMMPS is designed to allow it to be coupled to other codes. For example, a quantum mechanics code might compute forces on a subset of atoms and pass those forces to LAMMPS. Or a continuum finite element (FE) simulation might use atom positions as boundary conditions on FE nodal points, compute a FE solution, and return interpolated forces on MD atoms.

LAMMPS can be coupled to other codes in at least 4 ways. Each has advantages and disadvantages, which you will have to think about in the context of your application.

1. Define a new *fix* command that calls the other code. In this scenario, LAMMPS is the driver code. During timestepping, the *fix* is invoked, and can make library calls to the other code, which has been linked to LAMMPS as a library. This is the way the *LATTE* package, which performs density-functional tight-binding calculations using the *LATTE software* to compute forces, is hooked to LAMMPS. See the *fix latte* command for more details. Also see the *Modify* doc pages for info on how to add a new *fix* to LAMMPS.
2. Define a new LAMMPS command that calls the other code. This is conceptually similar to method (1), but in this case LAMMPS and the other code are on a more equal footing. Note that now the other code is not called during the timestepping of a LAMMPS run, but between runs. The LAMMPS input script can be used to alternate LAMMPS runs with calls to the other code, invoked via the new command. The *run* command facilitates this

with its *every* option, which makes it easy to run a few steps, invoke the command, run a few steps, invoke the command, etc.

In this scenario, the other code can be called as a library, as in 1., or it could be a stand-alone code, invoked by a `system()` call made by the command (assuming your parallel machine allows one or more processors to start up another program). In the latter case the stand-alone code could communicate with LAMMPS through files that the command writes and reads.

See the [Modify command](#) page for info on how to add a new command to LAMMPS.

3. Use LAMMPS as a library called by another code. In this case the other code is the driver and calls LAMMPS as needed. Or a wrapper code could link and call both LAMMPS and another code as libraries. Again, the *run* command has options that allow it to be invoked with minimal overhead (no setup or clean-up) if you wish to do multiple short runs, driven by another program. Details about using the library interface are given in the [library API](#) documentation.
4. Couple LAMMPS with another code in a client/server fashion, using using the [MDI Library](#) developed by the [Molecular Sciences Software Institute \(MolSSI\)](#) to run LAMMPS as either an MDI driver (client) or an MDI engine (server). The MDI driver issues commands to the MDI server to exchange data between them. See the [Howto mdi](#) page for more information about how LAMMPS can operate in either of these modes.

### 8.1.7 Using LAMMPS with the MDI library for code coupling

Client/server coupling of two (or more) codes is where one code is the “client” and sends request messages (data) to one (or more) “server” code(s). A server responds to each request with a reply message (data). This enables two (or more) codes to work in tandem to perform a simulation. In this context, LAMMPS can act as either a client or server code. It does this by using the [MolSSI Driver Interface \(MDI\) library](#), developed by the [Molecular Sciences Software Institute \(MolSSI\)](#), which is supported by the [MDI](#) package.

Alternate methods for code coupling with LAMMPS are described on the [Howto couple](#) doc page.

Some advantages of client/server coupling are that the codes can run as stand-alone executables; they need not be linked together. Thus neither code needs to have a library interface. This also makes it easy to run the two codes on different numbers of processors. If a message protocol (format and content) is defined for a particular kind of simulation, then in principle any code which implements the client-side protocol can be used in tandem with any code which implements the server-side protocol. Neither code needs to know what specific other code it is working with.

In MDI nomenclature, a client code is the “driver”, and a server code is an “engine”. One driver code can communicate with one or more instances of one or more engine codes. Driver and engine codes can be written in any language: C, C++, Fortran, Python, etc.

In addition to allowing driver and engine(s) to run as stand-alone executables, MDI also enables an engine to be a *plugin* to the client code. In this scenario, server code(s) are compiled as shared libraries, and one (or more) instances of the server are instantiated by the driver code. If the driver code runs in parallel, it can split its MPI communicator into multiple sub-communicators, and launch each plugin engine instance on a sub-communicator. Driver processors within that sub-communicator exchange messages with the corresponding engine instance, and can also send MPI messages to other processors in the driver. The driver code can also destroy engine instances and re-instantiate them. LAMMPS can operate as either a stand-alone or plugin MDI engine. When it operates as a driver, it can use either stand-alone or plugin MDI engines.

The way in which an MDI driver communicates with an MDI engine is by making `MDI_Send()` and `MDI_Recv()` calls, which are conceptually similar to `MPI_Send()` and `MPI_Recv()` calls. Each send or receive operation uses a string to identify the command name, and optionally some data, which can be a single value or vector of values of any data type. Inside the MDI library, data is exchanged between the driver and engine via MPI calls or sockets. This a run-time choice by the user.

The *MDI* package provides a *mdi engine* command which enables LAMMPS to operate as an MDI engine. Its doc page explains the variety of standard and custom MDI commands which the LAMMPS engine recognizes and can respond to.

The package also provides a *mdi plugin* command which enables LAMMPS to operate as an MDI driver and load an MDI engine as a plugin library.

The package also has a *fix mdi/qm* `<fix_mdi_qm>` command in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine. The `post_force()` method of the `fix_mdi_qm.cpp` file shows how a driver issues MDI commands to another code. This command can be used to couple to an MDI engine which is either a stand-alone code or a plugin library.

As explained on the *fix mdi/qm* `<fix_mdi_qm>` command doc page, it can be used to perform *ab initio* MD simulations or energy minimizations, or to evaluate the quantum energy and forces for a series of independent systems. The `examples/mdi` directory has example input scripts for all of these use cases.

The `examples/mdi` directory contains Python scripts and LAMMPS input script which use LAMMPS as either an MDI driver or engine or both. Currently, 5 example use cases are provided:

- Run *ab initio* MD (AIMD) using 2 instances of LAMMPS. As a driver LAMMPS performs the timestepping in either NVE or NPT mode. As an engine, LAMMPS computes forces and is a surrogate for a quantum code.
- As a driver, LAMMPS runs an MD simulation. Every N steps it passes the current snapshot to an MDI engine to evaluate the energy, virial, and peratom forces. As the engine LAMMPS is a surrogate for a quantum code.
- As a driver, LAMMPS loops over a series of data files and passes the configuration to an MDI engine to evaluate the energy, virial, and peratom forces. As the engine LAMMPS is a surrogate for a quantum code.
- A Python script driver invokes a sequence of unrelated LAMMPS calculations. Calculations can be single-point energy/force evaluations, MD runs, or energy minimizations.
- Run AIMD with a Python driver code and 2 LAMMPS instances as engines. The first LAMMPS instance performs MD timestepping. The second LAMMPS instance acts as a surrogate QM code to compute forces.

Note that in any of these example where LAMMPS is used as an engine, an actual QM code (which supports MDI) could be used in its place, without modifying the input scripts or launch commands, except to specify the name of the QM code.

The `examples/mdi/Run.sh` file illustrates how to launch both driver and engine codes so that they communicate using the MDI library via either MPI or sockets. Or using the engine as a stand-alone code or plugin library.

Currently there are at least two quantum DFT codes which have direct MDI support, [Quantum ESPRESSO \(QE\)](#) and [INQ](#). There are also several QM codes which have indirect support through QCEngine or i-PI. The former means they require a wrapper program (QCEngine) with MDI support which writes/read files to pass data to the quantum code itself. The list of QCEngine-supported and i-PI-supported quantum codes is on the [MDI webpage](#).

Here is how to build QE as a stand-alone `pw.x` file which can be used in stand-alone mode:

```
% git clone --branch mdi_plugin https://github.com/MolSSI-MDI/q-e.git <base_path>/q-e
% build the executable pw.x, following the `QE build guide <https://gitlab.com/QEF/q-e/-/
wikis/Developers/CMake-build-system>` _
```

Here is how to build QE as a shared library which can be used in plugin mode, which results in a `libqemdi.so` file in `<base_path>/q-e/MDI/src`:

```
% git clone --branch mdi_plugin https://github.com/MolSSI-MDI/q-e.git <base_path>/q-e
% cd <base_path>/q-e
% ./configure --enable-parallel --enable-openmp --enable-shared FFLAGS="-fPIC" FCFLAGS="-
↳fPIC" CFLAGS="-fPIC" foxflags="-fPIC" try_foxflags="-fPIC"
% make -j 4 mdi
```

INQ cannot be built as a stand-alone code; it is by design a library. Here is how to build INQ as a shared library which can be used in plugin mode, which results in a `libinqmdi.so` file in `<base_path>/inq/build/examples`:

```
% git clone --branch mdi --recurse-submodules https://gitlab.com/taylor-a-barnes/inq.git
↳<base_path>/inq
% cd <base_path>/inq
% mkdir -p build
% cd build
% ../configure --prefix=<install_path>/install
% make -j 4
% make install
```

### 8.1.8 Bonded particle models

The BPM package implements bonded particle models which can be used to simulate mesoscale solids. Solids are constructed as a collection of particles which each represent a coarse-grained region of space much larger than the atomistic scale. Particles within a solid region are then connected by a network of bonds to provide solid elasticity.

Unlike traditional bonds in molecular dynamics, the equilibrium bond length can vary between bonds. Bonds store the reference state. This includes setting the equilibrium length equal to the initial distance between the two particles but can also include data on the bond orientation for rotational models. This produces a stress free initial state. Furthermore, bonds are allowed to break under large strains producing fracture. The `examples/bpm` directory has sample input scripts for simulations of the fragmentation of an impacted plate and the pouring of extended, elastic bodies.

---

Bonds can be created using a *read data* or *create bonds* command. Alternatively, a *molecule* template with bonds can be used with *fix deposit* or *fix pour* to create solid grains.

In this implementation, bonds store their reference state when they are first computed in the setup of the first simulation run. Data is then preserved across run commands and is written to *binary restart files* such that restarting the system will not reset the reference state of a bond. Bonds that are created midway into a run, such as those created by pouring grains using *fix pour*, are initialized on that timestep.

As bonds can be broken between neighbor list builds, the *special\_bonds* command works differently for BPM bond styles. There are two possible settings which determine how pair interactions work between bonded particles. First, one can turn off all pair interactions between bonded particles. Unlike *bond quartic*, this is not done by subtracting pair forces during the bond computation but rather by dynamically updating the special bond list. This is the default behavior of BPM bond styles and is done by updating the 1-2 special bond list as bonds break. To do this, LAMMPS requires *newton* bond off such that all processors containing an atom know when a bond breaks. Additionally, one must do either (A) or (B).

A) Use the following special bond settings

```
special_bonds lj 0 1 1 coul 1 1 1
```

These settings accomplish two goals. First, they turn off 1-3 and 1-4 special bond lists, which are not currently supported for BPMs. As BPMs often have dense bond networks, generating 1-3 and 1-4 special bond lists is expensive. By setting the `lj` weight for 1-2 bonds to zero, this turns off pairwise interactions. Even though there

are no charges in BPM models, setting a nonzero coul weight for 1-2 bonds ensures all bonded neighbors are still included in the neighbor list in case bonds break between neighbor list builds.

- B) Alternatively, one can simply overlay pair interactions such that all bonded particles also feel pair interactions. This can be accomplished by using the *overlay/pair* keyword present in all bpm bond styles and by using the following special bond settings

```
special_bonds lj/coul 1 1 1
```

See the *Howto* page on broken bonds for more information.

Currently there are two types of bonds included in the BPM package. The first bond style, *bond bpm/spring*, only applies pairwise, central body forces. Point particles must have *bond atom style* and may be thought of as nodes in a spring network. Alternatively, the second bond style, *bond bpm/rotational*, resolves tangential forces and torques arising with the shearing, bending, and twisting of the bond due to rotation or displacement of particles. Particles are similar to those used in the *granular package*, *atom style sphere*. However, they must also track the current orientation of particles and store bonds and therefore use a *bpm/sphere atom style*. This also requires a unique integrator *fix nve/bpm/sphere* which numerically integrates orientation similar to *fix nve/asphere*.

To monitor the fracture of bonds in the system, all BPM bond styles have the ability to record instances of bond breakage to output using the *dump local* command. Additionally, one can use *compute nbond/atom* to tally the current number of bonds per atom.

In addition to bond styles, a new pair style *pair bpm/spring* was added to accompany the bpm/spring bond style. This pair style is simply a hookean repulsion with similar velocity damping as its sister bond style.

While LAMMPS has many utilities to create and delete bonds, *only* the following are currently compatible with BPM bond styles:

- *create\_bonds*
- *delete\_bonds*
- *fix bond/create*
- *fix bond/break*
- *fix bond/swap*

Note *create\_bonds* requires certain special\_bonds settings. To subtract pair interactions, one will need to switch between different special\_bonds settings in the input script. An example is found in examples/bpm/impact.

### 8.1.9 Broken Bonds

Typically, bond interactions persist for the duration of a simulation in LAMMPS. However, there are some exceptions that allow for bonds to break including the *quartic bond style* and the bond styles in the *BPM package* which contains the *bpm/spring* and *bpm/rotational* bond styles. In these cases, a bond can be broken if it is stretched beyond a user-defined threshold. LAMMPS accomplishes this by setting the bond type to zero such that the bond force is no longer computed.

Users are normally able to weight the contribution of pair forces to atoms that are bonded using the *special\_bonds command*. When bonds break, this is not always the case. For the quartic bond style, pair forces are always turned off between bonded particles. LAMMPS does this via a computational sleight-of-hand. It subtracts the pairwise interaction as part of the bond computation. When the bond breaks, the subtraction stops. For this to work, the pairwise interaction must always be computed by the *pair\_style* command, whether the bond is broken or not. This means that *special\_bonds*

must be set to 1,1,1. After the bond breaks, the pairwise interaction between the two atoms is turned on, since they are no longer bonded.

In the BPM package, one can either turn off all pair interactions between bonded particles or leave them on, overlaying pair forces on top of bond forces. To remove pair forces, the special bond list is dynamically updated. More details can be found on the [Howto BPM](#) page.

Bonds can also be broken by fixes which change bond topology, including [fix bond/break](#) and [fix bond/react](#). These fixes will automatically trigger a rebuild of the neighbor list and update special bond data structures when bonds are broken.

Note that when bonds are dumped to a file via the [dump local](#) command, bonds with type 0 are not included. The [delete\\_bonds](#) command can also be used to query the status of broken bonds or permanently delete them, e.g.:

```
delete_bonds all stats
delete_bonds all bond 0 remove
```

The compute [nbond/atom](#) can also be used to tally the current number of bonds per atom, excluding broken bonds.

## 8.2 Settings howto

### 8.2.1 2d simulations

Use the [dimension](#) command to specify a 2d simulation.

Make the simulation box periodic in z via the [boundary](#) command. This is the default.

If using the [create\\_box](#) command to define a simulation box, set the z dimensions narrow, but finite, so that the [create\\_atoms](#) command will fill the 3d simulation box with a single z plane of atoms - e.g.

```
create_box 1 -10 10 -10 10 -0.25 0.25
```

If using the [read data](#) command to read in a file of atom coordinates, set the “zlo zhi” values to be finite but narrow, similar to the [create\\_box](#) command settings just described. For each atom in the file, assign a z coordinate so it falls inside the z-boundaries of the box - e.g. 0.0.

Use the [fix enforce2d](#) command as the last defined fix to insure that the z-components of velocities and forces are zeroed out every timestep. The reason to make it the last fix is so that any forces induced by other fixes will be zeroed out.

Many of the example input scripts included in the LAMMPS distribution are for 2d models.

---

**Note:** Some models in LAMMPS treat particles as finite-size spheres, as opposed to point particles. See the [atom\\_style sphere](#) and [fix nve/sphere](#) commands for details. By default, for 2d simulations, such particles will still be modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be that of a sphere. If you wish to model them as 2d discs, see the [set density/disc](#) command and the [disc](#) option for the [fix nve/sphere](#), [fix nvt/sphere](#), [fix nph/sphere](#), [fix npt/sphere](#) commands.

---

## 8.2.2 Type labels

New in version 15Sep2022.

Each atom in LAMMPS has an associated numeric atom type. Similarly, each bond, angle, dihedral, and improper is assigned a bond type, angle type, and so on. The primary use of these types is to map potential (force field) parameters to the interactions of the atom, bond, angle, dihedral, and improper.

By default, type values are entered as integers from 1 to Ntypes wherever they appear in LAMMPS input or output files. The total number Ntypes for each interaction is “locked in” when the simulation box is created.

A recent addition to LAMMPS is the option to use strings - referred to as type labels - as an alternative. Using type labels instead of numeric types can be advantageous in various scenarios. For example, type labels can make inputs more readable and generic (i.e. usable through the *include command* for different systems with different numerical values assigned to types. This generality also applies to other inputs like data files read by *read\_data* or molecule template files read by the *molecule* command. See below for a list of other commands that can use type labels in different ways.

LAMMPS will *internally* continue to use numeric types, which means that many previous restrictions still apply. For example, the total number of types is locked in when creating the simulation box, and potential parameters for each type must be provided even if not used by any interactions.

A collection of type labels for all type-kinds (atom types, bond types, etc.) is stored as a “label map” which is simply a list of numeric types and their associated type labels. Within a type-kind, each type label must be unique. It can be assigned to only one numeric type. To read and write type labels to data files for a given type-kind, *all* associated numeric types need have a type label assigned. Partial maps can be saved with the *labelmap write* command and read back with the *include* command.

Valid type labels can contain most ASCII characters, but cannot start with a number, a ‘#’, or a ‘\*’. Also, labels must not contain whitespace characters. When using the *labelmap command* in the LAMMPS input, if certain characters appear in the type label, such as the single (‘) or double (‘’) quote or the ‘#’ character, the label must be put in either double, single, or triple (‘‘‘’) quotes. Triple quotes allow for the most generic type label strings, but they require to have a leading and trailing blank space. When defining type labels the blanks will be ignored. Example:

```
labelmap angle 1 "" " C1'-C2"-C3# ""
```

This command will map the string `C1'-C2"-C3#` to the angle type 1.

There are two ways to define label maps. One is via the *labelmap* command. The other is via the *read\_data* command. A data file can have sections such as *Atom Type Labels*, *Bond Type Labels*, etc., which assign type labels to numeric types. The label map can be written out to data files by the *write\_data* command. This map is also written to and read from restart files, by the *write\_restart* and *read\_restart* commands.

### Use of type labels in LAMMPS input or output

Many LAMMPS input script commands that take a numeric type as an argument can use the associated type label instead. If a type label is not defined for a particular numeric type, only its numeric type can be used.

This example assigns labels to the atom types, and then uses the type labels to redefine the pair coefficients.

```
pair_coeff 1 2 1.0 1.0          # numeric types
labelmap atom 1 C 2 H
pair_coeff C H 1.0 1.0        # type labels
```

Adding support for type labels to various commands is an ongoing project. If an input script command (or a section in a file read by a command) allows substituting a type label for a numeric type argument, it will be explicitly mentioned in that command's documentation page.

As a temporary measure, input script commands can take advantage of variables and how they can be expanded during processing of the input. The variables can use functions that will translate type label strings to their respective number as defined in the current label map. See the *variable* command for details.

For example, here is how the `pair_coeff` command could be used with type labels if it did not yet support them, either with an explicit variable command or an implicit variable used in the `pair_coeff` command.

```
labelmap atom 1 C 2 H
variable atom1 equal label2type(atom,C)
variable atom2 equal label2type(atom,H)
pair_coeff ${atom1} ${atom2} 1.0 1.0
```

```
labelmap atom 1 C 2 H
pair_coeff $(label2type(atom,C)) $(label2type(atom,H)) 80.0 1.2
```

---

### Commands that can use label types

Any workflow that involves reading multiple data files, molecule templates or a combination of the two can be streamlined by using type labels instead of numeric types, because types are automatically synced between the files. The creation of simulation-ready reaction templates for *fix bond/react* is much simpler when using type labels, and results in templates that can be used without modification in multiple simulations or different systems.

### 8.2.3 Triclinic (non-orthogonal) simulation boxes

By default, LAMMPS uses an orthogonal simulation box to encompass the particles. The *boundary* command sets the boundary conditions of the box (periodic, non-periodic, etc). The orthogonal box has its “origin” at (xlo,ylo,zlo) and is defined by 3 edge vectors starting from the origin given by  $\mathbf{a} = (xhi-xlo,0,0)$ ;  $\mathbf{b} = (0,yhi-ylo,0)$ ;  $\mathbf{c} = (0,0,zhi-zlo)$ . The 6 parameters (xlo,xhi,ylo,yhi,zlo,zhi) are defined at the time the simulation box is created, e.g. by the *create\_box* or *read\_data* or *read\_restart* commands. Additionally, LAMMPS defines box size parameters lx,ly,lz where lx = xhi-xlo, and similarly in the y and z dimensions. The 6 parameters, as well as lx,ly,lz, can be output via the *thermo\_style custom* command.

LAMMPS also allows simulations to be performed in triclinic (non-orthogonal) simulation boxes shaped as a parallelepiped with triclinic symmetry. The parallelepiped has its “origin” at (xlo,ylo,zlo) and is defined by 3 edge vectors starting from the origin given by  $\mathbf{a} = (xhi-xlo,0,0)$ ;  $\mathbf{b} = (xy,yhi-ylo,0)$ ;  $\mathbf{c} = (xz,yz,zhi-zlo)$ . xy,xz,yz can be 0.0 or positive or negative values and are called “tilt factors” because they are the amount of displacement applied to faces of an originally orthogonal box to transform it into the parallelepiped. In LAMMPS the triclinic simulation box edge vectors  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  cannot be arbitrary vectors. As indicated,  $\mathbf{a}$  must lie on the positive x axis.  $\mathbf{b}$  must lie in the xy plane, with strictly positive y component.  $\mathbf{c}$  may have any orientation with strictly positive z component. The requirement that  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  have strictly positive x, y, and z components, respectively, ensures that  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  form a complete right-handed basis. These restrictions impose no loss of generality, since it is possible to rotate/invert any set of 3 crystal basis vectors so that they conform to the restrictions.

For example, assume that the 3 vectors  $\mathbf{A}, \mathbf{B}, \mathbf{C}$  are the edge vectors of a general parallelepiped, where there is no restriction on  $\mathbf{A}, \mathbf{B}, \mathbf{C}$  other than they form a complete right-handed basis i.e.  $\mathbf{A} \times \mathbf{B} \cdot \mathbf{C} > 0$ . The equivalent LAMMPS

$\mathbf{a}, \mathbf{b}, \mathbf{c}$  are a linear rotation of  $\mathbf{A}, \mathbf{B}$ , and  $\mathbf{C}$  and can be computed as follows:

$$\begin{aligned}
 (\mathbf{a} \ \mathbf{b} \ \mathbf{c}) &= \begin{pmatrix} a_x & b_x & c_x \\ 0 & b_y & c_y \\ 0 & 0 & c_z \end{pmatrix} \\
 a_x &= A \\
 b_x &= \mathbf{B} \cdot \hat{\mathbf{A}} = B \cos \gamma \\
 b_y &= |\hat{\mathbf{A}} \times \mathbf{B}| = B \sin \gamma = \sqrt{B^2 - b_x^2} \\
 c_x &= \mathbf{C} \cdot \hat{\mathbf{A}} = C \cos \beta \\
 c_y &= \mathbf{C} \cdot (\widehat{\mathbf{A} \times \mathbf{B}}) \times \hat{\mathbf{A}} = \frac{\mathbf{B} \cdot \mathbf{C} - b_x c_x}{b_y} \\
 c_z &= |\mathbf{C} \cdot (\widehat{\mathbf{A} \times \mathbf{B}})| = \sqrt{C^2 - c_x^2 - c_y^2}
 \end{aligned}$$

where  $A = |\mathbf{A}|$  indicates the scalar length of  $\mathbf{A}$ . The hat symbol (^) indicates the corresponding unit vector.  $\beta$  and  $\gamma$  are angles between the vectors described below. Note that by construction,  $\mathbf{a}, \mathbf{b}$ , and  $\mathbf{c}$  have strictly positive x, y, and z components, respectively. If it should happen that  $\mathbf{A}, \mathbf{B}$ , and  $\mathbf{C}$  form a left-handed basis, then the above equations are not valid for  $\mathbf{c}$ . In this case, it is necessary to first apply an inversion. This can be achieved by interchanging two basis vectors or by changing the sign of one of them.

For consistency, the same rotation/inversion applied to the basis vectors must also be applied to atom positions, velocities, and any other vector quantities. This can be conveniently achieved by first converting to fractional coordinates in the old basis and then converting to distance coordinates in the new basis. The transformation is given by the following equation:

$$\mathbf{x} = (\mathbf{a} \ \mathbf{b} \ \mathbf{c}) \cdot \frac{1}{V} \begin{pmatrix} \mathbf{B} \times \mathbf{C} \\ \mathbf{C} \times \mathbf{A} \\ \mathbf{A} \times \mathbf{B} \end{pmatrix} \cdot \mathbf{X}$$

where  $V$  is the volume of the box,  $\mathbf{X}$  is the original vector quantity and  $\mathbf{x}$  is the vector in the LAMMPS basis.

There is no requirement that a triclinic box be periodic in any dimension, though it typically should be in at least the second dimension of the tilt (y in xy) if you want to enforce a shift in periodic boundary conditions across that boundary. Some commands that work with triclinic boxes, e.g. the *fix deform* and *fix npt* commands, require periodicity or non-shrink-wrap boundary conditions in specific dimensions. See the command doc pages for details.

The 9 parameters (xlo,xhi,ylo,yhi,zlo,zhi,xy,xz,yz) are defined at the time the simulation box is created. This happens in one of 3 ways. If the *create\_box* command is used with a region of style *prism*, then a triclinic box is setup. See the *region* command for details. If the *read\_data* command is used to define the simulation box, and the header of the data file contains a line with the “xy xz yz” keyword, then a triclinic box is setup. See the *read\_data* command for details. Finally, if the *read\_restart* command reads a restart file which was written from a simulation using a triclinic box, then a triclinic box will be setup for the restarted simulation.

Note that you can define a triclinic box with all 3 tilt factors = 0.0, so that it is initially orthogonal. This is necessary if the box will become non-orthogonal, e.g. due to the *fix npt* or *fix deform* commands. Alternatively, you can use the *change\_box* command to convert a simulation box from orthogonal to triclinic and vice versa.

As with orthogonal boxes, LAMMPS defines triclinic box size parameters lx,ly,lz where lx = xhi-xlo, and similarly in the y and z dimensions. The 9 parameters, as well as lx,ly,lz, can be output via the *thermo\_style custom* command.

To avoid extremely tilted boxes (which would be computationally inefficient), LAMMPS normally requires that no tilt factor can skew the box more than half the distance of the parallel box length, which is the first dimension in the tilt factor (x for xz). This is required both when the simulation box is created, e.g. via the *create\_box* or *read\_data* commands, as well as when the box shape changes dynamically during a simulation, e.g. via the *fix deform* or *fix npt* commands.

For example, if  $xlo = 2$  and  $xhi = 12$ , then the  $x$  box length is 10 and the  $xy$  tilt factor must be between -5 and 5. Similarly, both  $xz$  and  $yz$  must be between  $-(xhi-xlo)/2$  and  $+(yhi-ylo)/2$ . Note that this is not a limitation, since if the maximum tilt factor is 5 (as in this example), then configurations with  $tilt = \dots, -15, -5, 5, 15, 25, \dots$  are geometrically all equivalent. If the box tilt exceeds this limit during a dynamics run (e.g. via the *fix deform* command), then the box is “flipped” to an equivalent shape with a tilt factor within the bounds, so the run can continue. See the *fix deform* page for further details.

One exception to this rule is if the first dimension in the tilt factor ( $x$  for  $xy$ ) is non-periodic. In that case, the limits on the tilt factor are not enforced, since flipping the box in that dimension does not change the atom positions due to non-periodicity. In this mode, if you tilt the system to extreme angles, the simulation will simply become inefficient, due to the highly skewed simulation box.

The limitation on not creating a simulation box with a tilt factor skewing the box more than half the distance of the parallel box length can be overridden via the *box* command. Setting the *tilt* keyword to *large* allows any tilt factors to be specified.

Box flips that may occur using the *fix deform* or *fix npt* commands can be turned off using the *flip no* option with either of the commands.

Note that if a simulation box has a large tilt factor, LAMMPS will run less efficiently, due to the large volume of communication needed to acquire ghost atoms around a processor’s irregular-shaped sub-domain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

Triclinic crystal structures are often defined using three lattice constants  $a$ ,  $b$ , and  $c$ , and three angles  $\alpha$ ,  $\beta$ , and  $\gamma$ . Note that in this nomenclature, the  $a$ ,  $b$ , and  $c$  lattice constants are the scalar lengths of the edge vectors **a**, **b**, and **c** defined above. The relationship between these 6 quantities ( $a$ ,  $b$ ,  $c$ ,  $\alpha$ ,  $\beta$ ,  $\gamma$ ) and the LAMMPS box sizes ( $lx, ly, lz$ ) = ( $xhi-xlo, yhi-ylo, zhi-zlo$ ) and tilt factors ( $xy, xz, yz$ ) is as follows:

$$\begin{aligned} a &= lx \\ b^2 &= ly^2 + xy^2 \\ c^2 &= lz^2 + xz^2 + yz^2 \\ \cos \alpha &= \frac{xy * xz + ly * yz}{b * c} \\ \cos \beta &= \frac{xz}{c} \\ \cos \gamma &= \frac{xy}{b} \end{aligned}$$

The inverse relationship can be written as follows:

$$\begin{aligned} lx &= a \\ xy &= b \cos \gamma \\ xz &= c \cos \beta \\ ly^2 &= b^2 - xy^2 \\ yz &= \frac{b * c \cos \alpha - xy * xz}{ly} \\ lz^2 &= c^2 - xz^2 - yz^2 \end{aligned}$$

The values of  $a$ ,  $b$ ,  $c$ ,  $\alpha$ ,  $\beta$ , and  $\gamma$  can be printed out or accessed by computes using the *thermo\_style custom* keywords *cella*, *cellb*, *cellc*, *cellalpha*, *cellbeta*, *cellgamma*, respectively.

As discussed on the *dump* command doc page, when the BOX BOUNDS for a snapshot is written to a dump file for a triclinic box, an orthogonal bounding box which encloses the triclinic simulation box is output, along with the 3 tilt factors ( $xy$ ,  $xz$ ,  $yz$ ) of the triclinic box, formatted as follows:

```
ITEM: BOX BOUNDS xy xz yz
xlo_bound xhi_bound xy
ylo_bound yhi_bound xz
zlo_bound zhi_bound yz
```

This bounding box is convenient for many visualization programs and is calculated from the 9 triclinic box parameters (xlo,xhi,ylo,yhi,zlo,zhi,xy,xz,yz) as follows:

```
xlo_bound = xlo + MIN(0.0, xy, xz, xy+xz)
xhi_bound = xhi + MAX(0.0, xy, xz, xy+xz)
ylo_bound = ylo + MIN(0.0, yz)
yhi_bound = yhi + MAX(0.0, yz)
zlo_bound = zlo
zhi_bound = zhi
```

These formulas can be inverted if you need to convert the bounding box back into the triclinic box parameters, e.g.  $xlo = xlo\_bound - \text{MIN}(0.0, xy, xz, xy+xz)$ .

One use of triclinic simulation boxes is to model solid-state crystals with triclinic symmetry. The *lattice* command can be used with non-orthogonal basis vectors to define a lattice that will tile a triclinic simulation box via the *create\_atoms* command.

A second use is to run Parrinello-Rahman dynamics via the *fix npt* command, which will adjust the xy, xz, yz tilt factors to compensate for off-diagonal components of the pressure tensor. The analog for an *energy minimization* is the *fix box/relax* command.

A third use is to shear a bulk solid to study the response of the material. The *fix deform* command can be used for this purpose. It allows dynamic control of the xy, xz, yz tilt factors as a simulation runs. This is discussed in the next section on non-equilibrium MD (NEMD) simulations.

## 8.2.4 Thermostats

Thermostatting means controlling the temperature of particles in an MD simulation. *Barostatting* means controlling the pressure. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Thermostatting in LAMMPS is performed by *fixes*, or in one case by a pair style. Several thermostatting fixes are available: Nose-Hoover (nvt), Berendsen, CSVr, Langevin, and direct rescaling (temp/rescale). Dissipative particle dynamics (DPD) thermostatting can be invoked via the *dpd/tstat* pair style:

- *fix nvt*
- *fix nvt/sphere*
- *fix nvt/asphere*
- *fix nvt/sllod*
- *fix temp/berendsen*
- *fix temp/csvr*
- *fix langevin*
- *fix temp/rescale*
- *pair\_style dpd/tstat*

*Fix nvt* only thermostats the translational velocity of particles. *Fix nvt/sllod* also does this, except that it subtracts out a velocity bias due to a deforming box and integrates the SLLOD equations of motion. See the *Howto nemd* page for further details. *Fix nvt/sphere* and *fix nvt/asphere* thermostat not only translation velocities but also rotational velocities for spherical and aspherical particles.

---

**Note:** A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

---

DPD thermostating alters pairwise interactions in a manner analogous to the per-particle thermostating of *fix langevin*.

Any of the thermostating fixes can be instructed to use custom temperature computes that remove bias which has two effects: first, the current calculated temperature, which is compared to the requested target temperature, is calculated with the velocity bias removed; second, the thermostat adjusts only the thermal temperature component of the particle's velocities, which are the velocities with the bias removed. The removed bias is then added back to the adjusted velocities. See the doc pages for the individual fixes and for the *fix\_modify* command for instructions on how to assign a temperature compute to a thermostating fix.

For example, you can apply a thermostat only to atoms in a spatial region by using it in conjunction with *compute temp/region*. Or you can apply a thermostat to only the x and z components of velocity by using it with *compute temp/partial*. Of you could thermostat only the thermal temperature of a streaming flow of particles without affecting the streaming velocity, by using *compute temp/profile*.

Below is a list of custom temperature computes that can be used like that:

- *compute temp/asphere command*
- *compute temp/body command*
- *compute temp/chunk command*
- *compute temp/com command*
- *compute temp/deform command*
- *compute temp/partial command*
- *compute temp/profile command*
- *compute temp/ramp command*
- *compute temp/region command*
- *compute temp/rotate command*
- *compute temp/sphere command*

---

**Note:** Only the nvt fixes perform time integration, meaning they update the velocities and positions of particles due to forces and velocities respectively. The other thermostat fixes only adjust velocities; they do NOT perform time integration updates. Thus they should be used in conjunction with a constant NVE integration fix such as these:

---

- *fix nve*
- *fix nve/sphere*
- *fix nve/asphere*

Thermodynamic output, which can be setup via the *thermo\_style* command, often includes temperature values. As explained on the page for the *thermo\_style* command, the default temperature is setup by the thermo command itself. It is NOT the temperature associated with any thermostating fix you have defined or with any compute you have defined

that calculates a temperature. The doc pages for the thermostating fixes explain the ID of the temperature compute they create. Thus if you want to view these temperatures, you need to specify them explicitly via the *thermo\_style custom* command. Or you can use the *thermo\_modify* command to re-define what temperature compute is used for default thermodynamic output.

---

**(Daivis and Todd)** Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

## 8.2.5 Barostats

Barostatting means controlling the pressure in an MD simulation. *Thermostating* means controlling the temperature of the particles. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Barostatting in LAMMPS is performed by *fixes*. Two barostatting methods are currently available: Nose-Hoover (*npt* and *nph*) and Berendsen:

- *fix npt*
- *fix npt/sphere*
- *fix npt/asphere*
- *fix nph*
- *fix press/berendsen*

The *fix npt* commands include a Nose-Hoover thermostat and barostat. *Fix nph* is just a Nose/Hoover barostat; it does no thermostating. Both *fix nph* and *fix press/berendsen* can be used in conjunction with any of the thermostating fixes.

As with the *thermostats*, *fix npt* and *fix nph* only use translational motion of the particles in computing T and P and performing thermo/barostatting. *Fix npt/sphere* and *fix npt/asphere* thermo/barostat using not only translation velocities but also rotational velocities for spherical and aspherical particles.

All of the barostatting fixes use the *compute pressure* compute to calculate a current pressure. By default, this compute is created with a simple *compute temp* (see the last argument of the *compute pressure* command), which is used to calculate the kinetic component of the pressure. The barostatting fixes can also use temperature computes that remove bias for the purpose of computing the kinetic component which contributes to the current pressure. See the doc pages for the individual fixes and for the *fix\_modify* command for instructions on how to assign a temperature or pressure compute to a barostatting fix.

---

**Note:** As with the thermostats, the Nose/Hoover methods (*fix npt* and *fix nph*) perform time integration. *Fix press/berendsen* does NOT, so it should be used with one of the constant NVE fixes or with one of the NVT fixes.

---

Thermodynamic output, which can be setup via the *thermo\_style* command, often includes pressure values. As explained on the page for the *thermo\_style* command, the default pressure is setup by the thermo command itself. It is NOT the pressure associated with any barostatting fix you have defined or with any compute you have defined that calculates a pressure. The doc pages for the barostatting fixes explain the ID of the pressure compute they create. Thus if you want to view these pressures, you need to specify them explicitly via the *thermo\_style custom* command. Or you can use the *thermo\_modify* command to re-define what pressure compute is used for default thermodynamic output.

## 8.2.6 Walls

Walls in an MD simulation are typically used to bound particle motion, i.e. to serve as a boundary condition.

Walls in LAMMPS can be of rough (made of particles) or idealized surfaces. Ideal walls can be smooth, generating forces only in the normal direction, or frictional, generating forces also in the tangential direction.

Rough walls, built of particles, can be created in various ways. The particles themselves can be generated like any other particle, via the *lattice* and *create\_atoms* commands, or read in via the *read\_data* command.

Their motion can be constrained by many different commands, so that they do not move at all, move together as a group at constant velocity or in response to a net force acting on them, move in a prescribed fashion (e.g. rotate around a point), etc. Note that if a time integration fix like *fix nve* or *fix nvt* is not used with the group that contains wall particles, their positions and velocities will not be updated.

- *fix aveforce* - set force on particles to average value, so they move together
- *fix setforce* - set force on particles to a value, e.g. 0.0
- *fix freeze* - freeze particles for use as granular walls
- *fix nve/noforce* - advect particles by their velocity, but without force
- *fix move* - prescribe motion of particles by a linear velocity, oscillation, rotation, variable

The *fix move* command offers the most generality, since the motion of individual particles can be specified with *variable* formula which depends on time and/or the particle position.

For rough walls, it may be useful to turn off pairwise interactions between wall particles via the *neigh\_modify exclude* command.

Rough walls can also be created by specifying frozen particles that do not move and do not interact with mobile particles, and then tethering other particles to the fixed particles, via a *bond*. The bonded particles do interact with other mobile particles.

Idealized walls can be specified via several *fix* commands. *Fix wall/gran* creates frictional walls for use with granular particles; all the other commands create smooth walls.

- *fix wall/reflect* - reflective flat walls
- *fix wall/lj93* - flat walls, with Lennard-Jones 9/3 potential
- *fix wall/lj126* - flat walls, with Lennard-Jones 12/6 potential
- *fix wall/colloid* - flat walls, with *pair\_style colloid* potential
- *fix wall/harmonic* - flat walls, with repulsive harmonic spring potential
- *fix wall/morse* - flat walls, with Morse potential
- *fix wall/region* - use region surface as wall
- *fix wall/gran* - flat or curved walls with *pair\_style granular* potential

The *lj93*, *lj126*, *colloid*, *harmonic*, and *morse* styles all allow the flat walls to move with a constant velocity, or oscillate in time. The *fix wall/region* command offers the most generality, since the region surface is treated as a wall, and the geometry of the region can be a simple primitive volume (e.g. a sphere, or cube, or plane), or a complex volume made from the union and intersection of primitive volumes. *Regions* can also specify a volume “interior” or “exterior” to the specified primitive shape or *union* or *intersection*. *Regions* can also be “dynamic” meaning they move with constant velocity, oscillate, or rotate.

The only frictional idealized walls currently in LAMMPS are flat or curved surfaces specified by the *fix wall/gran* command. At some point we plan to allow region surfaces to be used as frictional walls, as well as triangulated surfaces.

## 8.2.7 NEMD simulations

Non-equilibrium molecular dynamics or NEMD simulations are typically used to measure a fluid's rheological properties such as viscosity. In LAMMPS, such simulations can be performed by first setting up a non-orthogonal simulation box (see the preceding Howto section).

A shear strain can be applied to the simulation box at a desired strain rate by using the *fix deform* command. The *fix nvt/sllod* command can be used to thermostat the sheared fluid and integrate the SLLOD equations of motion for the system. Fix nvt/sllod uses *compute temp/deform* to compute a thermal temperature by subtracting out the streaming velocity of the shearing atoms. The velocity profile or other properties of the fluid can be monitored via the *fix ave/chunk* command.

---

**Note:** A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

---

As discussed in the previous section on non-orthogonal simulation boxes, the amount of tilt or skew that can be applied is limited by LAMMPS for computational efficiency to be 1/2 of the parallel box length. However, *fix deform* can continuously strain a box by an arbitrary amount. As discussed in the *fix deform* command, when the tilt value reaches a limit, the box is flipped to the opposite limit which is an equivalent tiling of periodic space. The strain rate can then continue to change as before. In a long NEMD simulation these box re-shaping events may occur many times.

In a NEMD simulation, the “remap” option of *fix deform* should be set to “remap v”, since that is what *fix nvt/sllod* assumes to generate a velocity profile consistent with the applied shear strain rate.

An alternative method for calculating viscosities is provided via the *fix viscosity* command.

NEMD simulations can also be used to measure transport properties of a fluid through a pore or channel. Simulations of steady-state flow can be performed using the *fix flow/gauss* command.

---

**(Daivis and Todd)** Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

## 8.2.8 Long-range dispersion settings

The PPPM method computes interactions by splitting the pair potential into two parts, one of which is computed in a normal pairwise fashion, the so-called real-space part, and one of which is computed using the Fourier transform, the so called reciprocal-space or kspace part. For both parts, the potential is not computed exactly but is approximated. Thus, there is an error in both parts of the computation, the real-space and the kspace error. The just mentioned facts are true both for the PPPM for Coulomb as well as dispersion interactions. The deciding difference - and also the reason why the parameters for *pppm/disp* have to be selected with more care - is the impact of the errors on the results: The kspace error of the PPPM for Coulomb and dispersion interaction and the real-space error of the PPPM for Coulomb interaction have the character of noise. In contrast, the real-space error of the PPPM for dispersion has a clear physical interpretation: the underprediction of cohesion. As a consequence, the real-space error has a much stronger effect than the kspace error on simulation results for *pppm/disp*. Parameters must thus be chosen in a way that this error is much smaller than the kspace error.

When using *pppm/disp* and not making any specifications on the PPPM parameters via the *kspace modify* command, parameters will be tuned such that the real-space error and the kspace error are equal. This will result in simulations that are either inaccurate or slow, both of which is not desirable. For selecting parameters for the *pppm/disp* that provide fast and accurate simulations, there are two approaches, which both have their up- and downsides.

The first approach is to set desired real-space and kspace accuracies via the *kspace\_modify force/disp/real* and *kspace\_modify force/disp/kspace* commands. Note that the accuracies have to be specified in force units and are thus

dependent on the chosen unit settings. For real units, 0.0001 and 0.002 seem to provide reasonable accurate and efficient computations for the real-space and kspace accuracies. 0.002 and 0.05 work well for most systems using lj units. PPPM parameters will be generated based on the desired accuracies. The upside of this approach is that it usually provides a good set of parameters and will work for both the *kspace\_modify diff ad* and *kspace\_modify diff ik* options. The downside of the method is that setting the PPPM parameters will take some time during the initialization of the simulation.

The second approach is to set the parameters for the *pppm/disp* explicitly using the *kspace\_modify mesh/disp*, *kspace\_modify order/disp*, and *kspace\_modify gewald/disp* commands. This approach requires a more experienced user who understands well the impact of the choice of parameters on the simulation accuracy and performance. This approach provides a fast initialization of the simulation. However, it is sensitive to errors: A combination of parameters that will perform well for one system might result in far-from-optimal conditions for other simulations. For example, parameters that provide accurate and fast computations for all-atomistic force fields can provide insufficient accuracy or united-atomistic force fields (which is related to that the latter typically have larger dispersion coefficients).

To avoid inaccurate or inefficient simulations, the *pppm/disp* stops simulations with an error message if no action is taken to control the PPPM parameters. If the automatic parameter generation is desired and real-space and kspace accuracies are desired to be equal, this error message can be suppressed using the *kspace\_modify disp/auto yes* command.

A reasonable approach that combines the upsides of both methods is to make the first run using the *kspace\_modify force/disp/real* and *kspace\_modify force/disp/kspace* commands, write down the PPPM parameters from the output, and specify these parameters using the second approach in subsequent runs (which have the same composition, force field, and approximately the same volume).

Concerning the performance of the *pppm/disp* there are two more things to consider. The first is that when using the *pppm/disp*, the cutoff parameter does no longer affect the accuracy of the simulation (subject to that *gewald/disp* is adjusted when changing the cutoff). The performance can thus be increased by examining different values for the cutoff parameter. A lower bound for the cutoff is only set by the truncation error of the repulsive term of pair potentials.

The second is that the mixing rule of the pair style has an impact on the computation time when using the *pppm/disp*. Fastest computations are achieved when using the geometric mixing rule. Using the arithmetic mixing rule substantially increases the computational cost. The computational overhead can be reduced using the *kspace\_modify mix/disp geom* and *kspace\_modify splittol* commands. The first command simply enforces geometric mixing of the dispersion coefficients in kspace computations. This introduces some error in the computations but will also significantly speed-up the simulations. The second keyword sets the accuracy with which the dispersion coefficients are approximated using a matrix factorization approach. This may result in better accuracy than using the first command, but will usually also not provide an equally good increase of efficiency.

Finally, *pppm/disp* can also be used when no mixing rules apply. This can be achieved using the *kspace\_modify mix/disp none* command. Note that the code does not check automatically whether any mixing rule is fulfilled. If mixing rules do not apply, the user will have to specify this command explicitly.

## 8.3 Analysis howto

### 8.3.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables)

There are four basic kinds of LAMMPS output:

- *Thermodynamic output*, which is a list of quantities printed every few timesteps to the screen and logfile.
- *Dump files*, which contain snapshots of atoms and various per-atom values and are written at a specified frequency.
- Certain fixes can output user-specified quantities to files: *fix ave/time* for time averaging, *fix ave/chunk* for spatial or other averaging, and *fix print* for single-line output of *variables*. Fix print can also output to the screen.
- *Restart files*.

A simulation prints one set of thermodynamic output and (optionally) restart files. It can generate any number of dump files and fix output files, depending on what *dump* and *fix* commands you specify.

As discussed below, LAMMPS gives you a variety of ways to determine what quantities are computed and printed when the thermodynamics, dump, or fix commands listed above perform output. Throughout this discussion, note that users can also *add their own computes and fixes to LAMMPS* which can then generate values that can then be output with these commands.

The following sub-sections discuss different LAMMPS command related to output and the kind of data they operate on and produce:

- *Global/per-atom/local data*
- *Scalar/vector/array data*
- *Thermodynamic output*
- *Dump file output*
- *Fixes that write output files*
- *Computes that process output quantities*
- *Fixes that process output quantities*
- *Computes that generate values to output*
- *Fixes that generate values to output*
- *Variables that generate values to output*
- *Summary table of output options and data flow between commands*

### Global/per-atom/local data

Various output-related commands work with three different styles of data: global, per-atom, or local. A global datum is one or more system-wide values, e.g. the temperature of the system. A per-atom datum is one or more values per atom, e.g. the kinetic energy of each atom. Local datums are calculated by each processor based on the atoms it owns, but there may be zero or more per atom, e.g. a list of bond distances.

### Scalar/vector/array data

Global, per-atom, and local datums can each come in three kinds: a single scalar value, a vector of values, or a 2d array of values. The doc page for a “compute” or “fix” or “variable” that generates data will specify both the style and kind of data it produces, e.g. a per-atom vector.

When a quantity is accessed, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID in this case is the ID of a compute. The leading “c\_” would be replaced by “f\_” for a fix, or “v\_” for a variable:

c_ID	entire scalar, vector, or array
c_ID[I]	one element of vector, one column of array
c_ID[I][J]	one element of array

In other words, using one bracket reduces the dimension of the data once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar values as input can typically also process elements of a vector or array.

## Disambiguation

Some computes and fixes produce data in multiple styles, e.g. a global scalar and a per-atom vector. Usually the context in which the input script references the data determines which style is meant. Example: if a compute provides both a global scalar and a per-atom vector, the former will be accessed by using `c_ID` in an equal-style variable, while the latter will be accessed by using `c_ID` in an atom-style variable. Note that atom-style variable formulas can also access global scalars, but in this case it is not possible to do directly because of the ambiguity. Instead, an equal-style variable can be defined which accesses the global scalar, and that variable used in the atom-style variable formula in place of `c_ID`.

## Thermodynamic output

The frequency and format of thermodynamic output is set by the *thermo*, *thermo\_style*, and *thermo\_modify* commands. The *thermo\_style* command also specifies what values are calculated and written out. Pre-defined keywords can be specified (e.g. `press`, `etotal`, etc). Three additional kinds of keywords can also be specified (`c_ID`, `f_ID`, `v_name`), where a *compute* or *fix* or *variable* provides the value to be output. In each case, the compute, fix, or variable must generate global values for input to the *thermo\_style custom* command.

Note that thermodynamic output values can be “extensive” or “intensive”. The former scale with the number of atoms in the system (e.g. total energy), the latter do not (e.g. temperature). The setting for *thermo\_modify norm* determines whether extensive quantities are normalized or not. Computes and fixes produce either extensive or intensive values; see their individual doc pages for details. *Equal-style variables* produce only intensive values; you can include a division by “natoms” in the formula if desired, to make an extensive calculation produce an intensive result.

## Dump file output

Dump file output is specified by the *dump* and *dump\_modify* commands. There are several pre-defined formats (`dump atom`, `dump xtc`, etc).

There is also a *dump custom* format where the user specifies what values are output with each atom. Pre-defined atom attributes can be specified (`id`, `x`, `fx`, etc). Three additional kinds of keywords can also be specified (`c_ID`, `f_ID`, `v_name`), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the compute, fix, or variable must generate per-atom values for input to the *dump custom* command.

There is also a *dump local* format where the user specifies what local values to output. A pre-defined index keyword can be specified to enumerate the local values. Two additional kinds of keywords can also be specified (`c_ID`, `f_ID`), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the compute or fix must generate local values for input to the *dump local* command.

## Fixes that write output files

Several fixes take various quantities as input and can write output files: *fix ave/time*, *fix ave/chunk*, *fix ave/histo*, *fix ave/correlate*, and *fix print*.

The *fix ave/time* command enables direct output to a file and/or time-averaging of global scalars or vectors. The user specifies one or more quantities as input. These can be global *compute* values, global *fix* values, or *variables* of any style except the atom style which produces per-atom values. Since a variable can refer to keywords used by the *thermo\_style custom* command (like `temp` or `press`) and individual per-atom values, a wide variety of quantities can be time averaged and/or output in this way. If the inputs are one or more scalar values, then the fix generate a global scalar or vector of output. If the inputs are one or more vector values, then the fix generates a global vector or array of output. The time-averaged output of this fix can also be used as input to other output commands.

The *fix ave/chunk* command enables direct output to a file of chunk-averaged per-atom quantities like those output in dump files. Chunks can represent spatial bins or other collections of atoms, e.g. individual molecules. The per-atom

quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The chunk-averaged output of this *fix* can also be used as input to other output commands.

The *fix ave/histo* command enables direct output to a file of histogrammed quantities, which can be global or per-atom or local quantities. The histogram output of this *fix* can also be used as input to other output commands.

The *fix ave/correlate* command enables direct output to a file of time-correlated quantities, which can be global values. The correlation matrix output of this *fix* can also be used as input to other output commands.

The *fix print* command can generate a line of output written to the screen and log file or to a separate file, periodically during a running simulation. The line can contain one or more *variable* values for any style variable except the vector or atom styles). As explained above, variables themselves can contain references to global values generated by *thermodynamic keywords*, *computes*, *fixes*, or other *variables*, or to per-atom values for a specific atom. Thus the *fix print* command is a means to output a wide variety of quantities separate from normal thermodynamic or dump file output.

### Computes that process output quantities

The *compute reduce* and *compute reduce/region* commands take one or more per-atom or local vector quantities as inputs and “reduce” them (sum, min, max, ave) to scalar quantities. These are produced as output values which can be used as input to other output commands.

The *compute slice* command take one or more global vector or array quantities as inputs and extracts a subset of their values to create a new vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/atom* command takes a list of one or more pre-defined atom attributes (id, x, fx, etc) and stores the values in a per-atom vector or array. These are produced as output values which can be used as input to other output commands. The list of atom attributes is the same as for the *dump custom* command.

The *compute property/local* command takes a list of one or more pre-defined local attributes (bond info, angle info, etc) and stores the values in a local vector or array. These are produced as output values which can be used as input to other output commands.

### Fixes that process output quantities

The *fix vector* command can create global vectors as output from global scalars as input, accumulating them one element at a time.

The *fix ave/atom* command performs time-averaging of per-atom vectors. The per-atom quantities can be atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The time-averaged per-atom output of this *fix* can be used as input to other output commands.

The *fix store/state* command can archive one or more per-atom attributes at a particular time, so that the old values can be used in a future calculation or output. The list of atom attributes is the same as for the *dump custom* command, including per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The output of this *fix* can be used as input to other output commands.

## Computes that generate values to output

Every *compute* in LAMMPS produces either global or per-atom or local values. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each compute command describes what it produces. Computes that produce per-atom or local values have the word “atom” or “local” in their style name. Computes without the word “atom” or “local” produce global values.

## Fixes that generate values to output

Some *fixes* in LAMMPS produces either global or per-atom or local values which can be accessed by other commands. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each fix command tells whether it produces any output quantities and describes them.

## Variables that generate values to output

*Variables* defined in an input script can store one or more strings. But equal-style, vector-style, and atom-style or atomfile-style variables generate a global scalar value, global vector or values, or a per-atom vector, respectively, when accessed. The formulas used to define these variables can contain references to the thermodynamic keywords and to global and per-atom data generated by computes, fixes, and other variables. The values generated by variables can be used as input to and thus output by the other commands described in this section.

## Summary table of output options and data flow between commands

This table summarizes the various commands that can be used for generating output from LAMMPS. Each command produces output data of some kind and/or writes data to a file. Most of the commands can take data from other commands as input. Thus you can link many of these commands together in pipeline form, where data produced by one command is used as input to another command and eventually written to the screen or to a file. Note that to hook two commands together the output and input data types must match, e.g. global/per-atom/local data and scalar/vector/array data.

Also note that, as described above, when a command takes a scalar as input, that could be an element of a vector or array. Likewise a vector input could be a column of an array.

Command	Input	Output
<i>thermo_style custom</i>	global scalars	screen, log file
<i>dump custom</i>	per-atom vectors	dump file
<i>dump local</i>	local vectors	dump file
<i>fix print</i>	global scalar from variable	screen, file
<i>print</i>	global scalar from variable	screen
<i>computes</i>	N/A	global/per-atom/local scalar/vector/array
<i>fixes</i>	N/A	global/per-atom/local scalar/vector/array
<i>variables</i>	global scalars and vectors, per-atom vectors	global scalar and vector, per-atom vector
<i>compute reduce</i>	per-atom/local vectors	global scalar/vector
<i>compute slice</i>	global vectors/arrays	global vector/array
<i>compute property/atom</i>	per-atom vectors	per-atom vector/array
<i>compute property/local</i>	local vectors	local vector/array
<i>fix vector</i>	global scalars	global vector
<i>fix ave/atom</i>	per-atom vectors	per-atom vector/array
<i>fix ave/time</i>	global scalars/vectors	global scalar/vector/array, file
<i>fix ave/chunk</i>	per-atom vectors	global array, file
<i>fix ave/histo</i>	global/per-atom/local scalars and vectors	global array, file
<i>fix ave/correlate</i>	global scalars	global array, file
<i>fix store/state</i>	per-atom vectors	per-atom vector/array

### 8.3.2 Use chunks to calculate system properties

In LAMMPS, “chunks” are collections of atoms, as defined by the *compute chunk/atom* command, which assigns each atom to a chunk ID (or to no chunk at all). The number of chunks and the assignment of chunk IDs to atoms can be static or change over time. Examples of “chunks” are molecules or spatial bins or atoms with similar values (e.g. coordination number or potential energy).

The per-atom chunk IDs can be used as input to two other kinds of commands, to calculate various properties of a system:

- *fix ave/chunk*
- any of the *compute \*/chunk* commands

Here a brief overview for each of the 4 kinds of chunk-related commands is provided. Then some examples are given of how to compute different properties with chunk commands.

### Compute chunk/atom command:

This compute can assign atoms to chunks of various styles. Only atoms in the specified group and optional specified region are assigned to a chunk. Here are some possible chunk definitions:

atoms in same molecule	chunk ID = molecule ID
atoms of same atom type	chunk ID = atom type
all atoms with same atom property (charge, radius, etc)	chunk ID = output of compute property/atom
atoms in same cluster	chunk ID = output of <i>compute cluster/atom</i> command
atoms in same spatial bin	chunk ID = bin ID
atoms in same rigid body	chunk ID = molecule ID used to define rigid bodies
atoms with similar potential energy	chunk ID = output of <i>compute pe/atom</i>
atoms with same local defect structure	chunk ID = output of <i>compute centro/atom</i> or <i>compute coord/atom</i> command

Note that chunk IDs are integer values, so for atom properties or computes that produce a floating point value, they will be truncated to an integer. You could also use the compute in a variable that scales the floating point value to spread it across multiple integers.

Spatial bins can be of various kinds, e.g. 1d bins = slabs, 2d bins = pencils, 3d bins = boxes, spherical bins, cylindrical bins.

This compute also calculates the number of chunks *Nchunk*, which is used by other commands to tally per-chunk data. *Nchunk* can be a static value or change over time (e.g. the number of clusters). The chunk ID for an individual atom can also be static (e.g. a molecule ID), or dynamic (e.g. what spatial bin an atom is in as it moves).

Note that this compute allows the per-atom output of other *computes*, *fixes*, and *variables* to be used to define chunk IDs for each atom. This means you can write your own compute or fix to output a per-atom quantity to use as chunk ID. See the *Modify* doc pages for info on how to do this. You can also define a *per-atom variable* in the input script that uses a formula to generate a chunk ID for each atom.

### Fix ave/chunk command:

This fix takes the ID of a *compute chunk/atom* command as input. For each chunk, it then sums one or more specified per-atom values over the atoms in each chunk. The per-atom values can be any atom property, such as velocity, force, charge, potential energy, kinetic energy, stress, etc. Additional keywords are defined for per-chunk properties like density and temperature. More generally any per-atom value generated by other *computes*, *fixes*, and *per-atom variables*, can be summed over atoms in each chunk.

Similar to other averaging fixes, this fix allows the summed per-chunk values to be time-averaged in various ways, and output to a file. The fix produces a global array as output with one row of values per chunk.

### Compute \*/chunk commands:

The following computes operate on chunks of atoms to produce per-chunk values. Any compute whose style name ends in “/chunk” is in this category:

- *compute com/chunk*
- *compute gyration/chunk*
- *compute inertia/chunk*
- *compute msd/chunk*

- *compute property/chunk*
- *compute temp/chunk*
- *compute torque/chunk*
- *compute vcm/chunk*

They each take the ID of a *compute chunk/atom* command as input. As their names indicate, they calculate the center-of-mass, radius of gyration, moments of inertia, mean-squared displacement, temperature, torque, and velocity of center-of-mass for each chunk of atoms. The *compute property/chunk* command can tally the count of atoms in each chunk and extract other per-chunk properties.

The reason these various calculations are not part of the *fix ave/chunk command*, is that each requires a more complicated operation than simply summing and averaging over per-atom values in each chunk. For example, many of them require calculation of a center of mass, which requires summing mass\*position over the atoms and then dividing by summed mass.

All of these computes produce a global vector or global array as output, with one or more values per chunk. The output can be used in various ways:

- As input to the *fix ave/time* command, which can write the values to a file and optionally time average them.
- As input to the *fix ave/histo* command to histogram values across chunks. E.g. a histogram of cluster sizes or molecule diffusion rates.
- As input to special functions of *equal-style variables*, like `sum()` and `max()` and `ave()`. E.g. to find the largest cluster or fastest diffusing molecule or average radius-of-gyration of a set of molecules (chunks).

#### Other chunk commands:

- *compute chunk/spread/atom*
- *compute reduce/chunk*

The *compute chunk/spread/atom* command spreads per-chunk values to each atom in the chunk, producing per-atom values as its output. This can be useful for outputting per-chunk values to a per-atom *dump file*. Or for using an atom's associated chunk value in an *atom-style variable*. Or as input to the *fix ave/chunk* command to spatially average per-chunk values calculated by a per-chunk compute.

The *compute reduce/chunk* command reduces a peratom value across the atoms in each chunk to produce a value per chunk. When used with the *compute chunk/spread/atom* command it can create peratom values that induce a new set of chunks with a second *compute chunk/atom* command.

#### Example calculations with chunks

Here are examples using chunk commands to calculate various properties:

- (1) Average velocity in each of 1000 2d spatial bins:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.01 units reduced
fix 1 all ave/chunk 100 10 1000 cc1 vx vy file tmp.out
```

- (2) Temperature in each spatial bin, after subtracting a flow velocity:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.1 units reduced
compute vbias all temp/profile 1 0 0 y 10
fix 1 all ave/chunk 100 10 1000 cc1 temp bias vbias file tmp.out
```

(3) Center of mass of each molecule:

```
compute cc1 all chunk/atom molecule
compute myChunk all com/chunk cc1
fix 1 all ave/time 100 1 100 c_myChunk[*] file tmp.out mode vector
```

(4) Total force on each molecule and ave/max across all molecules:

```
compute cc1 all chunk/atom molecule
fix 1 all ave/chunk 1000 1 1000 cc1 fx fy fz file tmp.out
variable xave equal ave(f_1[2])
variable xmax equal max(f_1[2])
thermo 1000
thermo_style custom step temp v_xave v_xmax
```

(5) Histogram of cluster sizes:

```
compute cluster all cluster/atom 1.0
compute cc1 all chunk/atom c_cluster compress yes
compute size all property/chunk cc1 count
fix 1 all ave/histo 100 1 100 0 20 20 c_size mode vector ave running beyond ignore file_
↪tmp.histo
```

(6) An example for using a per-chunk value to apply per-atom forces to compress individual polymer chains (molecules) in a mixture, is explained on the [compute chunk/spread/atom](#) command doc page.

(7) An example for using one set of per-chunk values for molecule chunks, to create a second set of micelle-scale chunks (clustered molecules, due to hydrophobicity), is explained on the [compute reduce/chunk](#) command doc page.

(8) An example for using one set of per-chunk values (dipole moment vectors) for molecule chunks, spreading the values to each atom in each chunk, then defining a second set of chunks as spatial bins, and using the [fix ave/chunk](#) command to calculate an average dipole moment vector for each bin. This example is explained on the [compute chunk/spread/atom](#) command doc page.

### 8.3.3 Calculate temperature

Temperature is computed as kinetic energy divided by some number of degrees of freedom (and the Boltzmann constant). Since kinetic energy is a function of particle velocity, there is often a need to distinguish between a particle's advection velocity (due to some aggregate motion of particles) and its thermal velocity. The sum of the two is the particle's total velocity, but the latter is often what is wanted to compute a temperature.

LAMMPS has several options for computing temperatures, any of which can be used in *thermostatting* and *barostatting*. These [compute commands](#) calculate temperature:

- [compute temp](#)
- [compute temp/sphere](#)
- [compute temp/asphere](#)
- [compute temp/com](#)
- [compute temp/deform](#)
- [compute temp/partial](#)
- [compute temp/profile](#)
- [compute temp/ramp](#)

- *compute temp/region*

All but the first 3 calculate velocity biases directly (e.g. advection velocities) that are removed when computing the thermal temperature. *Compute temp/sphere* and *compute temp/asphere* compute kinetic energy for finite-size particles that includes rotational degrees of freedom. They both allow for velocity biases indirectly, via an optional extra argument which is another temperature compute that subtracts a velocity bias. This allows the translational velocity of spherical or aspherical particles to be adjusted in prescribed ways.

### 8.3.4 Calculate elastic constants

Elastic constants characterize the stiffness of a material. The formal definition is provided by the linear relation that holds between the stress and strain tensors in the limit of infinitesimal deformation. In tensor notation, this is expressed as  $s_{ij} = C_{ijkl} * e_{kl}$ , where the repeated indices imply summation.  $s_{ij}$  are the elements of the symmetric stress tensor.  $e_{kl}$  are the elements of the symmetric strain tensor.  $C_{ijkl}$  are the elements of the fourth rank tensor of elastic constants. In three dimensions, this tensor has  $3^4=81$  elements. Using Voigt notation, the tensor can be written as a 6x6 matrix, where  $C_{ij}$  is now the derivative of  $s_i$  w.r.t.  $e_j$ . Because  $s_i$  is itself a derivative w.r.t.  $e_i$ , it follows that  $C_{ij}$  is also symmetric, with at most  $7*6/2 = 21$  distinct elements.

At zero temperature, it is easy to estimate these derivatives by deforming the simulation box in one of the six directions using the *change\_box* command and measuring the change in the stress tensor. A general-purpose script that does this is given in the examples/ELASTIC directory described on the *Examples* doc page.

Calculating elastic constants at finite temperature is more challenging, because it is necessary to run a simulation that performs time averages of differential properties. There are at least 3 ways to do this in LAMMPS. The most reliable way to do this is by exploiting the relationship between elastic constants, stress fluctuations, and the Born matrix, the second derivatives of energy w.r.t. strain (*Ray*). The Born matrix calculation has been enabled by the *compute born/matrix* command, which works for any bonded or non-bonded potential in LAMMPS. The most expensive part of the calculation is the sampling of the stress fluctuations. Several examples of this method are provided in the examples/ELASTIC\_T/BORN\_MATRIX directory described on the *Examples* doc page.

A second way is to measure the change in average stress tensor in an NVT simulations when the cell volume undergoes a finite deformation. In order to balance the systematic and statistical errors in this method, the magnitude of the deformation must be chosen judiciously, and care must be taken to fully equilibrate the deformed cell before sampling the stress tensor. An example of this method is provided in the examples/ELASTIC\_T/DEFORMATION directory described on the *Examples* doc page.

Another approach is to sample the triclinic cell fluctuations that occur in an NPT simulation. This method can also be slow to converge and requires careful post-processing (*Shinoda*). We do not provide an example of this method.

A nice review of the advantages and disadvantages of all of these methods is provided in the paper by Clavier et al. (*Clavier*).

### 8.3.5 Calculate thermal conductivity

The thermal conductivity  $\kappa$  of a material can be measured in at least 4 ways using various options in LAMMPS. See the examples/KAPPA directory for scripts that implement the 4 methods discussed here for a simple Lennard-Jones fluid model. Also, see the [Howto viscosity](#) page for an analogous discussion for viscosity.

The thermal conductivity tensor  $\kappa$  is a measure of the propensity of a material to transmit heat energy in a diffusive manner as given by Fourier's law

$$J = -\kappa \text{grad}(T)$$

where  $J$  is the heat flux in units of energy per area per time and  $\text{grad}(T)$  is the spatial gradient of temperature. The thermal conductivity thus has units of energy per distance per time per degree K and is often approximated as an isotropic quantity, i.e. as a scalar.

The first method is to setup two thermostatted regions at opposite ends of a simulation box, or one in the middle and one at the end of a periodic box. By holding the two regions at different temperatures with a *thermostatting fix*, the energy added to the hot region should equal the energy subtracted from the cold region and be proportional to the heat flux moving between the regions. See the papers by *Ikeshoji and Hafskjold* and *Wirnsberger et al* for details of this idea. Note that thermostatting fixes such as *fix nvt*, *fix langevin*, and *fix temp/rescale* store the cumulative energy they add/subtract.

Alternatively, as a second method, the *fix heat* or *fix ehex* commands can be used in place of thermostats on each of two regions to add/subtract specified amounts of energy to both regions. In both cases, the resulting temperatures of the two regions can be monitored with the “compute temp/region” command and the temperature profile of the intermediate region can be monitored with the *fix ave/chunk* and *compute ke/atom* commands.

The third method is to perform a reverse non-equilibrium MD simulation using the *fix thermal/conductivity* command which implements the rNEMD algorithm of Muller-Plathe. Kinetic energy is swapped between atoms in two different layers of the simulation box. This induces a temperature gradient between the two layers which can be monitored with the *fix ave/chunk* and *compute ke/atom* commands. The *fix* tallies the cumulative energy transfer that it performs. See the *fix thermal/conductivity* command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the heat flux to  $\kappa$ . The heat flux can be calculated from the fluctuations of per-atom potential and kinetic energies and per-atom stress tensor in a steady-state equilibrated simulation. This is in contrast to the two preceding non-equilibrium methods, where energy flows continuously between hot and cold regions of the simulation box.

The *compute heat/flux* command can calculate the needed heat flux and describes how to implement the Green\_Kubo formalism using additional LAMMPS commands, such as the *fix ave/correlate* command to calculate the needed auto-correlation. See the page for the *compute heat/flux* command for an example input script that calculates the thermal conductivity of solid Ar via the GK formalism.

### 8.3.6 Calculate viscosity

The shear viscosity  $\eta$  of a fluid can be measured in at least 6 ways using various options in LAMMPS. See the examples/VISCOSITY directory for scripts that implement the 5 methods discussed here for a simple Lennard-Jones fluid model and 1 method for SPC/E water model. Also, see the [page on calculating thermal conductivity](#) for an analogous discussion for thermal conductivity.

$\eta$  is a measure of the propensity of a fluid to transmit momentum in a direction perpendicular to the direction of velocity or momentum flow. Alternatively it is the resistance the fluid has to being sheared. It is given by

$$J = -\eta \text{grad}(V_{\text{stream}})$$

where  $J$  is the momentum flux in units of momentum per area per time. and  $\text{grad}(V_{\text{stream}})$  is the spatial gradient of the velocity of the fluid moving in another direction, normal to the area through which the momentum flows. Viscosity thus has units of pressure-time.

The first method is to perform a non-equilibrium MD (NEMD) simulation by shearing the simulation box via the *fix deform* command, and using the *fix nvt/sllod* command to thermostat the fluid via the SLLOD equations of motion. Alternatively, as a second method, one or more moving walls can be used to shear the fluid in between them, again with some kind of thermostat that modifies only the thermal (non-shearing) components of velocity to prevent the fluid from heating up.

---

**Note:** A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

---

In both cases, the velocity profile setup in the fluid by this procedure can be monitored by the *fix ave/chunk* command, which determines  $\text{grad}(V_{\text{stream}})$  in the equation above. E.g. the derivative in the y-direction of the  $V_x$  component of fluid motion or  $\text{grad}(V_{\text{stream}}) = dV_x/dy$ . The  $P_{xy}$  off-diagonal component of the pressure or stress tensor, as calculated by the *compute pressure* command, can also be monitored, which is the  $J$  term in the equation above. See the *Howto nemd* page for details on NEMD simulations.

The third method is to perform a reverse non-equilibrium MD simulation using the *fix viscosity* command which implements the rNEMD algorithm of Muller-Plathe. Momentum in one dimension is swapped between atoms in two different layers of the simulation box in a different dimension. This induces a velocity gradient which can be monitored with the *fix ave/chunk* command. The *fix* tallies the cumulative momentum transfer that it performs. See the *fix viscosity* command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the stress/pressure tensor to  $\eta$ . This can be done in a fully equilibrated simulation which is in contrast to the two preceding non-equilibrium methods, where momentum flows continuously through the simulation box.

Here is an example input script that calculates the viscosity of liquid Ar via the GK formalism:

```
# Sample LAMMPS input script for viscosity of liquid Ar

```

The fifth method is related to the above Green-Kubo method, but uses the Einstein formulation, analogous to the Einstein mean-square-displacement formulation for self-diffusivity. The time-integrated momentum fluxes play the role of Cartesian coordinates, whose mean-square displacement increases linearly with time at sufficiently long times.

The sixth is the periodic perturbation method, which is also a non-equilibrium MD method. However, instead of measuring the momentum flux in response to an applied velocity gradient, it measures the velocity profile in response to applied stress. A cosine-shaped periodic acceleration is added to the system via the *fix accelerate/cos* command, and the *compute viscosity/cos* command is used to monitor the generated velocity profile and remove the velocity bias before thermostating.

---

**Note:** An article by (*Hess*) discussed the accuracy and efficiency of these methods.

### 8.3.7 Calculate diffusion coefficients

The diffusion coefficient  $D$  of a material can be measured in at least 2 ways using various options in LAMMPS. See the examples/DIFFUSE directory for scripts that implement the 2 methods discussed here for a simple Lennard-Jones fluid model.

The first method is to measure the mean-squared displacement (MSD) of the system, via the `compute msd` command. The slope of the MSD versus time is proportional to the diffusion coefficient. The instantaneous MSD values can be accumulated in a vector via the `fix vector` command, and a line fit to the vector to compute its slope via the `variable slope` function, and thus extract  $D$ .

The second method is to measure the velocity auto-correlation function (VACF) of the system, via the `compute vacf` command. The time-integral of the VACF is proportional to the diffusion coefficient. The instantaneous VACF values can be accumulated in a vector via the `fix vector` command, and time integrated via the `variable trap` function, and thus extract  $D$ .

### 8.3.8 Output structured data from LAMMPS

LAMMPS can output structured data with the `print` and `fix print` command. This gives you flexibility since you can build custom data formats that contain system properties, thermo data, and variables values. This output can be directed to the screen and/or to a file for post processing.

#### Writing the current system state, thermo data, variable values

Use the `print` command to output the current system state, which can include system properties, thermo data and variable values.

#### YAML

```
print ""---
timestep: $(step)
pe: $(pe)
ke: $(ke)
..."" file current_state.yaml screen no
```

Listing 1: current\_state.yaml

```
---
timestep: 250
pe: -4.7774327356321810711
ke: 2.4962152903997174569
```

## JSON

```
print """{
  "timestep": $(step),
  "pe": $(pe),
  "ke": $(ke)
}""" file current_state.json screen no
```

Listing 2: current\_state.json

```
{
  "timestep": 250,
  "pe": -4.7774327356321810711,
  "ke": 2.4962152903997174569
}
```

## YAML format thermo\_style output

## Extracting data from log file

New in version 24Mar2022.

LAMMPS supports the thermo style “yaml” and for “custom” style thermodynamic output the format can be changed to YAML with *thermo\_modify line yaml*. This will produce a block of output in a compact YAML format - one “document” per run - of the following style:

```
---
keywords: ['Step', 'Temp', 'E_pair', 'E_mol', 'TotEng', 'Press', ]
data:
- [100, 0.757453103239935, -5.7585054860159, 0, -4.62236133677021, 0.207261053624721, ]
- [110, 0.759322359337036, -5.7614668389562, 0, -4.62251889318624, 0.194314975399602, ]
- [120, 0.759372342462676, -5.76149365656489, 0, -4.62247073844943, 0.191600048851267, ]
↵]
- [130, 0.756833027516501, -5.75777334823494, 0, -4.62255928350835, 0.208792327853067, ]
↵]
...

```

This data can be extracted and parsed from a log file using python with:

```
import re, yaml
try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\.\.\.$| - \[.*\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))
```

(continues on next page)

(continued from previous page)

```
print("Number of runs: ", len(thermo))
print(thermo[1]['keywords'][4], ' = ', thermo[1]['data'][2][4])
```

After loading the YAML data, *thermo* is a list containing a dictionary for each “run” where the tag “keywords” maps to the list of thermo header strings and the tag “data” has a list of lists where the outer list represents the lines of output and the inner list the values of the columns matching the header keywords for that step. The second print() command for example will print the header string for the fifth keyword of the second run and the corresponding value for the third output line of that run:

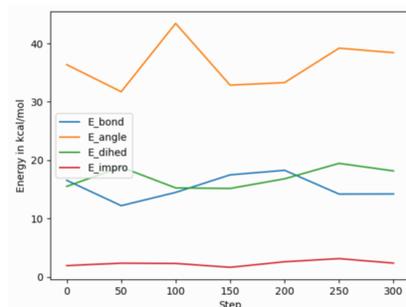

```
Number of runs: 2
TotEng = -4.62140097780047
```

New in version 4May2022.

YAML format output has been added to multiple commands in LAMMPS, for example *dump yaml* or *fix ave/time*. Depending on the kind of data being written, organization of the data or the specific syntax used may change, but the principles are very similar and all files should be readable with a suitable YAML parser.

### Processing scalar data with Python

After reading and parsing the YAML format data, it can be easily imported for further processing and visualization with the *pandas* and *matplotlib* Python modules. Because of the organization of the data in the YAML format thermo output, it needs to be told to process only the ‘data’ part of the imported data to create a pandas data frame, and one needs to set the column names from the ‘keywords’ entry. The following Python script code example demonstrates this, and creates the image shown on the right of a simple plot of various bonded energy contributions versus the timestep from a run of the ‘peptide’ example input after changing the *thermo style* to ‘yaml’. The properties to be used for x and y values can be conveniently selected through the keywords. Please note that those keywords can be changed to custom strings with the *thermo\_modify colname* command.

```
import re, yaml
import pandas as pd
import matplotlib.pyplot as plt

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\.\.\.\$| - \[.*\])", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

df = pd.DataFrame(data=thermo[0]['data'], columns=thermo[0]['keywords'])
```

(continues on next page)

(continued from previous page)

```
fig = df.plot(x='Step', y=['E_bond', 'E_angle', 'E_dihed', 'E_impro'], ylabel='Energy in_
↳kcal/mol')
plt.savefig('thermo_bondeng.png')
```

## Processing vector data with Python

Global *vector* data as produced by *fix ave/time* uses a slightly different organization of the data. You still have the dictionary keys ‘keywords’ and ‘data’ for the column headers and the data. But the data is a dictionary indexed by the time step and for each step there are multiple rows of values each with a list of the averaged properties. This requires a slightly different processing, since the entire data cannot be directly imported into a single pandas DataFrame class instance. The following Python script example demonstrates how to read such data. The result will combine the data for the different steps into one large “multi-index” table. The pandas IndexSlice class can then be used to select data from this combined data frame.

```
import yaml
import pandas as pd

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

with open("ave.yaml") as f:
    ave = yaml.load(f, Loader=Loader)

keys = ave['keywords']
df = {}
for k in ave['data'].keys():
    df[k] = pd.DataFrame(data=ave['data'][k], columns=keys)

# create multi-index data frame
df = pd.concat(df)

# output only the first 3 value for steps 200 to 300 of the column Pressure
idx = pd.IndexSlice
print(df['Pressure'].loc[idx[200:300, 0:2]])
```

## Processing scalar data with Perl

The ease of processing YAML data is not limited to Python. Here is an example for extracting and processing a LAMMPS log file with Perl instead.

```
use YAML::XS;

open(LOG, "log.lammps") or die("could not open log.lammps: $!");
my $file = "";
while(my $line = <LOG>) {
    if ($line =~ /^(keywords:.*$|data:$|---$|\.\.\.$| - \[.*\]$)/) {
        $file .= $line;
    }
}
```

(continues on next page)

(continued from previous page)

```

    }
  }
close(LOG);

# convert YAML to perl as nested hash and array references
my $thermo = Load $file;

# convert references to real arrays
my @keywords = @{$thermo->{'keywords'}};
my @data = @{$thermo->{'data'}};

# print first two columns
print("$keywords[0] $keywords[1]\n");
foreach (@data) {
    print("${$_}[0] ${$_}[1]\n");
}

```

### Writing continuous data during a simulation

The *fix print* command allows you to output an arbitrary string at defined times during a simulation run.

### YAML

```

fix extra all print 50 ""
- timestep: $(step)
  pe: $(pe)
  ke: $(ke)"" file output.yaml screen no

```

Listing 3: output.yaml

```

# Fix print output for fix extra
- timestep: 0
  pe: -6.77336805325924729
  ke: 4.49887500000000026219

- timestep: 50
  pe: -4.8082494418323200591
  ke: 2.5257981827119797558

- timestep: 100
  pe: -4.7875608875581505686
  ke: 2.5062598821985102582

- timestep: 150
  pe: -4.7471033686005483787
  ke: 2.466095925545450207

- timestep: 200
  pe: -4.7509052858544134068

```

(continues on next page)

(continued from previous page)

```

ke: 2.4701136792591693592
- timestep: 250
  pe: -4.7774327356321810711
  ke: 2.4962152903997174569

```

Post-processing of YAML files can be easily be done with Python and other scripting languages. In case of Python the *yaml* package allows you to load the data files and obtain a list of dictionaries.

```

import yaml

with open("output.yaml") as f:
    data = yaml.load(f, Loader=yaml.FullLoader)

print(data)

```

```

[{'timestep': 0, 'pe': -6.773368053259247, 'ke': 4.4988750000000003}, {'timestep': 50, 'pe'
↪ ': -4.80824944183232, 'ke': 2.5257981827119798}, {'timestep': 100, 'pe': -4.
↪ 787560887558151, 'ke': 2.5062598821985103}, {'timestep': 150, 'pe': -4.747103368600548,
↪ 'ke': 2.46609592554545}, {'timestep': 200, 'pe': -4.750905285854413, 'ke': 2.
↪ 4701136792591694}, {'timestep': 250, 'pe': -4.777432735632181, 'ke': 2.
↪ 4962152903997175}]

```

## Line Delimited JSON (LD-JSON)

The JSON format itself is very strict when it comes to delimiters. For continuous output/streaming data it is beneficial use the *line delimited JSON* format. Each line represents one JSON object.

```

fix extra all print 50 """"{"timestep": $(step), "pe": $(pe), "ke": $(ke)}"""" title ""_
↪file output.json screen no

```

Listing 4: output.json

```

{"timestep": 0, "pe": -6.77336805325924729, "ke": 4.49887500000000026219}
{"timestep": 50, "pe": -4.8082494418323200591, "ke": 2.5257981827119797558}
{"timestep": 100, "pe": -4.7875608875581505686, "ke": 2.5062598821985102582}
{"timestep": 150, "pe": -4.7471033686005483787, "ke": 2.466095925545450207}
{"timestep": 200, "pe": -4.7509052858544134068, "ke": 2.4701136792591693592}
{"timestep": 250, "pe": -4.7774327356321810711, "ke": 2.4962152903997174569}

```

One simple way to load this data into a Python script is to use the *pandas* package. It can directly load these files into a data frame:

```

import pandas as pd

data = pd.read_json('output.json', lines=True)
print(data)

```

	timestep	pe	ke
0	0	-6.773368	4.498875

(continues on next page)

(continued from previous page)

1	50	-4.808249	2.525798
2	100	-4.787561	2.506260
3	150	-4.747103	2.466096

## 8.4 Force fields howto

### 8.4.1 CHARMM, AMBER, COMPASS, and DREIDING force fields

A force field has 2 parts: the formulas that define it and the coefficients used for a particular system. Here we only discuss formulas implemented in LAMMPS that correspond to formulas commonly used in the CHARMM, AMBER, COMPASS, and DREIDING force fields. Setting coefficients is done either from special sections in an input data file via the *read\_data* command or in the input script with commands like *pair\_coeff* or *bond\_coeff* and so on. See the *Tools* doc page for additional tools that can use CHARMM, AMBER, or Materials Studio generated files to assign force field coefficients and convert their output into LAMMPS input.

See (*MacKerell*) for a description of the CHARMM force field. See (*Cornell*) for a description of the AMBER force field. See (*Sun*) for a description of the COMPASS force field.

The interaction styles listed below compute force field formulas that are consistent with common options in CHARMM or AMBER. See each command's documentation for the formula it computes.

- *bond\_style* harmonic
- *angle\_style* charmm
- *dihedral\_style* charmmfsh
- *dihedral\_style* charmm
- *pair\_style* lj/charmmfsw/coul/charmmfsh
- *pair\_style* lj/charmmfsw/coul/long
- *pair\_style* lj/charmm/coul/charmm
- *pair\_style* lj/charmm/coul/charmm/implicit
- *pair\_style* lj/charmm/coul/long
- *special\_bonds* charmm
- *special\_bonds* amber

---

**Note:** For CHARMM, newer *charmmfsw* or *charmmfsh* styles were released in March 2017. We recommend they be used instead of the older *charmm* styles. See discussion of the differences on the *pair charmm* and *dihedral charmm* doc pages.

---

COMPASS is a general force field for atomistic simulation of common organic molecules, inorganic small molecules, and polymers which was developed using ab initio and empirical parameterization techniques. See the *Tools* page for the *msi2lmp* tool for creating LAMMPS template input and data files from BIOVIA's Materials Studio files. Please note that the *msi2lmp* tool is very old and largely unmaintained, so it does not support all features of Materials Studio provided force field files, especially additions during the last decade. You should watch the output carefully and compare results, where possible. See (*Sun*) for a description of the COMPASS force field.

These interaction styles listed below compute force field formulas that are consistent with the COMPASS force field. See each command's documentation for the formula it computes.

- *bond\_style* class2
- *angle\_style* class2
- *dihedral\_style* class2
- *improper\_style* class2
- *pair\_style* lj/class2
- *pair\_style* lj/class2/coul/cut
- *pair\_style* lj/class2/coul/long
- *special\_bonds* lj/coul 0 0 1

DREIDING is a generic force field developed by the [Goddard group](#) at Caltech and is useful for predicting structures and dynamics of organic, biological and main-group inorganic molecules. The philosophy in DREIDING is to use general force constants and geometry parameters based on simple hybridization considerations, rather than individual force constants and geometric parameters that depend on the particular combinations of atoms involved in the bond, angle, or torsion terms. DREIDING has an *explicit hydrogen bond term* to describe interactions involving a hydrogen atom on very electronegative atoms (N, O, F).

See (*Mayo*) for a description of the DREIDING force field

The interaction styles listed below compute force field formulas that are consistent with the DREIDING force field. See each command's documentation for the formula it computes.

- *bond\_style* harmonic
- *bond\_style* morse
- *angle\_style* cosine/squared
- *angle\_style* harmonic
- *angle\_style* cosine
- *angle\_style* cosine/periodic
- *dihedral\_style* charmm
- *improper\_style* umbrella
- *pair\_style* buck
- *pair\_style* buck/coul/cut
- *pair\_style* buck/coul/long
- *pair\_style* lj/cut

## 8.4.2 AMOEBA and HIPPO force fields

The AMOEBA and HIPPO polarizable force fields were developed by Jay Ponder’s group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their [Tinker MD software](#).

The current implementation (July 2022) of AMOEBA in LAMMPS matches the version discussed in (*Ponder*), (*Ren*), and (*Shi*). Likewise the current implementation of HIPPO in LAMMPS matches the version discussed in (*Rackers*).

These force fields can be used when polarization effects are desired in simulations of water, organic molecules, and biomolecules including proteins, provided that parameterizations (Tinker PRM force field files) are available for the systems you are interested in. Files in the LAMMPS potentials directory with a “amoeba” or “hippo” suffix can be used. The Tinker distribution and website have additional force field files as well: <https://github.com/TinkerTools/tinker/tree/release/params>.

Note that currently, HIPPO can only be used for water systems, but HIPPO files for a variety of small organic and biomolecules are in preparation by the Ponder group. Those force field files will be included in the LAMMPS distribution when available.

To use the AMOEBA or HIPPO force fields, a simulation must be 3d, and fully periodic or fully non-periodic, and use an orthogonal (not triclinic) simulation box.

The AMOEBA and HIPPO force fields contain the following terms in their energy ( $U$ ) computation. Further details for AMOEBA equations are in (*Ponder*), further details for the HIPPO equations are in (*Rackers*).

$$\begin{aligned}
 U &= U_{intermolecular} + U_{intramolecular} \\
 U_{intermolecular} &= U_{hal} + U_{repulsion} + U_{dispersion} + U_{multipole} + U_{polar} + U_{q\dot{x}fer} \\
 U_{intramolecular} &= U_{bond} + U_{angle} + U_{torsion} + U_{oop} + U_{b\theta} + U_{UB} + U_{pitorsion} + U_{bitorsion}
 \end{aligned}$$

For intermolecular terms, the AMOEBA force field includes only the  $U_{hal}$ ,  $U_{multipole}$ ,  $U_{polar}$  terms. The HIPPO force field includes all but the  $U_{hal}$  term. In LAMMPS, these are all computed by the *pair\_style amoeba or hippo* command. Note that the  $U_{multipole}$  and  $U_{polar}$  terms in this formula are not the same for the AMOEBA and HIPPO force fields.

For intramolecular terms, the  $U_{bond}$ ,  $U_{angle}$ ,  $U_{torsion}$ ,  $U_{oop}$  terms are computed by the *bond\_style class2 angle\_style amoeba, dihedral\_style fourier*, and *improper\_style amoeba* commands respectively. The *angle\_style amoeba* command includes the  $U_{b\theta}$  bond-angle cross term, and the  $U_{UB}$  term for a Urey-Bradley bond contribution between the I,K atoms in the IJK angle.

The  $U_{pitorsion}$  term is computed by the *fix amoeba/pitorsion* command. It computes 6-body interaction between a pair of bonded atoms which each have 2 additional bond partners.

The  $U_{bitorsion}$  term is computed by the *fix amoeba/bitorsion* command. It computes 5-body interaction between two 4-body torsions (dihedrals) which overlap, having 3 atoms in common.

These command doc pages have additional details on the terms they compute:

- *pair\_style amoeba or hippo*
- *bond\_style class2*
- *angle\_style amoeba*

- *dihedral\_style fourier*
- *improper\_style amoeba*
- *fix amoeba/pitortion*
- *fix amoeba/bitortion*

To use the AMOEBA or HIPPO force fields in LAMMPS, use commands like the following appropriately in your input script. The only change needed for AMOEBA vs HIPPO simulation is for the *pair\_style* and *pair\_coeff* commands, as shown below. See examples/amoeba for example input scripts for both AMOEBA and HIPPO.

```

units                real                                # required

                    fix pit "pitortion types" "PiTorsion Coeffs" &
                    fix pit pitortions PiTortions &
                    fix bit bitortions BiTortions

pair_style           amoeba                            # AMOEBA FF
pair_coeff           * * amoeba_ubiquitin.prm amoeba_ubiquitin.key

pair_style           hippo                             # HIPPO FF
pair_coeff           * * hippo_water.prm hippo_water.key

special_bonds        lj/coul 0.5 0.5 0.5 one/five yes # 1-5 neighbors

```

The data file read by the *read\_data* command should be created by the tools/tinker/tinker2lmp.py conversion program described below. It will create a section in the data file with the header “Tinker Types”. A *fix property/atom* command for the data must be specified before the *read\_data* command. In the example above the fix ID is *amtype*.

Similarly, if the system you are simulating defines AMOEBA/HIPPO pitortion or bitortion interactions, there will be entries in the data file for those interactions. They require a *fix amoeba/pitortion* and *fix amoeba/bitortion* command to be defined. In the example above, the IDs for these two fixes are *pit* and *bit*.

Of course, if the system being modeled does not have one or more of the following – bond, angle, dihedral, improper, pitortion, bitortion interactions – then the corresponding style and fix commands above do not need to be used. See the example scripts in examples/amoeba for water systems as examples; they are simpler than what is listed above.

The two *fix property/atom* commands with IDs (in the example above) *extra* and *polaxe* are also needed to define internal per-atom quantities used by the AMOEBA and HIPPO force fields.

The *pair\_coeff* command used for either the AMOEBA or HIPPO force field takes two arguments for Tinker force field files, namely a PRM and KEY file. The keyfile can be specified as NULL and default values for a various settings will be used. Note that these 2 files are meant to allow use of native Tinker files as-is. However LAMMPS does not support all the options which can be included in a Tinker PRM or KEY file. See specifics below.

A *special\_bonds* command with the *one/five* option is required, since the AMOEBA/HIPPO force fields define weighting factors for not only 1-2, 1-3, 1-4 interactions, but also 1-5 interactions. This command will trigger a per-atom list of 1-5 neighbors to be generated. The AMOEBA and HIPPO force fields define their own custom weighting factors for all the 1-2, 1-3, 1-4, 1-5 terms which in the Tinker PRM and KEY files; they can be different for different terms in the force field.

In addition to the list above, these command doc pages have additional details:

- [\*atom\\_style amoeba\*](#)
  - [\*fix property/atom\*](#)
  - [\*special\\_bonds\*](#)
- 

Tinker PRM and KEY files

A Tinker PRM file is composed of sections, each of which has multiple lines. This is the list of PRM sections LAMMPS knows how to parse and use. Any other sections are skipped:

- Angle Bending Parameters
- Atom Type Definitions
- Atomic Multipole Parameters
- Bond Stretching Parameters
- Charge Penetration Parameters
- Charge Transfer Parameters
- Dipole Polarizability Parameters
- Dispersion Parameters
- Force Field Definition
- Literature References
- Out-of-Plane Bend Parameters
- Pauli Repulsion Parameters
- Pi-Torsion Parameters
- Stretch-Bend Parameters
- Torsion-Torsion Parameters
- Torsional Parameters
- Urey-Bradley Parameters
- Van der Waals Pair Parameters
- Van der Waals Parameters

A Tinker KEY file is composed of lines, each of which has a keyword followed by zero or more parameters. This is the list of keywords LAMMPS knows how to parse and use in the same manner Tinker does. Any other keywords are skipped. The value in parenthesis is the default value for the keyword if it is not specified, or if the keyfile in the *pair\_coeff* command is specified as NULL:

- a-axis (0.0)
- b-axis (0.0)
- c-axis (0.0)
- ctrn-cutoff (6.0)
- ctrn-taper (0.9 \* ctrn-cutoff)
- cutoff
- delta-halgren (0.07)
- dewald (no long-range dispersion unless specified)
- dewald-alpha (0.4)
- dewald-cutoff (7.0)
- dispersion-cutoff (9.0)
- dispersion-taper (9.0 \* dispersion-cutoff)
- dpme-grid
- dpme-order (4)
- ewald (no long-range electrostatics unless specified)
- ewald-alpha (0.4)
- ewald-cutoff (7.0)
- gamma-halgren (0.12)
- mpole-cutoff (9.0)
- mpole-taper (0.65 \* mpole-cutoff)
- pcg-guess (enabled by default)
- pcg-noguess (disable pcg-guess if specified)
- pcg-noprecond (disable pcg-precond if specified)
- pcg-peek (1.0)
- pcg-precond (enabled by default)
- pewald-alpha (0.4)
- pme-grid
- pme-order (5)
- polar-eps (1.0e-6)
- polar-iter (100)
- polar-predict (no prediction operation unless specified)
- ppme-order (5)
- repulsion-cutoff (6.0)

- repulsion-taper (0.9 \* repulsion-cutoff)
- taper
- usolve-cutoff (4.5)
- usolve-diag (2.0)
- vdw-cutoff (9.0)
- vdw-taper (0.9 \* vdw-cutoff)

### Tinker2lmp.py tool

This conversion tool is found in the tools/tinker directory. As shown in examples/amoeba/README, these commands produce the data files found in examples/amoeba, and also illustrate all the options available to use with the tinker2lmp.py script:

```
% python tinker2lmp.py -xyz water_dimer.xyz -amoeba amoeba_water.prm -data data.water_
↳dimer.amoeba           # AMOEBA non-periodic system
% python tinker2lmp.py -xyz water_dimer.xyz -hippo hippo_water.prm -data data.water_
↳dimer.hippo           # HIPPO non-periodic system
% python tinker2lmp.py -xyz water_box.xyz -amoeba amoeba_water.prm -data data.water_box.
↳amoeba -pbc 18.643 18.643 18.643 # AMOEBA periodic system
% python tinker2lmp.py -xyz water_box.xyz -hippo hippo_water.prm -data data.water_box.
↳hippo -pbc 18.643 18.643 18.643 # HIPPO periodic system
% python tinker2lmp.py -xyz ubiquitin.xyz -amoeba amoeba_ubiquitin.prm -data data.
↳ubiquitin.new -pbc 54.99 41.91 41.91 -bitorsion bitorsion.ubiquitin.data.new #
↳system with bitorsions
```

Switches and their arguments may be specified in any order.

The -xyz switch is required and specifies an input XYZ file as an argument. The format of this file is an extended XYZ format defined and used by Tinker for its input. Example \*.xyz files are in the examples/amoeba directory. The file lists the atoms in the system. Each atom has the following information: Tinker species name (ignored by LAMMPS), xyz coordinates, Tinker numeric type, and a list of atom IDs the atom is bonded to.

Here is more information about the extended XYZ format defined and used by Tinker, and links to programs that convert standard PDB files to the extended XYZ format:

- [http://openbabel.org/docs/current/FileFormats/Tinker\\_XYZ\\_format.html](http://openbabel.org/docs/current/FileFormats/Tinker_XYZ_format.html)
- <https://github.com/emleddin/pdbxyz-xyzpdb>
- <https://github.com/TinkerTools/tinker/blob/release/source/pdbxyz.f>

The -amoeba or -hippo switch is required. It specifies an input AMOEBA or HIPPO PRM force field file as an argument. This should be the same file used by the *pair\_style* command in the input script.

The -data switch is required. It specifies an output file name for the LAMMPS data file that will be produced.

For periodic systems, the -pbc switch is required. It specifies the periodic box size for each dimension (x,y,z). For a Tinker simulation these are specified in the KEY file.

The -bitorsion switch is only needed if the system contains Tinker bitorsion interactions. The data for each type of bitorsion interaction will be written to the specified file, and read by the *fix amoeba/bitorsion* command. The data includes 2d arrays of values to which splines are fit, and thus is not compatible with the LAMMPS data file format.

### 8.4.3 TIP3P water model

The TIP3P water model as implemented in CHARMM (*MacKerell*) specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the 3 atoms. In LAMMPS the *fix shake* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid TIP3P-CHARMM model with a cutoff. The K values can be used if a flexible TIP3P model (without fix shake) is desired. If the LJ epsilon and sigma for HH and OH are set to 0.0, it corresponds to the original 1983 TIP3P model (*Jorgensen*).

O mass = 15.9994  
H mass = 1.008  
O charge = -0.834  
H charge = 0.417  
LJ  $\epsilon$  of OO = 0.1521  
LJ  $\sigma$  of OO = 3.1507  
LJ  $\epsilon$  of HH = 0.0460  
LJ  $\sigma$  of HH = 0.4000  
LJ  $\epsilon$  of OH = 0.0836  
LJ  $\sigma$  of OH = 1.7753  
K of OH bond = 450  
 $r_0$  of OH bond = 0.9572  
K of HOH angle = 55  
 $\theta$  of HOH angle = 104.52°

These are the parameters to use for TIP3P with a long-range Coulomb solver (e.g. Ewald or PPPM in LAMMPS), see (*Price*) for details:

O mass = 15.9994  
H mass = 1.008  
O charge = -0.830  
H charge = 0.415  
LJ  $\epsilon$  of OO = 0.102  
LJ  $\sigma$  of OO = 3.188  
LJ  $\epsilon, \sigma$  of OH, HH = 0.0  
K of OH bond = 450  
 $r_0$  of OH bond = 0.9572  
K of HOH angle = 55  
 $\theta$  of HOH angle = 104.52°

Wikipedia also has a nice article on [water models](#).

**(Jorgensen)** Jorgensen, Chandrasekhar, Madura, Impey, Klein, J Chem Phys, 79, 926 (1983).

**(Price)** Price and Brooks, J Chem Phys, 121, 10096 (2004).

#### 8.4.4 TIP4P water model

The four-point TIP4P rigid water model extends the traditional three-point TIP3P model by adding an additional site, usually massless, where the charge associated with the oxygen atom is placed. This site M is located at a fixed distance away from the oxygen along the bisector of the HOH bond angle. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used.

A TIP4P model is run with LAMMPS using either this command for a cutoff model:

- `pair_style lj/cut/tip4p/cut`

or these two commands for a long-range model:

- `pair_style lj/cut/tip4p/long`
- `kspace_style ppm/tip4p`

For both models, the bond lengths and bond angles should be held fixed using the *fix shake* command.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid TIP4P model with a cutoff (*Jorgensen*). Note that the OM distance is specified in the *pair\_style* command, not as part of the pair coefficients.

```
O mass = 15.9994
H mass = 1.008
O charge = -1.040
H charge = 0.520
r0 of OH bond = 0.9572
θ of HOH angle = 104.52°
OM distance = 0.15
LJ ε of O-O = 0.1550
LJ σ of O-O = 3.1536
LJ ε, σ of OH, HH = 0.0
Coulomb cutoff = 8.5
```

For the TIP4/Ice model (J Chem Phys, 122, 234511 (2005); <https://doi.org/10.1063/1.1931662>) these values can be used:

```
O mass = 15.9994
H mass = 1.008
O charge = -1.1794
```

H charge = 0.5897  
 $r_0$  of OH bond = 0.9572  
 $\theta$  of HOH angle = 104.52°  
OM distance = 0.1577  
LJ  $\epsilon$  of O-O = 0.21084  
LJ  $\sigma$  of O-O = 3.1668  
LJ  $\epsilon$ ,  $\sigma$  of OH, HH = 0.0  
Coulomb cutoff = 8.5

For the TIP4P/2005 model (J Chem Phys, 123, 234505 (2005); <https://doi.org/10.1063/1.2121687>), these values can be used:

O mass = 15.9994  
H mass = 1.008  
O charge = -1.1128  
H charge = 0.5564  
 $r_0$  of OH bond = 0.9572  
 $\theta$  of HOH angle = 104.52°  
OM distance = 0.1546  
LJ  $\epsilon$  of O-O = 0.1852  
LJ  $\sigma$  of O-O = 3.1589  
LJ  $\epsilon$ ,  $\sigma$  of OH, HH = 0.0  
Coulomb cutoff = 8.5

These are the parameters to use for TIP4P with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS):

O mass = 15.9994  
H mass = 1.008  
O charge = -1.0484  
H charge = 0.5242  
 $r_0$  of OH bond = 0.9572  
 $\theta$  of HOH angle = 104.52°  
OM distance = 0.1250  
LJ  $\epsilon$  of O-O = 0.16275  
LJ  $\sigma$  of O-O = 3.16435  
LJ  $\epsilon$ ,  $\sigma$  of OH, HH = 0.0

Note that when using the TIP4P pair style, the neighbor list cutoff for Coulomb interactions is effectively extended by a distance  $2 * (\text{OM distance})$ , to account for the offset distance of the fictitious charges on O atoms in water molecules. Thus it is typically best in an efficiency sense to use a LJ cutoff  $\geq$  Coulomb cutoff +  $2 * (\text{OM distance})$ , to shrink the size of the neighbor list. This leads to slightly larger cost for the long-range calculation, so you can test the trade-off for your model. The OM distance and the LJ and Coulombic cutoffs are set in the *pair\_style lj/cut/tip4p/long* command.

Wikipedia also has a nice article on [water models](#).

---

(**Jorgensen**) Jorgensen, Chandrasekhar, Madura, Impey, Klein, J Chem Phys, 79, 926 (1983).

### 8.4.5 SPC water model

The SPC water model specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the 3 atoms. In LAMMPS the *fix shake* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid SPC model.

O mass = 15.9994  
H mass = 1.008  
O charge = -0.820  
H charge = 0.410  
LJ  $\epsilon$  of OO = 0.1553  
LJ  $\sigma$  of OO = 3.166  
LJ  $\epsilon$ ,  $\sigma$  of OH, HH = 0.0  
 $r_0$  of OH bond = 1.0  
 $\theta_0$  of HOH angle = 109.47°

Note that as originally proposed, the SPC model was run with a 9 Angstrom cutoff for both LJ and Coulomb terms. It can also be used with long-range electrostatic solvers (e.g. Ewald or PPPM in LAMMPS) without changing any of the parameters above, although it becomes a different model in that mode of usage.

The SPC/E (extended) water model is the same, except the partial charge assignments change:

O charge = -0.8476  
H charge = 0.4238

See the (*Berendsen*) reference for more details on both the SPC and SPC/E models.

Wikipedia also has a nice article on [water models](#).

## 8.5 Packages howto

### 8.5.1 Finite-size spherical and aspherical particles

Typical MD models treat atoms or particles as point masses. Sometimes it is desirable to have a model with finite-size particles such as spheroids or ellipsoids or generalized aspherical bodies. The difference is that such particles have a moment of inertia, rotational energy, and angular momentum. Rotation is induced by torque coming from interactions with other particles.

LAMMPS has several options for running simulations with these kinds of particles. The following aspects are discussed in turn:

- atom styles
- pair potentials
- time integration
- computes, thermodynamics, and dump output
- rigid bodies composed of finite-size particles

Example input scripts for these kinds of models are in the `body`, `colloid`, `dipole`, `ellipse`, `line`, `peri`, `pour`, and `tri` directories of the *examples directory* in the LAMMPS distribution.

#### Atom styles

There are several *atom styles* that allow for definition of finite-size particles: `sphere`, `dipole`, `ellipsoid`, `line`, `tri`, `peri`, and `body`.

The `sphere` style defines particles that are spheroids and each particle can have a unique diameter and mass (or density). These particles store an angular velocity ( $\omega$ ) and can be acted upon by torque. The “set” command can be used to modify the diameter and mass of individual particles, after then are created.

The `dipole` style does not actually define finite-size particles, but is often used in conjunction with spherical particles, via a command like

```
atom_style hybrid sphere dipole
```

This is because when dipoles interact with each other, they induce torques, and a particle must be finite-size (i.e. have a moment of inertia) in order to respond and rotate. See the *atom\_style dipole* command for details. The “set” command can be used to modify the orientation and length of the dipole moment of individual particles, after then are created.

The `ellipsoid` style defines particles that are ellipsoids and thus can be aspherical. Each particle has a shape, specified by 3 diameters, and mass (or density). These particles store an angular momentum and their orientation (quaternion), and can be acted upon by torque. They do not store an angular velocity ( $\omega$ ), which can be in a different direction than angular momentum, rather they compute it as needed. The “set” command can be used to modify the diameter, orientation, and mass of individual particles, after then are created. It also has a brief explanation of what quaternions are.

The `line` style defines line segment particles with two end points and a mass (or density). They can be used in 2d simulations, and they can be joined together to form rigid bodies which represent arbitrary polygons.

The `tri` style defines triangular particles with three corner points and a mass (or density). They can be used in 3d simulations, and they can be joined together to form rigid bodies which represent arbitrary particles with a triangulated surface.

The `peri` style is used with *Peridynamic models* and defines particles as having a volume, that is used internally in the *pair\_style peri* potentials.

The body style allows for definition of particles which can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. The body style is discussed in more detail on the *Howto body* doc page.

Note that if one of these atom styles is used (or multiple styles via the *atom\_style hybrid* command), not all particles in the system are required to be finite-size or aspherical.

For example, in the ellipsoid style, if the 3 shape parameters are set to the same value, the particle will be a sphere rather than an ellipsoid. If the 3 shape parameters are all set to 0.0 or if the diameter is set to 0.0, it will be a point particle. In the line or tri style, if the lineflag or triflag is specified as 0, then it will be a point particle.

Some of the pair styles used to compute pairwise interactions between finite-size particles also compute the correct interaction with point particles as well, e.g. the interaction between a point particle and a finite-size particle or between two point particles. If necessary, *pair\_style hybrid* can be used to insure the correct interactions are computed for the appropriate style of interactions. Likewise, using groups to partition particles (ellipsoids versus spheres versus point particles) will allow you to use the appropriate time integrators and temperature computations for each class of particles. See the doc pages for various commands for details.

Also note that for *2d simulations*, atom styles sphere and ellipsoid still use 3d particles, rather than as circular disks or ellipses. This means they have the same moment of inertia as the 3d object. When temperature is computed, the correct degrees of freedom are used for rotation in a 2d versus 3d system.

## Pair potentials

When a system with finite-size particles is defined, the particles will only rotate and experience torque if the force field computes such interactions. These are the various *pair styles* that generate torque:

- *pair\_style gran/history*
- *pair\_style gran/hertz*
- *pair\_style gran/no\_history*
- *pair\_style dipole/cut*
- *pair\_style gayberne*
- *pair\_style resquared*
- *pair\_style brownian*
- *pair\_style lubricate*
- *pair\_style line/lj*
- *pair\_style tri/lj*
- *pair\_style body/nparticle*

The granular pair styles are used with spherical particles. The dipole pair style is used with the dipole atom style, which could be applied to spherical or ellipsoidal particles. The GayBerne and REsquared potentials require ellipsoidal particles, though they will also work if the 3 shape parameters are the same (a sphere). The Brownian and lubrication potentials are used with spherical particles. The line, tri, and body potentials are used with line segment, triangular, and body particles respectively.

## Time integration

There are several fixes that perform time integration on finite-size spherical particles, meaning the integrators update the rotational orientation and angular velocity or angular momentum of the particles:

- *fix nve/sphere*
- *fix nvt/sphere*
- *fix npt/sphere*

Likewise, there are 3 fixes that perform time integration on ellipsoidal particles:

- *fix nve/asphere*
- *fix nvt/asphere*
- *fix npt/asphere*

The advantage of these fixes is that those which thermostat the particles include the rotational degrees of freedom in the temperature calculation and thermostatting. The *fix langevin* command can also be used with its *omega* or *angmom* options to thermostat the rotational degrees of freedom for spherical or ellipsoidal particles. Other thermostatting fixes only operate on the translational kinetic energy of finite-size particles.

These fixes perform constant NVE time integration on line segment, triangular, and body particles:

- *fix nve/line*
- *fix nve/tri*
- *fix nve/body*

Note that for mixtures of point and finite-size particles, these integration fixes can only be used with *groups* which contain finite-size particles.

## Computes, thermodynamics, and dump output

There are several computes that calculate the temperature or rotational energy of spherical or ellipsoidal particles:

- *compute temp/sphere*
- *compute temp/asphere*
- *compute erotate/sphere*
- *compute erotate/asphere*

These include rotational degrees of freedom in their computation. If you wish the thermodynamic output of temperature or pressure to use one of these computes (e.g. for a system entirely composed of finite-size particles), then the compute can be defined and the *thermo\_modify* command used. Note that by default thermodynamic quantities will be calculated with a temperature that only includes translational degrees of freedom. See the *thermo\_style* command for details.

These commands can be used to output various attributes of finite-size particles:

- *dump custom*
- *compute property/atom*
- *dump local*
- *compute body/local*

Attributes include the dipole moment, the angular velocity, the angular momentum, the quaternion, the torque, the end-point and corner-point coordinates (for line and tri particles), and sub-particle attributes of body particles.

## Rigid bodies composed of finite-size particles

The *fix rigid* command treats a collection of particles as a rigid body, computes its inertia tensor, sums the total force and torque on the rigid body each timestep due to forces on its constituent particles, and integrates the motion of the rigid body.

If any of the constituent particles of a rigid body are finite-size particles (spheres or ellipsoids or line segments or triangles), then their contribution to the inertia tensor of the body is different than if they were point particles. This means the rotational dynamics of the rigid body will be different. Thus a model of a dimer is different if the dimer consists of two point masses versus two spheroids, even if the two particles have the same mass. Finite-size particles that experience torque due to their interaction with other particles will also impart that torque to a rigid body they are part of.

See the “fix rigid” command for example of complex rigid-body models it is possible to define in LAMMPS.

Note that the *fix shake* command can also be used to treat 2, 3, or 4 particles as a rigid body, but it always assumes the particles are point masses.

Also note that body particles cannot be modeled with the *fix rigid* command. Body particles are treated by LAMMPS as single particles, though they can store internal state, such as a list of sub-particles. Individual body particles are typically treated as rigid bodies, and their motion integrated with a command like *fix nve/body*. Interactions between pairs of body particles are computed via a command like *pair\_style body/nparticle*.

### 8.5.2 Granular models

Granular system are composed of spherical particles with a diameter, as opposed to point particles. This means they have an angular velocity and torque can be imparted to them to cause them to rotate.

To run a simulation of a granular model, you will want to use the following commands:

- *atom\_style sphere*
- *fix nve/sphere*
- *fix gravity*

This compute

- *compute erotate/sphere*

calculates rotational kinetic energy which can be *output with thermodynamic info*. The compute

- *compute fabric*

calculates various versions of the fabric tensor for granular and non-granular pair styles.

Use one of these 4 pair potentials, which compute forces and torques between interacting pairs of particles:

- *pair\_style gran/history*
- *pair\_style gran/no\_history*
- *pair\_style gran/hertzian*
- *pair\_style granular*

These commands implement fix options specific to granular systems:

- *fix freeze*
- *fix pour*
- *fix viscous*

- *fix wall/gran*
- *fix wall/gran/region*

The fix style *freeze* zeroes both the force and torque of frozen atoms, and should be used for granular system instead of the fix style *setforce*.

For computational efficiency, you can eliminate needless pairwise computations between frozen atoms by using this command:

- *neigh\_modify* exclude

---

**Note:** By default, for 2d systems, granular particles are still modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be the same as in 3d. If you wish to model granular particles in 2d as 2d discs, see the note on this topic on the [Howto 2d](#) doc page, where 2d simulations are discussed.

---

### 8.5.3 Body particles

#### Overview:

In LAMMPS, body particles are generalized finite-size particles. Individual body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. Note that other kinds of finite-size spherical and aspherical particles are also supported by LAMMPS, such as spheres, ellipsoids, line segments, and triangles, but they are simpler entities than body particles. See the [Howto spherical](#) page for a general overview of all these particle types.

Body particles are used via the *atom\_style body* command. It takes a body style as an argument. The current body styles supported by LAMMPS are as follows. The name in the first column is used as the *bstyle* argument for the *atom\_style body* command.

<i>nparticle</i>	rigid body with N sub-particles
<i>rounded/polygon</i>	2d polygons with N vertices
<i>rounded/polyhedron</i>	3d polyhedra with N vertices, E edges and F faces

The body style determines what attributes are stored for each body and thus how they can be used to compute pairwise body/body or bond/non-body (point particle) interactions. More details of each style are described below.

More styles may be added in the future. See the [page on creating new body styles](#) for details on how to add a new body style to the code.

---

#### When to use body particles:

You should not use body particles to model a rigid body made of simpler particles (e.g. point, sphere, ellipsoid, line segment, triangular particles), if the interaction between pairs of rigid bodies is just the summation of pairwise interactions between the simpler particles. LAMMPS already supports this kind of model via the *fix rigid* command. Any of the numerous pair styles that compute interactions between simpler particles can be used. The *fix rigid* command time integrates the motion of the rigid bodies. All of the standard LAMMPS commands for thermostating, adding constraints, performing output, etc will operate as expected on the simple particles.

By contrast, when body particles are used, LAMMPS treats an entire body as a single particle for purposes of computing pairwise interactions, building neighbor lists, migrating particles between processors, output of particles to a dump file, etc. This means that interactions between pairs of bodies or between a body and non-body (point) particle need to be encoded in an appropriate pair style. If such a pair style were to mimic the *fix rigid* model, it would need to loop over the entire collection of interactions between pairs of simple particles within the two bodies, each time a single body/body interaction was computed.

Thus it only makes sense to use body particles and develop such a pair style, when particle/particle interactions are more complex than what the *fix rigid* command can already calculate. For example, consider particles with one or more of the following attributes:

- represented by a surface mesh
- represented by a collection of geometric entities (e.g. planes + spheres)
- deformable
- internal stress that induces fragmentation

For these models, the interaction between pairs of particles is likely to be more complex than the summation of simple pairwise interactions. An example is contact or frictional forces between particles with planar surfaces that interpenetrate. Likewise, the body particle may store internal state, such as a stress tensor used to compute a fracture criterion.

These are additional LAMMPS commands that can be used with body particles of different styles

<i>fix nve/body</i>	integrate motion of a body particle in NVE ensemble
<i>fix nvt/body</i>	ditto for NVT ensemble
<i>fix npt/body</i>	ditto for NPT ensemble
<i>fix nph/body</i>	ditto for NPH ensemble
<i>compute body/local</i>	store sub-particle attributes of a body particle
<i>compute temp/body</i>	compute temperature of body particles
<i>dump local</i>	output sub-particle attributes of a body particle
<i>dump image</i>	output body particle attributes as an image

The pair styles defined for use with specific body styles are listed in the sections below.

### Specifics of body style *nparticle*:

The *nparticle* body style represents body particles as a rigid body with a variable number  $N$  of sub-particles. It is provided as a vanilla, prototypical example of a body particle, although as mentioned above, the *fix rigid* command already duplicates its functionality.

The *atom\_style* body command for this body style takes two additional arguments:

```
atom_style body nparticle Nmin Nmax
Nmin = minimum # of sub-particles in any body in the system
Nmax = maximum # of sub-particles in any body in the system
```

The  $Nmin$  and  $Nmax$  arguments are used to bound the size of data structures used internally by each particle.

When the *read\_data* command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixz iyz
x1 y1 z1
...
xN yN zN
```

where  $M = 6 + 3*N$ , and  $N$  is the number of sub-particles in the body particle.

The integer line has a single value  $N$ . The floating point line(s) list 6 moments of inertia followed by the coordinates of the  $N$  sub-particles ( $x_1$  to  $z_N$ ) as  $3N$  values. These values can be listed on as many lines as you wish; see the [read\\_data](#) command for more details.

The 6 moments of inertia ( $ixx,iyy,izz,ixy,ixz,iyz$ ) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally. The coordinates of each sub-particle are specified as its  $x,y,z$  displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the  $x,y,z$  values in the *Atoms* section of the data file, as is the total mass of the body particle.

The [pair\\_style body/nparticle](#) command can be used with this body style to compute body/body and body/non-body interactions.

---

### Specifics of body style rounded/polygon:

The *rounded/polygon* body style represents body particles as a 2d polygon with a variable number of  $N$  vertices. This style can only be used for 2d models; see the [boundary](#) command. See the “[pair\\_style body/rounded/polygon](#)” page for a diagram of two squares with rounded circles at the vertices. Special cases for  $N = 1$  (circle) and  $N = 2$  (rod with rounded ends) can also be specified.

One use of this body style is for 2d discrete element models, as described in [Fraige](#).

Similar to body style *nparticle*, the `atom_style` body command for this body style takes two additional arguments:

```
atom_style body rounded/polygon Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The  $Nmin$  and  $Nmax$  arguments are used to bound the size of data structures used internally by each particle.

When the [read\\_data](#) command reads a data file for this body style, the following information must be provided for each body in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
diameter
```

where  $M = 6 + 3*N + 1$ , and  $N$  is the number of vertices in the body particle.

The integer line has a single value  $N$ . The floating point line(s) list 6 moments of inertia, followed by the coordinates of the  $N$  vertices ( $x_1$  to  $z_N$ ) as  $3N$  values (with  $z = 0.0$  for each), followed by a diameter value = the rounded diameter of the circle that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the [read\\_data](#) command for more details.

---

**Note:** It is important that the vertices for each polygonal body particle be listed in order around its perimeter, so that edges can be inferred. LAMMPS does not check that this is the case.

---

The 6 moments of inertia ( $ixx,iyy,izz,ixy,ixz,iyz$ ) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally. The coordinates of each

vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a square particle whose edge length is  $\sqrt{2}$  and rounded diameter is 1.0. The orientation of the square is aligned with the xy coordinate axes which is consistent with the 6 moments of inertia:  $ixx\ iyy\ izz\ ixy\ ixz\ iyz = 1\ 1\ 4\ 0\ 0\ 0$ . Note that only *Izz* matters in 2D simulations.

```
3 1 19
4
1 1 4 0 0 0
-0.7071 -0.7071 0
-0.7071 0.7071 0
0.7071 0.7071 0
0.7071 -0.7071 0
1.0
```

A rod in 2D, whose length is 4.0, mass 1.0, rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 1 13
2
1 1 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A disk, whose diameter is 3.0, mass 1.0, is specified as follows:

```
1 1 10
1
1 1 4.5 0 0 0
0 0 0
3.0
```

The *pair\_style body/rounded/polygon* command can be used with this body style to compute body/body interactions. The *fix wall/body/polygon* command can be used with this body style to compute the interaction of body particles with a wall.

### Specifics of body style rounded/polyhedron:

The *rounded/polyhedron* body style represents body particles as a 3d polyhedron with a variable number of *N* vertices, *E* edges and *F* faces. This style can only be used for 3d models; see the *boundary* command. See the “pair\_style body/rounded/polygon” page for a diagram of a two 2d squares with rounded circles at the vertices. A 3d cube with rounded spheres at the 8 vertices and 12 rounded edges would be similar. Special cases for *N* = 1 (sphere) and *N* = 2 (rod with rounded ends) can also be specified.

This body style is for 3d discrete element models, as described in *Wang*.

Similar to body style *rounded/polygon*, the *atom\_style body* command for this body style takes two additional arguments:

```
atom_style body rounded/polyhedron Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The *Nmin* and *Nmax* arguments are used to bound the size of data structures used internally by each particle.

When the `read_data` command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```
atom-ID 3 M
N E F
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
0 1
1 2
2 3
...
0 1 2 -1
0 2 3 -1
...
1 2 3 4
diameter
```

where  $M = 6 + 3*N + 2*E + 4*F + 1$ , and  $N$  is the number of vertices in the body particle,  $E$  = number of edges,  $F$  = number of faces. For  $N = 1$  or  $2$ , the format is simpler.  $E$  and  $F$  are ignored and no edges or faces are listed, so that  $M = 6 + 3*N + 1$ .

The integer line has three values: number of vertices ( $N$ ), number of edges ( $E$ ) and number of faces ( $F$ ). The floating point line(s) list 6 moments of inertia followed by the coordinates of the  $N$  vertices ( $x1$  to  $zN$ ) as  $3N$  values, followed by  $2N$  vertex indices corresponding to the end points of the  $E$  edges, then  $4*F$  vertex indices defining  $F$  faces. The last value is the diameter value = the rounded diameter of the sphere that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the `read_data` command for more details.

Note that vertices are numbered from 0 to  $N-1$  inclusive. The order of the 2 vertices in each edge does not matter. Faces can be triangles or quadrilaterals. In both cases 4 vertices must be specified. For a triangle the 4th vertex is -1. The 4 vertices within each triangle or quadrilateral face should be ordered by the right-hand rule so that the normal vector of the face points outwards from the center of mass. For polyhedron with faces with more than 4 vertices, you should split the complex face into multiple simple faces, each of which is a triangle or quadrilateral.

**Note:** If a face is a quadrilateral then its 4 vertices must be co-planar. LAMMPS does not check that this is the case. If you have a quad-face of a polyhedron that is not planar (e.g. a cube whose vertices have been randomly displaced), then you should represent the single quad face as two triangle faces instead.

The 6 moments of inertia ( $ixx,iyy,izz,ixy,ixz,iyz$ ) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box  $XYZ$  axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally. The coordinates of each vertex are specified as its  $x,y,z$  displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the  $x,y,z$  values in the *Atoms* section of the data file.

For example, the following information would specify a cubic particle whose edge length is 2.0 and rounded diameter is 0.5. The orientation of the cube is aligned with the  $xyz$  coordinate axes which is consistent with the 6 moments of inertia:  $ixx iyy izz ixy ixz iyz = 0.667 0.667 0.667 0 0 0$ .

```
1 3 79

```

A sphere whose diameter is 3.0 and mass 1.0, is specified as follows:

```

1 3 10
1 1 1
0.9 0.9 0.9 0 0 0
0 0 0
3.0

```

The number of edges and faces for a rod or sphere must be listed, but is ignored.

The *pair\_style body/rounded/polhedron* command can be used with this body style to compute body/body interactions. The *fix wall/body/polyhedron* command can be used with this body style to compute the interaction of body particles with a wall.

### Output specifics for all body styles:

For the *compute body/local* and *dump local* commands, all 3 of the body styles described on this page produces one datum for each of the N vertices (of sub-particles) in a body particle. The datum has 3 values:

1 = x position of vertex (or sub-particle) 2 = y position of vertex 3 = z position of vertex
--

These values are the current position of the vertex within the simulation domain, not a displacement from the center-of-mass (COM) of the body particle itself. These values are calculated using the current COM and orientation of the body particle.

The *dump image* command and its *body* keyword can be used to render body particles.

For the *nparticle* body style, each body is drawn as a collection of spheres, one for each sub-particle. The size of each sphere is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

For the *rounded/polygon* body style, each body is drawn as a polygon with N line segments. For the *rounded/polyhedron* body style, each face of each body is drawn as a polygon with N line segments. The drawn diameter of each line segment is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

Note that for both the *rounded/polygon* and *rounded/polyhedron* styles, line segments are drawn between the pairs of vertices. Depending on the diameters of the line segments this may be slightly different than the physical extent of the body as calculated by the *pair\_style rounded/polygon* or *pair\_style rounded/polyhedron* commands. Conceptually, the pair styles define the surface of a 2d or 3d body by lines or planes that are tangent to the finite-size spheres of specified diameter which are placed on each vertex position.

## 8.5.4 Polarizable models

In polarizable force fields the charge distributions in molecules and materials respond to their electrostatic environments. Polarizable systems can be simulated in LAMMPS using three methods:

- the fluctuating charge method, implemented in the *QEQ* package,
- the adiabatic core-shell method, implemented in the *CORESHELL* package,
- the thermalized Drude dipole method, implemented in the *DRUDE* package.

The fluctuating charge method calculates instantaneous charges on interacting atoms based on the electronegativity equalization principle. It is implemented in the *fix qeq* which is available in several variants. It is a relatively efficient technique since no additional particles are introduced. This method allows for charge transfer between molecules or atom groups. However, because the charges are located at the interaction sites, off-plane components of polarization cannot be represented in planar molecules or atom groups.

The two other methods share the same basic idea: polarizable atoms are split into one core atom and one satellite particle (called shell or Drude particle) attached to it by a harmonic spring. Both atoms bear a charge and they represent collectively an induced electric dipole. These techniques are computationally more expensive than the QEq method because of additional particles and bonds. These two charge-on-spring methods differ in certain features, with the core-shell model being normally used for ionic/crystalline materials, whereas the so-called Drude model is normally used for molecular systems and fluid states.

The core-shell model is applicable to crystalline materials where the high symmetry around each site leads to stable trajectories of the core-shell pairs. However, bonded atoms in molecules can be so close that a core would interact too strongly or even capture the Drude particle of a neighbor. The Drude dipole model is relatively more complex in order to remedy this and other issues. Specifically, the Drude model includes specific thermostating of the core-Drude pairs and short-range damping of the induced dipoles.

The three polarization methods can be implemented through a self-consistent calculation of charges or induced dipoles at each timestep. In the fluctuating charge scheme this is done by the matrix inversion method in *fix qeq/point*, but for core-shell or Drude-dipoles the relaxed-dipoles technique would require an slow iterative procedure. These self-consistent solutions yield accurate trajectories since the additional degrees of freedom representing polarization are massless. An alternative is to attribute a mass to the additional degrees of freedom and perform time integration using an extended Lagrangian technique. For the fluctuating charge scheme this is done by *fix qeq/dynamic*, and for the charge-on-spring models by the methods outlined in the next two sections. The assignment of masses to the additional degrees of freedom can lead to unphysical trajectories if care is not exerted in choosing the parameters of the polarizable models and the simulation conditions.

In the core-shell model the vibration of the shells is kept faster than the ionic vibrations to mimic the fast response of the polarizable electrons. But in molecular systems thermalizing the core-Drude pairs at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, too short a timestep, etc.) In order to avoid these problems the relative motion of the Drude particles with respect to their cores is kept “cold” so the vibration of the core-Drude pairs is very slow, approaching the self-consistent regime. In both models the temperature is regulated using the velocities of the center of mass of core+shell (or Drude) pairs, but in the Drude model the actual relative core-Drude particle motion is thermostatted separately as well.

### 8.5.5 Adiabatic core/shell model

The adiabatic core-shell model by *Mitchell and Fincham* is a simple method for adding polarizability to a system. In order to mimic the electron shell of an ion, a satellite particle is attached to it. This way the ions are split into a core and a shell where the latter is meant to react to the electrostatic environment inducing polarizability. See the *Howto polarizable* page for a discussion of all the polarizable models available in LAMMPS.

Technically, shells are attached to the cores by a spring force  $f = k \cdot r$  where  $k$  is a parameterized spring constant and  $r$  is the distance between the core and the shell. The charges of the core and the shell add up to the ion charge, thus  $q(\text{ion}) = q(\text{core}) + q(\text{shell})$ . This setup introduces the ion polarizability ( $\alpha$ ) given by  $\alpha = q(\text{shell})^2 / k$ . In a similar fashion the mass of the ion is distributed on the core and the shell with the core having the larger mass.

To run this model in LAMMPS, *atom\_style full* can be used since atom charge and bonds are needed. Each kind of core/shell pair requires two atom types and a bond type. The core and shell of a core/shell pair should be bonded to each other with a harmonic bond that provides the spring force. For example, a data file for NaCl, as found in *examples/coreshell*, has this format:

```
432 atoms # core and shell atoms
216 bonds # number of core/shell springs

4 atom types # 2 cores and 2 shells for Na and Cl
2 bond types

0.0 24.09597 xlo xhi
0.0 24.09597 ylo yhi
0.0 24.09597 zlo zhi

Masses # core/shell mass ratio = 0.1

1 20.690784 # Na core
2 31.90500 # Cl core
3 2.298976 # Na shell
4 3.54500 # Cl shell

Atoms
```

```

Non-Coulombic (e.g. Lennard-Jones) pairwise interactions are only defined between the shells. Coulombic interactions are defined between all cores and shells. If desired, additional bonds can be specified between cores.

The *special\_bonds* command should be used to turn-off the Coulombic interaction within core/shell pairs, since that interaction is set by the bond spring. This is done using the *special\_bonds* command with a 1-2 weight = 0.0, which is the default value. It needs to be considered whether one has to adjust the *special\_bonds* weighting according to the molecular topology since the interactions of the shells are bypassed over an extra bond.

Note that this core/shell implementation does not require all ions to be polarized. One can mix core/shell pairs and ions without a satellite particle if desired.

Since the core/shell model permits distances of  $r = 0.0$  between the core and shell, a pair style with a “cs” suffix needs to be used to implement a valid long-range Coulombic correction. Several such pair styles are provided in the CORESHELL package. See [this page](#) for details. All of the core/shell enabled pair styles require the use of a long-range Coulombic solver, as specified by the *kspcse\_style* command. Either the PPPM or Ewald solvers can be used.

For the NaCl example problem, these pair style and bond style settings are used:

```

pair_style      born/coul/long/cs 20.0 20.0
pair_coeff      * *          0.0 1.000  0.00 0.00  0.00
pair_coeff      3 3          487.0 0.23768 0.00 1.05  0.50 #Na-Na
pair_coeff      3 4          145134.0 0.23768 0.00 6.99  8.70 #Na-Cl
pair_coeff      4 4          405774.0 0.23768 0.00 72.40 145.40 #Cl-Cl

bond_style      harmonic
bond_coeff      1 63.014 0.0
bond_coeff      2 25.724 0.0
```

When running dynamics with the adiabatic core/shell model, the following issues should be considered. The relative motion of the core and shell particles corresponds to the polarization, hereby an instantaneous relaxation of the shells is approximated and a fast core/shell spring frequency ensures a nearly constant internal kinetic energy during the simulation. Thermostats can alter this polarization behavior, by scaling the internal kinetic energy, meaning the shell will not react freely to its electrostatic environment. Therefore it is typically desirable to decouple the relative motion of the core/shell pair, which is an imaginary degree of freedom, from the real physical system. To do that, the *compute temp/cs* command can be used, in conjunction with any of the thermostat fixes, such as *fix nvt* or *fix langevin*. This compute uses the center-of-mass velocity of the core/shell pairs to calculate a temperature, and insures that velocity is what is rescaled for thermostatting purposes. This compute also works for a system with both core/shell pairs and non-polarized ions (ions without an attached satellite particle). The *compute temp/cs* command requires input of two groups, one for the core atoms, another for the shell atoms. Non-polarized ions which might also be included in the treated system should not be included into either of these groups, they are taken into account by the *group-ID* (second argument) of the compute. The groups can be defined using the *group \*type\** command. Note that to perform thermostatting using this definition of temperature, the *fix modify temp* command should be used to assign the compute to the thermostat fix. Likewise the *thermo\_modify temp* command can be used to make this temperature be output for

the overall system.

For the NaCl example, this can be done as follows:

```
group cores type 1 2
group shells type 3 4
compute CSequ all temp/cs cores shells
fix thermostoberendsen all temp/berendsen 1427 1427 0.4 # thermostat for the true_
↪physical system
fix thermostatequ all nve # integrator as needed for the_
↪berendsen thermostat
fix_modify thermostoberendsen temp CSequ
thermo_modify temp CSequ # output of center-of-mass_
↪derived temperature
```

The pressure for the core/shell system is computed via the regular LAMMPS convention by *treating the cores and shells as individual particles*. For the thermo output of the pressure as well as for the application of a barostat, it is necessary to use an additional *pressure* compute based on the default *temperature* and specifying it as a second argument in *fix modify* and *thermo\_modify* resulting in:

```
(...)
compute CSequ all temp/cs cores shells
compute thermo_press_lmp all pressure thermo_temp # pressure for individual_
↪particles
thermo_modify temp CSequ press thermo_press_lmp # modify thermo to regular_
↪pressure
fix press_bar all npt temp 300 300 0.04 iso 0 0 0.4
fix_modify press_bar temp CSequ press thermo_press_lmp # pressure modification for_
↪correct kinetic scalar
```

If *compute temp/cs* is used, the decoupled relative motion of the core and the shell should in theory be stable. However numerical fluctuation can introduce a small momentum to the system, which is noticeable over long trajectories. Therefore it is recommendable to use the *fix momentum* command in combination with *compute temp/cs* when equilibrating the system to prevent any drift.

When initializing the velocities of a system with core/shell pairs, it is also desirable to not introduce energy into the relative motion of the core/shell particles, but only assign a center-of-mass velocity to the pairs. This can be done by using the *bias* keyword of the *velocity create* command and assigning the *compute temp/cs* command to the *temp* keyword of the *velocity* command, e.g.

```
velocity all create 1427 134 bias yes temp CSequ
velocity all scale 1427 temp CSequ
```

To maintain the correct polarizability of the core/shell pairs, the kinetic energy of the internal motion shall remain nearly constant. Therefore the choice of spring force and mass ratio need to ensure much faster relative motion of the 2 atoms within the core/shell pair than their center-of-mass velocity. This allows the shells to effectively react instantaneously to the electrostatic environment and limits energy transfer to or from the core/shell oscillators. This fast movement also dictates the timestep that can be used.

The primary literature of the adiabatic core/shell model suggests that the fast relative motion of the core/shell pairs only allows negligible energy transfer to the environment. The mentioned energy transfer will typically lead to a small drift in total energy over time. This internal energy can be monitored using the *compute chunk/atom* and *compute temp/chunk* commands. The internal kinetic energies of each core/shell pair can then be summed using the *sum()* special function of the *variable* command. Or they can be time/averaged and output using the *fix ave/time* command. To use these commands, each core/shell pair must be defined as a “chunk”. If each core/shell pair is defined as its own molecule, the molecule ID can be used to define the chunks. If cores are bonded to each other to form larger molecules,

the chunks can be identified by the *fix property/atom* via assigning a core/shell ID to each atom using a special field in the data file read by the *read\_data* command. This field can then be accessed by the *compute property/atom* command, to use as input to the *compute chunk/atom* command to define the core/shell pairs as chunks.

For example if core/shell pairs are the only molecules:

```
read_data NaCl_CS_x0.1_prop.data
compute prop all property/atom molecule
compute cs_chunk all chunk/atom c_prop
compute csthern all temp/chunk cs_chunk temp internal com yes cdof 3.0 # note the
↪chosen degrees of freedom for the core/shell pairs
fix ave_chunk all ave/time 10 1 10 c_csthern file chunk.dump mode vector
```

For example if core/shell pairs and other molecules are present:

```
fix csinfo all property/atom i_CSID # property/atom command
read_data NaCl_CS_x0.1_prop.data fix csinfo NULL CS-Info # atom property added in the
↪data-file
compute prop all property/atom i_CSID
(...)
```

The additional section in the data file would be formatted like this:

```
CS-Info # header of additional section

1 1 # column 1 = atom ID, column 2 = core/shell ID
2 1
3 2
4 2
5 3
6 3
7 4
8 4
(...)
```

### 8.5.6 Drude induced dipoles

The thermalized Drude model represents induced dipoles by a pair of charges (the core atom and the Drude particle) connected by a harmonic spring. See the *Howto polarizable* doc page for a discussion of all the polarizable models available in LAMMPS.

The Drude model has a number of features aimed at its use in molecular systems (*Lamoureux and Roux*):

- Thermostatting of the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
- Consistent definition of 1-2 to 1-4 neighbors. A core-Drude particle pair represents a single (polarizable) atom, so the special screening factors in a covalent structure should be the same for the core and the Drude particle. Drude particles have to inherit the 1-2, 1-3, 1-4 special neighbor relations from their respective cores.

- Stabilization of the interactions between induced dipoles. Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short range can be done by Thole functions (for which there are physical grounds). This Thole damping is applied to the point charges composing the induced dipole (the charge of the Drude particle and the opposite charge on the core, not to the total charge of the core atom).

A detailed tutorial covering the usage of Drude induced dipoles in LAMMPS is on the [here](#).

As with the core-shell model, the cores and Drude particles should appear in the data file as standard atoms. The same holds for the springs between them, which are described by standard harmonic bonds. The nature of the atoms (core, Drude particle or non-polarizable) is specified via the `fix drude` command. The special list of neighbors is automatically refactored to account for the equivalence of core and Drude particles as regards special 1-2 to 1-4 screening. It may be necessary to use the `extra/special/per/atom` keyword of the `read_data` command. If using `fix shake`, make sure no Drude particle is in this fix group.

There are three ways to thermostat the Drude particles at a low temperature: use either `fix langevin/drude` for a Langevin thermostat, or `fix drude/transform/*` for a Nose-Hoover thermostat, or `fix tgnvt/drude` for a temperature-grouped Nose-Hoover thermostat. The first and third require use of the command `comm_modify vel yes`. The second requires two separate integration fixes like `nvt` or `npt`. The correct temperatures of the reduced degrees of freedom can be calculated using the `compute temp/drude`. This requires also to use the command `comm_modify vel yes`.

Short-range damping of the induced dipole interactions can be achieved using Thole functions through the `pair style thole` in `pair_style hybrid/overlay` with a Coulomb pair style. It may be useful to use `coul/long/cs` or similar from the CORESHELL package if the core and Drude particle come too close, which can cause numerical issues.

## 8.5.7 Tutorial for Thermalized Drude oscillators in LAMMPS

This tutorial explains how to use Drude oscillators in LAMMPS to simulate polarizable systems using the DRUDE package. As an illustration, the input files for a simulation of 250 phenol molecules are documented. First of all, LAMMPS has to be compiled with the DRUDE package activated. Then, the data file and input scripts have to be modified to include the Drude dipoles and how to handle them.

Example input scripts available: `examples/PACKAGES/drude`

---

### Overview of Drude induced dipoles

Polarizable atoms acquire an induced electric dipole moment under the action of an external electric field, for example the electric field created by the surrounding particles. Drude oscillators represent these dipoles by two fixed charges: the core (DC) and the Drude particle (DP) bound by a harmonic potential. The Drude particle can be thought of as the electron cloud whose center can be displaced from the position of the corresponding nucleus.

The sum of the masses of a core-Drude pair should be the mass of the initial (unsplit) atom,  $m_C + m_D = m$ . The sum of their charges should be the charge of the initial (unsplit) atom,  $q_C + q_D = q$ . A harmonic potential between the core and Drude partners should be present, with force constant  $k_D$  and an equilibrium distance of zero. The (half-)stiffness of the *harmonic bond*  $K_D = k_D/2$  and the Drude charge  $q_D$  are related to the atom polarizability  $\alpha$  by

$$K_D = \frac{1}{2} \frac{q_D^2}{\alpha}$$

Ideally, the mass of the Drude particle should be small, and the stiffness of the harmonic bond should be large, so that the Drude particle remains close to the core. The values of Drude mass, Drude charge, and force constant can be chosen following different strategies, as in the following examples of polarizable force fields:

- *Lamoureux and Roux* suggest adopting a global half-stiffness,  $K_D = 500$  kcal/(mol Ang<sup>2</sup>) - which corresponds to a force constant  $k_D = 4184$  kJ/(mol Ang<sup>2</sup>) - for all types of core-Drude bond, a global mass  $m_D = 0.4$  g/mol (or u) for all types of Drude particles, and to calculate the Drude charges for individual atom types from the atom polarizabilities using equation (1). This choice is followed in the polarizable CHARMM force field.
- Alternately *Schroeder and Steinhauser* suggest adopting a global charge  $q_D = -1.0e$  and a global mass  $m_D = 0.1$  g/mol (or u) for all Drude particles, and to calculate the force constant for each type of core-Drude bond from equation (1). The timesteps used by these authors are between 0.5 and 2 fs, with the degrees of freedom of the Drude oscillators kept cold at 1 K.
- In both these force fields hydrogen atoms are treated as non-polarizable.

The motion of the Drude particles can be calculated by minimizing the energy of the induced dipoles at each timestep, by an iterative, self-consistent procedure. The Drude particles can be massless and therefore do not contribute to the kinetic energy. However, the relaxed method is computational slow. An extended-lagrangian method can be used to calculate the positions of the Drude particles, but this requires them to have mass. It is important in this case to decouple the degrees of freedom associated with the Drude oscillators from those of the normal atoms. Thermalizing the Drude dipoles at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, very short timestep, etc.), which can be remedied by the “cold Drude” technique (*Lamoureux and Roux*).

Two closely related models are used to represent polarization through “charges on a spring”: the core-shell model and the Drude model. Although the basic idea is the same, the core-shell model is normally used for ionic/crystalline materials, whereas the Drude model is normally used for molecular systems and fluid states. In ionic crystals the symmetry around each ion and the distance between them are such that the core-shell model is sufficiently stable. But to be applicable to molecular/covalent systems the Drude model includes two important features:

1. The possibility to thermostat the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
2. The Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle (shell) of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short of the interactions between the point charges composing the induced dipole can be done by *Thole* functions.

### Preparation of the data file

The data file is similar to a standard LAMMPS data file for *atom\_style full*. The DPs and the *harmonic bonds* connecting them to their DC should appear in the data file as normal atoms and bonds.

You can use the *polarizer* tool (Python script distributed with the DRUDE package) to convert a non-polarizable data file (here *data.102494.lmp*) to a polarizable data file (*data-p.lmp*)

```
polarizer -q -f phenol.dff data.102494.lmp data-p.lmp
```

This will automatically insert the new atoms and bonds. The masses and charges of DCs and DPs are computed from *phenol.dff*, as well as the DC-DP bond constants. The file *phenol.dff* contains the polarizabilities of the atom types and the mass of the Drude particles, for instance:

```
# units: kJ/mol, A, deg
# kforce is in the form k/2 r_D^2
# type m_D/u q_D/e k_D alpha/A3 thole
OH 0.4 -1.0 4184.0 0.63 0.67
CA 0.4 -1.0 4184.0 1.36 2.51
CAI 0.4 -1.0 4184.0 1.09 2.51
```

The hydrogen atoms are absent from this file, so they will be treated as non-polarizable atoms. In the non-polarizable data file *data.102494.lmp*, atom names corresponding to the atom type numbers have to be specified as comments at the end of lines of the *Masses* section. You probably need to edit it to add these names. It should look like

## Masses

```
1 12.011 # CAI
2 12.011 # CA
3 15.999 # OH
4 1.008 # HA
5 1.008 # HO
```

## Basic input file

The atom style should be set to (or derive from) *full*, so that you can define atomic charges and molecular bonds, angles, dihedrals...

The *polarizer* tool also outputs certain lines related to the input script (the use of these lines will be explained below). In order for LAMMPS to recognize that you are using Drude oscillators, you should use the fix *drude*. The command is

```
fix DRUDE all drude C C C N N D D D
```

The N, C, D following the *drude* keyword have the following meaning: There is one tag for each atom type. This tag is C for DCs, D for DPs and N for non-polarizable atoms. Here the atom types 1 to 3 (C and O atoms) are DC, atom types 4 and 5 (H atoms) are non-polarizable and the atom types 6 to 8 are the newly created DPs.

By recognizing the fix *drude*, LAMMPS will find and store matching DC-DP pairs and will treat DP as equivalent to their DC in the *special bonds* relations. It may be necessary to extend the space for storing such special relations. In this case extra space should be reserved by using the *extra/special/per/atom* keyword of either the *read\_data* or *create\_box* command. With our phenol, there is 1 more special neighbor for which space is required. Otherwise LAMMPS crashes and gives the required value.

```
read_data data-p.lmp extra/special/per/atom 1
```

Let us assume we want to run a simple NVT simulation at 300 K. Note that Drude oscillators need to be thermalized at a low temperature in order to approximate a self-consistent field (SCF), therefore it is not possible to simulate an NVE ensemble with this package. Since dipoles are approximated by a charged DC-DP pair, the *pair\_style* must include Coulomb interactions, for instance *lj/cut/coul/long* with *k-space\_style ppm*. For example, with a cutoff of 10. and a precision 1.e-4:

```
pair_style lj/cut/coul/long 10.0
k-space_style ppm 1.0e-4
```

As compared to the non-polarizable input file, *pair\_coeff* lines need to be added for the DPs. Since the DPs have no Lennard-Jones interactions, their  $\epsilon$  is 0. so the only *pair\_coeff* line that needs to be added is

```
pair_coeff * 6* 0.0 0.0 # All-DPs
```

Now for the thermalization, the simplest choice is to use the fix *langevin/drude*.

```
fix LANG all langevin/drude 300. 100 12345 1. 20 13977
```

This applies a Langevin thermostat at temperature 300. to the centers of mass of the DC-DP pairs, with relaxation time 100 and with random seed 12345. This fix applies also a Langevin thermostat at temperature 1. to the relative motion of the DPs around their DCs, with relaxation time 20 and random seed 13977. Only the DCs and non-polarizable atoms need to be in this fix's group. LAMMPS will thermostat the DPs together with their DC. For this, ghost atoms need to know their velocities. Thus you need to add the following command:

```
comm_modify vel yes
```

In order to avoid that the center of mass of the whole system drifts due to the random forces of the Langevin thermostat on DCs, you can add the *zero yes* option at the end of the fix line.

If the fix *shake* is used to constrain the C-H bonds, it should be invoked after the fix *langevin/drude* for more accuracy.

```
fix SHAKE ATOMS shake 0.0001 20 0 t 4 5
```

---

**Note:** The group of the fix *shake* must not include the DPs. If the group *ATOMS* is defined by non-DPs atom types, you could use

---

Since the fix *langevin/drude* does not perform time integration (just modification of forces but no position/velocity updates), the fix *nve* should be used in conjunction.

```
fix NVE all nve
```

To avoid the flying ice cube artifact, where the atoms progressively freeze and the center of mass of the whole system drifts faster and faster, the fix *momentum* can be used. For instance:

```
fix MOMENTUM all momentum 100 linear 1 1 1
```

Finally, do not forget to update the atom type elements if you use them in a *dump\_modify ... element ...* command, by adding the element type of the DPs. Here for instance

```
dump DUMP all custom 10 dump.lammpstrj id mol type element x y z ix iy iz
dump_modify DUMP element C C O H H D D D
```

The input file should now be ready for use!

You will notice that the global temperature *thermo\_temp* computed by LAMMPS is not 300. K as wanted. This is because LAMMPS treats DPs as standard atoms in his default compute. If you want to output the temperatures of the DC-DP pair centers of mass and of the DPs relative to their DCs, you should use the *compute temp\_drude*

```
compute TDRUDE all temp/drude
```

And then output the correct temperatures of the Drude oscillators using *thermo\_style custom* with respectively *c\_TDRUDE[1]* and *c\_TDRUDE[2]*. These should be close to 300.0 and 1.0 on average.

```
thermo_style custom step temp c_TDRUDE[1] c_TDRUDE[2]
```

---

### Thole screening

Dipolar interactions represented by point charges on springs may not be stable, for example if the atomic polarizability is too high for instance, a DP can escape from its DC and be captured by another DC, which makes the force and energy diverge and the simulation crash. Even without reaching this extreme case, the correlation between nearby dipoles on the same molecule may be exaggerated. Often, special bond relations prevent bonded neighboring atoms to see the charge of each other's DP, so that the problem does not always appear. It is possible to use screened dipole-dipole interactions by using the *\*pair\_style thole\**. This is implemented as a correction to the Coulomb pair\_styles, which dampens at short distance the interactions between the charges representing the induced dipoles. It is to be used as *hybrid/overlay* with any standard *coul* pair style. In our example, we would use

```
pair_style hybrid/overlay lj/cut/coul/long 10.0 thole 2.6 10.0
```

This tells LAMMPS that we are using two `pair_styles`. The first one is as above (`lj/cut/coul/long 10.0`). The second one is a `thole` `pair_style` with default screening factor 2.6 (*Noskov*) and cutoff 10.0.

Since `hybrid/overlay` does not support mixing rules, the interaction coefficients of all the pairs of atom types with  $i < j$  should be explicitly defined. The output of the `polarizer` script can be used to complete the `pair_coeff` section of the input file. In our example, this will look like:

```
pair_coeff 1 1 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 1 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 2 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 2 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 2 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 3 3 lj/cut/coul/long 0.1700 3.070
pair_coeff 3 4 lj/cut/coul/long 0.0714 2.745
pair_coeff 4 4 lj/cut/coul/long 0.0300 2.420
pair_coeff * 5 lj/cut/coul/long 0.0000 0.000
pair_coeff * 6* lj/cut/coul/long 0.0000 0.000
pair_coeff 1 1 thole 1.090 2.510
pair_coeff 1 2 thole 1.218 2.510
pair_coeff 1 3 thole 0.829 1.590
pair_coeff 1 6 thole 1.090 2.510
pair_coeff 1 7 thole 1.218 2.510
pair_coeff 1 8 thole 0.829 1.590
pair_coeff 2 2 thole 1.360 2.510
pair_coeff 2 3 thole 0.926 1.590
pair_coeff 2 6 thole 1.218 2.510
pair_coeff 2 7 thole 1.360 2.510
pair_coeff 2 8 thole 0.926 1.590
pair_coeff 3 3 thole 0.630 0.670
pair_coeff 3 6 thole 0.829 1.590
pair_coeff 3 7 thole 0.926 1.590
pair_coeff 3 8 thole 0.630 0.670
pair_coeff 6 6 thole 1.090 2.510
pair_coeff 6 7 thole 1.218 2.510
pair_coeff 6 8 thole 0.829 1.590
pair_coeff 7 7 thole 1.360 2.510
pair_coeff 7 8 thole 0.926 1.590
pair_coeff 8 8 thole 0.630 0.670
```

For the `thole` pair style the coefficients are

1. the atom polarizability in units of cubic length
2. the screening factor of the Thole function (optional, default value specified by the `pair_style` command)
3. the cutoff (optional, default value defined by the `pair_style` command)

The special neighbors have charge-charge and charge-dipole interactions screened by the `coul` factors of the `special_bonds` command (0.0, 0.0, and 0.5 in the example above). Without using the `pair_style thole`, dipole-dipole interactions are screened by the same factor. By using the `pair_style thole`, dipole-dipole interactions are screened by Thole's function, whatever their special relationship (except within each DC-DP pair of course). Consider for example 1-2 neighbors: using the `pair_style thole`, their dipoles will see each other (despite the `coul` factor being 0.) and the

interactions between these dipoles will be damped by Thole's function.

---

### Thermostats and barostats

Using a Nose-Hoover barostat with the *langevin/drude* thermostat is straightforward using *fix nph* instead of *nve*. For example:

```
fix NPH all nph iso 1. 1. 500
```

It is also possible to use a Nose-Hoover instead of a Langevin thermostat. This requires to use *\*fix drude/transform\** just before and after the time integration fixes. The *fix drude/transform/direct* converts the atomic masses, positions, velocities and forces into a reduced representation, where the DCs transform into the centers of mass of the DC-DP pairs and the DPs transform into their relative position with respect to their DC. The *fix drude/transform/inverse* performs the reverse transformation. For a NVT simulation, with the DCs and atoms at 300 K and the DPs at 1 K relative to their DC one would use

```
fix DIRECT all drude/transform/direct
fix NVT1 ATOMS nvt temp 300. 300. 100
fix NVT2 DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

For our phenol example, the groups would be defined as

```
group ATOMS type 1 2 3 4 5 # DCs and non-polarizable atoms
group CORES type 1 2 3 # DCs
group DRUDES type 6 7 8 # DPs
```

Note that with the fixes *drude/transform*, it is not required to specify *comm\_modify vel yes* because the fixes do it anyway (several times and for the forces also).

It is a bit more tricky to run a NPT simulation with Nose-Hoover barostat and thermostat. First, the volume should be integrated only once. So the fix for DCs and atoms should be *npt* while the fix for DPs should be *nvt* (or vice versa). Second, the *fix npt* computes a global pressure and thus a global temperature whatever the fix group. We do want the pressure to correspond to the whole system, but we want the temperature to correspond to the fix group only. We must then use the *fix\_modify* command for this. In the end, the block of instructions for thermostating and barostatting will look like

```
compute TATOMS ATOMS temp
fix DIRECT all drude/transform/direct
fix NPT ATOMS npt temp 300. 300. 100 iso 1. 1. 500
fix_modify NPT temp TATOMS press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

Another option for thermalizing the Drude model is to use the temperature-grouped Nose-Hoover (TGNH) thermostat proposed by (Son). This is implemented as *fix tgnvt/drude* and *fix tgnpt/drude*. It separates the kinetic energy into three contributions: the molecular center of mass (COM) motion, the motion of atoms or atom-Drude pairs relative to molecular COMs, and the relative motion of atom-Drude pairs. An independent Nose-Hoover chain is applied to each type of motion. When TGNH is used, the temperatures of molecular, atomic and Drude motion can be printed out with *thermo\_style command* command.

NVT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNVT all tgnvt/drude temp 300. 300. 100 1. 20
thermo_style custom f_TGNVT[1] f_TGNVT[2] f_TGNVT[3]
```

NPT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNPT all tgnpt/drude temp 300. 300. 100 1. 20 iso 1. 1. 500
thermo_style custom f_TGNPT[1] f_TGNPT[2] f_TGNPT[3]
```

## Rigid bodies

You may want to simulate molecules as rigid bodies (but polarizable). Common cases are water models such as *SWM4-NDP*, which is a kind of polarizable TIP4P water. The rigid bodies and the DPs should be integrated separately, even with the Langevin thermostat. Let us review the different thermostats and ensemble combinations.

NVT ensemble using Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nve/small molecule
fix NVE DRUDES nve
```

NVT ensemble using Nose-Hoover thermostat:

```
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/nvt/small molecule temp 300. 300. 100
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

NPT ensemble with Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nph/small molecule iso 1. 1. 500
fix NVE DRUDES nve
```

NPT ensemble using Nose-Hoover thermostat:

```
compute TATOM ATOMS temp
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/npt/small molecule temp 300. 300. 100 iso 1. 1. 500
fix_modify RIGID temp TATOM press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

## 8.5.8 Manifolds (surfaces)

### Overview:

This page is not about a LAMMPS input script command, but about manifolds, which are generalized surfaces, as defined and used by the MANIFOLD package, to track particle motion on the manifolds. See the src/MANIFOLD/README file for more details about the package and its commands.

Below is a list of currently supported manifolds by the MANIFOLD package, their parameters and a short description of them. The parameters listed here are in the same order as they should be passed to the relevant fixes.

<i>manifold</i>	<i>parameters</i>	<i>equation</i>	<i>description</i>
cylinder	R	$x^2 + y^2 - R^2 = 0$	Cylinder along z-axis, axis going through (0,0,0)
cylinder_dent	R l a	$x^2 + y^2 - r(z)^2 = 0$ , $r(x) = R$ if $ z  > l$ , $r(z) = R - a*(1 + \cos(z/l))/2$ otherwise	A cylinder with a dent around $z = 0$
dumbbell	a A B c	$-(x^2 + y^2) + (a^2 - z^2/c^2) * (1 + (A*\sin(B*z^2))^4) = 0$	A dumbbell
ellipsoid	a b c	$(x/a)^2 + (y/b)^2 + (z/c)^2 = 0$	An ellipsoid
gaussian_bump	A l rc1 rc2	if $(x < rc1) -z + A * \exp(-x^2 / (2 l^2))$ ; else if $(x < rc2) -z + a + b*x + c*x^2 + d*x^3$ ; else $z$	A Gaussian bump at $x = y = 0$ , smoothly tapered to a flat plane $z = 0$ .
plane	a b c x0 y0 z0	$a*(x-x0) + b*(y-y0) + c*(z-z0) = 0$	A plane with normal (a,b,c) going through point (x0,y0,z0)
plane_wiggle	w	$z - a*\sin(w*x) = 0$	A plane with a sinusoidal modulation on z along x.
sphere	R	$x^2 + y^2 + z^2 - R^2 = 0$	A sphere of radius R
supersphere	R q	$ x ^q +  y ^q +  z ^q - R^q = 0$	A supersphere of hyperradius R
spine	a, A, B, B2, c	$-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*\sin(g(z)*z^2))^4)$ , $f(z) = c$ if $z > 0$ , 1 otherwise; $g(z) = B$ if $z > 0$ , B2 otherwise	An approximation to a dendritic spine
spine_two	a, A, B, B2, c	$-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*\sin(g(z)*z^2))^2)$ , $f(z) = c$ if $z > 0$ , 1 otherwise; $g(z) = B$ if $z > 0$ , B2 otherwise	Another approximation to a dendritic spine
thylakoid	wB LB IB	Various, see ( <i>Paquay</i> )	A model grana thylakoid consisting of two block-like compartments connected by a bridge of width wB, length LB and taper length IB
torus	R r	$(R - \sqrt{x^2 + y^2})^2 + z^2 - r^2 = 0$	A torus with large radius R and small radius r, centered on (0,0,0)

(Paquay) Paquay and Kusters, Biophys. J., 110, 6, (2016). preprint available at [arXiv:1411.3019](https://arxiv.org/abs/1411.3019).

## 8.5.9 Magnetic spins

The magnetic spin simulations are enabled by the SPIN package, whose implementation is detailed in *Tranchida*.

The model represents the simulation of atomic magnetic spins coupled to lattice vibrations. The dynamics of those magnetic spins can be used to simulate a broad range a phenomena related to magneto-elasticity, or or to study the influence of defects on the magnetic properties of materials.

The magnetic spins are interacting with each others and with the lattice via pair interactions. Typically, the magnetic exchange interaction can be defined using the *pair/spin/exchange* command. This exchange applies a magnetic torque to a given spin, considering the orientation of its neighboring spins and their relative distances. It also applies a force on the atoms as a function of the spin orientations and their associated inter-atomic distances.

The command *fix precession/spin* allows to apply a constant magnetic torque on all the spins in the system. This torque can be an external magnetic field (Zeeman interaction), and an uniaxial or cubic magnetic anisotropy.

A Langevin thermostat can be applied to those magnetic spins using *fix langevin/spin*. Typically, this thermostat can be coupled to another Langevin thermostat applied to the atoms using *fix langevin* in order to simulate thermostatted spin-lattice systems.

The magnetic Gilbert damping can also be applied using *fix langevin/spin*. It allows to either dissipate the thermal energy of the Langevin thermostat, or to perform a relaxation of the magnetic configuration toward an equilibrium state.

The command *fix setforce/spin* allows to set the components of the magnetic precession vectors (while erasing and replacing the previously computed magnetic precession vectors on the atom). This command can be used to freeze the magnetic moment of certain atoms in the simulation by zeroing their precession vector.

The command *fix nve/spin* can be used to perform a symplectic integration of the combined dynamics of spins and atomic motions.

The minimization style *min/spin* can be applied to the spins to perform a minimization of the spin configuration.

All the computed magnetic properties can be output by two main commands. The first one is *compute spin*, that enables to evaluate magnetic averaged quantities, such as the total magnetization of the system along x, y, or z, the spin temperature, or the magnetic energy. The second command is *compute property/atom*. It enables to output all the per atom magnetic quantities. Typically, the orientation of a given magnetic spin, or the magnetic force acting on this spin.

## 8.6 Tutorials howto

### 8.6.1 Using CMake with LAMMPS tutorial

The support for building LAMMPS with CMake is a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (Temple U). One of the key strengths of CMake is that it is not tied to a specific platform or build system and thus generate the files necessary to build and develop for different build systems and on different platforms. Note, that this applies to the build system itself not the LAMMPS code. In other words, without additional porting effort, it is not possible - for example - to compile LAMMPS with Visual C++ on Windows. The build system output can also include support files necessary to program LAMMPS as a project in integrated development environments (IDE) like Eclipse, Visual Studio, QtCreator, Xcode, CodeBlocks, Kate and others.

A second important feature of CMake is, that it can detect and validate available libraries, optimal settings, available support tools and so on, so that by default LAMMPS will take advantage of available tools without requiring to provide the details about how to enable/integrate them.

The downside of this approach is, that there is some complexity associated with running CMake itself and how to customize the building of LAMMPS. This tutorial will show how to manage this through some selected examples. Please see the chapter about *building LAMMPS* for descriptions of specific flags and options for LAMMPS in general and for specific packages.

CMake can be used through either the command-line interface (CLI) program `cmake` (or `cmake3`), a text mode interactive user interface (TUI) program `ccmake` (or `ccmake3`), or a graphical user interface (GUI) program `cmake-gui`. All of them are portable software available on all supported platforms and can be used interchangeably. The minimum supported CMake version is 3.10 (3.12 or later is recommended).

All details about features and settings for CMake are in the [CMake online documentation](#). We focus below on the most important aspects with respect to compiling LAMMPS.

### Prerequisites

This tutorial assumes that you are operating in a command-line environment using a shell like Bash.

- Linux: any Terminal window will work
- MacOS X: launch the Terminal application.
- Windows 10: install and run the *Windows Subsystem for Linux*

We also assume that you have downloaded and unpacked a recent LAMMPS source code package or used Git to create a clone of the LAMMPS sources on your compilation machine.

You should change into the top level directory of the LAMMPS source tree all paths mentioned in the tutorial are relative to that. Immediately after downloading it should look like this:

```
$ ls
bench  doc      lib      potentials  README  tools
cmake  examples LICENSE  python      src
```

### Build versus source directory

When using CMake the build procedure is separated into multiple distinct phases:

1. **Configuration:** detect or define which features and settings should be enable and used and how LAMMPS should be compiled
2. **Compilation:** generate and compile all necessary source files and build libraries and executables.
3. **Installation:** copy selected files from the compilation into your file system, so they can be used without having to keep the source and build tree around.

The configuration and compilation of LAMMPS has to happen in a dedicated *build directory* which must be different from the source directory. Also the source directory (`src`) must remain pristine, so it is not allowed to “install” packages using the traditional make process and after an compilation attempt all created source files must be removed. This can be achieved with `make no-all purge`.

You can pick **any** folder outside the source tree. We recommend to create a folder `build` in the top-level directory, or multiple folders in case you want to have separate builds of LAMMPS with different options (`build-parallel`, `build-serial`) or with different compilers (`build-gnu`, `build-clang`, `build-intel`) and so on. All the auxiliary files created by one build process (executable, object files, log files, etc) are stored in this directory or sub-directories within it that CMake creates.

## Running CMake

### CLI version

In the (empty) build directory, we now run the command `cmake ../cmake`, which will start the configuration phase and you will see the progress of the configuration printed to the screen followed by a summary of the enabled features, options and compiler settings. A typical summary screen will look like this:

```
$ cmake ../cmake/
-- The CXX compiler identification is GNU 8.2.0
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++ - works

```

The `cmake` command has one mandatory argument, and that is a folder with either the file `CMakeLists.txt` or `CMakeCache.txt`. The `CMakeCache.txt` file is created during the CMake configuration run and contains all active settings, thus after a first run of CMake all future runs in the build folder can use the folder `.` and CMake will know where to find the CMake scripts and reload the settings from the previous step. This means, that one can modify an existing configuration by re-running CMake, but only needs to provide flags indicating the desired change, everything else will be retained. One can also mix compilation and configuration, i.e. start with a minimal configuration and then, if needed, enable additional features and recompile.

The steps above **will NOT compile the code**. The compilation can be started in a portable fashion with `cmake --build .`, or you use the selected built tool, e.g. `make`.

## TUI version

For the text mode UI CMake program the basic principle is the same. You start the command `ccmake ../cmake` in the build folder.

This will show you the initial screen (left image) with the empty configuration cache. Now you type the ‘c’ key to run the configuration step. That will do a first configuration run and show the summary (center image). You exit the summary screen with ‘e’ and see now the main screen with detected options and settings. You can now make changes by moving and down with the arrow-g of the keyboard and modify entries. For on/off settings, the enter key will toggle the state. For others, hitting enter will allow you to modify the value and you commit the change by hitting the enter key again or cancel using the escape key. All “new” settings will be marked with a star ‘\*’ and for as long as one setting is marked like this, you have to re-run the configuration by hitting the ‘c’ key again, sometimes multiple times unless the TUI shows the word “generate” next to the letter ‘g’ and by hitting the ‘g’ key the build files will be written to the folder and the TUI exits. You can quit without generating build files by hitting ‘q’.

## GUI version

For the graphical CMake program the steps are similar to the TUI version. You can type the command `cmake-gui . ./cmake` in the `build` folder. In this case the path to the CMake script folder is not required, it can also be entered from the GUI.

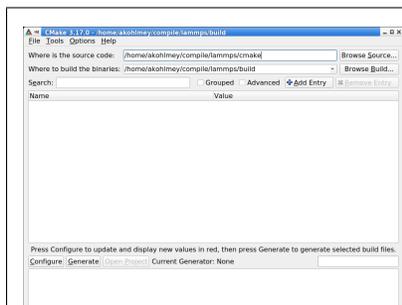

Fig. 4: Initial `cmake-gui` screen

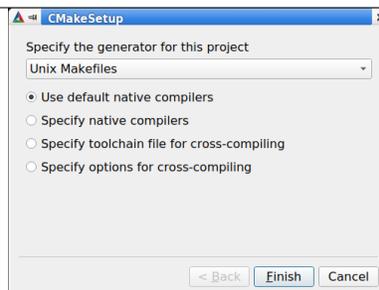

Fig. 5: Generator selection in `cmake-gui`

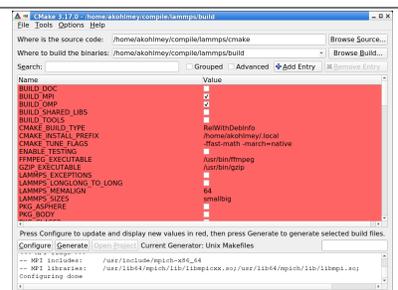

Fig. 6: Options screen of `cmake-gui`

Again, you start with an empty configuration cache (left image) and need to start the configuration step. For the very first configuration in a folder, you will have a pop-up dialog (center image) asking to select the desired build tool and some configuration settings (stick with the default) and then you get the option screen with all new settings highlighted in red. You can modify them (or not) and click on the “configure” button again until satisfied and click on the “generate” button to write out the build files. You can exit the GUI from the “File” menu or hit “ctrl-q”.

## Setting options

Options that enable, disable or modify settings are modified by setting the value of CMake variables. This is done on the command line with the `-D` flag in the format `-D VARIABLE=value`, e.g. `-D CMAKE_BUILD_TYPE=Release` or `-D BUILD_MPI=on`. There is one quirk: when used before the CMake directory, there may be a space between the `-D` flag and the variable, after it must not be. Such CMake variables can have boolean values (on/off, yes/no, or 1/0 are all valid) or are strings representing a choice, or a path, or are free format. If the string would contain whitespace, it must be put in quotes, for example `-D CMAKE_TUNE_FLAGS="-ftree-vectorize -ffast-math"`.

CMake variables fall into two categories: 1) common CMake variables that are used by default for any CMake configuration setup and 2) project specific variables, i.e. settings that are specific for LAMMPS. Also CMake variables can be flagged as *advanced*, which means they are not shown in the text mode or graphical CMake program in the overview of all settings by default, but only when explicitly requested (by hitting the ‘t’ key or clicking on the ‘Advanced’ check-box).

### Some common CMake variables

Variable	Description
CMAKE_INSTALL_PREFIX	root directory of install location for <code>make install</code> (default: <code>\$HOME/.local</code> )
LAMMPS_INSTALL_RPATH	set or remove runtime path setting from binaries for <code>make install</code> (default: <code>off</code> )
CMAKE_BUILD_TYPE	controls compilation options: one of <code>RelWithDebInfo</code> (default), <code>Release</code> , <code>Debug</code> , <code>MinSizeRel</code>
BUILD_SHARED_LIBS	if set to <code>on</code> build the LAMMPS library as shared library (default: <code>off</code> )
CMAKE_MAKE_PROGRAM	name/path of the compilation command (default depends on <code>-G</code> option, usually <code>make</code> )
CMAKE_VERBOSE_MAKEFILE	if set to <code>on</code> echo commands while executing during build (default: <code>off</code> )
CMAKE_C_COMPILER	C compiler to be used for compilation (default: system specific, <code>gcc</code> on Linux)
CMAKE_CXX_COMPILER	C++ compiler to be used for compilation (default: system specific, <code>g++</code> on Linux)
CMAKE_Fortran_COMPILER	Fortran compiler to be used for compilation (default: system specific, <code>gfortran</code> on Linux)
CXX_COMPILER_LAUNCHER	tool to launch the C++ compiler, e.g. <code>ccache</code> or <code>distcc</code> for faster compilation (default: empty)

### Some common LAMMPS specific variables

Variable	Description
BUILD_MPI	build LAMMPS with MPI support (default: <code>on</code> if a working MPI available, else <code>off</code> )
BUILD_OMP	build LAMMPS with OpenMP support (default: <code>on</code> if compiler supports OpenMP fully, else <code>off</code> )
BUILD_TOOLS	compile some additional executables from the <code>tools</code> folder (default: <code>off</code> )
BUILD_LAMMPS_SHELL	compile the LAMMPS shell from the <code>tools/lammps-shell</code> folder (default: <code>off</code> )
BUILD_DOC	include building the HTML format documentation for packaging/installing (default: <code>off</code> )
CMAKE_TUNE_FLAGS	common compiler flags, for optimization or instrumentation (default:)
LAMMPS_MACHINE	when set to name the LAMMPS executable and library will be called <code>lmp_name</code> and <code>liblammps_name.a</code>
LAMMPS_EXCEPTIONS	when set to <code>on</code> errors will throw a C++ exception instead of aborting (default: <code>off</code> )
FFT	select which FFT library to use: <code>FFTW3</code> , <code>MKL</code> , <code>KISS</code> (default, unless <code>FFTW3</code> is found)
FFT_SINGLE	select whether to use single precision FFTs (default: <code>off</code> )
WITH_JPEG	whether to support JPEG format in <i>dump image</i> (default: <code>on</code> if found)
WITH_PNG	whether to support PNG format in <i>dump image</i> (default: <code>on</code> if found)
WITH_GZIP	whether to support reading and writing compressed files (default: <code>on</code> if found)
WITH_FFmpeg	whether to support generating movies with <i>dump movie</i> (default: <code>on</code> if found)

### Enabling or disabling LAMMPS packages

The LAMMPS software is organized into a common core that is always included and a large number of *add-on packages* that have to be enabled to be included into a LAMMPS executable. Packages are enabled through setting variables of the kind `PKG_<NAME>` to `on` and disabled by setting them to `off` (or using `yes`, `no`, `1`, `0` correspondingly). `<NAME>` has to be replaced by the name of the package, e.g. `MOLECULE` or `EXTRA-PAIR`.

## Using presets

Since LAMMPS has a lot of optional features and packages, specifying them all on the command line can be tedious. Or when selecting a different compiler toolchain, multiple options have to be changed consistently and that is rather error prone. Or when enabling certain packages, they require consistent settings to be operated in a particular mode. For this purpose, we are providing a selection of “preset files” for CMake in the folder `cmake/presets`. They represent a way to pre-load or override the CMake configuration cache by setting or changing CMake variables. Preset files are loaded using the `-C` command line flag. You can combine loading multiple preset files or change some variables later with additional `-D` flags. A few examples:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_MISC=on ../cmake
cmake -C ../cmake/presets/clang.cmake -C ../cmake/presets/most.cmake ../cmake
cmake -C ../cmake/presets/basic.cmake -D BUILD_MPI=off ../cmake
```

The first command will install the packages `KSPACE`, `MANYBODY`, `MOLECULE`, `RIGID` and `MISC`; the first four from the preset file and the fifth from the explicit variable definition. The second command will first switch the compiler toolchain to use the Clang compilers and install a large number of packages that are not depending on any special external libraries or tools and are not very unusual. The third command will enable the first four packages like above and then enforce compiling LAMMPS as a serial program (using the `MPI STUBS` library).

It is also possible to do this incrementally.

```
cmake -C ../cmake/presets/basic.cmake ../cmake
cmake -D PKG_MISC=on .
```

will achieve the same final configuration as in the first example above. In this scenario it is particularly convenient to do the second configuration step using either the text mode or graphical user interface (`ccmake` or `cmake-gui`).

---

**Note:** Using a preset to select a compiler package (`clang.cmake`, `gcc.cmake`, `intel.cmake`, `oneapi.cmake`, or `pgi.cmake`) are an exception to the mechanism of updating the configuration incrementally, as they will trigger a reset of cached internal CMake settings and thus reset settings to their default values.

---

## Compilation and build targets

The actual compilation will be started by running the selected build command (on Linux this is by default `make`, see below how to select alternatives). You can also use the portable command `cmake --build .` which will adapt to whatever the selected build command is. This is particularly convenient, if you have set a custom build command via the `CMAKE_MAKE_PROGRAM` variable.

When calling the build program, you can also select which “target” is to be build through appending the `--target` flag and the name of the target to the build command. When using `make` as build tool, you can just append the target name to the command. Example: `cmake --build . --target all` or `make all`. The following abstract targets are available:

Target	Description
<code>all</code>	build “everything” (default)
<code>lammps</code>	build the LAMMPS library and executable
<code>doc</code>	build the HTML documentation (if configured)
<code>install</code>	install all target files into folders in <code>CMAKE_INSTALL_PREFIX</code>
<code>test</code>	run some tests (if configured with <code>-D ENABLE_TESTING=on</code> )
<code>clean</code>	remove all generated files

## Choosing generators

While CMake usually defaults to creating makefiles to compile software with the make program, it supports multiple alternate build tools (e.g. `ninja-build` which tends to be faster and more efficient in parallelizing builds than `make`) and can generate project files for integrated development environments (IDEs) like VisualStudio, Eclipse or CodeBlocks. This is specific to how the local CMake version was configured and compiled. The list of available options can be seen at the end of the output of `cmake --help`. Example on Fedora 31 this is:

### Generators

The following generators are available on this platform (\* marks default):

```
* Unix Makefiles           = Generates standard UNIX makefiles.
  Green Hills MULTI       = Generates Green Hills MULTI files
                          (experimental, work-in-progress).
  Ninja                   = Generates build.ninja files.
  Ninja Multi-Config      = Generates build-<Config>.ninja files.
  Watcom WMake            = Generates Watcom WMake makefiles.
  CodeBlocks - Ninja      = Generates CodeBlocks project files.
  CodeBlocks - Unix Makefiles = Generates CodeBlocks project files.

```

Below is a screenshot of using the CodeBlocks IDE with the ninja build tool after running CMake as follows:

```
cmake -G 'CodeBlocks - Ninja' ../cmake/presets/most.cmake ../cmake/
```

The screenshot shows the Code::Blocks IDE with the following components:

- Management Panel:** Shows the project structure for 'lammmps' with subfolders for CMake Files, Sources, and Headers.
- Source Editor:** Displays the `src/lammps.cpp` file, showing the `LAMMPS::LAMMPS` constructor function. Lines 91-113 are visible, including the function signature and the initialization of various pointers like `memory`, `error`, `universe`, `clientserver`, `cslib`, `cscomm`, `screen`, `logfile`, `infile`, `initclock`, and `init_pkg_lists`.
- Output Window:** Shows the execution output for the 'lammmps' process. It includes:
  - Performance metrics: Loop time of 0.408998 on 1 procs for 250 steps with 4000 atoms. Performance: 264059,963 tau/day, 611,250 timesteps/s, 99.9% CPU use with 1 MPI tasks x 1 OpenMP threads.
  - MPI task timing breakdown table:
  - System statistics: Nlocal, Histogram, Nghost, Histogram, Neighs, Histogram.
  - Summary: Total # of neighbors = 151513, Ave neighs/atom = 37.8783, Neighbor list builds = 12, Dangerous builds not checked, Total wall time: 0:00:00.
  - Process termination: Process returned 0 (0x0) execution time : 0,457 s. Press ENTER to continue.
  - Build command: `Run: all in lammmps (compiler: GNU GCC Compiler)`
- Log & others:** Shows the compilation process, including the command `g++ -P /home/akohmey/compile/lammps/... -o lammmps` and the message 'Process terminated with status 0 (0 minutes), 0 error(s), 0 warning(s) (0 minute(s), 0 second(s))'.
- Status Bar:** Shows the current file path, compiler, encoding, cursor position, and mode.

## 8.6.2 LAMMPS GitHub tutorial

written by Stefan Paquay

This document describes the process of how to use GitHub to integrate changes or additions you have made to LAMMPS into the official LAMMPS distribution. It uses the process of updating this very tutorial as an example to describe the individual steps and options. You need to be familiar with git and you may want to have a look at the [git book](#) to familiarize yourself with some of the more advanced git features used below.

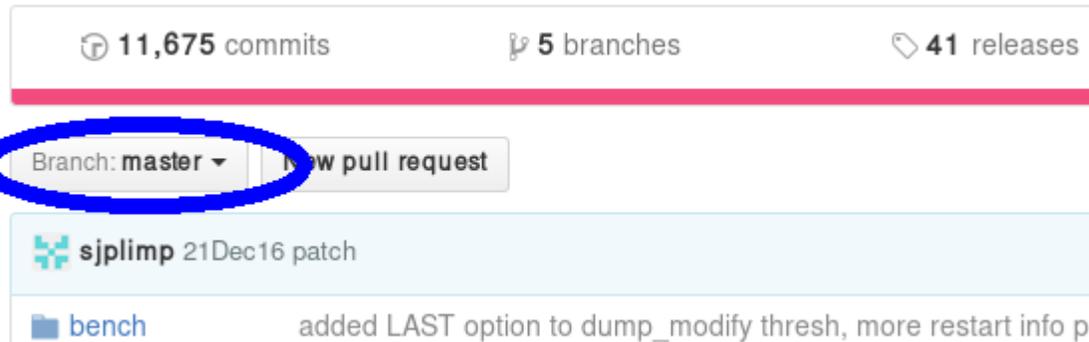

As of fall 2016, submitting contributions to LAMMPS via pull requests on GitHub is the preferred option for integrating contributed features or improvements to LAMMPS, as it significantly reduces the amount of work required by the LAMMPS developers. Consequently, creating a pull request will increase your chances to have your contribution included and will reduce the time until the integration is complete. For more information on the requirements to have your code included into LAMMPS please see [this page](#).

### Making an account

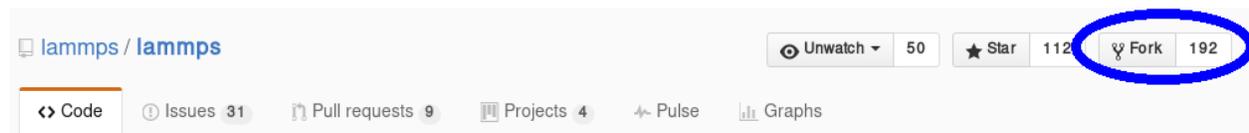

First of all, you need a GitHub account. This is fairly simple, just go to [GitHub](#) and create an account by clicking the “Sign up for GitHub” button. Once your account is created, you can sign in by clicking the button in the top left and filling in your username or e-mail address and password.

## Forking the repository

To get changes into LAMMPS, you need to first fork the *lammps/lammps* repository on GitHub. At the time of writing, *develop* is the preferred target branch. Thus go to [LAMMPS on GitHub](#) and make sure branch is set to “develop”, as shown in the figure below.

If it is not, use the button to change it to *develop*. Once it is, use the fork button to create a fork.

This will create a fork (which is essentially a copy, but uses less resources) of the LAMMPS repository under your own GitHub account. You can make changes in this fork and later file *pull requests* to allow the upstream repository to merge changes from your own fork into the one we just forked from (or others that were forked from the same repository). At the same time, you can set things up, so you can include changes from upstream into your repository and thus keep it in sync with the ongoing LAMMPS development.

## Adding changes to your own fork

Additions to the upstream version of LAMMPS are handled using *feature branches*. For every new feature, a so-called feature branch is created, which contains only those modification relevant to one specific feature. For example, adding a single fix would consist of creating a branch with only the fix header and source file and nothing else. It is explained in more detail here: [feature branch workflow](#).

### Feature branches

First of all, create a clone of your version on GitHub on your local machine via HTTPS:

```
$ git clone https://github.com/<your user name>/lammps.git <some name>
```

or, if you have set up your GitHub account for using SSH keys, via SSH:

```
$ git clone git@github.com:<your user name>/lammps.git
```

You can find the proper URL by clicking the “Clone or download”-button:

Pakketeret2 / lammps  
forked from lammps/lammps

Unwatch 1 Star 0 Fork 192

Code Pull requests 0 Projects 0 Wiki Pulse Graphs Settings

Public/backup repository of the LAMMPS MD software package <http://lammps.sandia.gov> Edit

16,191 commits 8 branches 10 releases 12 contributors GPL-2.0

Branch: master New pull request Create new file Upload files Clone or download

This branch is 6178 commits ahead, 1662 commits behind lammps:master.

Pakketeret2 Merged stuffs.

- bench Merge remote branch 'lammps-ro/master' into lammps-icm
- doc Updated docs.

Clone with SSH Use an SSH key and passphrase from account.  
git@github.com:Pakketeret2/lammps.git Download ZIP

The above command copies (“clones”) the git repository to your local machine to a directory with the name you chose. If none is given, it will default to “lammps”. Typical names are “mylammps” or something similar.

You can use this local clone to make changes and test them without interfering with the repository on GitHub.

To pull changes from upstream into this copy, you can go to the directory and use git pull:

```
$ cd mylammps
$ git checkout develop
$ git pull https://github.com/lammps/lammps develop
```

You can also add this URL as a remote:

```
$ git remote add upstream https://www.github.com/lammps/lammps
```

From then on you can update your upstream branches with:

```
$ git fetch upstream
```

and then refer to the upstream repository branches with *upstream/develop* or *upstream/release* and so on.

At this point, you typically make a feature branch from the updated branch for the feature you want to work on. This tutorial contains the workflow that updated this tutorial, and hence we will call the branch “github-tutorial-update”:

```
$ git fetch upstream
$ git checkout -b github-tutorial-update upstream/develop
```

Now that we have changed branches, we can make our changes to our local repository. Just remember that if you want to start working on another, unrelated feature, you should switch branches!

---

**Note:** Committing changes to the *develop*, *release*, or *stable* branches is strongly discouraged. While it may be convenient initially, it will create more work in the long run. Various texts and tutorials on using git effectively discuss the motivation for using feature branches instead.

---

### After changes are made

After everything is done, add the files to the branch and commit them:

```
$ git add doc/src/Howto_github.txt
$ git add doc/src/JPG/tutorial*.png
```

**Warning:** Do not use `git commit -a` (or `git add -A`). The `-a` flag (or `-A` flag) will automatically include **all** modified **and** new files and that is rarely the behavior you want. It can easily lead to accidentally adding unrelated and unwanted changes into the repository. Instead it is preferable to explicitly use `git add`, `git rm`, `git mv` for adding, removing, renaming individual files, respectively, and then `git commit` to finalize the commit. Carefully check all pending changes with `git status` before committing them. If you find doing this on the command line too tedious, consider using a GUI, for example the one included in git distributions written in Tk, i.e. use `git gui` (on some Linux distributions it may be required to install an additional package to use it).

After adding all files, the change set can be committed with some useful message that explains the change.

```
$ git commit -m 'Finally updated the GitHub tutorial'
```

After the commit, the changes can be pushed to the same branch on GitHub:

```
$ git push
```

Git will ask you for your user name and password on GitHub if you have not configured anything. If your local branch is not present on GitHub yet, it will ask you to add it by running

```
$ git push --set-upstream origin github-tutorial-update
```

If you correctly type your user name and password, the feature branch should be added to your fork on GitHub.

If you want to make really sure you push to the right repository (which is good practice), you can provide it explicitly:

```
$ git push origin
```

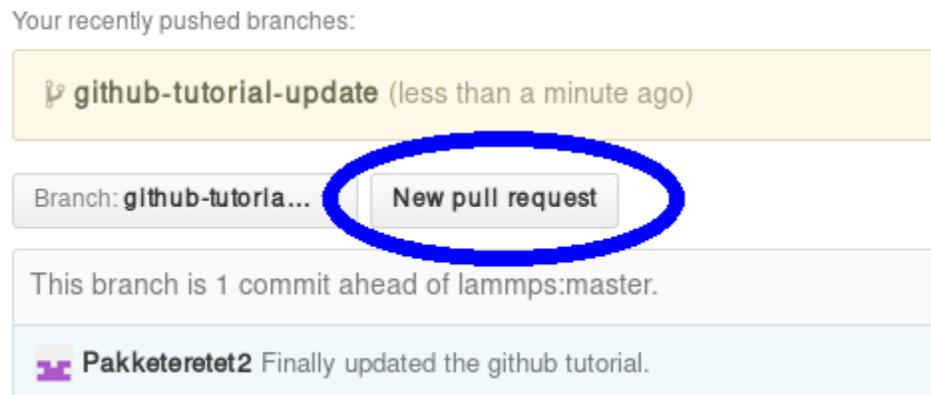

or using an explicit URL:

```
$ git push git@github.com:Pakketeretet2/lammps.git
```

---

### Filing a pull request

Up to this point in the tutorial, all changes were to *your* clones of LAMMPS. Eventually, however, you want this feature to be included into the official LAMMPS version. To do this, you will want to file a pull request by clicking on the “New pull request” button:

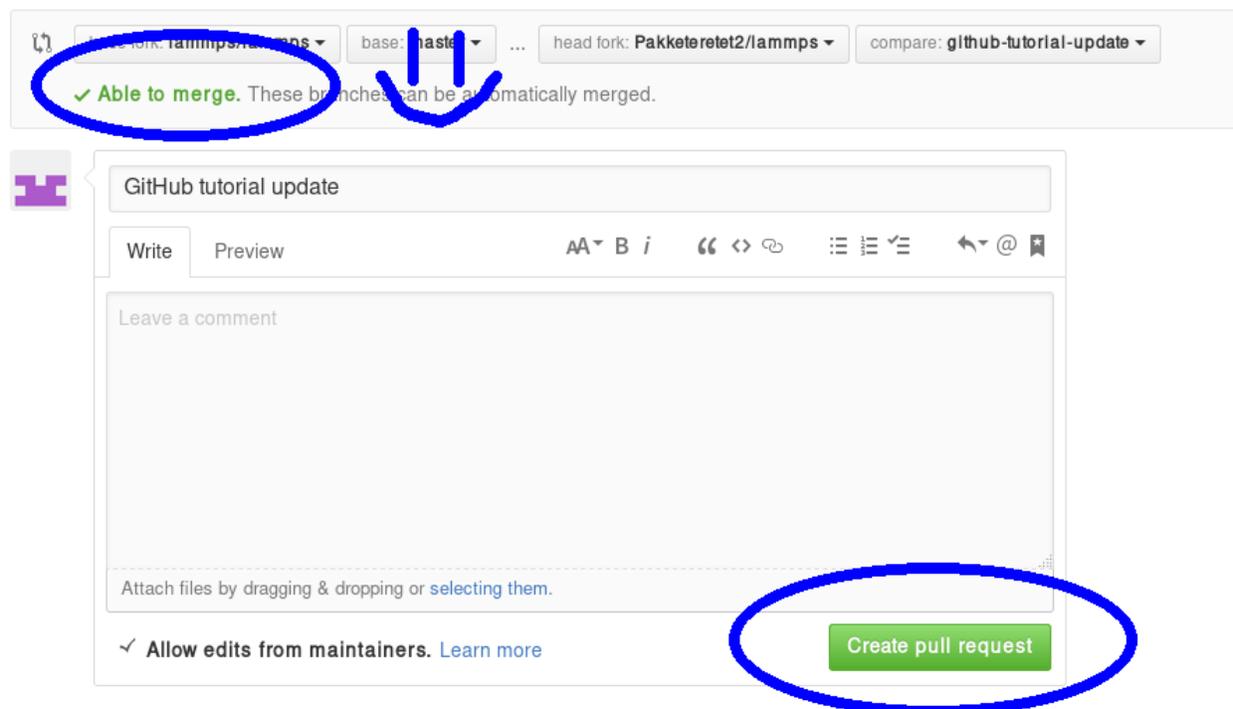

Make sure that the current branch is set to the correct one, which, in this case, is “github-tutorial-update”. If done correctly, the only changes you will see are those that were made on this branch.

This will open up a new window that lists changes made to the repository. If you are just adding new files, there is not much to do, but I suppose merge conflicts are to be resolved here if there are changes in existing files. If all changes can automatically be merged, green text at the top will say so and you can click the “Create pull request” button, see image.

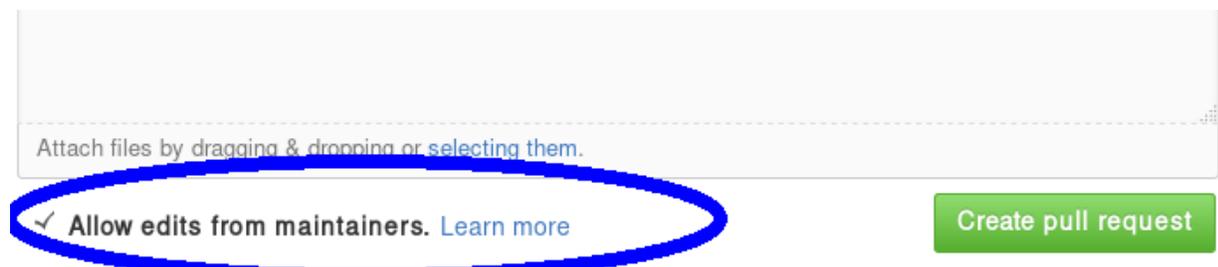

## Open a pull request

Create a new pull request by comparing changes across two branches. If you need to, you can also [compare across forks](#).

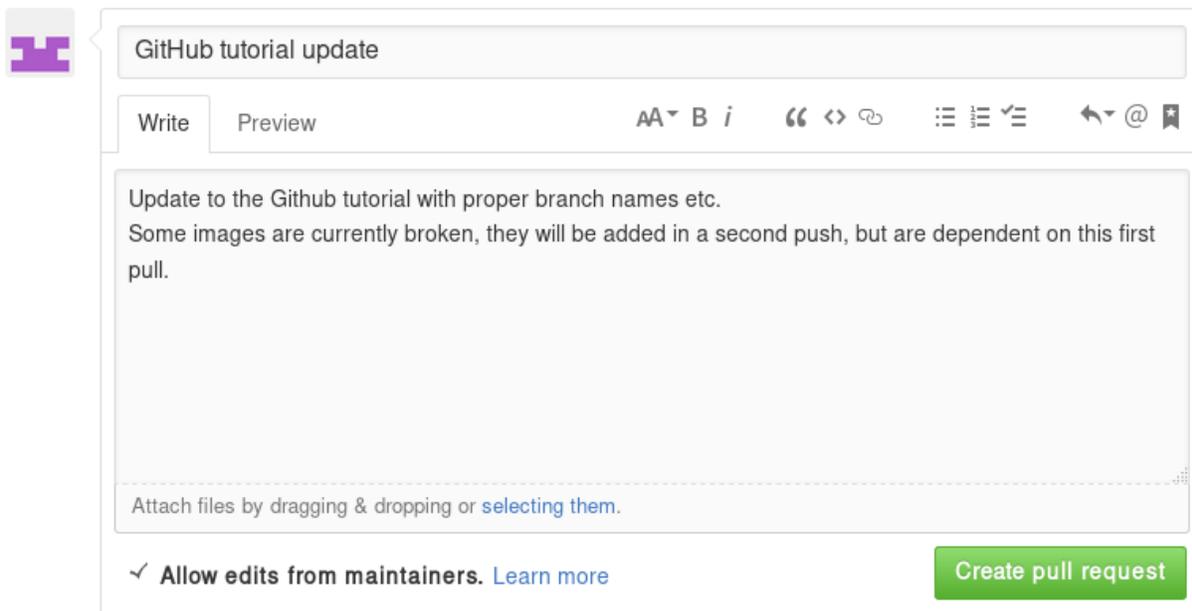

Before creating the pull request, make sure the short title is accurate and add a comment with details about your pull request. Here you write what your modifications do and why they should be incorporated upstream.

Note the checkbox that says “Allow edits from maintainers”. This is checked by default checkbox (although in my version of Firefox, only the checkmark is visible):

If it is checked, maintainers can immediately add their own edits to the pull request. This helps the inclusion of your branch significantly, as simple/trivial changes can be added directly to your pull request branch by the LAMMPS maintainers. The alternative would be that they make changes on their own version of the branch and file a reverse pull request to you. Just leave this box checked unless you have a very good reason not to.

Now just write some nice comments and click on “Create pull request”.

---

### After filing a pull request

**Note:** When you submit a pull request (or ask for a pull request) for the first time, you will receive an invitation to become a LAMMPS project collaborator. Please accept this invite as being a collaborator will simplify certain administrative tasks and will probably speed up the merging of your feature, too.

---

You will notice that after filing the pull request, some checks are performed automatically:

## GitHub tutorial update #315

**Open** Pakketeret2 wants to merge 2 commits into lammps:master from Pakketeret2:github-tutorial-update

Conversation 0 Commits 2 Files changed 5

**Pakketeret2** commented a minute ago Collaborator

Update to the Github tutorial with proper branch names etc.  
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

**Pakketeret2** added some commits 18 minutes ago

- Finally updated the github tutorial. 391ab76
- Almost done with the tutorial now. 4d98bbd

Add more commits by pushing to the `github-tutorial-update` branch on `Pakketeret2/lammps`.

**Some checks haven't completed yet** Hide all checks  
3 pending checks

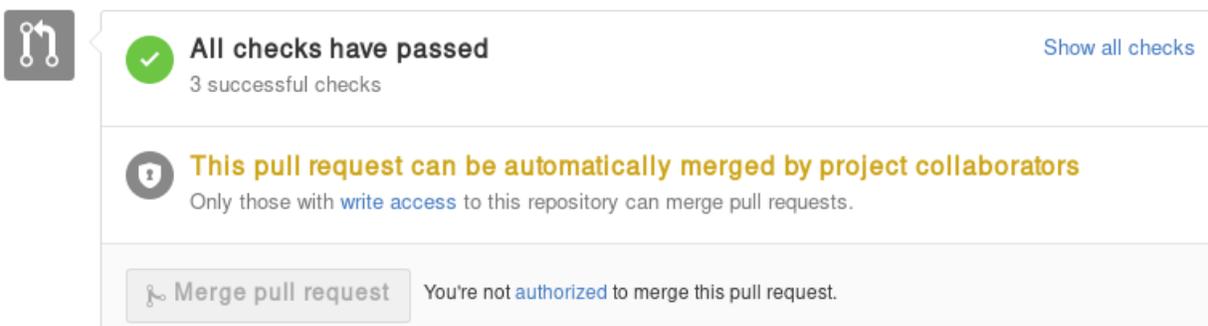

- `lammps/pull-requests/openmpi-pr` — head run star... [Details](#)
- `lammps/pull-requests/serial-pr` — head run started [Details](#)
- `lammps/pull-requests/shlib-pr` — head run started [Details](#)

**This pull request can be automatically merged by project collaborators**  
Only those with [write access](#) to this repository can merge pull requests.

[Merge pull request](#) You're not [authorized](#) to merge this pull request.

If all is fine, you will see this:

Add more commits by pushing to the `github-tutorial-update` branch on `Pakketeret2/lammps`.

**All checks have passed** [Show all checks](#)  
3 successful checks

**This pull request can be automatically merged by project collaborators**  
Only those with [write access](#) to this repository can merge pull requests.

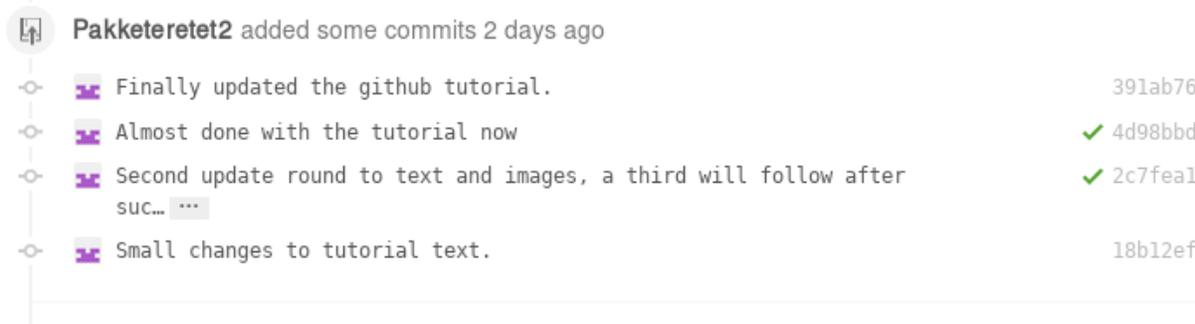

[Merge pull request](#) You're not [authorized](#) to merge this pull request.

If any of the checks are failing, your pull request will not be processed, as your changes may break compilation for certain configurations or may not merge cleanly. It is your responsibility to remove the reason(s) for the failed test(s). If you need help with this, please contact the LAMMPS developers by adding a comment explaining your problems with resolving the failed tests.

A few further interesting things (can) happen to pull requests before they are included.

### Additional changes

First of all, any additional changes you push into your branch in your repository will automatically become part of the pull request:

**Pakketeret2** added some commits 2 days ago

- Finally updated the github tutorial. 391ab76
- Almost done with the tutorial now ✓ 4d98bbd
- Second update round to text and images, a third will follow after suc... ✓ 2c7feal
- Small changes to tutorial text. 18b12ef

This means you can add changes that should be part of the feature after filing the pull request, which is useful in case you have forgotten them, or if a developer has requested that something needs to be changed before the feature can be accepted into the official LAMMPS version. After each push, the automated checks are run again.

### Labels

LAMMPS developers may add labels to your pull request to assign it to categories (mostly for bookkeeping purposes), but a few of them are important: *needs\_work*, *work\_in\_progress*, *run\_tests*, *test\_for\_regression*, and *ready\_for\_merge*. The first two indicate, that your pull request is not considered to be complete. With “needs\_work” the burden is on exclusively on you; while “work\_in\_progress” can also mean, that a LAMMPS developer may want to add changes. Please watch the comments to the pull requests. The two “test” labels are used to trigger extended tests before the code is merged. This is sometimes done by LAMMPS developers, if they suspect that there may be some subtle side effects from your changes. It is not done by default, because those tests are very time consuming. The *ready\_for\_merge* label is usually attached when the LAMMPS developer assigned to the pull request considers this request complete and to trigger a final full test evaluation.

### Reviews

As of Fall 2021, a pull request needs to pass all automatic tests and at least 1 approving review from a LAMMPS developer with write access to the repository before it is eligible for merging. In case your changes touch code that certain developers are associated with, they are auto-requested by the GitHub software. Those associations are set in the file `.github/CODEOWNERS` Thus if you want to be automatically notified to review when anybody changes files or

packages, that **you** have contributed to LAMMPS, you can add suitable patterns to that file, or a LAMMPS developer may add you.

Otherwise, you can also manually request reviews from specific developers, or LAMMPS developers - in their assessment of your pull request - may determine who else should be reviewing your contribution and add that person. Through reviews, LAMMPS developers also may request specific changes from you. If those are not addressed, your pull requests cannot be merged.

### Assignees

There is an assignee property for pull requests. If the request has not been reviewed by any developer yet, it is not assigned to anyone. After revision, a developer can choose to assign it to either a) you, b) a LAMMPS developer (including him/herself) or c) Axel Kohlmeyer (akohlmey).

- Case a) happens if changes are required on your part
- Case b) means that at the moment, it is being tested and reviewed by a LAMMPS developer with the expectation that some changes would be required. After the review, the developer can choose to implement changes directly or suggest them to you.
- Case c) means that the pull request has been assigned to the developer overseeing the merging of pull requests into the *develop* branch.

In this case, Axel assigned the tutorial to Steve:

Update to the Simba tutorial with proper branch names etc.  
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

**Assignees**  
sjplimp

**Labels**  
documentation

**Projects**  
None yet

**Milestone**  
No milestone

Pakketeret2 added some commits 2 days ago

- Finally updated the github tutorial. 391ab76
- Almost done with the tutorial now ✓ 4d98bbd
- Second update round to text and images, a third will follow after suc... ✓ 2c7feal
- Small changes to tutorial text. 18b12ef

sjplimp was assigned by akohlmey 2 days ago

### Edits from LAMMPS maintainers

If you allowed edits from maintainers (the default), any LAMMPS maintainer can add changes to your pull request. In this case, both Axel and Richard made changes to the tutorial:

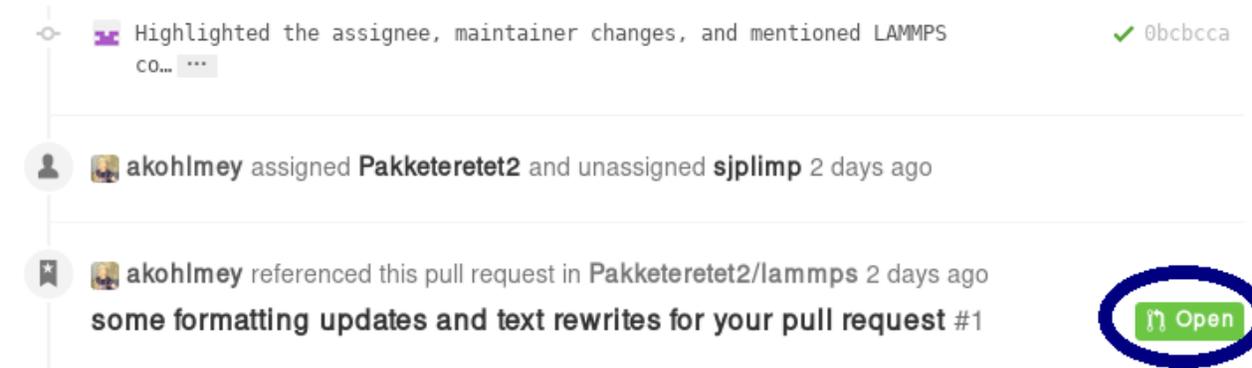

Pakketeret2 and others added some commits 2 days ago

- Updated some inconsistent text. ✓ 4f096db
- make it more explicit, that master needs to be updated and feature br... ✓ 7d057d4
- Add warning formatting ✓ 4f45d39

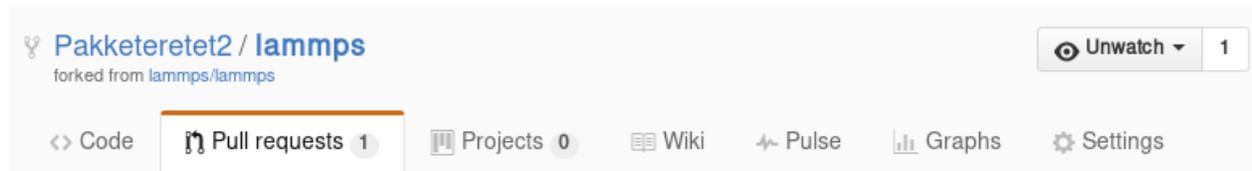

### Reverse pull requests

Sometimes, however, you might not feel comfortable having other people push changes into your own branch, or maybe the maintainers are not sure their idea was the right one. In such a case, they can make changes, reassign you as the assignee, and file a “reverse pull request”, i.e. file a pull request in **your** forked GitHub repository to include changes in the branch, that you have submitted as a pull request yourself. In that case, you can choose to merge their changes

back into your branch, possibly make additional changes or corrections and proceed from there. It looks something like this:

For some reason, the highlighted button did not work in my case, but I can go to my own repository and merge the pull request from there:

## some formatting updates and text rewrites for your pull request #1

[Open](#) akohlmei wants to merge 1 commit into `Pakketeretet2:github-tutorial-update` from `akohlmei:pull-315`

Conversation 0 Commits 1 Files changed 1

akohlmei commented 2 days ago

Here are some additional changes for your lammps/#315 pull request. It updates the "do not use git add -a" paragraph and some formatting improvements.

some formatting updates and text rewrites in the "do not use git add ..."

Be sure to check the changes to see if you agree with them by clicking on the tab button:

## some formatting updates and text rewrites for your pull request #1

---	---

Because the changes are OK with us, we are going to merge by clicking on "Merge pull request". After a merge it looks like this:

A screenshot of a GitHub interface. At the top, a comment from user 'Pakketeretet2' says 'Thanks Axel, will merge after a review.' Below this, a notification indicates that 'Pakketeretet2' merged commit '1310438' into the branch 'Pakketeretet2:github-tutorial-update'. A 'Revert' button is visible. At the bottom, there is a light blue notification box with a lightbulb icon that says 'Avoid bugs by automatically running your tests.' and provides information about continuous integration.

Now, since in the meantime our local text for the tutorial also changed, we need to pull Axel's change back into our branch, and merge them:

```
$ git add Howto_github.txt
$ git add JPG/tutorial_reverse_pull_request*.png
$ git commit -m "Updated text and images on reverse pull requests"
$ git pull
```

In this case, the merge was painless because git could auto-merge:

```
[ stefan@phys8250 src ] % git pull
Auto-merging doc/src/tutorial_github.txt
Waiting for Emacs...
Merge made by the 'recursive' strategy.
 doc/src/tutorial_github.txt | 68 ++++++-----
 1 file changed, 37 insertions(+), 31 deletions(-)
[ stefan@phys8250 src ] %
```

With Axel's changes merged in and some final text updates, our feature branch is now perfect as far as we are concerned, so we are going to commit and push again:

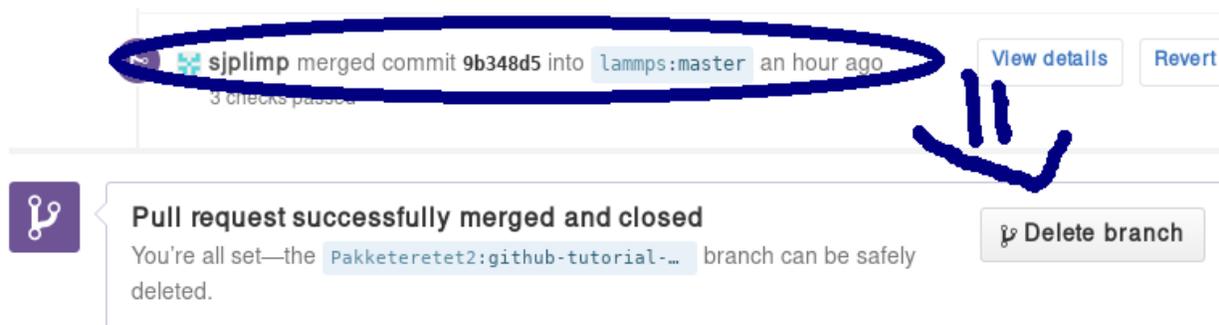

```
$ git add Howto_github.txt
$ git add JPG/tutorial_reverse_pull_request6.png
$ git commit -m "Merged Axel's suggestions and updated text"
$ git push git@github.com:Pakketeretet2/lammps
```

This merge also shows up on the lammps GitHub page:

A screenshot of a GitHub pull request page. The pull request title is 'polish the introduction, some more clarifications, corrections and fo...'. It is marked as 'Merged' with a green checkmark and the commit hash '6af56e6'. A comment from user 'akohlmei' says 'A few more suggested edits to the tutorial from me #2'. Another comment from 'akohlmei' says 'assigned sjplimp and unassigned Pakketeretet2 2 hours ago'.

After a merge

When everything is fine, the feature branch is merged into the *develop* branch:

Now one question remains: What to do with the feature branch that got merged into upstream?

It is in principle safe to delete them from your own fork. This helps keep it a bit more tidy. Note that you first have to switch to another branch!

```
$ git checkout develop
$ git pull https://github.com/lammps/lammps develop
$ git branch -d github-tutorial-update
```

If you do not pull first, it is not really a problem but git will warn you at the next statement that you are deleting a local branch that was not yet fully merged into HEAD. This is because git does not yet know your branch just got merged into LAMMPS upstream. If you first delete and then pull, everything should still be fine. You can display all branches that are fully merged by:

Finally, if you delete the branch locally, you might want to push this to your remote(s) as well:

```
$ git push origin :github-tutorial-update
```

### Recent changes in the workflow

Some changes to the workflow are not captured in this tutorial. For example, in addition to the *develop* branch, to which all new features should be submitted, there is also a *release* and a *stable* branch; these have the same content as *develop*, but are only updated after a patch release or stable release was made. Furthermore, the naming of the patches now follow the pattern “patch\_<Day><Month><Year>” to simplify comparisons between releases. Finally, all patches and submissions are subject to automatic testing and code checks to make sure they at the very least compile.

A discussion of the LAMMPS developer GitHub workflow can be found in the file [doc/github-development-workflow.md](#)

## Overview

PyLammps is a Python wrapper class for LAMMPS which can be created on its own or use an existing lammps Python object. It creates a simpler, more “pythonic” interface to common LAMMPS functionality, in contrast to the lammps wrapper for the C-style LAMMPS library interface which is written using [Python ctypes](#). The lammps wrapper is discussed on the [Use Python with LAMMPS](#) doc page.

Unlike the flat ctypes interface, PyLammps exposes a discoverable API. It no longer requires knowledge of the underlying C++ code implementation. Finally, the IPyLammps wrapper builds on top of PyLammps and adds some additional features for IPython integration into Jupyter notebooks, e.g. for embedded visualization output from *dump style image*.

## Comparison of lammps and PyLammps interfaces

### lammps.lammps

- uses ctypes
- direct memory access to native C++ data
- provides functions to send and receive data to LAMMPS
- requires knowledge of how LAMMPS internally works (C pointers, etc)

## lammeps.PyLammps

- higher-level abstraction built on top of original ctypes interface
- manipulation of Python objects
- communication with LAMMPS is hidden from API user
- shorter, more concise Python
- better IPython integration, designed for quick prototyping

## Quick Start

### System-wide Installation

#### Step 1: Building LAMMPS as a shared library

To use LAMMPS inside of Python it has to be compiled as shared library. This library is then loaded by the Python interface. In this example we enable the MOLECULE package and compile LAMMPS with C++ exceptions, PNG, JPEG and FFMPEG output support enabled.

Step 1a: For the CMake based build system, the steps are:

```
mkdir $LAMMPS_DIR/build-shared
cd $LAMMPS_DIR/build-shared

# MPI, PNG, Jpeg, FFMPEG are auto-detected
cmake ../cmake -DPKG_MOLECULE=yes -DLAMMPS_EXCEPTIONS=yes -DBUILD_LIB=yes -DBUILD_SHARED_
↳LIBS=yes
make
```

Step 1b: For the legacy, make based build system, the steps are:

```
cd $LAMMPS_DIR/src

# add packages if necessary
make yes-MOLECULE

# compile shared library using Makefile
make mpi mode=shlib LMP_INC="-DLAMMPS_PNG -DLAMMPS_JPEG -DLAMMPS_FFMPEG -DLAMMPS_
↳EXCEPTIONS" JPG_LIB="-lpng -ljpeg"
```

#### Step 2: Installing the LAMMPS Python package

PyLammps is part of the lammeps Python package. To install it simply install that package into your current Python installation with:

```
make install-python
```

---

**Note:** Recompiling the shared library requires re-installing the Python package

---

## Installation inside of a virtualenv

You can use virtualenv to create a custom Python environment specifically tuned for your workflow.

### Benefits of using a virtualenv

- isolation of your system Python installation from your development installation
- installation can happen in your user directory without root access (useful for HPC clusters)
- installing packages through pip allows you to get newer versions of packages than e.g., through apt-get or yum package managers (and without root access)
- you can even install specific old versions of a package if necessary

### Prerequisite (e.g. on Ubuntu)

```
apt-get install python-virtualenv
```

### Creating a virtualenv with lammmps installed

```
# create virtualenv named 'testing'
virtualenv $HOME/python/testing

# activate 'testing' environment
source $HOME/python/testing/bin/activate
```

Now configure and compile the LAMMPS shared library as outlined above. When using CMake and the shared library has already been build, you need to re-run CMake to update the location of the python executable to the location in the virtual environment with:

```
cmake . -DPYTHON_EXECUTABLE=$(which python)

# install LAMMPS package in virtualenv
(testing) make install-python

# install other useful packages
(testing) pip install matplotlib jupyter mpi4py

...

# return to original shell
(testing) deactivate
```

## Creating a new instance of PyLammps

To create a PyLammps object you need to first import the class from the lammps module. By using the default constructor, a new *lammps* instance is created.

```
from lammps import PyLammps
L = PyLammps()
```

You can also initialize PyLammps on top of this existing *lammps* object:

```
from lammps import lammps, PyLammps
lmp = lammps()
L = PyLammps(ptr=lmp)
```

## Commands

Sending a LAMMPS command with the existing library interfaces is done using the command method of the lammps object instance.

For instance, let's take the following LAMMPS command:

```
region box block 0 10 0 5 -0.5 0.5
```

In the original interface this command can be executed with the following Python code if *L* was a lammps instance:

```
L.command("region box block 0 10 0 5 -0.5 0.5")
```

With the PyLammps interface, any command can be split up into arbitrary parts separated by white-space, passed as individual arguments to a region method.

```
L.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

Note that each parameter is set as Python literal floating-point number. In the PyLammps interface, each command takes an arbitrary parameter list and transparently merges it to a single command string, separating individual parameters by white-space.

The benefit of this approach is avoiding redundant command calls and easier parameterization. In the original interface parameterization needed to be done manually by creating formatted strings.

```
L.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo, zhi))
```

In contrast, methods of PyLammps accept parameters directly and will convert them automatically to a final command string.

```
L.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

## System state

In addition to dispatching commands directly through the PyLammps object, it also provides several properties which allow you to query the system state.

### **L.system**

Is a dictionary describing the system such as the bounding box or number of atoms

### **L.system.xlo, L.system.xhi**

bounding box limits along x-axis

### **L.system.ylo, L.system.yhi**

bounding box limits along y-axis

### **L.system.zlo, L.system.zhi**

bounding box limits along z-axis

### **L.communication**

configuration of communication subsystem, such as the number of threads or processors

### **L.communication.nthreads**

number of threads used by each LAMMPS process

### **L.communication.nprocs**

number of MPI processes used by LAMMPS

### **L.fixes**

List of fixes in the current system

### **L.computes**

List of active computes in the current system

### **L.dump**

List of active dumps in the current system

### **L.groups**

List of groups present in the current system

## Working with LAMMPS variables

LAMMPS variables can be both defined and accessed via the PyLammps interface.

To define a variable you can use the *variable* command:

```
L.variable("a index 2")
```

A dictionary of all variables is returned by `L.variables`

you can access an individual variable by retrieving a variable object from the `L.variables` dictionary by name

```
a = L.variables['a']
```

The variable value can then be easily read and written by accessing the `value` property of this object.

```
print(a.value)
a.value = 4
```

## Retrieving the value of an arbitrary LAMMPS expressions

LAMMPS expressions can be immediately evaluated by using the `eval` method. The passed string parameter can be any expression containing global thermo values, variables, compute or fix data.

```
result = L.eval("ke") # kinetic energy
result = L.eval("pe") # potential energy

result = L.eval("v_t/2.0")
```

## Accessing atom data

All atoms in the current simulation can be accessed by using the `L.atoms` list. Each element of this list is an object which exposes its properties (`id`, `type`, `position`, `velocity`, `force`, etc.).

```
# access first atom
L.atoms[0].id
L.atoms[0].type

# access second atom
L.atoms[1].position
L.atoms[1].velocity
L.atoms[1].force
```

Some properties can also be used to set:

```
# set position in 2D simulation
L.atoms[0].position = (1.0, 0.0)

# set position in 3D simulation
L.atoms[0].position = (1.0, 0.0, 1.)
```

## Evaluating thermo data

Each simulation run usually produces thermo output based on system state, computes, fixes or variables. The trajectories of these values can be queried after a run via the `L.runs` list. This list contains a growing list of run data. The first element is the output of the first run, the second element that of the second run.

```
L.run(1000)
L.runs[0] # data of first 1000 time steps

L.run(1000)
L.runs[1] # data of second 1000 time steps
```

Each run contains a dictionary of all trajectories. Each trajectory is accessible through its thermo name:

```
L.runs[0].thermo.Step # list of time steps in first run
L.runs[0].thermo.Ke  # list of kinetic energy values in first run
```

Together with `matplotlib` plotting data out of LAMMPS becomes simple:

```
import matplotlib.pyplot as plt
steps = L.runs[0].thermo.Step
ke     = L.runs[0].thermo.Ke
plt.plot(steps, ke)
```

## Error handling with PyLammps

Compiling the shared library with C++ exception support provides a better error handling experience. Without exceptions the LAMMPS code will terminate the current Python process with an error message. C++ exceptions allow capturing them on the C++ side and rethrowing them on the Python side. This way you can handle LAMMPS errors through the Python exception handling mechanism.

**Warning:** Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible.

## Using PyLammps in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as IPython, you can use PyLammps directly inside of an IPython notebook inside of Jupyter. Jupyter is a powerful integrated development environment (IDE) for many dynamic languages like Python, Julia and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

To launch an instance of Jupyter simply run the following command inside your Python environment (this assumes you followed the Quick Start instructions):

```
jupyter notebook
```

## IPyLammps Examples

Examples of IPython notebooks can be found in the `python/examples/pylammps` sub-directory. To open these notebooks launch `jupyter notebook` inside this directory and navigate to one of them. If you compiled and installed a LAMMPS shared library with exceptions, PNG, JPEG and FFMPEG support you should be able to rerun all of these notebooks.

## Validating a dihedral potential

This example showcases how an IPython Notebook can be used to compare a simple LAMMPS simulation of a harmonic dihedral potential to its analytical solution. Four atoms are placed in the simulation and the dihedral potential is applied on them using a datafile. Then one of the atoms is rotated along the central axis by setting its position from Python, which changes the dihedral angle.

```
phi = [d * math.pi / 180 for d in range(360)]
pos = [(1.0, math.cos(p), math.sin(p)) for p in phi]
pe = []
```

(continues on next page)

(continued from previous page)

```

for p in pos:
    L.atoms[3].position = p
    L.run(0)
    pe.append(L.eval("pe"))

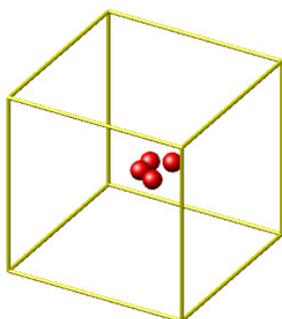

```

By evaluating the potential energy for each position we can verify that trajectory with the analytical formula. To compare both solutions, we plot both trajectories over each other using matplotlib, which embeds the generated plot inside the IPython notebook.

```

In [11]: L.image(zoom=1.0)
Out[11]:

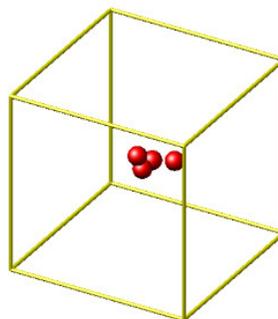

```

```

In [14]: L.image(zoom=1.0)
Out[14]:

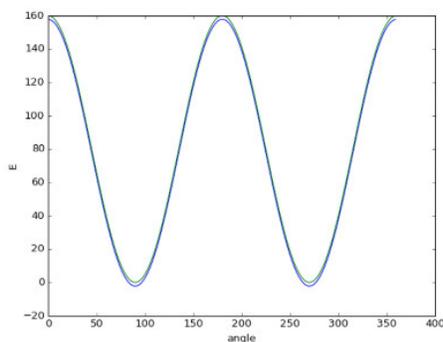

```

```

In [27]: plt.plot(range(360), pe, range(360), E_analytical)
plt.xlabel('angle')
plt.ylabel('E')

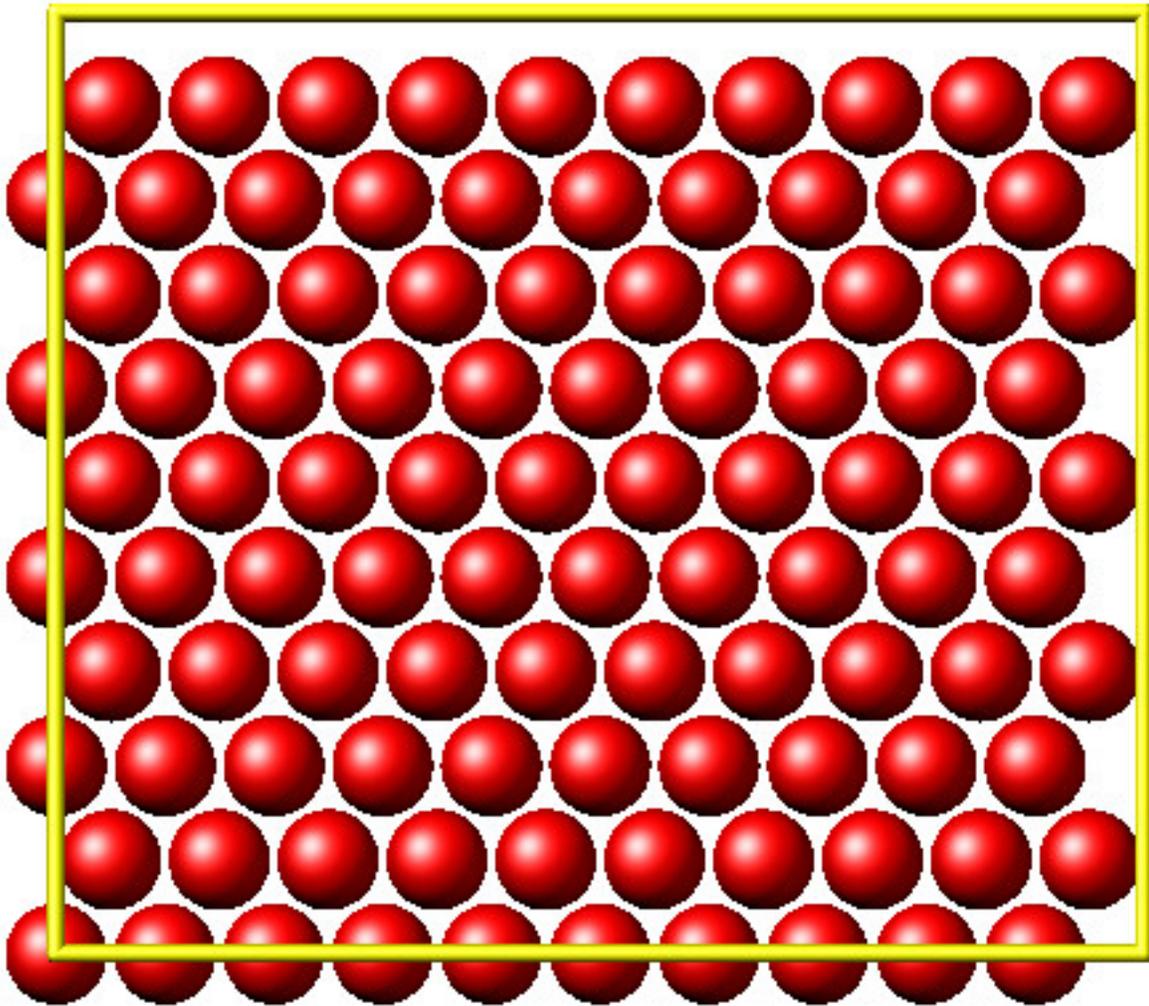

```

## Running a Monte Carlo relaxation

This second example shows how to use PyLammps to create a 2D Monte Carlo Relaxation simulation, computing and plotting energy terms and even embedding video output.

Initially, a 2D system is created in a state with minimal energy.

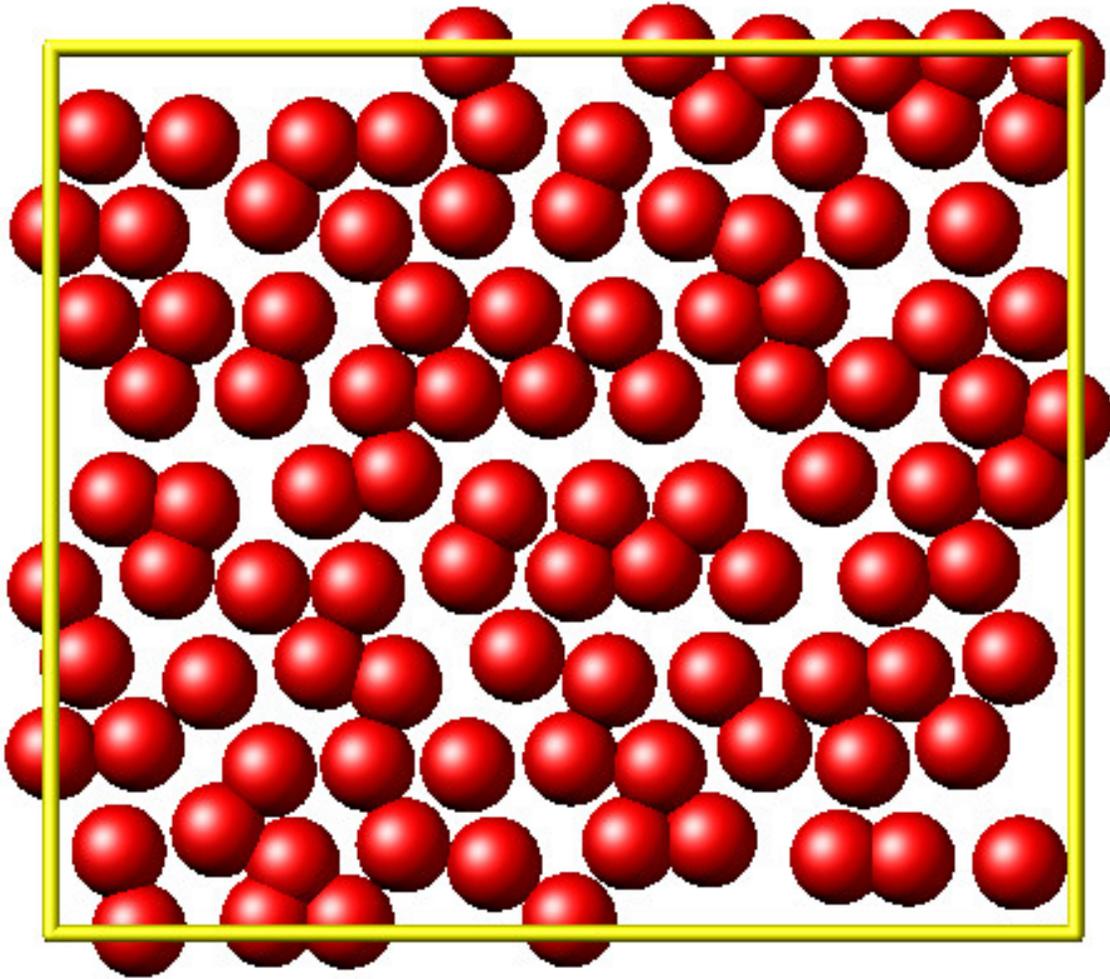

It is then disordered by moving each atom by a random delta.

```
random.seed(27848)
deltaperturb = 0.2

for i in range(L.system.natoms):
    x, y = L.atoms[i].position
    dx = deltaperturb * random.uniform(-1, 1)
    dy = deltaperturb * random.uniform(-1, 1)
    L.atoms[i].position = (x+dx, y+dy)

L.run(0)
```

Finally, the Monte Carlo algorithm is implemented in Python. It continuously moves random atoms by a random delta and only accepts certain moves.

```
estart = L.eval("pe")
elast = estart

naccept = 0
energies = [estart]

niterations = 3000
deltamove = 0.1
kT = 0.05

natoms = L.system.natoms

for i in range(niterations):
    iatom = random.randrange(0, natoms)
    current_atom = L.atoms[iatom]
```

(continues on next page)

(continued from previous page)

```
x0, y0 = current_atom.position

dx = deltamove \* random.uniform(-1, 1)
dy = deltamove \* random.uniform(-1, 1)

current_atom.position = (x0+dx, y0+dy)

L.run(1, "pre no post no")

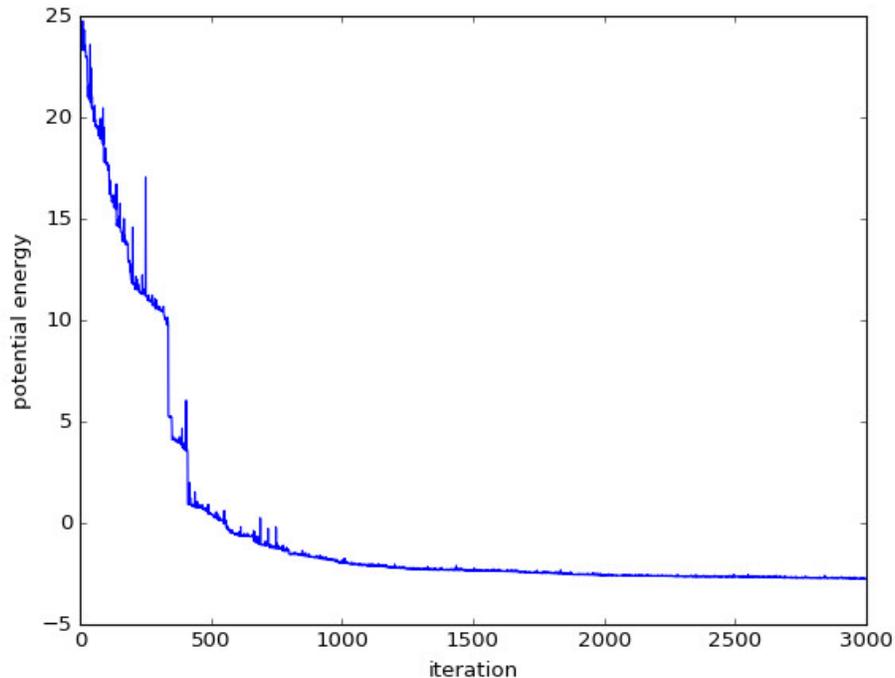

e = L.eval("pe")
energies.append(e)

if e <= elast:
    naccept += 1
    elast = e
elif random.random() <= math.exp(natoms\*(elast-e)/kT):
    naccept += 1
    elast = e
else:
    current_atom.position = (x0, y0)
```

The energies of each iteration are collected in a Python list and finally plotted using matplotlib.

```
In [20]: plt.xlabel('iteration')
plt.ylabel('potential energy')
plt.plot(energies)
```

Figure 1

```
Out[20]: [<matplotlib.lines.Line2D at 0x7f26a40123c8>]
```

The IPython notebook also shows how to use dump commands and embed video files inside of the IPython notebook.

### Using PyLammps and mpi4py (Experimental)

PyLammps can be run in parallel using mpi4py. This python package can be installed using

```
pip install mpi4py
```

The following is a short example which reads in an existing LAMMPS input file and executes it in parallel. You can find `in.melt` in the `examples/melt` folder.

```
from mpi4py import MPI
from lammps import PyLammps

L = PyLammps()
L.file("in.melt")

if MPI.COMM_WORLD.rank == 0:
    print("Potential energy: ", L.eval("pe"))
```

(continues on next page)

(continued from previous page)

```
MPI.Finalize()
```

To run this script (melt.py) in parallel using 4 MPI processes we invoke the following mpirun command:

```
mpirun -np 4 python melt.py
```

**Warning:** Any command must be executed by all MPI processes. However, evaluations and querying the system state is only available on rank 0.

## Feedback and Contributing

If you find this Python interface useful, please feel free to provide feedback and ideas on how to improve it to Richard Berger ([richard.berger@outlook.com](mailto:richard.berger@outlook.com)). We also want to encourage people to write tutorial style IPython notebooks showcasing LAMMPS usage and maybe their latest research results.

## 8.6.4 Using LAMMPS on Windows 10 with WSL

written by Richard Berger

---

It's always been tricky for us to have LAMMPS users and developers work on Windows. We primarily develop LAMMPS to run on Linux clusters. To teach LAMMPS in workshop settings, we had to redirect Windows users to Linux Virtual Machines such as VirtualBox or Unix-like compilation with Cygwin.

With the latest updates in Windows 10 (Version 2004, Build 19041 or higher), Microsoft has added a new way to work on Linux-based code. The Windows Subsystem for Linux (WSL). With WSL Version 2, you now get a Linux Virtual Machine that transparently integrates into Windows. All you need is to ensure you have the latest Windows updates installed and enable this new feature. Linux VMs are then easily installed using the Microsoft Store.

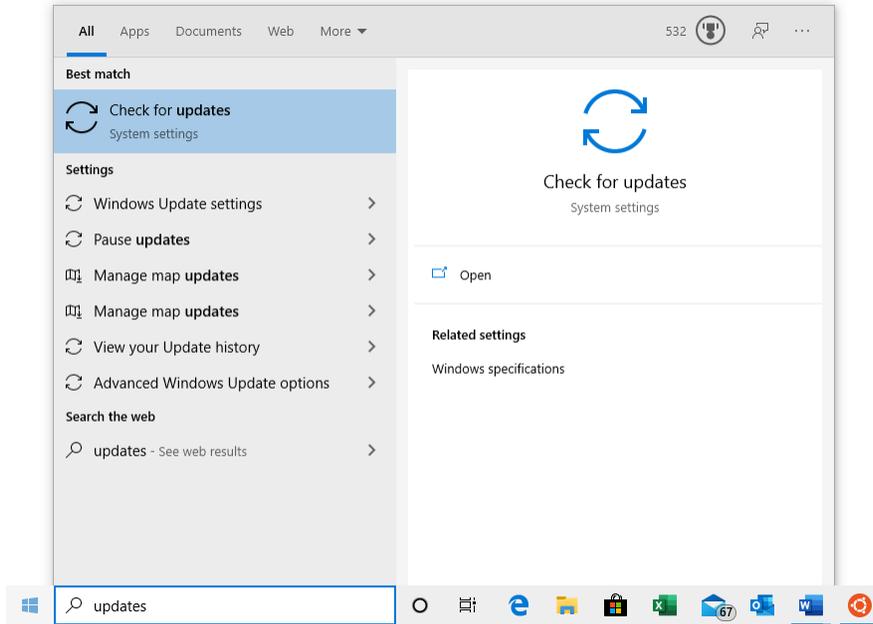

In this tutorial, I'll show you how to set up and compile LAMMPS for both serial and MPI usage in WSL2.

### Installation

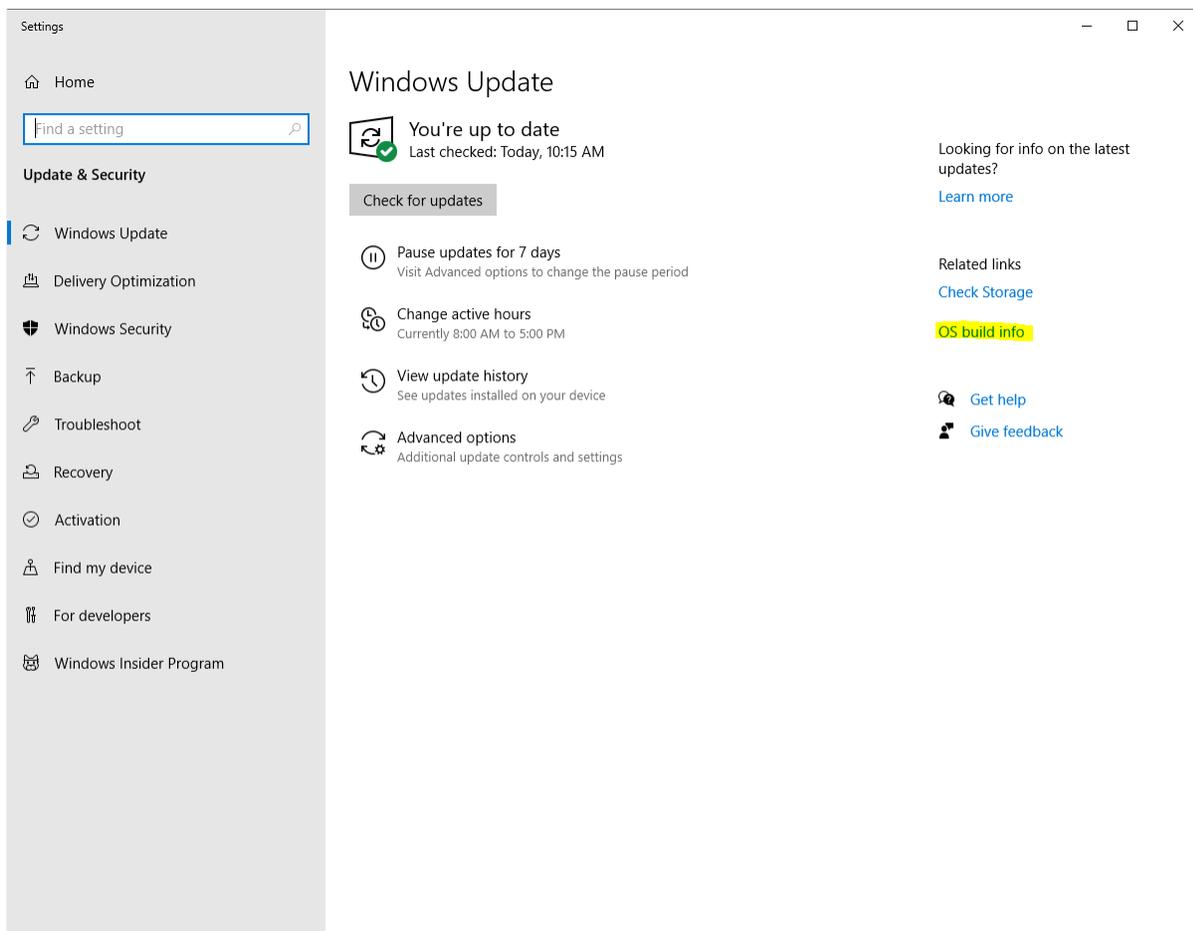

#### Upgrade to the latest Windows 10

Type "Updates" in Windows Start and select "Check for Updates".

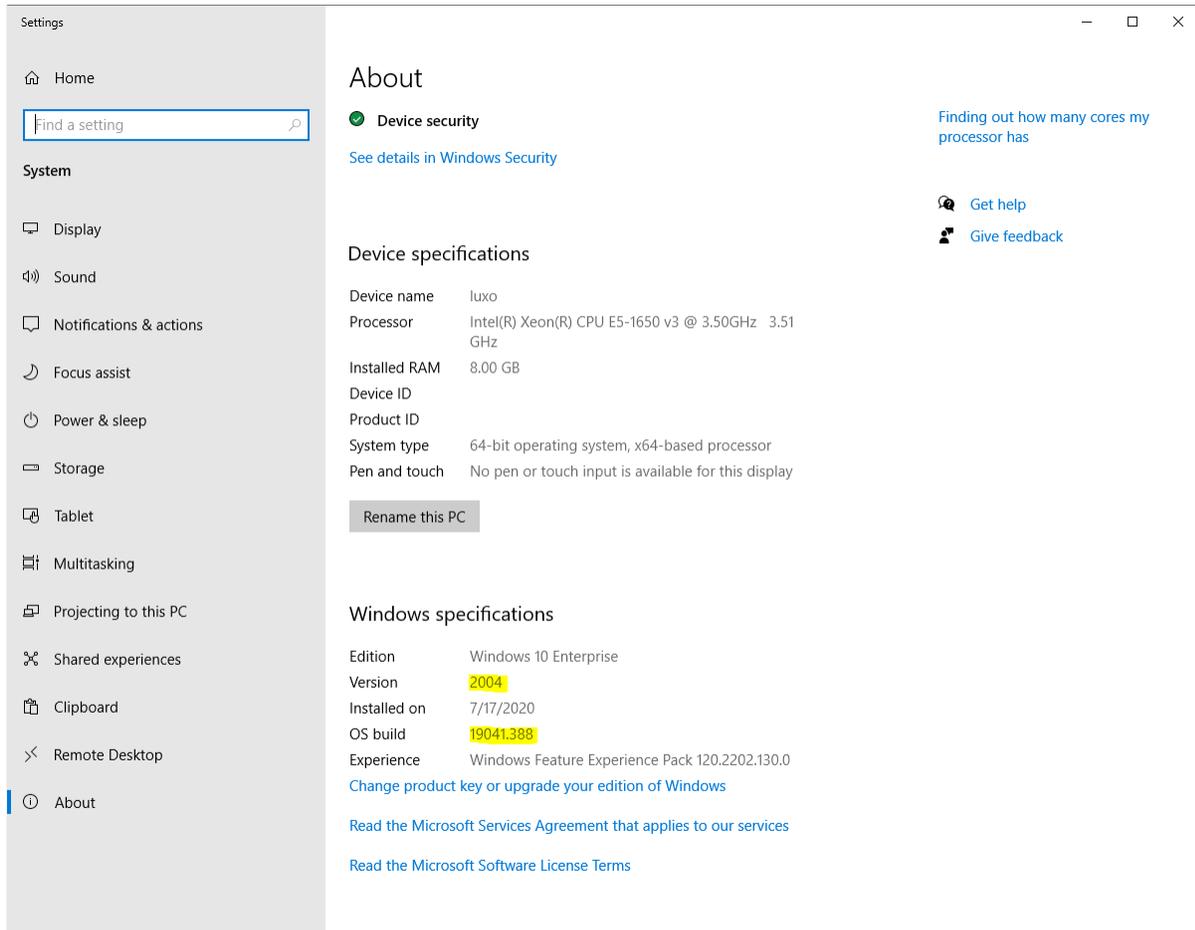

Install all pending updates and reboot your system as many times as necessary. Continue until your Windows installation is updated.

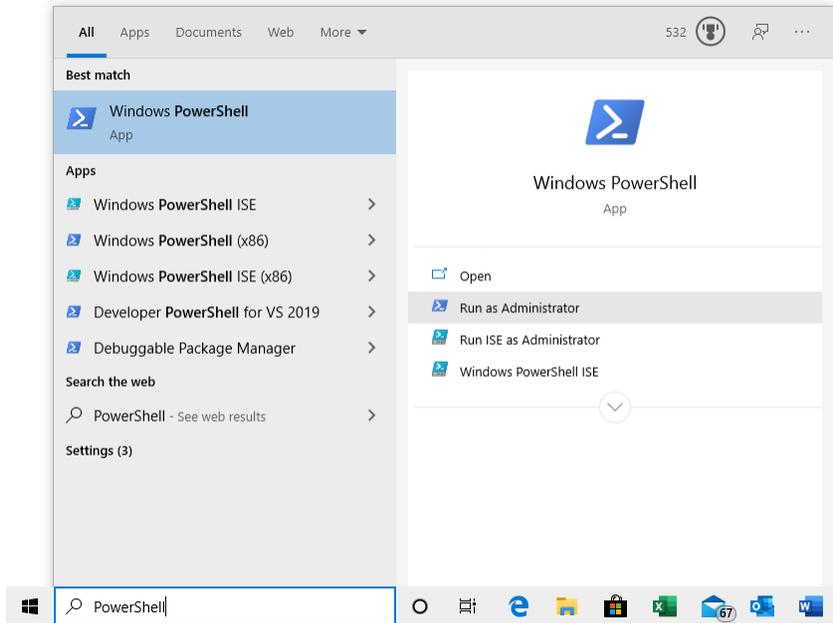

Verify your system has at least **version 2004 and build 19041 or later**. You can find this information by clicking on

“OS build info”.

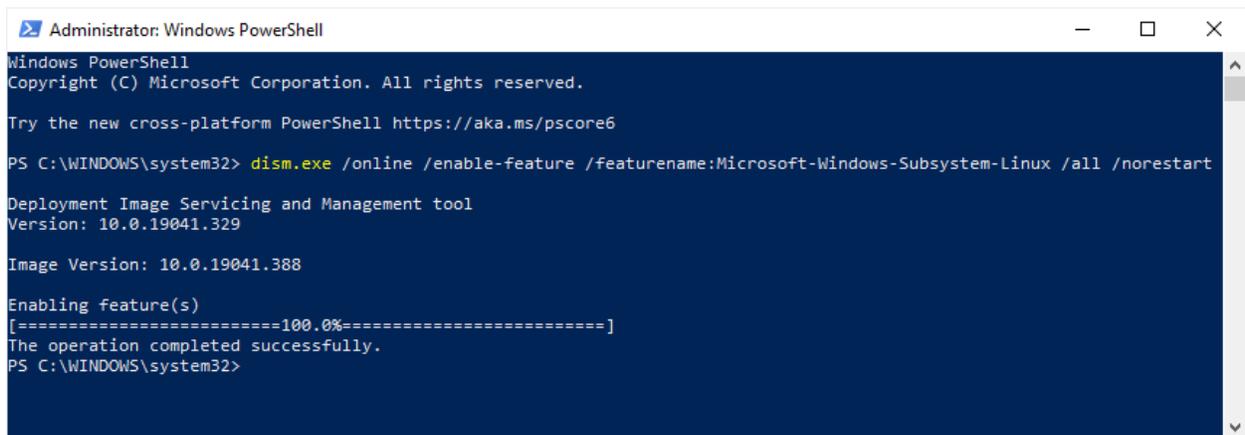

## Enable WSL

Next, we must install two additional Windows features to enable WSL support. Open a PowerShell window as an administrator. Type “PowerShell” in Windows Start and select “Run as Administrator”.

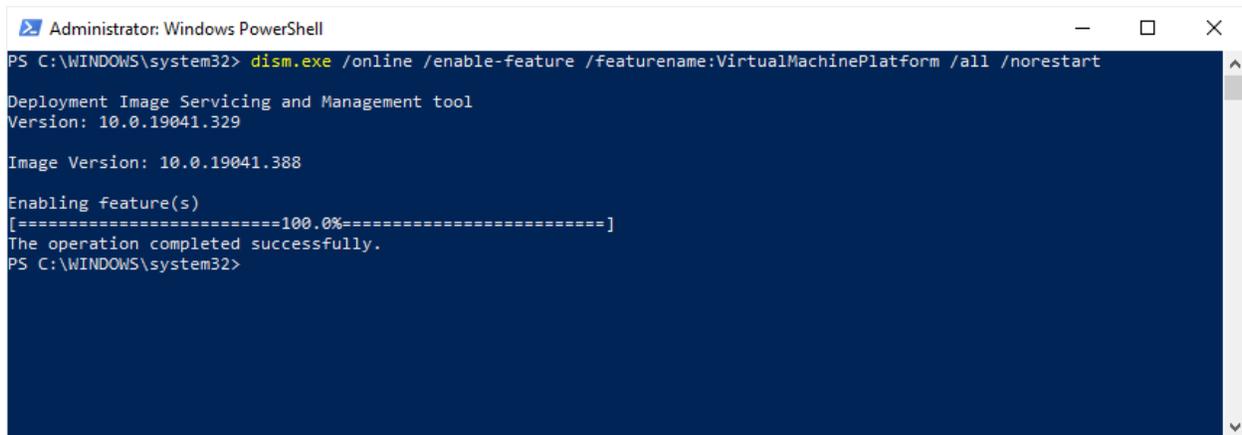

Windows will ask you for administrator access. After you accept a new command line window will appear. Type in the following command to install WSL:

```
dism.exe /online /enable-feature /featurename:Microsoft-Windows-Subsystem-Linux /all /
↵norestart
```

Next, enable the VirtualMachinePlatform feature using the following command:

```
dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart
```

```
Administrator: Windows PowerShell
PS C:\WINDOWS\system32> dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart

Deployment Image Servicing and Management tool
Version: 10.0.19041.329

Image Version: 10.0.19041.388

Enabling feature(s)
[=====100.0%=====]
The operation completed successfully.
PS C:\WINDOWS\system32>
```

Finally, reboot your system.

### Update WSL kernel component

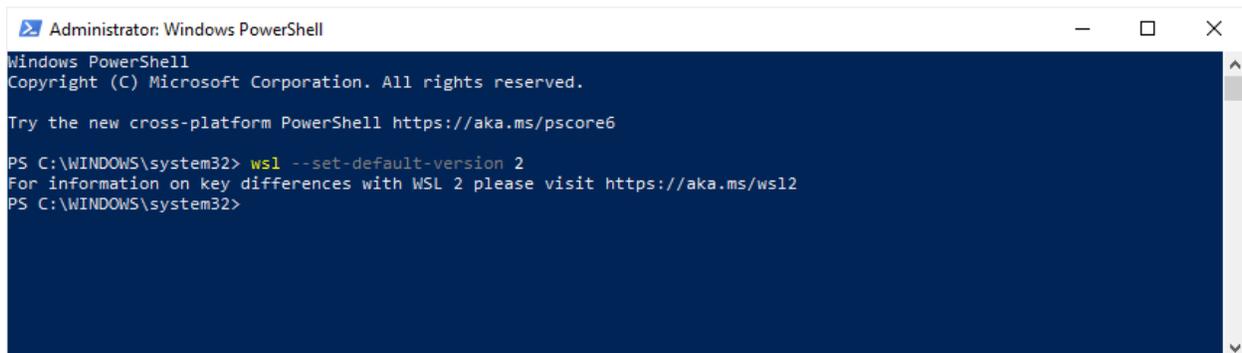

Download and install the WSL Kernel Component Update. Afterwards, reboot your system.

### Set WSL2 as default

Again, open PowerShell as administrator and run the following command:

```
wsl --set-default-version 2
```

This command ensures that all future Linux installations will use WSL version 2.

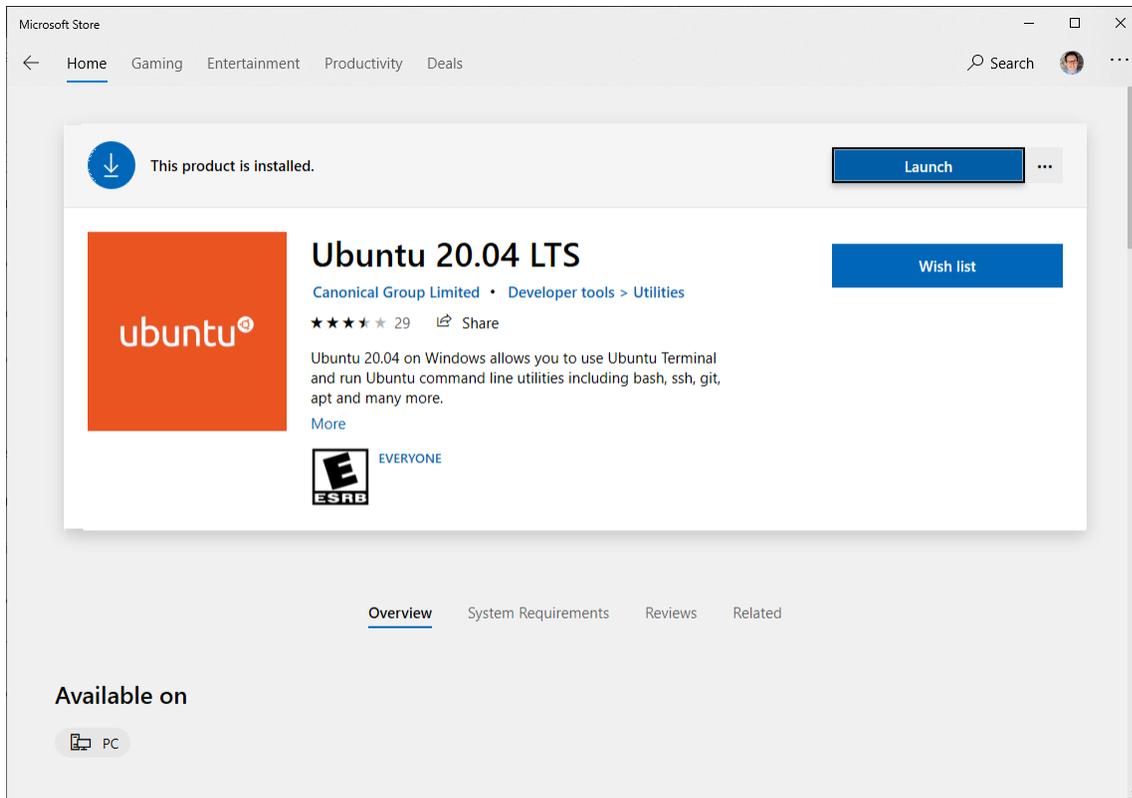

```
Administrator: Windows PowerShell
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Try the new cross-platform PowerShell https://aka.ms/pscore6

PS C:\WINDOWS\system32> wsl --set-default-version 2
For information on key differences with WSL 2 please visit https://aka.ms/wsl2
PS C:\WINDOWS\system32>
```

### Install a Linux Distribution

Next, we need to install a Linux distribution via the Microsoft Store. Install [Ubuntu 20.04 LTS](#). Once installed, you can launch it like any other application from the Start Menu.

## Initial Setup

The first time you launch the Ubuntu Linux console, it will prompt you for a UNIX username and password. You will need this password to perform sudo commands later. Once completed, your Linux shell is ready for use. All your actions and commands will run as the Linux user you specified.

```
richard@luxo: ~
Retype new password:
passwd: password updated successfully
Installation successful!
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

Welcome to Ubuntu 20.04 LTS (GNU/Linux 4.4.0-19041-Microsoft x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Fri Jul 17 13:51:44 EDT 2020

System load:  0.52   Processes:      7
Usage of /home: unknown   Users logged in:  0
Memory usage: 53%    IPv4 address for eth0: 10.0.2.15
Swap usage:   0%

0 updates can be installed immediately.
0 of these updates are security updates.

The list of available updates is more than a week old.
To check for new updates run: sudo apt update

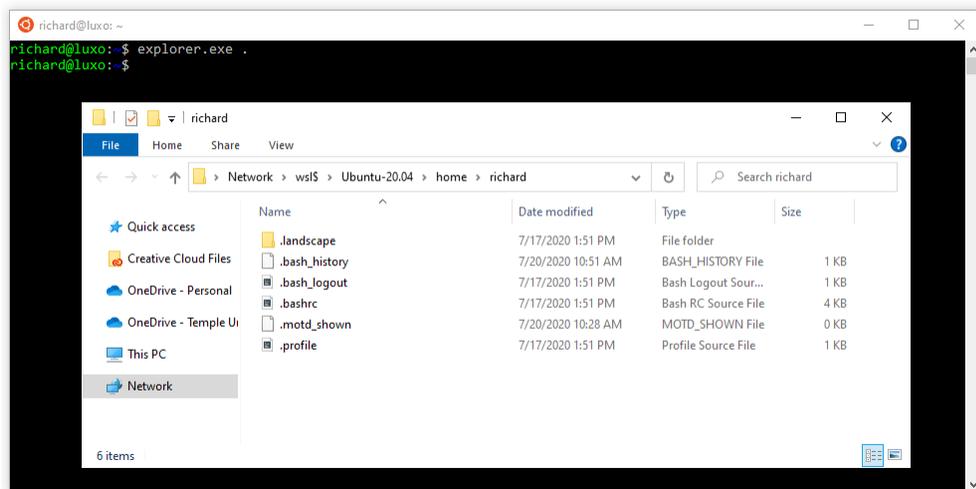

This message is shown once once a day. To disable it please create the
/home/richard/.hushlogin file.
richard@luxo: ~$
```

## Windows Explorer / WSL integration

Your Linux installation will have its own Linux filesystem, which contains the Ubuntu files. Your Linux user will have a regular Linux home directory in `/home/<USERNAME>`. This directory is different from your Windows User directory. Windows and Linux filesystems are connected through WSL.

All hard drives in Windows are accessible in the `/mnt` directory in Linux. E.g., WSL maps the C hard drive to the `/mnt/c` directory. That means you can access your Windows User directory in `/mnt/c/Users/<WINDOWS_USERNAME>`.

The Windows Explorer can also access the Linux filesystem. To illustrate this integration, open an Ubuntu console and navigate to a directory of your choice. To view this location in Windows Explorer, use the `explorer.exe .` command (do not forget the final dot!).

## Compiling LAMMPS

You now have a fully functioning Ubuntu installation and can follow most guides to install LAMMPS on a Linux system. Here are some of the essential steps to follow:

### Install prerequisite packages

Before we can begin, we need to download the necessary compiler toolchain and libraries to compile LAMMPS. In our Ubuntu-based Linux installation, we will use the `apt` package manager to install additional packages.

First, upgrade all existing packages using `apt update` and `apt upgrade`.

```
sudo apt update
sudo apt upgrade -y
```

Next, install the following packages with `apt install`:

```
sudo apt install -y cmake build-essential ccache gfortran openmpi-bin libopenmpi-dev \
libfftw3-dev libjpeg-dev libpng-dev python3-dev python3-pip \
python3-virtualenv libblas-dev liblapack-dev libhdf5-serial-dev \
hdf5-tools
```

## Download LAMMPS

Obtain a copy of the LAMMPS source code and go into it using the `cd` command.

### Option 1: Download a LAMMPS tarball using `wget`

```
wget https://github.com/lammps/lammps/archive/stable_3Mar2020.tar.gz
tar xvzf stable_3Mar2020.tar.gz
cd lammps
```

### Option 2: Download a LAMMPS development version from GitHub

```
git clone --depth=1 https://github.com/lammps/lammps.git
cd lammps
```

## Configure and Compile LAMMPS with CMake

A beginner-friendly way to compile LAMMPS is to use CMake. Create a build directory to compile LAMMPS and move into it. This directory will store the build configuration and any binaries generated during compilation.

```
mkdir build
cd build
```

There are countless ways to compile LAMMPS. It is beyond the scope of this tutorial. If you want to find out more about what can be enabled, please consult the extensive [documentation](#).

To compile a minimal version of LAMMPS, we're going to use a preset. Presets are a way to specify a collection of CMake options using a file.

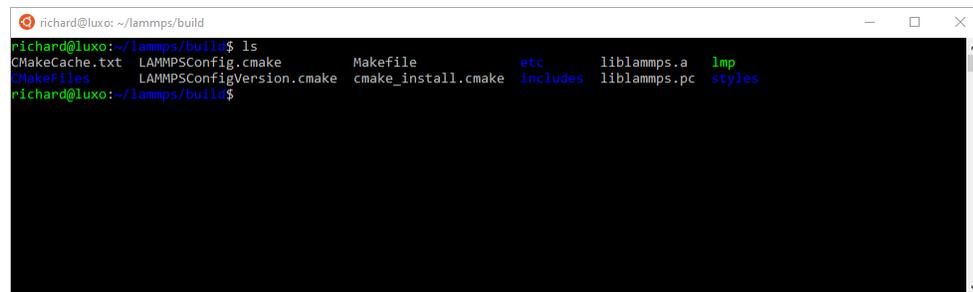

```
cmake ../cmake/presets/basic.cmake ../cmake
```

This command configures the build and generates the necessary Makefiles. To compile the binary, run the `make` command.

```
make -j 4
```

The `-j` option specifies how many parallel processes will perform the compilation. This option can significantly speed up compilation times. Use a number that corresponds to the number of processors in your system.

After the compilation completes successfully, you will have an executable called `lmp` in the `build` directory.

```
richard@luxo: ~/lammps/build
richard@luxo:~/lammps/build$ ls
CMakeCache.txt  LAMMPSConfig.cmake  Makefile          etc               liblammps.a  lmp
CMakeFiles     LAMMPSConfigVersion.cmake  cmake_install.cmake  includes         liblammps.pc  styles
richard@luxo:~/lammps/build$
```

Please take note of the absolute path of your build directory. You will need to know the location to execute the LAMMPS binary later.

One way of getting the absolute path of the current directory is through the \$PWD variable:

```
# prints out the current value of the PWD variable
echo $PWD
```

Let us save this value in a temporary variable LAMMPS\_BUILD\_DIR for future use:

```
LAMMPS_BUILD_DIR=$PWD
```

The full path of the LAMMPS binary then is \$LAMMPS\_BUILD\_DIR/lmp.

---

### Running an example script

Now that we have a LAMMPS binary, we will run a script from the examples folder.

Switch into the examples/melt folder:

```
cd ../examples/melt
```

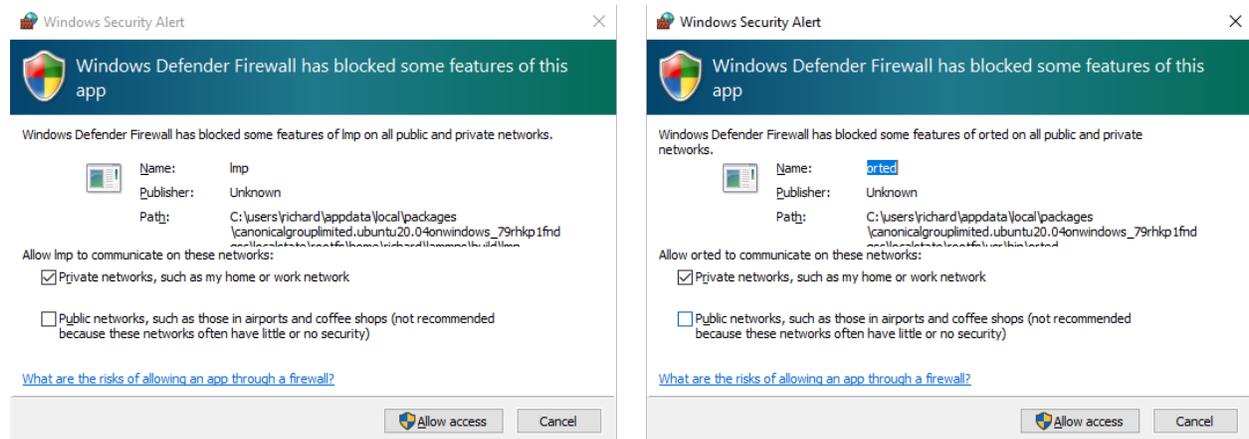

To run this example in serial, use the following command line:

```
$LAMMPS_BUILD_DIR/lmp -in in.melt
```

To run the same script in parallel using MPI with 4 processes, do the following:

```
mpirun -np 4 $LAMMPS_BUILD_DIR/lmp -in in.melt
```

If you run LAMMPS for the first time, the Windows Firewall might prompt you to confirm access. LAMMPS is accessing the network stack to enable parallel computation. Allow the access.

In either serial or MPI case, LAMMPS executes and will output something similar to this:

```
LAMMPS (30 Jun 2020)
...
...
...
```

(continues on next page)

(continued from previous page)

```
Total # of neighbors = 151513
Ave neighs/atom = 37.878250
Neighbor list builds = 12
Dangerous builds not checked
Total wall time: 0:00:00
```

**Congratulations! You've successfully compiled and executed LAMMPS on WSL!**

### Final steps

It is cumbersome to always specify the path of your LAMMPS binary. You can avoid this by adding the absolute path of your build directory to your PATH environment variable.

```
export PATH=$LAMMPS_BUILD_DIR:$PATH
```

You can then run LAMMPS input scripts like this:

```
lmp -in in.melt
```

or

```
mpirun -np 4 lmp -in in.melt
```

**Note:** The value of this PATH variable will disappear once you close your console window. To persist this setting edit the \$HOME/.bashrc file using your favorite text editor and add this line:

```
export PATH=/full/path/to/your/lammps/build:$PATH
```

**Example:** If the LAMMPS executable *lmp* has the following absolute path:

```
/home/<USERNAME>/lammps/build/lmp
```

the PATH variable should be:

```
export PATH=/home/<USERNAME>/lammps/build:$PATH
```

Once set up, all your Ubuntu consoles will always have access to your *lmp* binary without having to specify its location.

### Conclusion

I hope this gives you good overview on how to start compiling and running LAMMPS on Windows. WSL makes preparing and running scripts on Windows a much better experience.

If you are completely new to Linux, I highly recommend investing some time in studying Linux online tutorials. E.g., tutorials about Bash Shell and Basic Unix commands (e.g., [Linux Journey](#)). Acquiring these skills will make you much more productive in this environment.

- [Windows Subsystem for Linux Documentation](#)

## EXAMPLE SCRIPTS

The LAMMPS distribution includes an examples sub-directory with many sample problems. Many are 2d models that run quickly and are straightforward to visualize, requiring at most a couple of minutes to run on a desktop machine. Each problem has an input script (in.\*) and produces a log file (log.\*) when it runs. Some use a data file (data.\*) of initial coordinates as additional input. A few sample log file run on different machines and different numbers of processors are included in the directories to compare your answers to. E.g. a log file like log.date.crack.foo.P means the “crack” example was run on P processors of machine “foo” on that date (i.e. with that version of LAMMPS).

Many of the input files have commented-out lines for creating dump files and image files.

If you uncomment the *dump* command in the input script, a text dump file will be produced, which can be animated by various [visualization programs](#).

If you uncomment the *dump image* command in the input script, and assuming you have built LAMMPS with a JPG library, JPG snapshot images will be produced when the simulation runs. They can be quickly post-processed into a movie using commands described on the [dump image](#) doc page.

Animations of many of the examples can be viewed on the Movies section of the [LAMMPS website](#).

There are two kinds of sub-directories in the examples folder. Lower case named directories contain one or a few simple, quick-to-run problems. Upper case named directories contain up to several complex scripts that illustrate a particular kind of simulation method or model. Some of these run for longer times, e.g. to measure a particular quantity.

Lists of both kinds of directories are given below.

---

### 9.1 Lowercase directories

accelerate	run with various acceleration options (OpenMP, GPU, Phi)
airebo	polyethylene with AIREBO potential
atm	Axilrod-Teller-Muto potential example
balance	dynamic load balancing, 2d system
body	body particles, 2d system
bpm	BPM simulations of pouring elastic grains and plate impact
cmap	CMAF 5-body contributions to CHARMM force field
colloid	big colloid particles in a small particle solvent, 2d system
comb	models using the COMB potential
controller	use of fix controller as a thermostat
coreshell	core/shell model using CORESHELL package
crack	crack propagation in a 2d solid
deposit	deposit atoms and molecules on a surface

continues on next page

Table 1 – continued from previous page

dipole	point dipolar particles, 2d system
dreiding	methanol via Dreiding FF
eim	NaCl using the EIM potential
ellipse	ellipsoidal particles in spherical solvent, 2d system
flow	Couette and Poiseuille flow in a 2d channel
friction	frictional contact of spherical asperities between 2d surfaces
mc	Monte Carlo features via fix gcmc, widom and other commands
granregion	use of fix wall/region/gran as boundary on granular particles
hugoniostat	Hugoniostat shock dynamics
hyper	global and local hyperdynamics of diffusion on Pt surface
indent	spherical indenter into a 2d solid
kim	use of potentials from the <a href="#">OpenKIM Repository</a>
latte	examples for using fix latte for DFTB via the LATTE library
mdi	use of the MDI package and MolSSI MDI code coupling library
meam	MEAM test for SiC and shear (same as shear examples)
melt	rapid melt of 3d LJ system
micelle	self-assembly of small lipid-like molecules into 2d bilayers
min	energy minimization of 2d LJ melt
mscg	parameterize a multi-scale coarse-graining (MSCG) model
msst	MSST shock dynamics
multi	multi neighboring for systems with large interaction disparities
nb3b	use of non-bonded 3-body harmonic pair style
neb	nudged elastic band (NEB) calculation for barrier finding
nemd	non-equilibrium MD of 2d sheared system
obstacle	flow around two voids in a 2d channel
peptide	dynamics of a small solvated peptide chain (5-mer)
peri	Peridynamic model of cylinder impacted by indenter
pour	pouring of granular particles into a 3d box, then chute flow
prd	parallel replica dynamics of vacancy diffusion in bulk Si
python	using embedded Python in a LAMMPS input script
qeq	use of the QEQ package for charge equilibration
rdf-adf	computing radial and angle distribution functions for water
reax	RDX and TATB models using the ReaxFF
rerun	use of rerun and read_dump commands
rigid	rigid bodies modeled as independent or coupled
shear	sideways shear applied to 2d solid, with and without a void
snap	NVE dynamics for BCC tantalum crystal using SNAP potential
srd	stochastic rotation dynamics (SRD) particles as solvent
streitz	use of Streitz/Mintmire potential with charge equilibration
tad	temperature-accelerated dynamics of vacancy diffusion in bulk Si
threebody	regression test input for a variety of manybody potentials
tracker	track interactions in LJ melt
vashishta	use of the Vashishta potential
voronoi	Voronoi tessellation via compute voronoi/atom command

Here is how you can run and visualize one of the sample problems:

```
cd indent
cp ../../src/lmp_linux .           # copy LAMMPS executable to this dir
lmp_linux -in in.indent           # run the problem
```

Running the simulation produces the files *dump.indent* and *log.lammps*. You can visualize the dump file of snapshots

with a variety of third-party tools highlighted on the [Visualization](#) page of the LAMMPS website.

If you uncomment the *dump image* line(s) in the input script a series of JPG images will be produced by the run (assuming you built LAMMPS with JPG support; see the [Build\\_settings](#) page for details). These can be viewed individually or turned into a movie or animated by tools like ImageMagick or QuickTime or various Windows-based tools. See the [dump image](#) page for more details. E.g. this Imagemagick command would create a GIF file suitable for viewing in a browser.

```
% convert -loop 1 *.jpg foo.gif
```

## 9.2 Uppercase directories

ASPHERE	various aspherical particle models, using ellipsoids, rigid bodies, line/triangle particles, etc
COUPLE	examples of how to use LAMMPS as a library
DIFFUSE	compute diffusion coefficients via several methods
ELASTIC	compute elastic constants at zero temperature
ELASTIC_T	compute elastic constants at finite temperature
HEAT	compute thermal conductivity for LJ and water via fix ehex
KAPPA	compute thermal conductivity via several methods
MC-LOOP	using LAMMPS in a Monte Carlo mode to relax the energy of a system in a input script loop
PACKAGES	examples for specific packages and contributed commands
SPIN	examples for features of the SPIN package
UNITS	examples that run the same simulation in lj, real, metal units
VISCOSITY	compute viscosity via several methods

Nearly all of these directories have README files which give more details on how to understand and use their contents.

The PACKAGES directory has a large number of sub-directories which correspond by name to specific packages. They contain scripts that illustrate how to use the command(s) provided in those packages. Many of the sub-directories have their own README files which give further instructions. See the [Packages\\_details](#) doc page for more info on specific packages.

## AUXILIARY TOOLS

LAMMPS is designed to be a computational kernel for performing molecular dynamics computations. Additional pre- and post-processing steps are often necessary to setup and analyze a simulation. A list of such tools can be found on the [LAMMPS webpage](#) at these links:

- [Pre/Post processing](#)
- [External LAMMPS packages & tools](#)
- [Pizza.py toolkit](#)

The last link for [Pizza.py](#) is a Python-based tool developed at Sandia which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations.

Additional tools included in the LAMMPS distribution are described on this page.

Note that many users write their own setup or analysis tools or use other existing codes and convert their output to a LAMMPS input format or vice versa. The tools listed here are included in the LAMMPS distribution as examples of auxiliary tools. Some of them are not actively supported by the LAMMPS developers, as they were contributed by LAMMPS users. If you have problems using them, we can direct you to the authors.

The source code for each of these codes is in the tools sub-directory of the LAMMPS distribution. There is a Makefile (which you may need to edit for your platform) which will build several of the tools which reside in that directory. Most of them are larger packages in their own sub-directories with their own Makefiles and/or README files.

---

### 10.1 Pre-processing tools

<i>amber2lmp</i>	<i>ch2lmp</i>	<i>chain</i>	<i>createatoms</i>	<i>drude</i>	<i>eam database</i>

## 10.4 Tool descriptions

### 10.4.1 amber2Imp tool

The `amber2Imp` sub-directory contains two Python scripts for converting files back-and-forth between the AMBER MD code and LAMMPS. See the README file in `amber2Imp` for more information.

These tools were written by Keir Novik while he was at Queen Mary University of London. Keir is no longer there and cannot support these tools which are out-of-date with respect to the current LAMMPS version (and maybe with respect to AMBER as well). Since we don't use these tools at Sandia, you will need to experiment with them and make necessary modifications yourself.

---

### 10.4.2 binary2txt tool

The file `binary2txt.cpp` converts one or more binary LAMMPS dump file into ASCII text files. The syntax for running the tool is

```
binary2txt file1 file2 ...
```

which creates `file1.txt`, `file2.txt`, etc. This tool must be compiled on a platform that can read the binary file created by a LAMMPS run, since binary files are not compatible across all platforms.

---

### 10.4.3 ch2Imp tool

The `ch2Imp` sub-directory contains tools for converting files back-and-forth between the CHARMM MD code and LAMMPS.

They are intended to make it easy to use CHARMM as a builder and as a post-processor for LAMMPS. Using `charmm2lammps.pl`, you can convert a PDB file with associated CHARMM info, including CHARMM force field data, into its LAMMPS equivalent. Support for the CMAP correction of CHARMM22 and later is available as an option. This tool can also add solvent water molecules and Na<sup>+</sup> or Cl<sup>-</sup> ions to the system. Using `lammps2pdb.pl` you can convert LAMMPS atom dumps into PDB files.

See the README file in the `ch2Imp` sub-directory for more information.

These tools were created by Pieter in't Veld (`pjintve at sandia.gov`) and Paul Crozier (`pscrozi at sandia.gov`) at Sandia.

CMAP support added and tested by Xiaohu Hu (`hux2 at ornl.gov`) and Robert A. Latour (`latourr at clemson.edu`), David Hyde-Volpe, and Tigran Abramyan, (Clemson University) and Chris Lorenz (`chris.lorenz at kcl.ac.uk`), King's College London.

---

### 10.4.4 chain tool

The file `chain.f90` creates a LAMMPS data file containing bead-spring polymer chains and/or monomer solvent atoms. It uses a text file containing chain definition parameters as an input. The created chains and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
chain < def.chain > data.file
```

See the `def.chain` or `def.chain.ab` files in the `tools` directory for examples of definition files. This tool was used to create the system for the *chain benchmark*.

### 10.4.5 LAMMPS coding standard

The `coding_standard` folder contains multiple python scripts to check for and apply some LAMMPS coding conventions. The following scripts are available:

```
permissions.py # detects if sources have executable permissions and scripts have not
whitespace.py # detects TAB characters and trailing whitespace
homepage.py   # detects outdated LAMMPS homepage URLs (pointing to sandia.gov instead
↳of lammps.org)
errordocs.py  # detects deprecated error docs in header files
```

The tools need to be given the main folder of the LAMMPS distribution or individual file names as argument and will by default check them and report any non-compliance. With the optional `-f` argument the corresponding script will try to change the non-compliant file(s) to match the conventions.

For convenience this scripts can also be invoked by the make file in the `src` folder with, *make check-whitespace* or *make fix-whitespace* to either detect or edit the files. Correspondingly for the other python scripts. *make check* will run all checks.

### 10.4.6 colvars tools

The `colvars` directory contains a collection of tools for post-processing data produced by the `colvars` collective variable library. To compile the tools, edit the makefile for your system and run “make”.

Please report problems and issues the `colvars` library and its tools at: <https://github.com/colvars/colvars/issues>

`abf_integrate`:

MC-based integration of multidimensional free energy gradient Version 20110511

```
./abf_integrate < filename > [-n < nsteps >] [-t < temp >] [-m [0|1] (metadynamics)] [-h
↳< hill_height >] [-f < variable_hill_factor >]
```

The LAMMPS interface to the `colvars` collective variable library, as well as these tools, were created by Axel Kohlmeyer ([akohlmey@gmail.com](mailto:akohlmey@gmail.com)) while at ICTP, Italy.

### 10.4.7 createatoms tool

The tools/createatoms directory contains a Fortran program called createAtoms.f which can generate a variety of interesting crystal structures and geometries and output the resulting list of atom coordinates in LAMMPS or other formats.

See the included Manual.pdf for details.

The tool is authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov.

---

### 10.4.8 drude tool

The tools/drude directory contains a Python script called polarizer.py which can add Drude oscillators to a LAMMPS data file in the required format.

See the header of the polarizer.py file for details.

The tool is authored by Agilio Padua and Alain Dequidt: agilio.padua at ens-lyon.fr, alain.dequidt at uca.fr

---

### 10.4.9 eam database tool

The tools/eam\_database directory contains a Fortran and a Python program that will generate EAM alloy setfl potential files for any combination of the 17 elements: Cu, Ag, Au, Ni, Pd, Pt, Al, Pb, Fe, Mo, Ta, W, Mg, Co, Ti, Zr, Cr. The files can then be used with the *pair\_style eam/alloy* command.

The Fortran version of the tool was authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov, with updates from Lucas Hale (NIST) lucas.hale at nist.gov and is based on his paper:

X. W. Zhou, R. A. Johnson, and H. N. G. Wadley, Phys. Rev. B, 69, 144113 (2004).

The parameters for Cr were taken from:

Lin Z B, Johnson R A and Zhigilei L V, Phys. Rev. B 77 214108 (2008).

The Python version of the tool was authored by Germain Clavier (TU Eindhoven) g.m.g.c.clavier at tue.nl or germain.clavier at gmail.com

---

**Note:** The parameters in the database are only optimized for individual elements. The mixed parameters for interactions between different elements generated by this tool are derived from simple mixing rules and are thus inferior to parameterizations that are specifically optimized for specific mixtures and combinations of elements.

---

### 10.4.10 eam generate tool

The tools/eam\_generate directory contains several one-file C programs that convert an analytic formula into a tabulated *embedded atom method (EAM)* setfl potential file. The potentials they produce are in the potentials directory, and can be used with the *pair\_style eam/alloy* command.

The source files and potentials were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com).

---

### 10.4.11 eff tool

The tools/eff directory contains various scripts for generating structures and post-processing output for simulations using the electron force field (eFF).

These tools were provided by Andres Jaramillo-Botero at CalTech (ajaramil at wag.caltech.edu).

---

### 10.4.12 emacs tool

The tools/emacs directory contains an Emacs Lisp add-on file for GNU Emacs that enables a lammeps-mode for editing input scripts when using GNU Emacs, with various highlighting options set up.

These tools were provided by Aidan Thompson at Sandia (athomps at sandia.gov).

---

### 10.4.13 fep tool

The tools/fep directory contains Python scripts useful for post-processing results from performing free-energy perturbation simulations using the FEP package.

The scripts were contributed by Agilio Padua (ENS de Lyon), agilio.padua at ens-lyon.fr.

See README file in the tools/fep directory.

---

### 10.4.14 i-pi tool

The tools/i-pi directory contains a version of the i-PI package, with all the LAMMPS-unrelated files removed. It is provided so that it can be used with the *fix ipi* command to perform path-integral molecular dynamics (PIMD).

The i-PI package was created and is maintained by Michele Ceriotti, michele.ceriotti at gmail.com, to interface to a variety of molecular dynamics codes.

See the tools/i-pi/manual.pdf file for an overview of i-PI, and the *fix ipi* page for further details on running PIMD calculations with LAMMPS.

---

### 10.4.15 ipp tool

The tools/ipp directory contains a Perl script ipp which can be used to facilitate the creation of a complicated file (say, a lammeps input script or tools/createatoms input file) using a template file.

ipp was created and is maintained by Reese Jones (Sandia), rjones at sandia.gov.

See two examples in the tools/ipp directory. One of them is for the tools/createatoms tool's input file.

---

### 10.4.16 kate tool

The file in the tools/kate directory is an add-on to the Kate editor in the KDE suite that allow syntax highlighting of LAMMPS input scripts. See the README.txt file for details.

The file was provided by Alessandro Luigi Sellerio (alessandro.sellerio at ieni.cnr.it).

---

### 10.4.17 LAMMPS shell

New in version 9Oct2020.

#### Overview

The LAMMPS Shell, `lammops-shell` is a program that functions very similar to the regular LAMMPS executable but has several modifications and additions that make it more powerful for interactive sessions, i.e. where you type LAMMPS commands from the prompt instead of reading them from a file.

- It uses the readline and history libraries to provide command line editing and context aware TAB-expansion (details on that below).
- When processing an input file with the `'-in'` or `'-i'` flag from the command line, it does not exit at the end of that input file but stops at a prompt, so that additional commands can be issued
- Errors will not abort the shell but return to the prompt.
- It has additional commands aimed at interactive use (details below).
- Interrupting a calculation with CTRL-C will not terminate the session but rather enforce a timeout to cleanly stop an ongoing run (more info on timeouts is in the *timer command* documentation).

These enhancements make the LAMMPS shell an attractive choice for interactive LAMMPS sessions in graphical desktop environments (e.g. Gnome, KDE, Cinnamon, XFCE, Windows).

#### TAB-expansion

When writing commands interactively at the shell prompt, you can hit the TAB key at any time to try and complete the text. This completion is context aware and will expand any first word only to commands available in that executable.

- For style commands it will expand to available styles of the corresponding category (e.g. pair styles after a *pair\_style* command).
- For *compute*, *fix*, or *dump* it will also expand only to already defined groups for the group-ID keyword.
- For commands like *compute\_modify*, *fix\_modify*, or *dump\_modify* it will expand to known compute/fix/dump IDs only.
- When typing references to computes, fixes, or variables with a `"c_"`, `"f_"`, or `"v_"` prefix, respectively, then the expansion will be to known compute/fix IDs and variable names. Variable name expansion is also available for the `${name}` variable syntax.
- In all other cases TAB expansion will complete to names of files and directories.

## Command line editing and history

When typing commands, command line editing similar to what BASH provides is available. Thus it is possible to move around the currently line and perform various cut and insert and edit operations. Previous commands can be retrieved by scrolling up (and down) or searching (e.g. with CTRL-r).

Also history expansion through using the exclamation mark ‘!’ can be performed. Examples: ‘!’ will be replaced with the previous command, ‘!-2’ will repeat the command before that, ‘!30’ will be replaced with event number 30 in the command history list, and ‘!run’ with the last command line that started with “run”. Adding a “:p” to such a history expansion will result that the expansion is printed and added to the history list, but NOT executed. On exit the LAMMPS shell will write the history list to a file “.lammps\_history” in the current working directory. If such a file exists when the LAMMPS shell is launched it will be read to populate the history list.

This is realized via the readline library and can thus be customized with an `.inputrc` file in the home directory. For application specific customization, the LAMMPS shell uses the name “lammps-shell”. For more information about using and customizing an application using readline, please see the available documentation at: <http://www.gnu.org/s/readline/#Documentation>

## Additional commands

The following commands are added to the LAMMPS shell on top of the regular LAMMPS commands:

```

help (or ?)    print a brief help message
history        display the current command history list
clear_history  wipe out the current command history list
save_history <range> <file>
                write commands from the history to file.
                The range is given as <from>-<to>, where <from> and <to>
                may be empty. Example: save_history 100- in.recent
source <file>  read commands from file (same as "include")
pwd            print current working directory
cd <directory> change current working directory (same as pwd if no directory)
mem           print current and maximum memory usage
|<command>    execute <command> as a shell command and return to the command prompt
exit          exit the LAMMPS shell cleanly (unlike the "quit" command)

```

Please note that some known shell operations are implemented in the LAMMPS *shell command* in a platform neutral fashion, while using the ‘|’ character will always pass the following text to the operating system’s shell command.

## Compilation

Compilation of the LAMMPS shell can be enabled by setting the CMake variable `BUILD_LAMMPS_SHELL` to “on” or using the makefile in the `tools/lammps-shell` folder to compile after building LAMMPS using the conventional make procedure. The makefile will likely need customization depending on the features and settings used for compiling LAMMPS.

## Limitations

The LAMMPS shell was not designed for use with MPI parallelization via `mpirun` or `mpiexec` or `srun`.

## Readline customization

The behavior of the readline functionality can be customized in the `${HOME}/.inputrc` file. This can be used to alter the default settings or change the key-bindings. The LAMMPS Shell sets the application name `lammcs-shell`, so settings can be either applied globally or only for the LAMMPS shell by bracketing them between `$if lammcs-shell` and `$endif` like in the following example:

```
$if lammcs-shell
# disable "beep" or "screen flash"
set bell-style none
# bind the "Insert" key to toggle overwrite mode
"\e[2~": overwrite-mode
$endif
```

More details about this are in the [readline documentation](#).

## LAMMPS Shell tips and tricks

Below are some suggestions for how to use and customize the LAMMPS shell.

### Enable tilde expansion

Adding `set expand-tilde on` to `${HOME}/.inputrc` is recommended as this will change the filename expansion behavior to replace any text starting with “~” by the full path to the corresponding user’s home directory. While the expansion of filenames **will** happen on all arguments where the context is not known (e.g. `~/compile/lamm<TAB>` will expand to `~/compile/lammcs/`), it will not replace the tilde by default. But since LAMMPS does not do tilde expansion itself (unlike a shell), this will result in errors. Instead the tilde-expression should be expanded into a valid path, where the plain “~/” stands for the current user’s home directory and “~/someuser/” stands for “/home/someuser” or whatever the full path to that user’s home directory is.

### File extension association

Since the LAMMPS shell (unlike the regular LAMMPS executable) does not exit when an input file is passed on the command line with the “-in” or “-i” flag (the behavior is like for `python -i <filename>`), it makes the LAMMPS shell suitable for associating it with input files based on their filename extension (e.g. “.lmp”). Since `lammcs-shell` is a console application, you have to run it inside a terminal program with a command line like this:

```
xterm -title "LAMMPS Shell" -e /path/to/lammcs-shell -i in.file.lmp
```

## Use history to create an input file

When experimenting with commands to interactively to figure out a suitable choice of settings or simply the correct syntax, you may want to record part of your commands to a file for later use. This can be done with the `save_history` commands, which allows to selectively write a section of the command history to a file (Example: `save_history 25-30 in.run`). This file can be further edited (Example: `|vim in.run`) and then the file read back in and tried out (Example: `source in.run`). If the input also creates a system box, you first need to use the `clear_command` command.

### 10.4.18 Imp2arc tool

The `imp2arc` sub-directory contains a tool for converting LAMMPS output files to the format for Accelrys' Insight MD code (formerly MSI/Biosym and its Discover MD code). See the README file for more information.

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). John is now at the Mayo Clinic (`jec` at `mayo.edu`), but still fields questions about the tool.

This tool was updated for the current LAMMPS C++ version by Jeff Greathouse at Sandia (`jagreat` at `sandia.gov`).

### 10.4.19 Imp2cfg tool

The `imp2cfg` sub-directory contains a tool for converting LAMMPS output files into a series of `*.cfg` files which can be read into the `AtomEye` visualizer. See the README file for more information.

This tool was written by Ara Kooser at Sandia (`askoose` at `sandia.gov`).

### 10.4.20 Magic patterns for the “file” command

New in version 10Mar2021.

The `file` magic contains patterns that are used by the `file` program available on most Unix-like operating systems which enables it to detect various LAMMPS files and print some useful information about them. To enable these patterns, append or copy the contents of the file `.magic` in your home directory or (as administrator) to `/etc/magic` (for a system-wide installation). Afterwards the `file` command should be able to detect most LAMMPS restarts, dump, data and log files. Examples:

```
$ file *.*
dihedral-quadratic.restart:  LAMMPS binary restart file (rev 2), Version 10 Mar 2021,
↳Little Endian
mol-pair-wf_cut.restart:    LAMMPS binary restart file (rev 2), Version 24 Dec 2020,
↳Little Endian
atom.bin:                   LAMMPS atom style binary dump (rev 2), Little Endian,
↳First time step: 445570
custom.bin:                 LAMMPS custom style binary dump (rev 2), Little Endian,
↳First time step: 100
bn1.lammpstrj:              LAMMPS text mode dump, First time step: 5000
data.fourmol:               LAMMPS data file written by LAMMPS
pnc.data:                   LAMMPS data file written by msi2lmp
```

(continues on next page)

(continued from previous page)

data.spce:	LAMMPS data file written by TopoTools
B.data:	LAMMPS data file written by OVITO
log.lammps:	LAMMPS log file written by version 10 Feb 2021

---

### 10.4.21 matlab tool

The matlab sub-directory contains several **MATLAB** scripts for post-processing LAMMPS output. The scripts include readers for log and dump files, a reader for EAM potential files, and a converter that reads LAMMPS dump files and produces CFG files that can be visualized with the **AtomEye** visualizer.

See the README.pdf file for more information.

These scripts were written by Arun Subramaniyan at Purdue Univ (asubrama at purdue.edu).

---

### 10.4.22 micelle2d tool

The file micelle2d.f creates a LAMMPS data file containing short lipid chains in a monomer solution. It uses a text file containing lipid definition parameters as an input. The created molecules and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
micelle2d < def.micelle2d > data.file
```

See the def.micelle2d file in the tools directory for an example of a definition file. This tool was used to create the system for the *micelle example*.

---

### 10.4.23 moltemplate tool

The moltemplate sub-directory contains instructions for installing moltemplate, a Python-based tool for building molecular systems based on a text-file description, and creating LAMMPS data files that encode their molecular topology as lists of bonds, angles, dihedrals, etc. See the README.txt file for more information.

This tool was written by Andrew Jewett (jewett.aj at gmail.com), who supports it. It has its own WWW page at <https://moltemplate.org>. The latest sources can be found on its [GitHub page](#)

---

### 10.4.24 msi2lmp tool

The msi2lmp sub-directory contains a tool for creating LAMMPS template input and data files from BIOVIA’s **Materials Studio** files (formerly **Accelrys’ Insight MD** code, formerly **MSI/Biosym** and its **Discover MD** code).

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). Several people contributed changes to remove bugs and adapt its output to changes in LAMMPS.

This tool has several known limitations and is no longer under active development, so there are no changes except for the occasional bug fix.

---

See the README file in the tools/msi2lmp folder for more information.

## 10.4.25 Scripts for building LAMMPS when offline

In some situations it might be necessary to build LAMMPS on a system without direct internet access. The scripts in tools/offline folder allow you to pre-load external dependencies for both the documentation build and for building LAMMPS with CMake.

It does so by

1. downloading necessary pip packages,
2. cloning git repositories
3. downloading tarballs

to a designated cache folder.

As of April 2021, all of these downloads make up around 600MB. By default, the offline scripts will download everything into the \$HOME/.cache/lammps folder, but this can be changed by setting the LAMMPS\_CACHING\_DIR environment variable.

Once the caches have been initialized, they can be used for building the LAMMPS documentation or compiling LAMMPS using CMake on an offline system.

The use\_caches.sh script must be sourced into the current shell to initialize the offline build environment. Note that it must use the same LAMMPS\_CACHING\_DIR. This script does the following:

1. Set up environment variables that modify the behavior of both, pip and git
2. Start a simple local HTTP server using Python to host files for CMake

Afterwards, it will print out instruction on how to modify the CMake command line to make sure it uses the local HTTP server.

To undo the environment changes and shutdown the local HTTP server, run the deactivate\_caches command.

### Examples

For all of the examples below, you first need to create the cache, which requires an internet connection.

```
./tools/offline/init_caches.sh
```

Afterwards, you can disconnect or copy the contents of the LAMMPS\_CACHING\_DIR folder to an offline system.

### Documentation Build

The documentation build will create a new virtual environment that typically first installs dependencies from pip. With the offline environment loaded, these installations will instead grab the necessary packages from your local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh
cd doc/
make html
```

(continues on next page)

```
deactivate_caches
```

## CMake Build

When compiling certain packages with external dependencies, the CMake build system will download necessary files or sources from the web. For more flexibility the CMake configuration allows users to specify the URL of each of these dependencies. What the `init_caches.sh` script does is create a CMake “preset” file, which sets the URLs for all of the known dependencies and redirects the download to the local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh

mkdir build
cd build
cmake -D LAMMPS_DOWNLOADS_URL=${HTTP_CACHE_URL} -C "${LAMMPS_HTTP_CACHE_CONFIG}" -C ../
↪cmake/presets/most.cmake ../cmake
make -j 8

deactivate_caches
```

---

### 10.4.26 phonon tool

The phonon sub-directory contains a post-processing tool useful for analyzing the output of the *fix phonon* command in the PHONON package.

See the README file for instruction on building the tool and what library it needs. And see the examples/PACKAGES/phonon directory for example problems that can be post-processed with this tool.

This tool was written by Ling-Ti Kong at Shanghai Jiao Tong University.

---

### 10.4.27 polybond tool

The polybond sub-directory contains a Python-based tool useful for performing “programmable polymer bonding”. The Python file `lmpsdata.py` provides a “Lmpsdata” class with various methods which can be invoked by a user-written Python script to create data files with complex bonding topologies.

See the Manual.pdf for details and example scripts.

This tool was written by Zachary Kraus at Georgia Tech.

---

### 10.4.28 pymol\_asphere tool

The `pymol_asphere` sub-directory contains a tool for converting a LAMMPS dump file that contains orientation info for ellipsoidal particles into an input file for the [PyMol visualization package](#) or its [open source variant](#).

Specifically, the tool triangulates the ellipsoids so they can be viewed as true ellipsoidal particles within PyMol. See the `README` and `examples` directory within `pymol_asphere` for more information.

This tool was written by Mike Brown at Sandia.

---

### 10.4.29 python tool

The `python` sub-directory contains several Python scripts that perform common LAMMPS post-processing tasks, such as:

- extract thermodynamic info from a log file as columns of numbers
- plot two columns of thermodynamic info from a log file using GnuPlot
- sort the snapshots in a dump file by atom ID
- convert multiple *NEB* dump files into one dump file for viz
- convert dump files into XYZ, CFG, or PDB format for viz by other packages

These are simple scripts built on [Pizza.py](#) modules. See the `README` for more info on `Pizza.py` and how to use these scripts.

---

### 10.4.30 replica tool

The `tools/replica` directory contains the `reorder_remd_traj` python script which can be used to reorder the replica trajectories (resulting from the use of the `temper` command) according to temperature. This will produce discontinuous trajectories with all frames at the same temperature in each trajectory. Additional options can be used to calculate the canonical configurational log-weight for each frame at each temperature using the `pymbar` package. See the `README.md` file for further details. Try out the peptide example provided.

This tool was written by (and is maintained by) Tanmoy Sanyal, while at the Shell lab at UC Santa Barbara. (tanmoy dot 7989 at gmail.com)

---

### 10.4.31 smd tool

The `smd` sub-directory contains a C++ file `dump2vtk_tris.cpp` and `Makefile` which can be compiled and used to convert triangle output files created by the Smooth-Mach Dynamics (MACHDYN) package into a VTK-compatible unstructured grid file. It could then be read in and visualized by VTK.

See the header of `dump2vtk.cpp` for more details.

This tool was written by the MACHDYN package author, Georg Ganzenmuller at the Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute in Germany ([georg.ganzenmueller@emi.fhg.de](mailto:georg.ganzenmueller@emi.fhg.de)).

---

### 10.4.32 spin tool

The spin sub-directory contains a C file `interpolate.c` which can be compiled and used to perform a cubic polynomial interpolation of the MEP following a GNEB calculation.

See the README file in `tools/spin/interpolate_gneb` for more details.

This tool was written by the SPIN package author, Julien Tranchida at Sandia National Labs (`jtranch` at `sandia.gov`, and by Aleksei Ivanov, at University of Iceland (`ali5` at `hi.is`).

---

### 10.4.33 singularity/apptainer tool

The singularity sub-directory contains container definitions files that can be used to build container images for building and testing LAMMPS on specific OS variants using the [Apptainer](#) or [Singularity](#) container software. Contributions for additional variants are welcome. For more details please see the README.md file in that folder.

---

### 10.4.34 stl\_bin2txt tool

The file `stl_bin2txt.cpp` converts binary STL files - like they are frequently offered for download on the web - into ASCII format STL files that LAMMPS can read with the `create_atoms mesh` or the `fix smd/wall_surface` commands. The syntax for running the tool is

```
stl_bin2txt infile.stl outfile.stl
```

which creates `outfile.stl` from `infile.stl`. This tool must be compiled on a platform compatible with the byte-ordering that was used to create the binary file. This usually is a so-called little endian hardware (like x86).

---

### 10.4.35 SWIG interface

The [SWIG tool](#) offers a mostly automated way to incorporate compiled code modules into scripting languages. It processes the function prototypes in C and generates wrappers for a wide variety of scripting languages from it. Thus it can also be applied to the [C language library interface](#) of LAMMPS so that build a wrapper that allows to call LAMMPS from programming languages like: C#/Mono, Lua, Java, JavaScript, Perl, Python, R, Ruby, Tcl, and more.

#### What is included

We provide here an “interface file”, `lammps.i`, that has the content of the `library.h` file adapted so SWIG can process it. That will create wrappers for all the functions that are present in the LAMMPS C library interface. Please note that not all kinds of C functions can be automatically translated, so you would have to add custom functions to be able to utilize those where the automatic translation does not work. A few functions for converting pointers and accessing arrays are predefined. We provide the file here on an “as is” basis to help people getting started, but not as a fully tested and supported feature of the LAMMPS distribution. Any contributions to complete this are, of course, welcome. Please also note, that for the case of creating a Python wrapper, a fully supported [Ctypes based lammps module](#) already exists. That module is designed to be object oriented while SWIG will generate a 1:1 translation of the functions in the interface file.

## Building the wrapper

When using CMake, the build steps for building a wrapper module are integrated for the languages: Java, Lua, Perl5, Python, Ruby, and Tcl. These require that the LAMMPS library is build as a shared library and all necessary development headers and libraries are present.

```
-D WITH_SWIG=on      # to enable building any SWIG wrapper
-D BUILD_SWIG_JAVA=on # to enable building the Java wrapper
-D BUILD_SWIG_LUA=on  # to enable building the Lua wrapper
-D BUILD_SWIG_PERL5=on # to enable building the Perl 5.x wrapper
-D BUILD_SWIG_PYTHON=on # to enable building the Python wrapper
-D BUILD_SWIG_RUBY=on  # to enable building the Ruby wrapper
-D BUILD_SWIG_TCL=on  # to enable building the Tcl wrapper
```

Manual building allows a little more flexibility. E.g. one can choose the name of the module and build and use a dynamically loaded object for Tcl with:

```
$ swig -tcl -module tcllammps lammps.i
$ gcc -fPIC -shared $(pkgconf --cflags tcl) -o tcllammps.so \
    lammps_wrap.c -L ../src/ -llammps
$ tclsh
```

Or one can build an extended Tcl shell command with the wrapped functions included with:

```
$ swig -tcl -module tcllmps lammps_shell.i
$ gcc -o tcllmpsh lammps_wrap.c -Xlinker -export-dynamic \
    -DHAVE_CONFIG_H $(pkgconf --cflags tcl) \
    $(pkgconf --libs tcl) -L ../src -llammps
```

In both cases it is assumed that the LAMMPS library was compiled as a shared library in the src folder. Otherwise the last part of the commands needs to be adjusted.

## Utility functions

Definitions for several utility functions required to manage and access data passed or returned as pointers are included in the lammps.i file. So most of the functionality of the library interface should be accessible. What works and what does not depends a bit on the individual language for which the wrappers are built and how well SWIG supports those. The [SWIG documentation](#) has very detailed instructions and recommendations.

## Usage examples

The tools/swig folder has multiple shell scripts, run\_<name>\_example.sh that will create a small example script and demonstrate how to load the wrapper and run LAMMPS through it in the corresponding programming language.

For illustration purposes below is a part of the Tcl example script.

```
% load ./tcllammps.so
% set lmp [lammps_open_no_mpi 0 NULL NULL]
% lammps_command $lmp "units real"
% lammps_command $lmp "lattice fcc 2.5"
% lammps_command $lmp "region box block -5 5 -5 5 -5 5"
% lammps_command $lmp "create_box 1 box"
% lammps_command $lmp "create_atoms 1 box"
```

(continues on next page)

(continued from previous page)

```
%  
% set dt [doublep_value [voidp_to_doublep [lammmps_extract_global $lmp dt]]]  
% puts "LAMMPS version $ver"  
% puts [format "Number of created atoms: %g" [lammmps_get_natoms $lmp]]  
% puts "Current size of timestep: $dt"  
% puts "LAMMPS version: [lammmps_version $lmp]"  
% lammmps_close $lmp
```

---

### 10.4.36 vim tool

The files in the tools/vim directory are add-ons to the VIM editor that allow easier editing of LAMMPS input scripts. See the README.txt file for details.

These files were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com)

---

### 10.4.37 xmgrace tool

The files in the tools/xmgrace directory can be used to plot the thermodynamic data in LAMMPS log files via the xmgrace plotting package. There are several tools in the directory that can be used in post-processing mode. The lammplot.cpp file can be compiled and used to create plots from the current state of a running LAMMPS simulation.

See the README file for details.

These files were provided by Vikas Varshney (vv0210 at gmail.com)

## ERRORS

These doc pages describe many of the error and warning message you can encounter when using LAMMPS. The common problems include conceptual issues. The messages and warnings doc pages give complete lists of all the messages the code may generate, with additional details for many of them.

### 11.1 Common problems

If two LAMMPS runs do not produce the exact same answer on different machines or different numbers of processors, this is typically not a bug. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off can cause slight differences and eventual divergence of molecular dynamics phase space trajectories within a few 100s or few 1000s of timesteps. However, the statistical properties of the two runs (e.g. average energy or temperature) should still be the same.

If the *velocity* command is used to set initial atom velocities, a particular atom can be assigned a different velocity when the problem is run on a different number of processors or on different machines. If this happens, the phase space trajectories of the two simulations will rapidly diverge. See the discussion of the *loop* option in the *velocity* command for details and options that avoid this issue.

Similarly, the *create\_atoms* command generates a lattice of atoms. For the same physical system, the ordering and numbering of atoms by atom ID may be different depending on the number of processors.

Some commands use random number generators which may be setup to produce different random number streams on each processor and hence will produce different effects when run on different numbers of processors. A commonly-used example is the *fix langevin* command for thermostating.

A LAMMPS simulation typically has two stages, setup and run. Most LAMMPS errors are detected at setup time; others like a bond stretching too far may not occur until the middle of a run.

LAMMPS tries to flag errors and print informative error messages so you can fix the problem. For most errors it will also print the last input script command that it was processing. Of course, LAMMPS cannot figure out your physics or numerical mistakes, like choosing too big a timestep, specifying erroneous force field coefficients, or putting 2 atoms on top of each other! If you run into errors that LAMMPS does not catch that you think it should flag, please send an email to the [developers](#).

If you get an error message about an invalid command in your input script, you can determine what command is causing the problem by looking in the `log.lammps` file or using the *echo command* to see it on the screen. If you get an error like “Invalid ... style”, with ... being *fix*, *compute*, *pair*, etc, it means that you mistyped the style name or that the command is part of an optional package which was not compiled into your executable. The list of available styles in your executable can be listed by using *the -h command-line switch*. The installation and compilation of optional packages is explained on the [Build packages](#) doc page.

For a given command, LAMMPS expects certain arguments in a specified order. If you mess this up, LAMMPS will often flag the error, but it may also simply read a bogus argument and assign a value that is valid, but not what you wanted. E.g. trying to read the string “abc” as an integer value of 0. Careful reading of the associated doc page for the

command should allow you to fix these problems. In most cases, where LAMMPS expects to read a number, either integer or floating point, it performs a stringent test on whether the provided input actually is an integer or floating-point number, respectively, and reject the input with an error message (for instance, when an integer is required, but a floating-point number 1.0 is provided):

```
ERROR: Expected integer parameter instead of '1.0' in input script or data file
```

Some commands allow for using variable references in place of numeric constants so that the value can be evaluated and may change over the course of a run. This is typically done with the syntax `v_name` for a parameter, where name is the name of the variable. On the other hand, immediate variable expansion with the syntax `${name}` is performed while reading the input and before parsing commands,

---

**Note:** Using a variable reference (i.e. `v_name`) is only allowed if the documentation of the corresponding command explicitly says it is. Otherwise, you will receive an error message of this kind:

---

```
ERROR: Expected floating point parameter instead of 'v_name' in input script or data file
```

Generally, LAMMPS will print a message to the screen and logfile and exit gracefully when it encounters a fatal error. Sometimes it will print a WARNING to the screen and logfile and continue on; you can decide if the WARNING is important or not. A WARNING message that is generated in the middle of a run is only printed to the screen, not to the logfile, to avoid cluttering up thermodynamic output. If LAMMPS crashes or hangs without spitting out an error message first then it could be a bug (see [this section](#)) or one of the following cases:

LAMMPS runs in the available memory a processor allows to be allocated. Most reasonable MD runs are compute limited, not memory limited, so this should not be a bottleneck on most platforms. Almost all large memory allocations in the code are done via C-style malloc's which will generate an error message if you run out of memory. Smaller chunks of memory are allocated via C++ "new" statements. If you are unlucky you could run out of memory just when one of these small requests is made, in which case the code will crash or hang (in parallel), since LAMMPS does not trap on those errors.

Illegal arithmetic can cause LAMMPS to run slow or crash. This is typically due to invalid physics and numerics that your simulation is computing. If you see wild thermodynamic values or NaN values in your LAMMPS output, something is wrong with your simulation. If you suspect this is happening, it is a good idea to print out thermodynamic info frequently (e.g. every timestep) via the `thermo` so you can monitor what is happening. Visualizing the atom movement is also a good idea to insure your model is behaving as you expect.

In parallel, one way LAMMPS can hang is due to how different MPI implementations handle buffering of messages. If the code hangs without an error message, it may be that you need to specify an MPI setting or two (usually via an environment variable) to enable buffering or boost the sizes of messages that can be buffered.

## 11.2 Error and warning details

Many errors or warnings are self-explanatory and thus straightforward to resolve. However, there are also cases, where there is no single cause and explanation, where LAMMPS can only detect symptoms of an error but not the exact cause, or where the explanation needs to be more detailed than what can be fit into a message printed by the program. The following are discussions of such cases.

### 11.2.1 Unknown identifier in data file

This error happens when LAMMPS encounters a line of text in an unexpected format while reading a data file. This is most commonly caused by inconsistent header and section data. The header section informs LAMMPS how many entries or lines are expected in the various sections (like Atoms, Masses, Pair Coeffs, *etc.*) of the data file. If there is a mismatch, LAMMPS will either keep reading beyond the end of a section or stop reading before the section has ended.

Such a mismatch can happen unexpectedly when the first line of the data is *not* a comment as required by the format. That would result in LAMMPS expecting, for instance, 0 atoms because the “atoms” header line is treated as a comment.

## 11.3 Reporting bugs

If you are confident that you have found a bug in LAMMPS, please follow the steps outlined below:

- Check the [New features and bug fixes](#) section of the [LAMMPS WWW site](#) or the [GitHub Releases](#) page to see if the bug has already been addressed in a patch release.
- Check that your issue can be reproduced with the latest development version of LAMMPS.
- Check the manual carefully to verify that the unexpected behavior you are observing is indeed in conflict with the documentation
- Check the [GitHub Issue](#) page if your issue has already been reported and if it is still open.
- Check the [GitHub Pull Requests](#) page to see if there is already a fix for your bug pending.
- Check the [LAMMPS forum at MatSci](#) to see if the issue has been discussed before.

If none of these steps yields any useful information, please file a new bug report on the [GitHub Issue](#) page. The website will offer you to select a suitable template with explanations and then you should replace those explanations with the information that you can provide to reproduce your issue.

The most useful thing you can do to help us verify and fix a bug is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors with the simplest input script that reproduces the bug. Try to identify what command or combination of commands is causing the problem and upload the complete input deck as a tar or zip archive. Please avoid using binary restart files unless the issue requires it. In the latter case you should also include an input deck to quickly generate this restart from a data file or a simple additional input. This input deck can be used with tools like a debugger or `valgrind` to further *debug the crash*.

You may also post a message in the [development category of the LAMMPS forum at MatSci](#) describing the problem with the same kind of information. The forum can provide a faster response, especially if the bug reported is actually expected behavior or other LAMMPS users have come across it before.

## 11.4 Debugging crashes

If LAMMPS crashes with a “segmentation fault” or a “bus error” or similar message, then you can use the following two methods to further narrow down the origin of the issue. This will help the LAMMPS developers (or yourself) to understand the reason for the crash and apply a fix (either to the input script or the source code). This requires that your LAMMPS executable includes the required *debug information*. Otherwise it is not possible to look up the names of functions or variables.

The following patch will introduce a bug into the code for pair style `lj/cut` when using the `examples/melt/in.melt` input. We use it to show how to identify the origin of a segmentation fault.

```

--- a/src/pair_lj_cut.cpp
+++ b/src/pair_lj_cut.cpp
@@ -81,6 +81,7 @@ void PairLJCut::compute(int eflag, int vflag)
    int nlocal = atom->nlocal;
    double *special_lj = force->special_lj;
    int newton_pair = force->newton_pair;
+   double comx = 0.0;

    inum = list->inum;
    ilist = list->ilist;
@@ -134,8 +135,10 @@ void PairLJCut::compute(int eflag, int vflag)

+   comx += atom->rmass[i]*x[i][0]; /* BUG */
+ }
+ printf("comx = %g\n",comx);
+ if (vflag_fdotr) virial_fdotr_compute();
}

```

After recompiling LAMMPS and running the input you should get something like this:

```

$ ./lmp -in in.melt
LAMMPS (19 Mar 2020)
  using 1 OpenMP thread(s) per MPI task
Lattice spacing in x,y,z = 1.6796 1.6796 1.6796

    stencil: half/bin/3d/newton
    bin: standard
Setting up Verlet run ...
  Unit style      : lj
  Current step   : 0
  Time step      : 0.005
Segmentation fault (core dumped)

```

### 11.4.1 Using the GDB debugger to get a stack trace

There are two options to use the GDB debugger for identifying the origin of the segmentation fault or similar crash. The GDB debugger has many more features and options, as can be seen for example its [online documentation](#).

#### Run LAMMPS from within the debugger

Running LAMMPS under the control of the debugger as shown below only works for a single MPI rank (for debugging a program running in parallel you usually need a parallel debugger program). A simple way to launch GDB is to prefix the LAMMPS command line with `gdb --args` and then type the command “run” at the GDB prompt. This will launch the debugger, load the LAMMPS executable and its debug info, and then run it. When it reaches the code causing the segmentation fault, it will stop with a message why it stopped, print the current line of code, and drop back to the GDB prompt.

```
[...]
Setting up Verlet run ...
  Unit style      : lj
  Current step    : 0
  Time step       : 0.005

Program received signal SIGSEGV, Segmentation fault.
0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
↳<optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
139      comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)
```

Now typing the command “where” will show the stack of functions starting from the current function back to “main()”.

```
(gdb) where
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
↳<optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
#1  0x00000000004cf0a2 in LAMMPS_NS::Verlet::setup (this=0x7e6c90, flag=1) at /home/
↳akohlmey/compile/lammps/src/verlet.cpp:131
#2  0x000000000049db42 in LAMMPS_NS::Run::command (this=this@entry=0x7fffffffcca0,
↳narg=narg@entry=1, arg=arg@entry=0x7e8750)
    at /home/akohlmey/compile/lammps/src/run.cpp:177
#3  0x000000000041258a in LAMMPS_NS::Input::command_creator<LAMMPS_NS::Run> (lmp=
↳<optimized out>, narg=1, arg=0x7e8750)
    at /home/akohlmey/compile/lammps/src/input.cpp:878
#4  0x0000000000410ad3 in LAMMPS_NS::Input::execute_command (this=0x7d1410) at /home/
↳akohlmey/compile/lammps/src/input.cpp:864
#5  0x00000000004111fb in LAMMPS_NS::Input::file (this=0x7d1410) at /home/akohlmey/
↳compile/lammps/src/input.cpp:229
#6  0x000000000040933a in main (argc=<optimized out>, argv=<optimized out>) at /home/
↳akohlmey/compile/lammps/src/main.cpp:65
(gdb)
```

You can also print the value of variables and see if there is anything unexpected. Segmentation faults, for example, commonly happen when a pointer variable is not assigned and still initialized to NULL.

```
(gdb) print x
$1 = (double **) 0x7ffff7ca1010
(gdb) print i
```

(continues on next page)

(continued from previous page)

```

$2 = 0
(gdb) print x[0]
$3 = (double *) 0x7ffff6d80010
(gdb) print x[0][0]
$4 = 0
(gdb) print x[1][0]
$5 = 0.83979809569125363
(gdb) print atom->rmass
$6 = (double *) 0x0
(gdb)

```

### Inspect a core dump file with the debugger

When an executable crashes with a “core dumped” message, it creates a file “core” or “core.<PID#>” which contains the information about the current state. This file may be located in the folder where you ran LAMMPS or in some hidden folder managed by the systemd daemon. In the latter case, you need to “extract” the core file with the `coredumpctl` utility to the current folder. Example: `coredumpctl -o core dump lmp`. Now you can launch the debugger to load the executable, its debug info and the core dump and drop you to a prompt like before.

```

$ gdb lmp core
Reading symbols from lmp...
[New LWP 1928535]
[Thread debugging using libthread_db enabled]
Using host libthread_db library "/lib64/libthread_db.so.1".
Core was generated by `./lmp -in in.melt'.
Program terminated with signal SIGSEGV, Segmentation fault.
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x1b10740, eflag=1, vflag=
↳<optimized out>)
    at /home/akohlmeier/compile/lammps/src/pair_lj_cut.cpp:139
139      comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)

```

From here on, you use the same commands as shown before to get a stack trace and print current values of (pointer) variables.

### 11.4.2 Using valgrind to get a stack trace

The `valgrind` suite of tools allows to closely inspect the behavior of a compiled program by essentially emulating a CPU and instrumenting the program while running. This slows down execution quite significantly, but can also report issues that are not resulting in a crash. The default valgrind tool is a memory checker and you can use it by prefixing the normal command line with `valgrind`. Unlike GDB, this will also work for parallel execution, but it is recommended to redirect the valgrind output to a file (e.g. with `--log-file=crash-%p.txt`, the `%p` will be substituted with the process ID) so that the messages of the multiple valgrind instances to the console are not mixed.

```

$ valgrind ./lmp -in in.melt
==1933642== Memcheck, a memory error detector
==1933642== Copyright (C) 2002-2017, and GNU GPL'd, by Julian Seward et al.
==1933642== Using Valgrind-3.15.0 and LibVEX; rerun with -h for copyright info
==1933642== Command: ./lmp -in in.melt
==1933642==

```

(continues on next page)

(continued from previous page)

```

==1933642== Address 0x0 is not stack'd, malloc'd or (recently) free'd
==1933642==

```

As you can see, the stack trace information is similar to that obtained from GDB. In addition you get a more specific hint about what cause the segmentation fault, i.e. that it is a NULL pointer dereference. To find out which pointer exactly was NULL, you need to use the debugger, though.

## 11.5 Error messages

This is an alphabetic list of the ERROR messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. Error messages also list the source file and line number where the error was generated. For example, a message like this:

```
ERROR: Illegal velocity command (velocity.cpp:78)
```

means that line #78 in the file src/velocity.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Doc page with [WARNING messages](#)

***1-3 bond count is inconsistent***

An inconsistency was detected when computing the number of 1-3 neighbors for each atom. This likely means something is wrong with the bond topologies you have defined.

***1-4 bond count is inconsistent***

An inconsistency was detected when computing the number of 1-4 neighbors for each atom. This likely means something is wrong with the bond topologies you have defined.

***Accelerator sharing is not currently supported on system***

Multiple MPI processes cannot share the accelerator on your system. For NVIDIA GPUs, see the `nvidia-smi` command to change this setting.

***All angle coeffs are not set***

All angle coefficients must be set in the data file or by the `angle_coeff` command before running a simulation.

***All atom IDs = 0 but atom\_modify id = yes***

Self-explanatory.

***All atoms of a swapped type must have same charge.***

Self-explanatory.

***All atoms of a swapped type must have the same charge.***

Self-explanatory.

***All bond coeffs are not set***

All bond coefficients must be set in the data file or by the `bond_coeff` command before running a simulation.

***All dihedral coeffs are not set***

All dihedral coefficients must be set in the data file or by the `dihedral_coeff` command before running a simulation.

***All improper coeffs are not set***

All improper coefficients must be set in the data file or by the `improper_coeff` command before running a simulation.

***All masses are not set***

For atom styles that define masses for each atom type, all masses must be set in the data file or by the `mass` command before running a simulation. They must also be set before using the `velocity` command.

***All mol IDs should be set for fix gcmc group atoms***

The molecule flag is on, yet not all molecule ids in the fix group have been set to non-zero positive values by the user. This is an error since all atoms in the fix gcmc group are eligible for deletion, rotation, and translation and therefore must have valid molecule ids.

***All pair coeffs are not set***

All pair coefficients must be set in the data file or by the `pair_coeff` command before running a simulation.

***All read\_dump x,y,z fields must be specified for scaled, triclinic coords***

For triclinic boxes and scaled coordinates you must specify all 3 of the x,y,z fields, else LAMMPS cannot reconstruct the unscaled coordinates.

***All universe/uloop variables must have same # of values***

Self-explanatory.

***All variables in next command must be same style***

Self-explanatory.

***Angle atom missing in delete\_bonds***

The `delete_bonds` command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

***Angle atom missing in set command***

The set command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

***Angle atoms %d %d %d missing on proc %d at step %ld***

One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

***Angle atoms missing on proc %d at step %ld***

One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

***Angle coeff for hybrid has invalid style***

Angle style hybrid uses another angle style as one of its coefficients. The angle style used in the angle\_coeff command or read from a restart file is not recognized.

***Angle coeffs are not set***

No angle coefficients have been assigned in the data file or via the angle\_coeff command.

***Angle extent > half of periodic box length***

This error was detected by the neigh\_modify check yes setting. It is an error because the angle atoms are so far apart it is ambiguous how it should be defined.

***Angle potential must be defined for SHAKE***

When shaking angles, an angle\_style potential must be used.

***Angle style hybrid cannot have hybrid as an argument***

Self-explanatory.

***Angle style hybrid cannot have none as an argument***

Self-explanatory.

***Angle style hybrid cannot use same angle style twice***

Self-explanatory.

***Angle table must range from 0 to 180 degrees***

Self-explanatory.

***Angle table parameters did not set N***

List of angle table parameters must include N setting.

***Angle\_coeff command before angle\_style is defined***

Coefficients cannot be set in the data file or via the angle\_coeff command until an angle\_style has been assigned.

***Angle\_coeff command before simulation box is defined***

The angle\_coeff command cannot be used before a read\_data, read\_restart, or create\_box command.

***Angle\_coeff command when no angles allowed***

The chosen atom style does not allow for angles to be defined.

***Angle\_style command when no angles allowed***

The chosen atom style does not allow for angles to be defined.

***Angles assigned incorrectly***

Angles read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

***Angles defined but no angle types***

The data file header lists angles but no angle types.

***Append boundary must be shrink/minimum***

The boundary style of the face where atoms are added must be of type m (shrink/minimum).

***Arccos of invalid value in variable formula***

Argument of arccos() must be between -1 and 1.

***Arcsin of invalid value in variable formula***

Argument of arcsin() must be between -1 and 1.

***Assigning body parameters to non-body atom***

Self-explanatory.

***Assigning ellipsoid parameters to non-ellipsoid atom***

Self-explanatory.

***Assigning line parameters to non-line atom***

Self-explanatory.

***Assigning quat to non-body atom***

Self-explanatory.

***Assigning tri parameters to non-tri atom***

Self-explanatory.

***At least one atom of each swapped type must be present to define charges.***

Self-explanatory.

***Atom IDs must be consecutive for velocity create loop all***

Self-explanatory.

***Atom IDs must be used for molecular systems***

Atom IDs are used to identify and find partner atoms in bonds.

***Atom count changed in fix neb***

This is not allowed in a NEB calculation.

***Atom count is inconsistent, cannot write data file***

The sum of atoms across processors does not equal the global number of atoms. Probably some atoms have been lost.

***Atom count is inconsistent, cannot write restart file***

Sum of atoms across processors does not equal initial total count. This is probably because you have lost some atoms.

***Atom in too many rigid bodies - boost MAXBODY***

Fix poems has a parameter MAXBODY (in fix\_poems.cpp) which determines the maximum number of rigid bodies a single atom can belong to (i.e. a multibody joint). The bodies you have defined exceed this limit.

***Atom sort did not operate correctly***

This is an internal LAMMPS error. Please report it to the developers.

***Atom style hybrid cannot have hybrid as an argument***

Self-explanatory.

***Atom style hybrid cannot use same atom style twice***

Self-explanatory.

***Atom style template molecule must have atom types***

The defined molecule(s) does not specify atom types.

***Atom style was redefined after using fix property/atom***

This is not allowed.

***Atom type must be zero in fix gcmc mol command***

Self-explanatory.

***Atom vector in equal-style variable formula***

Atom vectors generate one value per atom which is not allowed in an equal-style variable.

***Atom-style variable in equal-style variable formula***

Atom-style variables generate one value per atom which is not allowed in an equal-style variable.

***Atom\_modify id command after simulation box is defined***

The atom\_modify id command cannot be used after a read\_data, read\_restart, or create\_box command.

***Atom\_modify map command after simulation box is defined***

The atom\_modify map command cannot be used after a read\_data, read\_restart, or create\_box command.

***Atom\_modify sort and first options cannot be used together***

Self-explanatory.

***Atom\_style command after simulation box is defined***

The atom\_style command cannot be used after a read\_data, read\_restart, or create\_box command.

***Atom\_style line can only be used in 2d simulations***

Self-explanatory.

***Atom\_style tri can only be used in 3d simulations***

Self-explanatory.

***Atomfile variable could not read values***

Check the file assigned to the variable.

***Atomfile variable in equal-style variable formula***

Self-explanatory.

***Atomfile-style variable in equal-style variable formula***

Self-explanatory.

***Attempt to pop empty stack in fix box/relax***

Internal LAMMPS error. Please report it to the developers.

***Attempt to push beyond stack limit in fix box/relax***

Internal LAMMPS error. Please report it to the developers.

***Attempting to rescale a 0.0 temperature***

Cannot rescale a temperature that is already 0.0.

***Attempting to insert more particles than available lattice points***

Self-explanatory.

***Bad FENE bond***

Two atoms in a FENE bond have become so far apart that the bond cannot be computed.

***Bad TIP4P angle type for PPPM/TIP4P***

Specified angle type is not valid.

***Bad TIP4P angle type for PPPMDisp/TIP4P***

Specified angle type is not valid.

***Bad TIP4P bond type for PPPM/TIP4P***

Specified bond type is not valid.

***Bad TIP4P bond type for PPPMDisp/TIP4P***

Specified bond type is not valid.

***Bad fix ID in fix append/atoms command***

The value of the fix\_id for keyword spatial must start with "f\_".

***Bad grid of processors***

The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

***Bad kspace\_modify kmax/ewald parameter***

Kspace\_modify values for the kmax/ewald keyword must be integers > 0

***Bad kspace\_modify slab parameter***

Kspace\_modify value for the slab/volume keyword must be >= 2.0.

***Bad matrix inversion in mldivide3***

This error should not occur unless the matrix is badly formed.

***Bad principal moments***

Fix rigid did not compute the principal moments of inertia of a rigid group of atoms correctly.

***Bad quadratic solve for particle/line collision***

This is an internal error. It should normally not occur.

***Bad quadratic solve for particle/tri collision***

This is an internal error. It should normally not occur.

***Bad real space Coulombic cutoff in fix tune/kspace***

Fix tune/kspace tried to find the optimal real space Coulombic cutoff using the Newton-Rhaphson method, but found a non-positive or NaN cutoff

***Balance command before simulation box is defined***

The balance command cannot be used before a read\_data, read\_restart, or create\_box command.

***Balance produced bad splits***

This should not occur. It means two or more cutting plane locations are on top of each other or out of order. Report the problem to the developers.

***Balance rcb cannot be used with comm\_style brick***

Comm\_style tiled must be used instead.

***Balance shift string is invalid***

The string can only contain the characters “x”, “y”, or “z”.

***Bias compute does not calculate a velocity bias***

The specified compute must compute a bias for temperature.

***Bias compute does not calculate temperature***

The specified compute must compute temperature.

***Bias compute group does not match compute group***

The specified compute must operate on the same group as the parent compute.

***Big particle in fix srd cannot be point particle***

Big particles must be extended spheroids or ellipsoids.

***Bigint setting in lmptype.h is invalid***

Size of bigint is less than size of tagint.

***Bigint setting in lmptype.h is not compatible***

Format of bigint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

***Bitmapped lookup tables require int/float be same size***

Cannot use pair tables on this machine, because of word sizes. Use the pair\_modify command with table 0 instead.

***Bitmapped table in file does not match requested table***

Setting for bitmapped table in pair\_coeff command must match table in file exactly.

***Bitmapped table is incorrect length in table file***

Number of table entries is not a correct power of 2.

***Bond and angle potentials must be defined for TIP4P***

Cannot use TIP4P pair potential unless bond and angle potentials are defined.

***Bond atom missing in box size check***

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond atom missing in delete\_bonds***

The delete\_bonds command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

***Bond atom missing in image check***

The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond atom missing in set command***

The set command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

***Bond atoms %d %d missing on proc %d at step %ld***

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond atoms missing on proc %d at step %ld***

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond coeff for hybrid has invalid style***

Bond style hybrid uses another bond style as one of its coefficients. The bond style used in the bond\_coeff command or read from a restart file is not recognized.

***Bond coeffs are not set***

No bond coefficients have been assigned in the data file or via the bond\_coeff command.

***Bond extent > half of periodic box length***

This error was detected by the neigh\_modify check yes setting. It is an error because the bond atoms are so far apart it is ambiguous how it should be defined.

***Bond potential must be defined for SHAKE***

Cannot use fix shake unless bond potential is defined.

***Bond style hybrid cannot have hybrid as an argument***

Self-explanatory.

***Bond style hybrid cannot have none as an argument***

Self-explanatory.

***Bond style hybrid cannot use same bond style twice***

Self-explanatory.

***Bond style quartic cannot be used with 3,4-body interactions***

No angle, dihedral, or improper styles can be defined when using bond style quartic.

***Bond style quartic cannot be used with atom style template***

This bond style can change the bond topology which is not allowed with this atom style.

***Bond style quartic requires special\_bonds = 1,1,1***

This is a restriction of the current bond quartic implementation.

***Bond table parameters did not set N***

List of bond table parameters must include N setting.

***Bond table values are not increasing***

The values in the tabulated file must be monotonically increasing.

***BondAngle coeff for hybrid angle has invalid format***

No “ba” field should appear in data file entry.

***BondBond coeff for hybrid angle has invalid format***

No “bb” field should appear in data file entry.

***Bond\_coeff command before bond\_style is defined***

Coefficients cannot be set in the data file or via the bond\_coeff command until an bond\_style has been assigned.

***Bond\_coeff command before simulation box is defined***

The bond\_coeff command cannot be used before a read\_data, read\_restart, or create\_box command.

***Bond\_coeff command when no bonds allowed***

The chosen atom style does not allow for bonds to be defined.

***Bond\_style command when no bonds allowed***

The chosen atom style does not allow for bonds to be defined.

***Bonds assigned incorrectly***

Bonds read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

***Bonds defined but no bond types***

The data file header lists bonds but no bond types.

***Both restart files must use % or neither***

Self-explanatory.

***Both restart files must use MPI-IO or neither***

Self-explanatory.

***Both sides of boundary must be periodic***

Cannot specify a boundary as periodic only on the lo or hi side. Must be periodic on both sides.

***Boundary command after simulation box is defined***

The boundary command cannot be used after a read\_data, read\_restart, or create\_box command.

***Box bounds are invalid***

The box boundaries specified in the read\_data file are invalid. The lo value must be less than the hi value for all 3 dimensions.

***Box command after simulation box is defined***

The box command cannot be used after a read\_data, read\_restart, or create\_box command.

***CPU neighbor lists must be used for ellipsoid/sphere mix.***

When using Gay-Berne or RE-squared pair styles with both ellipsoidal and spherical particles, the neighbor list must be built on the CPU

***Can not specify Pxy/Pxz/Pyz in fix box/relax with non-triclinic box***

Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

***Can not specify Pxy/Pxz/Pyz in fix nvt/npt/nph with non-triclinic box***

Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

***Can only use -plog with multiple partitions***

Self-explanatory. See page discussion of command-line switches.

***Can only use -pscreen with multiple partitions***

Self-explanatory. See page discussion of command-line switches.

***Can only use Kokkos supported regions with Kokkos package***

Self-explanatory.

***Can only use NEB with 1-processor replicas***

This is current restriction for NEB as implemented in LAMMPS.

***Can only use TAD with 1-processor replicas for NEB***

This is current restriction for NEB as implemented in LAMMPS.

***Cannot (yet) do analytic differentiation with ppm/gpu***

This is a current restriction of this command.

***Cannot (yet) request ghost atoms with Kokkos half neighbor list***

This feature is not yet supported.

***Cannot (yet) use 'electron' units with dipoles***

This feature is not yet supported.

***Cannot (yet) use Ewald with triclinic box and slab correction***

This feature is not yet supported.

***Cannot (yet) use K-space slab correction with compute group/group for triclinic systems***

This option is not yet supported.

***Cannot (yet) use MSM with 2d simulation***

This feature is not yet supported.

***Cannot (yet) use PPPM with triclinic box and TIP4P***

This feature is not yet supported.

***Cannot (yet) use PPPM with triclinic box and kspace\_modify diff ad***

This feature is not yet supported.

***Cannot (yet) use PPPM with triclinic box and slab correction***

This feature is not yet supported.

***Cannot (yet) use kspace slab correction with long-range dipoles and non-neutral systems or per-atom energy***

This feature is not yet supported.

***Cannot (yet) use kspace\_modify diff ad with compute group/group***

This option is not yet supported.

***Cannot (yet) use kspace\_style ppm/stagger with triclinic systems***

This feature is not yet supported.

***Cannot (yet) use molecular templates with Kokkos***

Self-explanatory.

***Cannot (yet) use respa with Kokkos***

Self-explanatory.

***Cannot (yet) use rigid bodies with fix deform and Kokkos***

Self-explanatory.

***Cannot (yet) use rigid bodies with fix nh and Kokkos***

Self-explanatory.

***Cannot (yet) use single precision with MSM (remove -DFFT\_SINGLE from Makefile and re-compile)***

Single precision cannot be used with MSM.

***Cannot add atoms to fix move variable***

Atoms can not be added afterwards to this fix option.

***Cannot append atoms to a triclinic box***

The simulation box must be defined with edges aligned with the Cartesian axes.

***Cannot balance in z dimension for 2d simulation***

Self-explanatory.

***Cannot change box ortho/triclinic with certain fixes defined***

This is because those fixes store the shape of the box. You need to use unfix to discard the fix, change the box, then redefine a new fix.

***Cannot change box ortho/triclinic with dumps defined***

This is because some dumps store the shape of the box. You need to use undump to discard the dump, change the box, then redefine a new dump.

***Cannot change box tilt factors for orthogonal box***

Cannot use tilt factors unless the simulation box is non-orthogonal.

***Cannot change box to orthogonal when tilt is non-zero***

Self-explanatory.

***Cannot change box z boundary to non-periodic for a 2d simulation***

Self-explanatory.

***Cannot change dump\_modify every for dump dcd***

The frequency of writing dump dcd snapshots cannot be changed.

***Cannot change dump\_modify every for dump xtc***

The frequency of writing dump xtc snapshots cannot be changed.

***Cannot change timestep once fix srd is setup***

This is because various SRD properties depend on the timestep size.

***Cannot change timestep with fix pour***

This is because fix pour pre-computes the time delay for particles to fall out of the insertion volume due to gravity.

***Cannot change to comm\_style brick from tiled layout***

Self-explanatory.

***Cannot change\_box after reading restart file with per-atom info***

This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

***Cannot change\_box in xz or yz for 2d simulation***

Self-explanatory.

***Cannot change\_box in z dimension for 2d simulation***

Self-explanatory.

***Cannot clear group all***

This operation is not allowed.

***Cannot close restart file - MPI error: %s***

This error was generated by MPI when reading/writing an MPI-IO restart file.

***Cannot compute initial g\_ewald\_disp***

LAMMPS failed to compute an initial guess for the PPPM\_disp g\_ewald\_6 factor that partitions the computation between real space and k-space for Dispersion interactions.

***Cannot create an atom map unless atoms have IDs***

The simulation requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

***Cannot create atoms with undefined lattice***

Must use the lattice command before using the create\_atoms command.

***Cannot create/grow a vector/array of pointers for %s***

LAMMPS code is making an illegal call to the templated memory allocators, to create a vector or array of pointers.

***Cannot create \_atoms after reading restart file with per-atom info***

The per-atom info was stored to be used when by a fix that you may re-define. If you add atoms before re-defining the fix, then there will not be a correct amount of per-atom info.

***Cannot create \_box after simulation box is defined***

A simulation box can only be defined once.

***Cannot currently use pair reax with pair hybrid***

This is not yet supported.

***Cannot currently use ppm/gpu with fix balance.***

Self-explanatory.

***Cannot delete group all***

Self-explanatory.

***Cannot delete group currently used by a compute***

Self-explanatory.

***Cannot delete group currently used by a dump***

Self-explanatory.

***Cannot delete group currently used by a fix***

Self-explanatory.

***Cannot delete group currently used by atom\_modify first***

Self-explanatory.

***Cannot delete \_atoms bond yes for non-molecular systems***

Self-explanatory.

***Cannot displace \_atoms after reading restart file with per-atom info***

This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

***Cannot do GCMC on atoms in atom\_modify first group***

This is a restriction due to the way atoms are organized in a list to enable the atom\_modify first command.

***Cannot do atom/swap on atoms in atom\_modify first group***

This is a restriction due to the way atoms are organized in a list to enable the atom\_modify first command.

***Cannot dump sort on atom IDs with no atom IDs defined***

Self-explanatory.

***Cannot dump sort when multiple dump files are written***

In this mode, each processor dumps its atoms to a file, so no sorting is allowed.

***Cannot embed Python when also extending Python with LAMMPS***

When running LAMMPS via Python through the LAMMPS library interface you cannot also use the input script python command.

***Cannot evaporate atoms in atom\_modify first group***

This is a restriction due to the way atoms are organized in a list to enable the atom\_modify first command.

***Cannot find create\_bonds group ID***

Self-explanatory.

***Cannot find delete\_bonds group ID***

Group ID used in the delete\_bonds command does not exist.

***Cannot find specified group ID for core particles***

Self-explanatory.

***Cannot find specified group ID for shell particles***

Self-explanatory.

***Cannot have both pair\_modify shift and tail set to yes***

These 2 options are contradictory.

***Cannot intersect groups using a dynamic group***

This operation is not allowed.

***Cannot mix molecular and molecule template atom styles***

Self-explanatory.

***Cannot open -reorder file***

Self-explanatory.

***Cannot open ADP potential file %s***

The specified ADP potential file cannot be opened. Check that the path and name are correct.

***Cannot open AIREBO potential file %s***

The specified AIREBO potential file cannot be opened. Check that the path and name are correct.

***Cannot open BOP potential file %s***

The specified BOP potential file cannot be opened. Check that the path and name are correct.

***Cannot open COMB potential file %s***

The specified COMB potential file cannot be opened. Check that the path and name are correct.

***Cannot open COMB3 lib.comb3 file***

The COMB3 library file cannot be opened. Check that the path and name are correct.

***Cannot open COMB3 potential file %s***

The specified COMB3 potential file cannot be opened. Check that the path and name are correct.

***Cannot open EAM potential file %s***

The specified EAM potential file cannot be opened. Check that the path and name are correct.

***Cannot open EIM potential file %s***

The specified EIM potential file cannot be opened. Check that the path and name are correct.

***Cannot open LCBOP potential file %s***

The specified LCBOP potential file cannot be opened. Check that the path and name are correct.

***Cannot open MEAM potential file %s***

The specified MEAM potential file cannot be opened. Check that the path and name are correct.

***Cannot open SNAP coefficient file %s***

The specified SNAP coefficient file cannot be opened. Check that the path and name are correct.

***Cannot open SNAP parameter file %s***

The specified SNAP parameter file cannot be opened. Check that the path and name are correct.

***Cannot open Stillinger-Weber potential file %s***

The specified SW potential file cannot be opened. Check that the path and name are correct.

***Cannot open Tersoff potential file %s***

The specified potential file cannot be opened. Check that the path and name are correct.

***Cannot open Vashishta potential file %s***

The specified Vashishta potential file cannot be opened. Check that the path and name are correct.

***Cannot open balance output file***

Self-explanatory.

***Cannot open coul/streitz potential file %s***

The specified coul/streitz potential file cannot be opened. Check that the path and name are correct.

***Cannot open custom file***

Self-explanatory.

***Cannot open data file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open dir to search for restart file***

Using a "\*" in the name of the restart file will open the current directory to search for matching file names.

***Cannot open dump file***

Self-explanatory.

***Cannot open dump file %s***

The output file for the dump command cannot be opened. Check that the path and name are correct.

***Cannot open file %s***

The specified file cannot be opened. Check that the path and name are correct. If the file is a compressed file, also check that the gzip executable can be found and run.

***Cannot open file variable file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix ave/chunk file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix ave/correlate file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix ave/histo file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix ave/time file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix balance output file***

Self-explanatory.

***Cannot open fix poems file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix print file %s***

The output file generated by the fix print command cannot be opened

***Cannot open fix qeq parameter file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix qeq/comb file %s***

The output file for the fix qeq/combs command cannot be opened. Check that the path and name are correct.

***Cannot open fix reax/bonds file %s***

The output file for the fix reax/bonds command cannot be opened. Check that the path and name are correct.

***Cannot open fix rigid infile %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix rigid restart file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix rigid/small infile %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open fix tmd file %s***

The output file for the fix tmd command cannot be opened. Check that the path and name are correct.

***Cannot open fix ttm file %s***

The output file for the fix ttm command cannot be opened. Check that the path and name are correct.

***Cannot open gzipped file***

LAMMPS was compiled without support for reading and writing gzipped files through a pipeline to the gzip program with -DLAMMPS\_GZIP.

***Cannot open input script %s***

Self-explanatory.

***Cannot open log.cite file***

This file is created when you use some LAMMPS features, to indicate what paper you should cite on behalf of those who implemented the feature. Check that you have write privileges into the directory you are running in.

***Cannot open log.lammps for writing***

The default LAMMPS log file cannot be opened. Check that the directory you are running in allows for files to be created.

***Cannot open logfile***

The LAMMPS log file named in a command-line argument cannot be opened. Check that the path and name are correct.

***Cannot open logfile %s***

The LAMMPS log file specified in the input script cannot be opened. Check that the path and name are correct.

***Cannot open molecule file %s***

The specified file cannot be opened. Check that the path and name are correct.

***Cannot open nb3b/harmonic potential file %s***

The specified potential file cannot be opened. Check that the path and name are correct.

***Cannot open pair\_write file***

The specified output file for pair energies and forces cannot be opened. Check that the path and name are correct.

***Cannot open polymorphic potential file %s***

The specified polymorphic potential file cannot be opened. Check that the path and name are correct.

***Cannot open print file %s***

Self-explanatory.

***Cannot open processors output file***

Self-explanatory.

***Cannot open restart file %s***

Self-explanatory.

***Cannot open restart file for reading - MPI error: %s***

This error was generated by MPI when reading/writing an MPI-IO restart file.

***Cannot open restart file for writing - MPI error: %s***

This error was generated by MPI when reading/writing an MPI-IO restart file.

***Cannot open screen file***

The screen file specified as a command-line argument cannot be opened. Check that the directory you are running in allows for files to be created.

***Cannot open temporary file for world counter.***

Self-explanatory.

***Cannot open universe log file***

For a multi-partition run, the master log file cannot be opened. Check that the directory you are running in allows for files to be created.

***Cannot open universe screen file***

For a multi-partition run, the master screen file cannot be opened. Check that the directory you are running in allows for files to be created.

***Cannot read from restart file - MPI error: %s***

This error was generated by MPI when reading/writing an MPI-IO restart file.

***Cannot read\_data without add keyword after simulation box is defined***

Self-explanatory.

***Cannot read\_restart after simulation box is defined***

The read\_restart command cannot be used after a read\_data, read\_restart, or create\_box command.

***Cannot redefine variable as a different style***

An equal-style variable can be re-defined but only if it was originally an equal-style variable.

***Cannot replicate 2d simulation in z dimension***

The replicate command cannot replicate a 2d simulation in the z dimension.

***Cannot replicate with fixes that store atom quantities***

Either fixes are defined that create and store atom-based vectors or a restart file was read which included atom-based vectors for fixes. The replicate command cannot duplicate that information for new atoms. You should use the replicate command before fixes are applied to the system.

***Cannot reset timestep with a dynamic region defined***

Dynamic regions (see the region command) have a time dependence. Thus you cannot change the timestep when one or more of these are defined.

***Cannot reset timestep with a time-dependent fix defined***

You cannot reset the timestep when a fix that keeps track of elapsed time is in place.

***Cannot run 2d simulation with non-periodic Z dimension***

Use the boundary command to make the z dimension periodic in order to run a 2d simulation.

***Cannot set bond topology types for atom style template***

The bond, angle, etc types cannot be changed for this atom style since they are static settings in the molecule template files.

***Cannot set both respa pair and inner/middle/outer***

In the rRESPA integrator, you must compute pairwise potentials either all together (pair), or in pieces (inner/middle/outer). You can't do both.

***Cannot set cutoff/multi before simulation box is defined***

Self-explanatory.

***Cannot set dpd/theta for this atom style***

Self-explanatory.

***Cannot set dump\_modify flush for dump xtc***

Self-explanatory.

***Cannot set mass for this atom style***

This atom style does not support mass settings for each atom type. Instead they are defined on a per-atom basis in the data file.

***Cannot set meso/cv for this atom style***

Self-explanatory.

***Cannot set meso/e for this atom style***

Self-explanatory.

***Cannot set meso/rho for this atom style***

Self-explanatory.

***Cannot set non-zero image flag for non-periodic dimension***

Self-explanatory.

***Cannot set non-zero z velocity for 2d simulation***

Self-explanatory.

***Cannot set quaternion for atom that has none***

Self-explanatory.

***Cannot set quaternion with xy components for 2d system***

Self-explanatory.

***Cannot set respa hybrid and any of pair/inner/middle/outer***

In the rRESPA integrator, you must compute pairwise potentials either all together (pair), with different cutoff regions (inner/middle/outer), or per hybrid sub-style (hybrid). You cannot mix those.

***Cannot set respa middle without inner/outer***

In the rRESPA integrator, you must define both a inner and outer setting in order to use a middle setting.

***Cannot set restart file size - MPI error: %s***

This error was generated by MPI when reading/writing an MPI-IO restart file.

***Cannot set smd/contact/radius for this atom style***

Self-explanatory.

***Cannot set smd/mass/density for this atom style***

Self-explanatory.

***Cannot set temperature for fix rigid/nph***

The temp keyword cannot be specified.

***Cannot set theta for atom that is not a line***

Self-explanatory.

***Cannot set this attribute for this atom style***

The attribute being set does not exist for the defined atom style.

***Cannot set variable z velocity for 2d simulation***

Self-explanatory.

***Cannot skew triclinic box in z for 2d simulation***

Self-explanatory.

***Cannot subtract groups using a dynamic group***

This operation is not allowed.

**Cannot union groups using a dynamic group**

This operation is not allowed.

**Cannot use -kokkos on without KOKKOS installed**

Self-explanatory.

**Cannot use -reorder after -partition**

Self-explanatory. See page discussion of command-line switches.

**Cannot use Ewald with 2d simulation**

The kspace style ewald cannot be used in 2d simulations. You can use 2d Ewald in a 3d simulation; see the kspace\_modify command.

**Cannot use Ewald/disp solver on system with no charge, dipole, or LJ particles**

No atoms in system have a non-zero charge or dipole, or are LJ particles. Change charges/dipoles or change options of the kspace solver/pair style.

**Cannot use EwaldDisp with 2d simulation**

This is a current restriction of this command.

**Cannot use Kokkos pair style with rRESPA inner/middle**

Self-explanatory.

**Cannot use NEB unless atom map exists**

Use the atom\_modify command to create an atom map.

**Cannot use NEB with a single replica**

Self-explanatory.

**Cannot use NEB with atom\_modify sort enabled**

This is current restriction for NEB implemented in LAMMPS.

**Cannot use PPPM with 2d simulation**

The kspace style pppm cannot be used in 2d simulations. You can use 2d PPPM in a 3d simulation; see the kspace\_modify command.

**Cannot use PPPMDisp with 2d simulation**

The kspace style pppm/disp cannot be used in 2d simulations. You can use 2d pppm/disp in a 3d simulation; see the kspace\_modify command.

**Cannot use PRD with a changing box**

The current box dimensions are not copied between replicas

**Cannot use PRD with a time-dependent fix defined**

PRD alters the timestep in ways that will mess up these fixes.

**Cannot use PRD with a time-dependent region defined**

PRD alters the timestep in ways that will mess up these regions.

**Cannot use PRD with atom\_modify sort enabled**

This is a current restriction of PRD. You must turn off sorting, which is enabled by default, via the atom\_modify command.

**Cannot use PRD with multi-processor replicas unless atom map exists**

Use the atom\_modify command to create an atom map.

**Cannot use TAD unless atom map exists for NEB**

See atom\_modify map command to set this.

**Cannot use TAD with a single replica for NEB**

NEB requires multiple replicas.

***Cannot use TAD with atom\_modify sort enabled for NEB***

This is a current restriction of NEB.

***Cannot use a damped dynamics min style with fix box/relax***

This is a current restriction in LAMMPS. Use another minimizer style.

***Cannot use a damped dynamics min style with per-atom DOF***

This is a current restriction in LAMMPS. Use another minimizer style.

***Cannot use append/atoms in periodic dimension***

The boundary style of the face where atoms are added can not be of type p (periodic).

***Cannot use atomfile-style variable unless atom map exists***

Self-explanatory. See the atom\_modify command to create a map.

***Cannot use both com and bias with compute temp/chunk***

Self-explanatory.

***Cannot use chosen neighbor list style with buck/coul/cut/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with buck/coul/long/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with buck/kk***

That style is not supported by Kokkos.

***Cannot use chosen neighbor list style with coul/cut/kk***

That style is not supported by Kokkos.

***Cannot use chosen neighbor list style with coul/debye/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with coul/dsf/kk***

That style is not supported by Kokkos.

***Cannot use chosen neighbor list style with coul/wolf/kk***

That style is not supported by Kokkos.

***Cannot use chosen neighbor list style with lj/charmm/coul/charmm/implicit/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with lj/charmm/coul/charmm/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with lj/charmm/coul/long/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with lj/class2/coul/cut/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with lj/class2/coul/long/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with lj/class2/kk***

Self-explanatory.

***Cannot use chosen neighbor list style with lj/cut/coul/cut/kk***

That style is not supported by Kokkos.

***Cannot use chosen neighbor list style with lj/cut/coul/debye/kk***

Self-explanatory.

**Cannot use chosen neighbor list style with lj/cut/coul/long/kk**

That style is not supported by Kokkos.

**Cannot use chosen neighbor list style with lj/cut/kk**

That style is not supported by Kokkos.

**Cannot use chosen neighbor list style with lj/expand/kk**

Self-explanatory.

**Cannot use chosen neighbor list style with lj/gromacs/coul/gromacs/kk**

Self-explanatory.

**Cannot use chosen neighbor list style with lj/gromacs/kk**

Self-explanatory.

**Cannot use chosen neighbor list style with lj/spica/kk**

That style is not supported by Kokkos.

**Cannot use chosen neighbor list style with pair eam/kk**

That style is not supported by Kokkos.

**Cannot use chosen neighbor list style with pair eam/kk/alloy**

Self-explanatory.

**Cannot use chosen neighbor list style with pair eam/kk/fs**

Self-explanatory.

**Cannot use chosen neighbor list style with pair sw/kk**

Self-explanatory.

**Cannot use chosen neighbor list style with tersoff/kk**

Self-explanatory.

**Cannot use chosen neighbor list style with tersoff/zbl/kk**

Self-explanatory.

**Cannot use compute chunk/atom bin z for 2d model**

Self-explanatory.

**Cannot use compute cluster/atom unless atoms have IDs**

Atom IDs are used to identify clusters.

**Cannot use create\_atoms rotate unless single style**

Self-explanatory.

**Cannot use create\_bonds unless atoms have IDs**

This command requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

**Cannot use create\_bonds with non-molecular system**

Self-explanatory.

**Cannot use cwiggle in variable formula between runs**

This is a function of elapsed time.

**Cannot use delete\_atoms bond yes with atom\_style template**

This is because the bonds for that atom style are hardwired in the molecule template.

**Cannot use delete\_atoms unless atoms have IDs**

Your atoms do not have IDs, so the delete\_atoms command cannot be used.

**Cannot use delete\_bonds with non-molecular system**

Your choice of atom style does not have bonds.

***Cannot use dump\_modify fileper without % in dump file name***

Self-explanatory.

***Cannot use dump\_modify nfile without % in dump file name***

Self-explanatory.

***Cannot use dynamic group with fix adapt atom***

This is not yet supported.

***Cannot use fix TMD unless atom map exists***

Using this fix requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom\_modify map command will force an atom map to be created.

***Cannot use fix bond/break with non-molecular systems***

Only systems with bonds that can be changed can be used. Atom\_style template does not qualify.

***Cannot use fix bond/create with non-molecular systems***

Only systems with bonds that can be changed can be used. Atom\_style template does not qualify.

***Cannot use fix bond/swap with non-molecular systems***

Only systems with bonds that can be changed can be used. Atom\_style template does not qualify.

***Cannot use fix box/relax on a 2nd non-periodic dimension***

When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

***Cannot use fix box/relax on a non-periodic dimension***

When specifying a diagonal pressure component, the dimension must be periodic.

***Cannot use fix box/relax with both relaxation and scaling on a tilt factor***

When specifying scaling on a tilt factor component, that component can not also be controlled by the barostat. E.g. if scalexy yes is specified and also keyword tri or xy, this is wrong.

***Cannot use fix box/relax with tilt factor scaling on a 2nd non-periodic dimension***

When specifying scaling on a tilt factor component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

***Cannot use fix deform on a shrink-wrapped boundary***

The x, y, z options cannot be applied to shrink-wrapped dimensions.

***Cannot use fix deform tilt on a shrink-wrapped 2nd dim***

This is because the shrink-wrapping will change the value of the strain implied by the tilt factor.

***Cannot use fix deform trape on a box with zero tilt***

The trape style alters the current strain.

***Cannot use fix deposit rigid and not molecule***

Self-explanatory.

***Cannot use fix deposit rigid and shake***

These two attributes are conflicting.

***Cannot use fix deposit shake and not molecule***

Self-explanatory.

***Cannot use fix enforce2d with 3d simulation***

Self-explanatory.

***Cannot use fix gcmc in a 2d simulation***

Fix gcmc is set up to run in 3d only. No 2d simulations with fix gcmc are allowed.

**Cannot use fix gcmc shake and not molecule**

Self-explanatory.

**Cannot use fix msst without per-type mass defined**

Self-explanatory.

**Cannot use fix npt and fix deform on same component of stress tensor**

This would be changing the same box dimension twice.

**Cannot use fix nvt/npt/nph on a 2nd non-periodic dimension**

When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

**Cannot use fix nvt/npt/nph on a non-periodic dimension**

When specifying a diagonal pressure component, the dimension must be periodic.

**Cannot use fix nvt/npt/nph with both xy dynamics and xy scaling**

Self-explanatory.

**Cannot use fix nvt/npt/nph with both xz dynamics and xz scaling**

Self-explanatory.

**Cannot use fix nvt/npt/nph with both yz dynamics and yz scaling**

Self-explanatory.

**Cannot use fix nvt/npt/nph with xy scaling when y is non-periodic dimension**

The second dimension in the barostated tilt factor must be periodic.

**Cannot use fix nvt/npt/nph with xz scaling when z is non-periodic dimension**

The second dimension in the barostated tilt factor must be periodic.

**Cannot use fix nvt/npt/nph with yz scaling when z is non-periodic dimension**

The second dimension in the barostated tilt factor must be periodic.

**Cannot use fix pour rigid and not molecule**

Self-explanatory.

**Cannot use fix pour rigid and shake**

These two attributes are conflicting.

**Cannot use fix pour shake and not molecule**

Self-explanatory.

**Cannot use fix pour with triclinic box**

This option is not yet supported.

**Cannot use fix press/berendsen and fix deform on same component of stress tensor**

These commands both change the box size/shape, so you cannot use both together.

**Cannot use fix press/berendsen on a non-periodic dimension**

Self-explanatory.

**Cannot use fix press/berendsen with triclinic box**

Self-explanatory.

**Cannot use fix reax/bonds without pair\_style reax**

Self-explanatory.

**Cannot use fix rigid npt/nph and fix deform on same component of stress tensor**

This would be changing the same box dimension twice.

**Cannot use fix rigid npt/nph on a non-periodic dimension**

When specifying a diagonal pressure component, the dimension must be periodic.

***Cannot use fix rigid/small npt/nph on a non-periodic dimension***

When specifying a diagonal pressure component, the dimension must be periodic.

***Cannot use fix shake with non-molecular system***

Your choice of atom style does not have bonds.

***Cannot use fix ttm with 2d simulation***

This is a current restriction of this fix due to the grid it creates.

***Cannot use fix ttm with triclinic box***

This is a current restriction of this fix due to the grid it creates.

***Cannot use fix tune/kSPACE without a kSPACE style***

Self-explanatory.

***Cannot use fix tune/kSPACE without a pair style***

This fix (tune/kSPACE) can only be used when a pair style has been specified.

***Cannot use fix wall in periodic dimension***

Self-explanatory.

***Cannot use fix wall zlo/zhi for a 2d simulation***

Self-explanatory.

***Cannot use fix wall/reflect in periodic dimension***

Self-explanatory.

***Cannot use fix wall/reflect zlo/zhi for a 2d simulation***

Self-explanatory.

***Cannot use fix wall/srd in periodic dimension***

Self-explanatory.

***Cannot use fix wall/srd more than once***

Nor is there a need to since multiple walls can be specified in one command.

***Cannot use fix wall/srd without fix srd***

Self-explanatory.

***Cannot use fix wall/srd zlo/zhi for a 2d simulation***

Self-explanatory.

***Cannot use fix\_deposit unless atoms have IDs***

Self-explanatory.

***Cannot use fix\_pour unless atoms have IDs***

Self-explanatory.

***Cannot use include command within an if command***

Self-explanatory.

***Cannot use lines with fix srd unless overlap is set***

This is because line segments are connected to each other.

***Cannot use multiple fix wall commands with pair brownian***

Self-explanatory.

***Cannot use multiple fix wall commands with pair lubricate***

Self-explanatory.

***Cannot use multiple fix wall commands with pair lubricate/poly***

Self-explanatory.

***Cannot use multiple fix wall commands with pair lubricateU***

Self-explanatory.

***Cannot use neigh\_modify exclude with GPU neighbor builds***

This is a current limitation of the GPU implementation in LAMMPS.

***Cannot use neighbor bins - box size << cutoff***

Too many neighbor bins will be created. This typically happens when the simulation box is very small in some dimension, compared to the neighbor cutoff. Use the “nsq” style instead of “bin” style.

***Cannot use newton pair with beck/gpu pair style***

Self-explanatory.

***Cannot use newton pair with born/coul/long/gpu pair style***

Self-explanatory.

***Cannot use newton pair with born/coul/wolf/gpu pair style***

Self-explanatory.

***Cannot use newton pair with born/gpu pair style***

Self-explanatory.

***Cannot use newton pair with buck/coul/cut/gpu pair style***

Self-explanatory.

***Cannot use newton pair with buck/coul/long/gpu pair style***

Self-explanatory.

***Cannot use newton pair with buck/gpu pair style***

Self-explanatory.

***Cannot use newton pair with colloid/gpu pair style***

Self-explanatory.

***Cannot use newton pair with coul/cut/gpu pair style***

Self-explanatory.

***Cannot use newton pair with coul/debye/gpu pair style***

Self-explanatory.

***Cannot use newton pair with coul/dsf/gpu pair style***

Self-explanatory.

***Cannot use newton pair with coul/long/gpu pair style***

Self-explanatory.

***Cannot use newton pair with dipole/cut/gpu pair style***

Self-explanatory.

***Cannot use newton pair with dipole/sf/gpu pair style***

Self-explanatory.

***Cannot use newton pair with dpd/gpu pair style***

Self-explanatory.

***Cannot use newton pair with dpd/tstat/gpu pair style***

Self-explanatory.

***Cannot use newton pair with eam/alloy/gpu pair style***

Self-explanatory.

***Cannot use newton pair with eam/fs/gpu pair style***

Self-explanatory.

*Cannot use newton pair with eam/gpu pair style*

Self-explanatory.

*Cannot use newton pair with gauss/gpu pair style*

Self-explanatory.

*Cannot use newton pair with gayberne/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/charmm/coul/long/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/class2/coul/long/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/class2/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cubic/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cut/coul/cut/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cut/coul/debye/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cut/coul/dsf/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cut/coul/long/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cut/coul/msm/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/cut/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/expand/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/gromacs/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/spica/coul/long/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj/spica/gpu pair style*

Self-explanatory.

*Cannot use newton pair with lj96/cut/gpu pair style*

Self-explanatory.

*Cannot use newton pair with mie/cut/gpu pair style*

Self-explanatory.

*Cannot use newton pair with morse/gpu pair style*

Self-explanatory.

*Cannot use newton pair with resquared/gpu pair style*

Self-explanatory.

**Cannot use newton pair with soft/gpu pair style**

Self-explanatory.

**Cannot use newton pair with table/gpu pair style**

Self-explanatory.

**Cannot use newton pair with yukawa/colloid/gpu pair style**

Self-explanatory.

**Cannot use newton pair with yukawa/gpu pair style**

Self-explanatory.

**Cannot use newton pair with zbl/gpu pair style**

Self-explanatory.

**Cannot use non-zero forces in an energy minimization**

Fix setforce cannot be used in this manner. Use fix addforce instead.

**Cannot use non-periodic boundares with fix ttm**

This fix requires a fully periodic simulation box.

**Cannot use non-periodic boundaries with Ewald**

For kspace style ewald, all 3 dimensions must have periodic boundaries unless you use the kspace\_modify command to define a 2d slab with a non-periodic z dimension.

**Cannot use non-periodic boundaries with EwaldDisp**

For kspace style ewald/disp, all 3 dimensions must have periodic boundaries unless you use the kspace\_modify command to define a 2d slab with a non-periodic z dimension.

**Cannot use non-periodic boundaries with PPPM**

For kspace style pppm, all 3 dimensions must have periodic boundaries unless you use the kspace\_modify command to define a 2d slab with a non-periodic z dimension.

**Cannot use non-periodic boundaries with PPPMDisp**

For kspace style pppm/disp, all 3 dimensions must have periodic boundaries unless you use the kspace\_modify command to define a 2d slab with a non-periodic z dimension.

**Cannot use order greater than 8 with pppm/gpu.**

Self-explanatory.

**Cannot use package gpu neigh yes with triclinic box**

This is a current restriction in LAMMPS.

**Cannot use pair tail corrections with 2d simulations**

The correction factors are only currently defined for 3d systems.

**Cannot use processors part command without using partitions**

See the command-line -partition switch.

**Cannot use ramp in variable formula between runs**

This is because the ramp() function is time dependent.

**Cannot use read\_data add before simulation box is defined**

Self-explanatory.

**Cannot use read\_data extra with add flag**

Self-explanatory.

**Cannot use read\_data offset without add flag**

Self-explanatory.

**Cannot use read\_data shift without add flag**

Self-explanatory.

***Cannot use region INF or EDGE when box does not exist***

Regions that extend to the box boundaries can only be used after the create\_box command has been used.

***Cannot use set atom with no atom IDs defined***

Atom IDs are not defined, so they cannot be used to identify an atom.

***Cannot use set mol with no molecule IDs defined***

Self-explanatory.

***Cannot use swiggle in variable formula between runs***

This is a function of elapsed time.

***Cannot use tris with fix srd unless overlap is set***

This is because triangles are connected to each other.

***Cannot use variable energy with constant efield in fix efield***

LAMMPS computes the energy itself when the E-field is constant.

***Cannot use variable energy with constant force in fix addforce***

This is because for constant force, LAMMPS can compute the change in energy directly.

***Cannot use variable every setting for dump dcd***

The format of DCD dump files requires snapshots be output at a constant frequency.

***Cannot use variable every setting for dump xtc***

The format of this file requires snapshots at regular intervals.

***Cannot use vdisplace in variable formula between runs***

This is a function of elapsed time.

***Cannot use velocity bias command without temp keyword***

Self-explanatory.

***Cannot use velocity create loop all unless atoms have IDs***

Atoms in the simulation do not have IDs, so this style of velocity creation cannot be performed.

***Cannot use wall in periodic dimension***

Self-explanatory.

***Cannot use write\_restart fileper without % in restart file name***

Self-explanatory.

***Cannot use write\_restart nfile without % in restart file name***

Self-explanatory.

***Cannot wiggle and shear fix wall/gran***

Cannot specify both options at the same time.

***Cannot write to restart file - MPI error: %s***

This error was generated by MPI when reading/writing an MPI-IO restart file.

***Cannot yet use KSpace solver with grid with comm style tiled***

This is current restriction in LAMMPS.

***Cannot yet use comm\_style tiled with multi-mode comm***

Self-explanatory.

***Cannot yet use comm\_style tiled with triclinic box***

Self-explanatory.

***Cannot yet use compute tally with Kokkos***

This feature is not yet supported.

***Cannot yet use fix bond/break with this improper style***

This is a current restriction in LAMMPS.

***Cannot yet use fix bond/create with this improper style***

This is a current restriction in LAMMPS.

***Cannot yet use minimize with Kokkos***

This feature is not yet supported.

***Cannot yet use pair hybrid with Kokkos***

This feature is not yet supported.

***Cannot zero Langevin force of 0 atoms***

The group has zero atoms, so you cannot request its force be zeroed.

***Cannot zero gld force for zero atoms***

There are no atoms currently in the group.

***Cannot zero momentum of no atoms***

Self-explanatory.

***Change\_box command before simulation box is defined***

Self-explanatory.

***Change\_box volume used incorrectly***

The “dim volume” option must be used immediately following one or two settings for “dim1 ...” (and optionally “dim2 ...”) and must be for a different dimension, i.e.  $\text{dim} \neq \text{dim1}$  and  $\text{dim} \neq \text{dim2}$ .

***Chunk/atom compute does not exist for compute angmom/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute com/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute gyration/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute inertia/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute msd/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute omega/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute property/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute temp/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute torque/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for compute vcm/chunk***

Self-explanatory.

***Chunk/atom compute does not exist for fix ave/chunk***

Self-explanatory.

***Comm tiled invalid index in box drop brick***

Internal error check in comm\_style tiled which should not occur. Contact the developers.

***Comm tiled mis-match in box drop brick***

Internal error check in comm\_style tiled which should not occur. Contact the developers.

***Comm\_modify group != atom\_modify first group***

Self-explanatory.

***Communication cutoff for comm\_style tiled cannot exceed periodic box length***

Self-explanatory.

***Communication cutoff too small for SNAP micro load balancing***

This can happen if you change the neighbor skin after your pair\_style command or if your box dimensions grow during a run. You can set the cutoff explicitly via the comm\_modify cutoff command.

***Compute %s does not allow use of dynamic group***

Dynamic groups have not yet been enabled for this compute.

***Compute for fix pafi does not calculate a local array***

Self-explanatory.

***Compute for fix pafi must have 9 fields per atom***

Self-explanatory.

***Compute ID for compute chunk /atom does not exist***

Self-explanatory.

***Compute ID for compute chunk/atom does not exist***

Self-explanatory.

***Compute gyration ID does not exist for compute gyration/shape***

Self-explanatory. Provide a valid compute ID.

***Compute gyration/shape compute ID does not point to a gyration compute***

Self-explanatory. Provide an ID of a compute gyration command.

***Compute ID for compute reduce does not exist***

Self-explanatory.

***Compute ID for compute slice does not exist***

Self-explanatory.

***Compute ID for fix ave/atom does not exist***

Self-explanatory.

***Compute ID for fix ave/chunk does not exist***

Self-explanatory.

***Compute ID for fix ave/correlate does not exist***

Self-explanatory.

***Compute ID for fix ave/histo does not exist***

Self-explanatory.

***Compute ID for fix ave/time does not exist***

Self-explanatory.

***Compute ID for fix numdiff does not exist***

Self-explanatory.

***Compute ID for fix numdiff/virial does not exist***

Self-explanatory.

***Compute ID for fix store/state does not exist***

Self-explanatory.

***Compute ID for fix vector does not exist***

Self-explanatory.

***Compute ID must be alphanumeric or underscore characters***

Self-explanatory.

***Compute angle/local used when angles are not allowed***

The atom style does not support angles.

***Compute angmom/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute body/local requires atom style body***

Self-explanatory.

***Compute bond/local used when bonds are not allowed***

The atom style does not support bonds.

***Compute centro/atom requires a pair style be defined***

This is because the computation of the centro-symmetry values uses a pairwise neighbor list.

***Compute chunk/atom bin/cylinder radius is too large for periodic box***

Radius cannot be bigger than 1/2 of a non-axis periodic dimension.

***Compute chunk/atom bin/sphere radius is too large for periodic box***

Radius cannot be bigger than 1/2 of any periodic dimension.

***Compute chunk/atom compute array is accessed out-of-range***

The index for the array is out of bounds.

***Compute chunk/atom compute does not calculate a per-atom array***

Self-explanatory.

***Compute chunk/atom compute does not calculate a per-atom vector***

Self-explanatory.

***Compute chunk/atom compute does not calculate per-atom values***

Self-explanatory.

***Compute chunk/atom cylinder axis must be z for 2d***

Self-explanatory.

***Compute chunk/atom fix array is accessed out-of-range***

the index for the array is out of bounds.

***Compute chunk/atom fix does not calculate a per-atom array***

Self-explanatory.

***Compute chunk/atom fix does not calculate a per-atom vector***

Self-explanatory.

***Compute chunk/atom fix does not calculate per-atom values***

Self-explanatory.

***Compute chunk/atom for triclinic boxes requires units reduced***

Self-explanatory.

***Compute chunk/atom ids once but nchunk is not once***

You cannot assign chunks IDs to atom permanently if the number of chunks may change.

***Compute chunk/atom molecule for non-molecular system***

Self-explanatory.

***Compute chunk/atom sphere z origin must be 0.0 for 2d***

Self-explanatory.

***Compute chunk/atom stores no IDs for compute property/chunk***

It will only store IDs if its compress option is enabled.

***Compute chunk/atom stores no coord1 for compute property/chunk***

Only certain binning options for compute chunk/atom store coordinates.

***Compute chunk/atom stores no coord2 for compute property/chunk***

Only certain binning options for compute chunk/atom store coordinates.

***Compute chunk/atom stores no coord3 for compute property/chunk***

Only certain binning options for compute chunk/atom store coordinates.

***Compute chunk/atom variable is not atom-style variable***

Self-explanatory.

***Compute chunk/atom without bins cannot use discard mixed***

That discard option only applies to the binning styles.

***Compute cluster/atom cutoff is longer than pairwise cutoff***

Cannot identify clusters beyond cutoff.

***Compute cluster/atom requires a pair style be defined***

This is so that the pair style defines a cutoff distance which is used to find clusters.

***Compute cna/atom cutoff is longer than pairwise cutoff***

Self-explanatory.

***Compute cna/atom requires a pair style be defined***

Self-explanatory.

***Compute com/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute contact/atom requires a pair style be defined***

Self-explanatory.

***Compute contact/atom requires atom style sphere***

Self-explanatory.

***Compute coord/atom cutoff is longer than pairwise cutoff***

Cannot compute coordination at distances longer than the pair cutoff, since those atoms are not in the neighbor list.

***Compute coord/atom requires a pair style be defined***

Self-explanatory.

***Compute damage/atom requires peridynamic potential***

Damage is a Peridynamic-specific metric. It requires you to be running a Peridynamics simulation.

***Compute dihedral/local used when dihedrals are not allowed***

The atom style does not support dihedrals.

***Compute dilatation/atom cannot be used with this pair style***

Self-explanatory.

***Compute dilatation/atom requires Peridynamic pair style***

Self-explanatory.

***Compute does not allow an extra compute or fix to be reset***

This is an internal LAMMPS error. Please report it to the developers.

***Compute erotate/asphere requires atom style ellipsoid or line or tri***

Self-explanatory.

***Compute erotate/asphere requires extended particles***

This compute cannot be used with point particles.

***Compute erotate/rigid with non-rigid fix-ID***

Self-explanatory.

***Compute erotate/sphere requires atom style sphere***

Self-explanatory.

***Compute erotate/sphere/atom requires atom style sphere***

Self-explanatory.

***Compute event/displace has invalid fix event assigned***

This is an internal LAMMPS error. Please report it to the developers.

***Compute group/group group ID does not exist***

Self-explanatory.

***Compute gyration/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute heat/flux compute ID does not compute ke/atom***

Self-explanatory.

***Compute heat/flux compute ID does not compute pe/atom***

Self-explanatory.

***Compute heat/flux compute ID does not compute stress/atom***

Self-explanatory.

***Compute hexorder/atom cutoff is longer than pairwise cutoff***

Cannot compute order parameter beyond cutoff.

***Compute hexorder/atom requires a pair style be defined***

Self-explanatory.

***Compute improper/local used when impropers are not allowed***

The atom style does not support impropers.

***Compute inertia/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute ke/rigid with non-rigid fix-ID***

Self-explanatory.

***Compute msd/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute msd/chunk nchunk is not static***

This is required because the MSD cannot be computed consistently if the number of chunks is changing. Compute chunk/atom allows setting nchunk to be static.

***Compute nve/asphere requires atom style ellipsoid***

Self-explanatory.

***Compute nvt/nph/npt asphere requires atom style ellipsoid***

Self-explanatory.

***Compute nvt/nph/npt body requires atom style body***

Self-explanatory.

***Compute omega/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute orientorder/atom cutoff is longer than pairwise cutoff***

Cannot compute order parameter beyond cutoff.

***Compute orientorder/atom requires a pair style be defined***

Self-explanatory.

***Compute pair must use group all***

Pair styles accumulate energy on all atoms.

***Compute pe must use group all***

Energies computed by potentials (pair, bond, etc) are computed on all atoms.

***Compute plasticity/atom cannot be used with this pair style***

Self-explanatory.

***Compute plasticity/atom requires Peridynamic pair style***

Self-explanatory.

***Compute pressure must use group all***

Virial contributions computed by potentials (pair, bond, etc) are computed on all atoms.

***Compute pressure requires temperature ID to include kinetic energy***

The keflag cannot be used unless a temperature compute is provided.

***Compute pressure temperature ID does not compute temperature***

The compute ID assigned to a pressure computation must compute temperature.

***Compute property/atom floating point vector does not exist***

The command is accessing a vector added by the fix property/atom command, that does not exist.

***Compute property/atom for atom property that is not allocated***

Self-explanatory.

***Compute property/atom integer vector does not exist***

The command is accessing a vector added by the fix property/atom command, that does not exist.

***Compute property/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute property/local cannot use these inputs together***

Only inputs that generate the same number of datums can be used together. E.g. bond and angle quantities cannot be mixed.

***Compute property/local does not (yet) work with atom\_style template***

Self-explanatory.

***Compute property/local for property that is not allocated***

Self-explanatory.

***Compute rdf requires a pair style be defined***

Self-explanatory.

***Compute reduce compute array is accessed out-of-range***

An index for the array is out of bounds.

***Compute reduce compute calculates global values***

A compute that calculates peratom or local values is required.

***Compute reduce compute does not calculate a local array***

Self-explanatory.

***Compute reduce compute does not calculate a local vector***

Self-explanatory.

***Compute reduce compute does not calculate a per-atom array***

Self-explanatory.

***Compute reduce compute does not calculate a per-atom vector***

Self-explanatory.

***Compute reduce fix array is accessed out-of-range***

An index for the array is out of bounds.

***Compute reduce fix calculates global values***

A fix that calculates peratom or local values is required.

***Compute reduce fix does not calculate a local array***

Self-explanatory.

***Compute reduce fix does not calculate a local vector***

Self-explanatory.

***Compute reduce fix does not calculate a per-atom array***

Self-explanatory.

***Compute reduce fix does not calculate a per-atom vector***

Self-explanatory.

***Compute reduce replace requires min or max mode***

Self-explanatory.

***Compute reduce variable is not atom-style variable***

Self-explanatory.

***Compute slice compute array is accessed out-of-range***

An index for the array is out of bounds.

***Compute slice compute does not calculate a global array***

Self-explanatory.

***Compute slice compute does not calculate a global vector***

Self-explanatory.

***Compute slice compute does not calculate global vector or array***

Self-explanatory.

***Compute slice compute vector is accessed out-of-range***

The index for the vector is out of bounds.

***Compute slice fix array is accessed out-of-range***

An index for the array is out of bounds.

***Compute slice fix does not calculate a global array***

Self-explanatory.

***Compute slice fix does not calculate a global vector***

Self-explanatory.

***Compute slice fix does not calculate global vector or array***

Self-explanatory.

***Compute slice fix vector is accessed out-of-range***

The index for the vector is out of bounds.

- Compute sna/atom cutoff is longer than pairwise cutoff*  
Self-explanatory.
- Compute sna/atom requires a pair style be defined*  
Self-explanatory.
- Compute snad/atom cutoff is longer than pairwise cutoff*  
Self-explanatory.
- Compute snad/atom requires a pair style be defined*  
Self-explanatory.
- Compute snav/atom cutoff is longer than pairwise cutoff*  
Self-explanatory.
- Compute snav/atom requires a pair style be defined*  
Self-explanatory.
- Compute stress/atom temperature ID does not compute temperature*  
The specified compute must compute temperature.
- Compute temp/asphere requires atom style ellipsoid*  
Self-explanatory.
- Compute temp/asphere requires extended particles*  
This compute cannot be used with point particles.
- Compute temp/body requires atom style body*  
Self-explanatory.
- Compute temp/body requires bodies*  
This compute can only be applied to body particles.
- Compute temp/chunk does not use chunk/atom compute*  
The style of the specified compute is not chunk/atom.
- Compute temp/cs requires ghost atoms store velocity*  
Use the comm\_modify vel yes command to enable this.
- Compute temp/cs used when bonds are not allowed*  
This compute only works on pairs of bonded particles.
- Compute temp/partial cannot use vz for 2d systemx*  
Self-explanatory.
- Compute temp/profile cannot bin z for 2d systems*  
Self-explanatory.
- Compute temp/profile cannot use vz for 2d systemx*  
Self-explanatory.
- Compute temp/sphere requires atom style sphere*  
Self-explanatory.
- Compute ti kspace style does not exist*  
Self-explanatory.
- Compute ti pair style does not exist*  
Self-explanatory.
- Compute ti tail when pair style does not compute tail corrections*  
Self-explanatory.

***Compute torque/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Compute used in dump between runs is not current***

The compute was not invoked on the current timestep, therefore it cannot be used in a dump between runs.

***Compute used in variable between runs is not current***

Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

***Compute used in variable thermo keyword between runs is not current***

Some thermo keywords rely on a compute to calculate their value(s). Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

***Compute vcm/chunk does not use chunk/atom compute***

The style of the specified compute is not chunk/atom.

***Computed temperature for fix temp/berendsen cannot be 0.0***

Self-explanatory.

***Computed temperature for fix temp/rescale cannot be 0.0***

Cannot rescale the temperature to a new value if the current temperature is 0.0.

***Core/shell partner atom not found***

Could not find one of the atoms in the bond pair.

***Core/shell partners were not all found***

Could not find or more atoms in the bond pairs.

***Could not adjust g\_ewald\_6***

The Newton-Raphson solver failed to converge to a good value for g\_ewald. This error should not occur for typical problems. Please send an email to the developers.

***Could not compute g\_ewald***

The Newton-Raphson solver failed to converge to a good value for g\_ewald. This error should not occur for typical problems. Please send an email to the developers.

***Could not compute grid size***

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

***Could not compute grid size for Coulomb interaction***

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

***Could not compute grid size for Dispersion***

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

***Could not create 3d FFT plan***

The FFT setup for the PPPM solver failed, typically due to lack of memory. This is an unusual error. Check the size of the FFT grid you are requesting.

***Could not create 3d grid of processors***

The specified constraints did not allow a Px by Py by Pz grid to be created where  $P_x * P_y * P_z = P$  = total number of processors.

***Could not create 3d remap plan***

The FFT setup in pppm failed.

***Could not create Python function arguments***

This is an internal Python error, possibly because the number of inputs to the function is too large.

***Could not create numa grid of processors***

The specified constraints did not allow this style of grid to be created. Usually this is because the total processor count is not a multiple of the cores/node or the user specified processor count is > 1 in one of the dimensions.

***Could not create twolevel 3d grid of processors***

The specified constraints did not allow this style of grid to be created.

***Could not evaluate Python function input variable***

Self-explanatory.

***Could not find Python function***

The provided Python code was run successfully, but it not define a callable function with the required name.

***Could not find atom\_modify first group ID***

Self-explanatory.

***Could not find change\_box group ID***

Group ID used in the change\_box command does not exist.

***Could not find compute ID for PRD***

Self-explanatory.

***Could not find compute ID for TAD***

Self-explanatory.

***Could not find compute ID for temperature bias***

Self-explanatory.

***Could not find compute ID to delete***

Self-explanatory.

***Could not find compute displace/atom fix ID***

Self-explanatory.

***Could not find compute event/displace fix ID***

Self-explanatory.

***Could not find compute group ID***

Self-explanatory.

***Could not find compute heat/flux compute ID***

Self-explanatory.

***Could not find compute msd fix ID***

Self-explanatory.

***Could not find compute msd/chunk fix ID***

The compute creates an internal fix, which has been deleted.

***Could not find compute pressure temperature ID***

The compute ID for calculating temperature does not exist.

***Could not find compute stress/atom temperature ID***

Self-explanatory.

***Could not find compute vacf fix ID***

Self-explanatory.

***Could not find compute/voronoi surface group ID***

Self-explanatory.

**Could not find compute\_modify ID**

Self-explanatory.

**Could not find custom per-atom property ID**

Self-explanatory.

**Could not find delete\_atoms group ID**

Group ID used in the delete\_atoms command does not exist.

**Could not find delete\_atoms region ID**

Region ID used in the delete\_atoms command does not exist.

**Could not find displace\_atoms group ID**

Group ID used in the displace\_atoms command does not exist.

**Could not find dump custom compute ID**

Self-explanatory.

**Could not find dump custom fix ID**

Self-explanatory.

**Could not find dump custom variable name**

Self-explanatory.

**Could not find dump group ID**

A group ID used in the dump command does not exist.

**Could not find dump local compute ID**

Self-explanatory.

**Could not find dump local fix ID**

Self-explanatory.

**Could not find dump modify compute ID**

Self-explanatory.

**Could not find dump modify custom atom floating point property ID**

Self-explanatory.

**Could not find dump modify custom atom integer property ID**

Self-explanatory.

**Could not find dump modify fix ID**

Self-explanatory.

**Could not find dump modify variable name**

Self-explanatory.

**Could not find fix ID to delete**

Self-explanatory.

**Could not find fix adapt storage fix ID**

This should not happen unless you explicitly deleted a secondary fix that fix adapt created internally.

**Could not find fix halt variable name**

Self-explanatory.

**Could not find fix gcmc exclusion group ID**

Self-explanatory.

**Could not find fix gcmc rotation group ID**

Self-explanatory.

***Could not find fix group ID***

A group ID used in the fix command does not exist.

***Could not find fix msst compute ID***

Self-explanatory.

***Could not find fix poems group ID***

A group ID used in the fix poems command does not exist.

***Could not find fix recenter group ID***

A group ID used in the fix recenter command does not exist.

***Could not find fix rigid group ID***

A group ID used in the fix rigid command does not exist.

***Could not find fix srd group ID***

Self-explanatory.

***Could not find fix\_modify ID***

A fix ID used in the fix\_modify command does not exist.

***Could not find fix\_modify pressure ID***

The compute ID for computing pressure does not exist.

***Could not find fix\_modify temperature ID***

The compute ID for computing temperature does not exist.

***Could not find group clear group ID***

Self-explanatory.

***Could not find group delete group ID***

Self-explanatory.

***Could not find pair fix ID***

A fix is created internally by the pair style to store shear history information. You cannot delete it.

***Could not find set group ID***

Group ID specified in set command does not exist.

***Could not find specified fix gcmc group ID***

Self-explanatory.

***Could not find thermo compute ID***

Compute ID specified in thermo\_style command does not exist.

***Could not find thermo custom compute ID***

The compute ID needed by thermo style custom to compute a requested quantity does not exist.

***Could not find thermo custom fix ID***

The fix ID needed by thermo style custom to compute a requested quantity does not exist.

***Could not find thermo custom variable name***

Self-explanatory.

***Could not find thermo fix ID***

Fix ID specified in thermo\_style command does not exist.

***Could not find thermo variable name***

Self-explanatory.

***Could not find thermo\_modify pressure ID***

The compute ID needed by thermo style custom to compute pressure does not exist.

***Could not find thermo\_modify temperature ID***

The compute ID needed by thermo style custom to compute temperature does not exist.

***Could not find undump ID***

A dump ID used in the undump command does not exist.

***Could not find velocity group ID***

A group ID used in the velocity command does not exist.

***Could not find velocity temperature ID***

The compute ID needed by the velocity command to compute temperature does not exist.

***Could not find/initialize a specified accelerator device***

Could not initialize at least one of the devices specified for the gpu package

***Could not grab element entry from EIM potential file***

Self-explanatory

***Could not grab global entry from EIM potential file***

Self-explanatory.

***Could not grab pair entry from EIM potential file***

Self-explanatory.

***Could not initialize embedded Python***

The main module in Python was not accessible.

***Could not open Python file***

The specified file of Python code cannot be opened. Check that the path and name are correct.

***Could not process Python file***

The Python code in the specified file was not run successfully by Python, probably due to errors in the Python code.

***Could not process Python string***

The Python code in the here string was not run successfully by Python, probably due to errors in the Python code.

***Coulomb PPPMDisp order has been reduced below minorder***

The default minimum order is 2. This can be reset by the kspace\_modify minorder command.

***Coulombic cutoff not supported in pair\_style buck/long/coul/coul***

Must use long-range Coulombic interactions.

***Coulombic cutoff not supported in pair\_style lj/long/coul/long***

Must use long-range Coulombic interactions.

***Coulombic cutoff not supported in pair\_style lj/long/tip4p/long***

Must use long-range Coulombic interactions.

***Coulombic cutoffs of pair hybrid sub-styles do not match***

If using a Kspace solver, all Coulombic cutoffs of long pair styles must be the same.

***Coulombic cut not supported in pair\_style lj/long/dipole/long***

Must use long-range Coulombic interactions.

***Cound not find dump\_modify ID***

Self-explanatory.

***Create\_atoms command before simulation box is defined***

The create\_atoms command cannot be used before a read\_data, read\_restart, or create\_box command.

***Create\_atoms molecule has atom IDs, but system does not***

The atom\_style id command can be used to force atom IDs to be stored.

***Create\_atoms molecule must have atom types***

The defined molecule does not specify atom types.

***Create\_atoms molecule must have coordinates***

The defined molecule does not specify coordinates.

***Create\_atoms region ID does not exist***

A region ID used in the create\_atoms command does not exist.

***Create\_bonds command before simulation box is defined***

Self-explanatory.

***Create\_bonds command requires no kspace\_style be defined***

This is so that atom pairs that are already bonded to not appear in the neighbor list.

***Create\_bonds command requires special\_bonds 1-2 weights be 0.0***

This is so that atom pairs that are already bonded to not appear in the neighbor list.

***Create\_bonds max distance > neighbor cutoff***

Can only create bonds for atom pairs that will be in neighbor list.

***Create\_bonds requires a pair style be defined***

Self-explanatory.

***Create\_box region ID does not exist***

Self-explanatory.

***Create\_box region does not support a bounding box***

Not all regions represent bounded volumes. You cannot use such a region with the create\_box command.

***Custom floating point vector for fix store/state does not exist***

The command is accessing a vector added by the fix property/atom command, that does not exist.

***Custom integer vector for fix store/state does not exist***

The command is accessing a vector added by the fix property/atom command, that does not exist.

***Custom per-atom property ID is not floating point***

Self-explanatory.

***Custom per-atom property ID is not integer***

Self-explanatory.

***Cut-offs missing in pair\_style lj/long/dipole/long***

Self-explanatory.

***Cutoffs missing in pair\_style buck/long/coul/long***

Self-explanatory.

***Cutoffs missing in pair\_style lj/long/coul/long***

Self-explanatory.

***Cyclic loop in joint connections***

Fix poems cannot (yet) work with coupled bodies whose joints connect the bodies in a ring (or cycle).

***Degenerate lattice primitive vectors***

Invalid set of 3 lattice vectors for lattice command.

***Delete region ID does not exist***

Self-explanatory.

***Delete\_atoms command before simulation box is defined***

The delete\_atoms command cannot be used before a read\_data, read\_restart, or create\_box command.

***Delete\_atoms cutoff > max neighbor cutoff***

Can only delete atoms in atom pairs that will be in neighbor list.

***Delete\_atoms mol yes requires atom attribute molecule***

Cannot use this option with a non-molecular system.

***Delete\_atoms requires a pair style be defined***

This is because atom deletion within a cutoff uses a pairwise neighbor list.

***Delete\_bonds command before simulation box is defined***

The delete\_bonds command cannot be used before a read\_data, read\_restart, or create\_box command.

***Delete\_bonds command with no atoms existing***

No atoms are yet defined so the delete\_bonds command cannot be used.

***Deposition region extends outside simulation box***

Self-explanatory.

***Did not assign all atoms correctly***

Atoms read in from a data file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

***Did not assign all restart atoms correctly***

Atoms read in from the restart file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box. Normally this should not happen. You may wish to use the “remap” option on the read\_restart command to see if this helps.

***Did not find all elements in MEAM library file***

Some requested elements were not found in the MEAM file. Check spelling etc.

***Did not find fix shake partner info***

Could not find bond partners implied by fix shake command. This error can be triggered if the delete\_bonds command was used before fix shake, and it removed bonds without resetting the 1-2, 1-3, 1-4 weighting list via the special keyword.

***Did not find keyword in table file***

Keyword used in pair\_coeff command was not found in table file.

***Did not set pressure for fix rigid/nph***

The press keyword must be specified.

***Did not set temp for fix rigid/nvt/small***

Self-explanatory.

***Did not set temp or press for fix rigid/npt/small***

Self-explanatory.

***Did not set temperature for fix rigid/nvt***

The temp keyword must be specified.

***Did not set temperature or pressure for fix rigid/npt***

The temp and press keywords must be specified.

***Dihedral atom missing in delete\_bonds***

The delete\_bonds command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

***Dihedral atom missing in set command***

The set command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

***Dihedral atoms %d %d %d %d missing on proc %d at step %ld***

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

***Dihedral atoms missing on proc %d at step %ld***

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

***Dihedral charmm is incompatible with Pair style***

Dihedral style charmm must be used with a pair style charmm in order for the 1-4 epsilon/sigma parameters to be defined.

***Dihedral coeff for hybrid has invalid style***

Dihedral style hybrid uses another dihedral style as one of its coefficients. The dihedral style used in the dihedral\_coeff command or read from a restart file is not recognized.

***Dihedral coeffs are not set***

No dihedral coefficients have been assigned in the data file or via the dihedral\_coeff command.

***Dihedral style hybrid cannot have hybrid as an argument***

Self-explanatory.

***Dihedral style hybrid cannot have none as an argument***

Self-explanatory.

***Dihedral style hybrid cannot use same dihedral style twice***

Self-explanatory.

***Dihedral/improper extent > half of periodic box length***

This error was detected by the neigh\_modify check yes setting. It is an error because the dihedral atoms are so far apart it is ambiguous how it should be defined.

***Dihedral\_coeff command before dihedral\_style is defined***

Coefficients cannot be set in the data file or via the dihedral\_coeff command until an dihedral\_style has been assigned.

***Dihedral\_coeff command before simulation box is defined***

The dihedral\_coeff command cannot be used before a read\_data, read\_restart, or create\_box command.

***Dihedral\_coeff command when no divedrals allowed***

The chosen atom style does not allow for divedrals to be defined.

***Dihedral\_style command when no divedrals allowed***

The chosen atom style does not allow for divedrals to be defined.

***Dihedrals assigned incorrectly***

Dihedrals read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

***Dihedrals defined but no dihedral types***

The data file header lists divedrals but no dihedral types.

***Dimension command after simulation box is defined***

The dimension command cannot be used after a read\_data, read\_restart, or create\_box command.

***Disk limit not supported by OS or illegal path***

Self-explanatory.

***Dispersion PPPMDisp order has been reduced below minorder***

The default minimum order is 2. This can be reset by the kspace\_modify minorder command.

***Displace\_atoms command before simulation box is defined***

The displace\_atoms command cannot be used before a read\_data, read\_restart, or create\_box command.

***Distance must be > 0 for compute event/displace***

Self-explanatory.

***Divide by 0 in influence function***

This should not normally occur. It is likely a problem with your model.

***Divide by 0 in influence function of pair peri/lps***

This should not normally occur. It is likely a problem with your model.

***Divide by 0 in variable formula***

Self-explanatory.

***Domain too large for neighbor bins***

The domain has become extremely large so that neighbor bins cannot be used. Most likely, one or more atoms have been blown out of the simulation box to a great distance.

***Double precision is not supported on this accelerator***

Self-explanatory

***Dump atom/gz only writes compressed files***

The dump atom/gz output file name must have a .gz suffix.

***Dump cfg arguments can not mix xs|ys|zs with xsu|ysu|zsu***

Self-explanatory.

***Dump cfg arguments must start with 'mass type xs ys zs' or 'mass type xsu ysu zsu'***

This is a requirement of the CFG output format. See the dump cfg doc page for more details.

***Dump cfg requires one snapshot per file***

Use the wildcard "\*" character in the filename.

***Dump cfg/gz only writes compressed files***

The dump cfg/gz output file name must have a .gz suffix.

***Dump custom and fix not computed at compatible times***

The fix must produce per-atom quantities on timesteps that dump custom needs them.

***Dump custom compute does not calculate per-atom array***

Self-explanatory.

***Dump custom compute does not calculate per-atom vector***

Self-explanatory.

***Dump custom compute does not compute per-atom info***

Self-explanatory.

***Dump custom compute vector is accessed out-of-range***

Self-explanatory.

***Dump custom fix does not compute per-atom array***

Self-explanatory.

***Dump custom fix does not compute per-atom info***

Self-explanatory.

***Dump custom fix does not compute per-atom vector***

Self-explanatory.

***Dump custom fix vector is accessed out-of-range***

Self-explanatory.

***Dump custom variable is not atom-style variable***

Only atom-style variables generate per-atom quantities, needed for dump output.

***Dump custom/gz only writes compressed files***

The dump custom/gz output file name must have a .gz suffix.

***Dump dcd of non-matching # of atoms***

Every snapshot written by dump dcd must contain the same # of atoms.

***Dump dcd requires sorting by atom ID***

Use the dump\_modify sort command to enable this.

***Dump every variable returned a bad timestep***

The variable must return a timestep greater than the current timestep.

***Dump file MPI-IO output not allowed with % in filename***

This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

***Dump file does not contain requested snapshot***

Self-explanatory.

***Dump file is incorrectly formatted***

Self-explanatory.

***Dump image body yes requires atom style body***

Self-explanatory.

***Dump image bond not allowed with no bond types***

Self-explanatory.

***Dump image cannot perform sorting***

Self-explanatory.

***Dump image line requires atom style line***

Self-explanatory.

***Dump image requires one snapshot per file***

Use a "\*" in the filename.

***Dump image tri requires atom style tri***

Self-explanatory.

***Dump local and fix not computed at compatible times***

The fix must produce per-atom quantities on timesteps that dump local needs them.

***Dump local attributes contain no compute or fix***

Self-explanatory.

***Dump local cannot sort by atom ID***

This is because dump local does not really dump per-atom info.

***Dump local compute does not calculate local array***

Self-explanatory.

***Dump local compute does not calculate local vector***

Self-explanatory.

***Dump local compute does not compute local info***

Self-explanatory.

***Dump local compute vector is accessed out-of-range***

Self-explanatory.

***Dump local count is not consistent across input fields***

Every column of output must be the same length.

***Dump local fix does not compute local array***

Self-explanatory.

***Dump local fix does not compute local info***

Self-explanatory.

***Dump local fix does not compute local vector***

Self-explanatory.

***Dump local fix vector is accessed out-of-range***

Self-explanatory.

***Dump modify bcolor not allowed with no bond types***

Self-explanatory.

***Dump modify bdiam not allowed with no bond types***

Self-explanatory.

***Dump modify compute ID does not compute per-atom array***

Self-explanatory.

***Dump modify compute ID does not compute per-atom info***

Self-explanatory.

***Dump modify compute ID does not compute per-atom vector***

Self-explanatory.

***Dump modify compute ID vector is not large enough***

Self-explanatory.

***Dump modify element names do not match atom types***

Number of element names must equal number of atom types.

***Dump modify fix ID does not compute per-atom array***

Self-explanatory.

***Dump modify fix ID does not compute per-atom info***

Self-explanatory.

***Dump modify fix ID does not compute per-atom vector***

Self-explanatory.

***Dump modify fix ID vector is not large enough***

Self-explanatory.

***Dump modify variable is not atom-style variable***

Self-explanatory.

***Dump sort column is invalid***

Self-explanatory.

***Dump xtc requires sorting by atom ID***

Use the dump\_modify sort command to enable this.

***Dump xyz/gz only writes compressed files***

The dump xyz/gz output file name must have a .gz suffix.

***Dump\_modify buffer yes not allowed for this style***

Self-explanatory.

***Dump\_modify format string is too short***

There are more fields to be dumped in a line of output than your format string specifies.

***Dump\_modify region ID does not exist***

Self-explanatory.

***Dumping an atom property that is not allocated***

The chosen atom style does not define the per-atom quantity being dumped.

***Duplicate atom IDs exist***

Self-explanatory.

***Duplicate fields in read\_dump command***

Self-explanatory.

***Duplicate particle in PeriDynamic bond - simulation box is too small***

This is likely because your box length is shorter than 2 times the bond length.

***Electronic temperature dropped below zero***

Something has gone wrong with the fix ttm electron temperature model.

***Element not defined in potential file***

The specified element is not in the potential file.

***Empty brackets in variable***

There is no variable syntax that uses empty brackets. Check the variable doc page.

***Energy was not tallied on needed timestep***

You are using a thermo keyword that requires potentials to have tallied energy, but they did not on this timestep. See the variable page for ideas on how to make this work.

***Epsilon or sigma reference not set by pair style in PPPMDisp***

Self-explanatory.

***Epsilon or sigma reference not set by pair style in ewald/n***

The pair style is not providing the needed epsilon or sigma values.

***Error in MEAM parameter file: keyword %s (further information)***

Self-explanatory. Check the parameter file.

***Error in vdw spline: inner radius > outer radius***

A pre-tabulated spline is invalid. Likely a problem with the potential parameters.

***Error writing averaged chunk data***

Something in the output to the file triggered an error.

***Error writing file header***

Something in the output to the file triggered an error.

***Error writing out correlation data***

Something in the output to the file triggered an error.

***Error writing out histogram data***

Something in the output to the file triggered an error.

***Error writing out time averaged data***

Something in the output to the file triggered an error.

***Failed to allocate %ld bytes for array %s***

Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

***Failed to open FFmpeg pipeline to file %s***

The specified file cannot be opened. Check that the path and name are correct and writable and that the FFmpeg executable can be found and run.

***Failed to reallocate %ld bytes for array %s***

Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

***Fewer SRD bins than processors in some dimension***

This is not allowed. Make your SRD bin size smaller.

***File variable could not read value***

Check the file assigned to the variable.

***Final box dimension due to fix deform is < 0.0***

Self-explanatory.

***Fix %s does not allow use of dynamic group***

Dynamic groups have not yet been enabled for this fix.

***Fix ID for compute chunk/atom does not exist***

Self-explanatory.

***Fix ID for compute erotate/rigid does not exist***

Self-explanatory.

***Fix ID for compute ke/rigid does not exist***

Self-explanatory.

***Fix ID for compute reduce does not exist***

Self-explanatory.

***Fix ID for compute slice does not exist***

Self-explanatory.

***Fix ID for fix ave/atom does not exist***

Self-explanatory.

***Fix ID for fix ave/chunk does not exist***

Self-explanatory.

***Fix ID for fix ave/correlate does not exist***

Self-explanatory.

***Fix ID for fix ave/histo does not exist***

Self-explanatory.

***Fix ID for fix ave/time does not exist***

Self-explanatory.

***Fix ID for fix store/state does not exist***

Self-explanatory

***Fix ID for fix vector does not exist***

Self-explanatory.

***Fix ID for read\_data does not exist***

Self-explanatory.

***Fix ID for velocity does not exist***

Self-explanatory.

***Fix ID must be alphanumeric or underscore characters***

Self-explanatory.

***Fix SRD: bad bin assignment for SRD advection***

Something has gone wrong in your SRD model; try using more conservative settings.

***Fix SRD: bad search bin assignment***

Something has gone wrong in your SRD model; try using more conservative settings.

***Fix SRD: bad stencil bin for big particle***

Something has gone wrong in your SRD model; try using more conservative settings.

***Fix SRD: too many big particles in bin***

Reset the ATOMPERBIN parameter at the top of fix\_srd.cpp to a larger value, and re-compile the code.

***Fix SRD: too many walls in bin***

This should not happen unless your system has been setup incorrectly.

***Fix adapt interface to this pair style not supported***

New coding for the pair style would need to be done.

***Fix adapt kspace style does not exist***

Self-explanatory.

***Fix adapt pair style does not exist***

Self-explanatory

***Fix adapt pair style param not supported***

The pair style does not know about the parameter you specified.

***Fix adapt requires atom attribute charge***

The atom style being used does not specify an atom charge.

***Fix adapt requires atom attribute diameter***

The atom style being used does not specify an atom diameter.

***Fix adapt type pair range is not valid for pair hybrid sub-style***

Self-explanatory.

***Fix append/atoms requires a lattice be defined***

Use the lattice command for this purpose.

***Fix ave/atom compute array is accessed out-of-range***

Self-explanatory.

***Fix ave/atom compute does not calculate a per-atom array***

Self-explanatory.

***Fix ave/atom compute does not calculate a per-atom vector***

A compute used by fix ave/atom must generate per-atom values.

***Fix ave/atom compute does not calculate per-atom values***

A compute used by fix ave/atom must generate per-atom values.

***Fix ave/atom fix array is accessed out-of-range***

Self-explanatory.

***Fix ave/atom fix does not calculate a per-atom array***

Self-explanatory.

***Fix ave/atom fix does not calculate a per-atom vector***

A fix used by fix ave/atom must generate per-atom values.

***Fix ave/atom fix does not calculate per-atom values***

A fix used by fix ave/atom must generate per-atom values.

***Fix ave/atom variable is not atom-style variable***

A variable used by fix ave/atom must generate per-atom values.

***Fix ave/chunk compute does not calculate a per-atom array***

Self-explanatory.

***Fix ave/chunk compute does not calculate a per-atom vector***

Self-explanatory.

***Fix ave/chunk compute does not calculate per-atom values***

Self-explanatory.

***Fix ave/chunk compute vector is accessed out-of-range***

Self-explanatory.

***Fix ave/chunk does not use chunk/atom compute***

The specified compute is not for a compute chunk/atom command.

***Fix ave/chunk fix does not calculate a per-atom array***

Self-explanatory.

***Fix ave/chunk fix does not calculate a per-atom vector***

Self-explanatory.

***Fix ave/chunk fix does not calculate per-atom values***

Self-explanatory.

***Fix ave/chunk fix vector is accessed out-of-range***

Self-explanatory.

***Fix ave/chunk variable is not atom-style variable***

Self-explanatory.

***Fix ave/correlate compute does not calculate a scalar***

Self-explanatory.

***Fix ave/correlate compute does not calculate a vector***

Self-explanatory.

***Fix ave/correlate compute vector is accessed out-of-range***

The index for the vector is out of bounds.

***Fix ave/correlate fix does not calculate a scalar***

Self-explanatory.

***Fix ave/correlate fix does not calculate a vector***

Self-explanatory.

***Fix ave/correlate fix vector is accessed out-of-range***

The index for the vector is out of bounds.

***Fix ave/correlate variable is not equal-style variable***

Self-explanatory.

***Fix ave/histo cannot input local values in scalar mode***

Self-explanatory.

***Fix ave/histo cannot input per-atom values in scalar mode***

Self-explanatory.

***Fix ave/histo compute array is accessed out-of-range***

Self-explanatory.

***Fix ave/histo compute does not calculate a global array***

Self-explanatory.

***Fix ave/histo compute does not calculate a global scalar***

Self-explanatory.

*Fix ave/histo compute does not calculate a global vector*

Self-explanatory.

*Fix ave/histo compute does not calculate a local array*

Self-explanatory.

*Fix ave/histo compute does not calculate a local vector*

Self-explanatory.

*Fix ave/histo compute does not calculate a per-atom array*

Self-explanatory.

*Fix ave/histo compute does not calculate a per-atom vector*

Self-explanatory.

*Fix ave/histo compute does not calculate local values*

Self-explanatory.

*Fix ave/histo compute does not calculate per-atom values*

Self-explanatory.

*Fix ave/histo compute vector is accessed out-of-range*

Self-explanatory.

*Fix ave/histo fix array is accessed out-of-range*

Self-explanatory.

*Fix ave/histo fix does not calculate a global array*

Self-explanatory.

*Fix ave/histo fix does not calculate a global scalar*

Self-explanatory.

*Fix ave/histo fix does not calculate a global vector*

Self-explanatory.

*Fix ave/histo fix does not calculate a local array*

Self-explanatory.

*Fix ave/histo fix does not calculate a local vector*

Self-explanatory.

*Fix ave/histo fix does not calculate a per-atom array*

Self-explanatory.

*Fix ave/histo fix does not calculate a per-atom vector*

Self-explanatory.

*Fix ave/histo fix does not calculate local values*

Self-explanatory.

*Fix ave/histo fix does not calculate per-atom values*

Self-explanatory.

*Fix ave/histo fix vector is accessed out-of-range*

Self-explanatory.

*Fix ave/histo input is invalid compute*

Self-explanatory.

*Fix ave/histo input is invalid fix*

Self-explanatory.

***Fix ave/histo input is invalid variable***

Self-explanatory.

***Fix ave/histo inputs are not all global, peratom, or local***

All inputs in a single fix ave/histo command must be of the same style.

***Fix ave/histo/weight value and weight vector lengths do not match***

Self-explanatory.

***Fix ave/time cannot set output array intensive/extensive from these inputs***

One or more of the vector inputs has individual elements which are flagged as intensive or extensive. Such an input cannot be flagged as all intensive/extensive when turned into an array by fix ave/time.

***Fix ave/time cannot use variable with vector mode***

Variables produce scalar values.

***Fix ave/time columns are inconsistent lengths***

Self-explanatory.

***Fix ave/time compute array is accessed out-of-range***

An index for the array is out of bounds.

***Fix ave/time compute does not calculate a scalar***

Self-explanatory.

***Fix ave/time compute does not calculate a vector***

Self-explanatory.

***Fix ave/time compute does not calculate an array***

Self-explanatory.

***Fix ave/time compute vector is accessed out-of-range***

The index for the vector is out of bounds.

***Fix ave/time fix array cannot be variable length***

Self-explanatory.

***Fix ave/time fix array is accessed out-of-range***

An index for the array is out of bounds.

***Fix ave/time fix does not calculate a scalar***

Self-explanatory.

***Fix ave/time fix does not calculate a vector***

Self-explanatory.

***Fix ave/time fix does not calculate an array***

Self-explanatory.

***Fix ave/time fix vector cannot be variable length***

Self-explanatory.

***Fix ave/time fix vector is accessed out-of-range***

The index for the vector is out of bounds.

***Fix ave/time variable is not equal-style variable***

Self-explanatory.

***Fix balance rcb cannot be used with comm\_style brick***

Comm\_style tiled must be used instead.

***Fix balance shift string is invalid***

The string can only contain the characters “x”, “y”, or “z”.

***Fix bond/break needs ghost atoms from further away***

This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm\_modify cutoff command can be used to extend the communication range.

***Fix bond/create angle type is invalid***

Self-explanatory.

***Fix bond/create cutoff is longer than pairwise cutoff***

This is not allowed because bond creation is done using the pairwise neighbor list.

***Fix bond/create dihedral type is invalid***

Self-explanatory.

***Fix bond/create improper type is invalid***

Self-explanatory.

***Fix bond/create induced too many angles/dihedrals/impropers per atom***

See the read\_data command for info on using the “extra/angle/per/atom”, (or dihedral, improper) keywords to allow for additional angles, dihedrals, and impropers to be formed.

***Fix bond/create needs ghost atoms from further away***

This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm\_modify cutoff command can be used to extend the communication range.

***Fix bond/react: Cannot use fix bond/react with non-molecular systems***

Only systems with bonds that can be changed can be used. Atom\_style template does not qualify.

***Fix bond/react: Invalid template atom ID in map file***

Atom IDs in molecule templates range from 1 to the number of atoms in the template.

***Fix bond/react: Rmax cutoff is longer than pairwise cutoff***

This is not allowed because bond creation is done using the pairwise neighbor list.

***Fix bond/react: Molecule template ID for fix bond/react does not exist***

A valid molecule template must have been created with the molecule command.

***Fix bond/react: Reaction templates must contain the same number of atoms***

There should be a one-to-one correspondence between atoms in the pre-reacted and post-reacted templates, as specified by the map file.

***Fix bond/react: Unknown section in map file***

Please ensure reaction map files are properly formatted.

***Fix bond/react: Atom/Bond type affected by reaction too close to template edge***

This means an atom which changes type or connectivity during the reaction is too close to an ‘edge’ atom defined in the map file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

***Fix bond/react: Fix bond/react needs ghost atoms from farther away***

This is because a processor needs to map the entire unreacted molecule template onto simulation atoms it knows about. The comm\_modify cutoff command can be used to extend the communication range.

***Fix bond/react: A deleted atom cannot remain bonded to an atom that is not deleted***

Self-explanatory.

***Fix bond/react: First neighbors of chiral atoms must be of mutually different types***

Self-explanatory.

***Fix bond/react: Chiral atoms must have exactly four first neighbors***

Self-explanatory.

***Fix bond/react: Molecule template 'Coords' section required for chiralIDs keyword***

The coordinates of atoms in the pre-reacted template are used to determine chirality.

***Fix bond/react special bond generation overflow***

The number of special bonds per-atom created by a reaction exceeds the system setting. See the read\_data or create\_box command for how to specify this value.

***Fix bond/react topology/atom exceed system topology/atom***

The number of bonds, angles etc per-atom created by a reaction exceeds the system setting. See the read\_data or create\_box command for how to specify this value.

***Fix bond/swap cannot use dihedral or improper styles***

These styles cannot be defined when using this fix.

***Fix bond/swap requires pair and bond styles***

Self-explanatory.

***Fix bond/swap requires special\_bonds = 0,1,1***

Self-explanatory.

***Fix box/relax generated negative box length***

The pressure being applied is likely too large. Try applying it incrementally, to build to the high pressure.

***Fix command before simulation box is defined***

The fix command cannot be used before a read\_data, read\_restart, or create\_box command.

***Fix deform cannot use yz variable with xy***

The yz setting cannot be a variable if xy deformation is also specified. This is because LAMMPS cannot determine if the yz setting will induce a box flip which would be invalid if xy is also changing.

***Fix deform is changing yz too much with xy***

When both yz and xy are changing, it induces changes in xz if the box must flip from one tilt extreme to another. Thus it is not allowed for yz to grow so much that a flip is induced.

***Fix deform tilt factors require triclinic box***

Cannot deform the tilt factors of a simulation box unless it is a triclinic (non-orthogonal) box.

***Fix deform volume setting is invalid***

Cannot use volume style unless other dimensions are being controlled.

***Fix deposit and fix rigid/small not using same molecule template ID***

Self-explanatory.

***Fix deposit and fix shake not using same molecule template ID***

Self-explanatory.

***Fix deposit molecule must have atom types***

The defined molecule does not specify atom types.

***Fix deposit molecule must have coordinates***

The defined molecule does not specify coordinates.

***Fix deposit molecule template ID must be same as atom\_style template ID***

When using atom\_style template, you cannot deposit molecules that are not in that template.

***Fix deposit region cannot be dynamic***

Only static regions can be used with fix deposit.

***Fix deposit region does not support a bounding box***

Not all regions represent bounded volumes. You cannot use such a region with the fix deposit command.

***Fix deposit shake fix does not exist***

Self-explanatory.

***Fix efield requires atom attribute q or mu***

The atom style defined does not have this attribute.

***Fix efield with dipoles cannot use atom-style variables***

This option is not supported.

***Fix evaporate molecule requires atom attribute molecule***

The atom style being used does not define a molecule ID.

***Fix external callback function not set***

This must be done by an external program in order to use this fix.

***Fix for fix ave/atom not computed at compatible time***

Fixes generate their values on specific timesteps. Fix ave/atom is requesting a value on a non-allowed timestep.

***Fix for fix ave/chunk not computed at compatible time***

Fixes generate their values on specific timesteps. Fix ave/chunk is requesting a value on a non-allowed timestep.

***Fix for fix ave/correlate not computed at compatible time***

Fixes generate their values on specific timesteps. Fix ave/correlate is requesting a value on a non-allowed timestep.

***Fix for fix ave/histo not computed at compatible time***

Fixes generate their values on specific timesteps. Fix ave/histo is requesting a value on a non-allowed timestep.

***Fix for fix ave/spatial not computed at compatible time***

Fixes generate their values on specific timesteps. Fix ave/spatial is requesting a value on a non-allowed timestep.

***Fix for fix ave/time not computed at compatible time***

Fixes generate their values on specific timesteps. Fix ave/time is requesting a value on a non-allowed timestep.

***Fix for fix store/state not computed at compatible time***

Fixes generate their values on specific timesteps. Fix store/state is requesting a value on a non-allowed timestep.

***Fix for fix vector not computed at compatible time***

Fixes generate their values on specific timesteps. Fix vector is requesting a value on a non-allowed timestep.

***Fix freeze requires atom attribute torque***

The atom style defined does not have this attribute.

***Fix gcmc and fix shake not using same molecule template ID***

Self-explanatory.

***Fix gcmc atom has charge, but atom style does not***

Self-explanatory.

***Fix gcmc cannot exchange individual atoms belonging to a molecule***

This is an error since you should not delete only one atom of a molecule. The user has specified atomic (non-molecular) gas exchanges, but an atom belonging to a molecule could be deleted.

***Fix gcmc does not (yet) work with atom\_style template***

Self-explanatory.

***Fix gcmc molecule command requires that atoms have molecule attributes***

Should not choose the gcmc molecule feature if no molecules are being simulated. The general molecule flag is off, but gcmc's molecule flag is on.

***Fix gcmc molecule has charges, but atom style does not***

Self-explanatory.

***Fix gcmc molecule must have atom types***

The defined molecule does not specify atom types.

***Fix gcmc molecule must have coordinates***

The defined molecule does not specify coordinates.

***Fix gcmc molecule template ID must be same as atom\_style template ID***

When using atom\_style template, you cannot insert molecules that are not in that template.

***Fix gcmc put atom outside box***

This should not normally happen. Contact the developers.

***Fix gcmc ran out of available atom IDs***

See the setting for tagint in the src/lmptype.h file.

***Fix gcmc ran out of available molecule IDs***

See the setting for tagint in the src/lmptype.h file.

***Fix gcmc region cannot be dynamic***

Only static regions can be used with fix gcmc.

***Fix gcmc region does not support a bounding box***

Not all regions represent bounded volumes. You cannot use such a region with the fix gcmc command.

***Fix gcmc region extends outside simulation box***

Self-explanatory.

***Fix gcmc shake fix does not exist***

Self-explanatory.

***Fix gld c coefficients must be  $\geq 0$*** 

Self-explanatory.

***Fix gld needs more prony series coefficients***

Self-explanatory.

***Fix gld prony terms must be  $> 0$*** 

Self-explanatory.

***Fix gld series type must be pprony for now***

Self-explanatory.

***Fix gld start temperature must be  $\geq 0$*** 

Self-explanatory.

***Fix gld stop temperature must be  $\geq 0$*** 

Self-explanatory.

***Fix gld tau coefficients must be  $> 0$*** 

Self-explanatory.

***Fix halt variable is not equal-style variable***

Self-explanatory.

***Fix heat group has no atoms***

Self-explanatory.

***Fix heat kinetic energy of an atom went negative***

This will cause the velocity rescaling about to be performed by fix heat to be invalid.

***Fix heat kinetic energy went negative***

This will cause the velocity rescaling about to be performed by fix heat to be invalid.

***Fix in variable not computed at compatible time***

Fixes generate their values on specific timesteps. The variable is requesting the values on a non-allowed timestep.

***Fix langevin angmom is not yet implemented with kokkos***

This option is not yet available.

***Fix langevin angmom requires atom style ellipsoid***

Self-explanatory.

***Fix langevin angmom requires extended particles***

This fix option cannot be used with point particles.

***Fix langevin gif and respa are not compatible***

Self-explanatory.

***Fix langevin gif cannot have period equal to dt/2***

If the period is equal to dt/2 then division by zero will happen.

***Fix langevin gif should come before fix nve***

Self-explanatory.

***Fix langevin gif with tbias is not yet implemented with kokkos***

This option is not yet available.

***Fix langevin omega is not yet implemented with kokkos***

This option is not yet available.

***Fix langevin omega requires atom style sphere***

Self-explanatory.

***Fix langevin omega requires extended particles***

One of the particles has radius 0.0.

***Fix langevin period must be > 0.0***

The time window for temperature relaxation must be > 0

***Fix langevin variable returned negative temperature***

Self-explanatory.

***Fix momentum group has no atoms***

Self-explanatory.

***Fix move cannot define z or vz variable for 2d problem***

Self-explanatory.

***Fix move cannot rotate around non z-axis for 2d problem***

Self-explanatory.

***Fix move cannot set linear z motion for 2d problem***

Self-explanatory.

***Fix move cannot set wiggle z motion for 2d problem***

Self-explanatory.

***Fix msst compute ID does not compute potential energy***

Self-explanatory.

***Fix msst compute ID does not compute pressure***

Self-explanatory.

***Fix msst compute ID does not compute temperature***

Self-explanatory.

***Fix msst requires a periodic box***

Self-explanatory.

***Fix msst tscale must satisfy  $0 \leq tscale < 1$*** 

Self-explanatory.

***Fix npt/nph has tilted box too far in one step - periodic cell is too far from equilibrium state***

Self-explanatory. The change in the box tilt is too extreme on a short timescale.

***Fix numdiff requires an atom map, see atom\_modify***

Self-explanatory. Efficient loop over all atoms for numerical difference requires an atom map.

***Fix numdiff requires consecutive atom IDs***

Self-explanatory. Efficient loop over all atoms for numerical difference requires consecutive atom IDs.

***Fix numdiff/virial must use group all***

Virial contributions computed by this fix are computed on all atoms.

***Fix nve/asphere requires extended particles***

This fix can only be used for particles with a shape setting.

***Fix nve/asphere/noforce requires atom style ellipsoid***

Self-explanatory.

***Fix nve/asphere/noforce requires extended particles***

One of the particles is not an ellipsoid.

***Fix nve/body requires atom style body***

Self-explanatory.

***Fix nve/body requires bodies***

This fix can only be used for particles that are bodies.

***Fix nve/line can only be used for 2d simulations***

Self-explanatory.

***Fix nve/line requires atom style line***

Self-explanatory.

***Fix nve/line requires line particles***

Self-explanatory.

***Fix nve/sphere dipole requires atom attribute mu***

An atom style with this attribute is needed.

***Fix nve/sphere requires atom style sphere***

Self-explanatory.

***Fix nve/sphere requires extended particles***

This fix can only be used for particles of a finite size.

***Fix nve/tri can only be used for 3d simulations***

Self-explanatory.

***Fix nve/tri requires atom style tri***

Self-explanatory.

***Fix nve/tri requires tri particles***

Self-explanatory.

***Fix nvt/nph/npt asphere requires extended particles***

The shape setting for a particle in the fix group has shape = 0.0, which means it is a point particle.

***Fix nvt/nph/npt body requires bodies***

Self-explanatory.

***Fix nvt/nph/npt sphere requires atom style sphere***

Self-explanatory.

***Fix nvt/npt/nph damping parameters must be > 0.0***

Self-explanatory.

***Fix nvt/npt/nph dilate group ID does not exist***

Self-explanatory.

***Fix nvt/sphere requires extended particles***

This fix can only be used for particles of a finite size.

***Fix orient/fcc file open failed***

The fix orient/fcc command could not open a specified file.

***Fix orient/fcc file read failed***

The fix orient/fcc command could not read the needed parameters from a specified file.

***Fix orient/fcc found self twice***

The neighbor lists used by fix orient/fcc are messed up. If this error occurs, it is likely a bug, so send an email to the [developers](#).

***Fix peri neigh does not exist***

Somehow a fix that the pair style defines has been deleted.

***Fix pour and fix rigid/small not using same molecule template ID***

Self-explanatory.

***Fix pour and fix shake not using same molecule template ID***

Self-explanatory.

***Fix pour insertion count per timestep is 0***

Self-explanatory.

***Fix pour molecule must have atom types***

The defined molecule does not specify atom types.

***Fix pour molecule must have coordinates***

The defined molecule does not specify coordinates.

***Fix pour molecule template ID must be same as atom style template ID***

When using atom\_style template, you cannot pour molecules that are not in that template.

***Fix pour polydisperse fractions do not sum to 1.0***

Self-explanatory.

***Fix pour region ID does not exist***

Self-explanatory.

***Fix pour region cannot be dynamic***

Only static regions can be used with fix pour.

***Fix pour region does not support a bounding box***

Not all regions represent bounded volumes. You cannot use such a region with the fix pour command.

***Fix pour requires atom attributes radius, rmass***

The atom style defined does not have these attributes.

***Fix pour rigid fix does not exist***

Self-explanatory.

***Fix pour shake fix does not exist***

Self-explanatory.

***Fix press/berendsen damping parameters must be > 0.0***

Self-explanatory.

***Fix property/atom cannot specify mol twice***

Self-explanatory.

***Fix property/atom cannot specify q twice***

Self-explanatory.

***Fix property/atom mol when atom\_style already has molecule attribute***

Self-explanatory.

***Fix property/atom q when atom\_style already has charge attribute***

Self-explanatory.

***Fix property/atom vector name already exists***

The name for an integer or floating-point vector must be unique.

***Fix qeq has negative upper Taper radius cutoff***

Self-explanatory.

***Fix qeq/comb group has no atoms***

Self-explanatory.

***Fix qeq/comb requires atom attribute q***

An atom style with charge must be used to perform charge equilibration.

***Fix qeq/dynamic group has no atoms***

Self-explanatory.

***Fix qeq/dynamic requires atom attribute q***

Self-explanatory.

***Fix qeq/fire group has no atoms***

Self-explanatory.

***Fix qeq/fire requires atom attribute q***

Self-explanatory.

***Fix qeq/point group has no atoms***

Self-explanatory.

***Fix qeq/point has insufficient QEq matrix size***

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE\_ZONE and MIN\_CAP in fix\_qeq.h and re-compile.

***Fix qeq/point requires atom attribute q***

Self-explanatory.

***Fix qeq/shielded group has no atoms***

Self-explanatory.

***Fix qeq/shielded has insufficient QEq matrix size***

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE\_ZONE and MIN\_CAP in fix\_qeq.h and re-compile.

***Fix qeq/shielded requires atom attribute q***

Self-explanatory.

***Fix qeq/slater could not extract params from pair coul/streitz***

This should not happen unless pair coul/streitz has been altered.

***Fix qeq/slater group has no atoms***

Self-explanatory.

***Fix qeq/slater has insufficient QEq matrix size***

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE\_ZONE and MIN\_CAP in fix\_qeq.h and re-compile.

***Fix qeq/slater requires atom attribute q***

Self-explanatory.

***Fix reax/bonds numbonds > nsbmax\_most***

The limit of the number of bonds expected by the ReaxFF force field was exceeded.

***Fix recenter group has no atoms***

Self-explanatory.

***Fix restrain requires an atom map, see atom\_modify***

Self-explanatory.

***Fix rigid atom has non-zero image flag in a non-periodic dimension***

Image flags for non-periodic dimensions should not be set.

***Fix rigid file has no lines***

Self-explanatory.

***Fix rigid langevin period must be > 0.0***

Self-explanatory.

***Fix rigid molecule requires atom attribute molecule***

Self-explanatory.

***Fix rigid npt/nph dilate group ID does not exist***

Self-explanatory.

***Fix rigid npt/nph does not yet allow triclinic box***

This is a current restriction in LAMMPS.

***Fix rigid npt/nph period must be > 0.0***

Self-explanatory.

***Fix rigid npt/small t\_chain should not be less than 1***

Self-explanatory.

***Fix rigid npt/small t\_order must be 3 or 5***

Self-explanatory.

***Fix rigid nvt/npt/nph damping parameters must be > 0.0***

Self-explanatory.

***Fix rigid nvt/small t\_chain should not be less than 1***

Self-explanatory.

***Fix rigid nvt/small t\_iter should not be less than 1***

Self-explanatory.

***Fix rigid nvt/small t\_order must be 3 or 5***

Self-explanatory.

***Fix rigid xy torque cannot be on for 2d simulation***

Self-explanatory.

***Fix rigid z force cannot be on for 2d simulation***

Self-explanatory.

***Fix rigid/npt period must be > 0.0***

Self-explanatory.

**Fix rigid/npt temperature order must be 3 or 5**

Self-explanatory.

**Fix rigid/npt/small period must be > 0.0**

Self-explanatory.

**Fix rigid/nvt period must be > 0.0**

Self-explanatory.

**Fix rigid/nvt temperature order must be 3 or 5**

Self-explanatory.

**Fix rigid/nvt/small period must be > 0.0**

Self-explanatory.

**Fix rigid/small atom has non-zero image flag in a non-periodic dimension**

Image flags for non-periodic dimensions should not be set.

**Fix rigid/small langevin period must be > 0.0**

Self-explanatory.

**Fix rigid/small molecule must have atom types**

The defined molecule does not specify atom types.

**Fix rigid/small molecule must have coordinates**

The defined molecule does not specify coordinates.

**Fix rigid/small npt/nph period must be > 0.0**

Self-explanatory.

**Fix rigid/small nvt/npt/nph damping parameters must be > 0.0**

Self-explanatory.

**Fix rigid/small nvt/npt/nph dilate group ID does not exist**

Self-explanatory.

**Fix rigid/small requires an atom map, see atom\_modify**

Self-explanatory.

**Fix rigid/small requires atom attribute molecule**

Self-explanatory.

**Fix rigid: Bad principal moments**

The principal moments of inertia computed for a rigid body are not within the required tolerances.

**Fix shake cannot be used with minimization**

Cannot use fix shake while doing an energy minimization since it turns off bonds that should contribute to the energy.

**Fix shake molecule template must have shake info**

The defined molecule does not specify SHAKE information.

**Fix spring couple group ID does not exist**

Self-explanatory.

**Fix srd can only currently be used with comm\_style brick**

This is a current restriction in LAMMPS.

**Fix srd lamda must be >= 0.6 of SRD grid size**

This is a requirement for accuracy reasons.

**Fix srd no-slip requires atom attribute torque**

This is because the SRD collisions will impart torque to the solute particles.

***Fix srd requires SRD particles all have same mass***

Self-explanatory.

***Fix srd requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Fix srd requires newton pair on***

Self-explanatory.

***Fix store/state compute array is accessed out-of-range***

Self-explanatory.

***Fix store/state compute does not calculate a per-atom array***

The compute calculates a per-atom vector.

***Fix store/state compute does not calculate a per-atom vector***

The compute calculates a per-atom vector.

***Fix store/state compute does not calculate per-atom values***

Computes that calculate global or local quantities cannot be used with fix store/state.

***Fix store/state fix array is accessed out-of-range***

Self-explanatory.

***Fix store/state fix does not calculate a per-atom array***

The fix calculates a per-atom vector.

***Fix store/state fix does not calculate a per-atom vector***

The fix calculates a per-atom array.

***Fix store/state fix does not calculate per-atom values***

Fixes that calculate global or local quantities cannot be used with fix store/state.

***Fix store/state for atom property that is not allocated***

Self-explanatory.

***Fix store/state variable is not atom-style variable***

Only atom-style variables calculate per-atom quantities.

***Fix temp/berendsen period must be > 0.0***

Self-explanatory.

***Fix temp/berendsen variable returned negative temperature***

Self-explanatory.

***Fix temp/csld is not compatible with fix rattle or fix shake***

These two commands cannot currently be used together with fix temp/csld.

***Fix temp/csld variable returned negative temperature***

Self-explanatory.

***Fix temp/csvr variable returned negative temperature***

Self-explanatory.

***Fix temp/rescale variable returned negative temperature***

Self-explanatory.

***Fix tfmc displacement length must be > 0***

Self-explanatory.

***Fix tfmc is not compatible with fix shake***

These two commands cannot currently be used together.

**Fix tfmc temperature must be > 0**

Self-explanatory.

**Fix thermal/conductivity swap value must be positive**

Self-explanatory.

**Fix tmd must come after integration fixes**

Any fix tmd command must appear in the input script after all time integration fixes (nve, nvt, npt). See the fix tmd documentation for details.

**Fix ttm electron temperatures must be > 0.0**

Self-explanatory.

**Fix ttm electronic\_density must be > 0.0**

Self-explanatory.

**Fix ttm electronic\_specific\_heat must be > 0.0**

Self-explanatory.

**Fix ttm electronic\_thermal\_conductivity must be >= 0.0**

Self-explanatory.

**Fix ttm gamma\_p must be > 0.0**

Self-explanatory.

**Fix ttm gamma\_s must be >= 0.0**

Self-explanatory.

**Fix ttm number of nodes must be > 0**

Self-explanatory.

**Fix ttm v\_0 must be >= 0.0**

Self-explanatory.

**Fix used in compute chunk/atom not computed at compatible time**

The chunk/atom compute cannot query the output of the fix on a timestep it is needed.

**Fix used in compute reduce not computed at compatible time**

Fixes generate their values on specific timesteps. Compute reduce is requesting a value on a non-allowed timestep.

**Fix used in compute slice not computed at compatible time**

Fixes generate their values on specific timesteps. Compute slice is requesting a value on a non-allowed timestep.

**Fix vector cannot set output array intensive/extensive from these inputs**

The inputs to the command have conflicting intensive/extensive attributes. You need to use more than one fix vector command.

**Fix vector compute does not calculate a scalar**

Self-explanatory.

**Fix vector compute does not calculate a vector**

Self-explanatory.

**Fix vector compute vector is accessed out-of-range**

Self-explanatory.

**Fix vector fix does not calculate a scalar**

Self-explanatory.

**Fix vector fix does not calculate a vector**

Self-explanatory.

**Fix vector fix vector is accessed out-of-range**

Self-explanatory.

***Fix vector variable is not equal-style variable***

Self-explanatory.

***Fix viscosity swap value must be positive***

Self-explanatory.

***Fix viscosity vtarget value must be positive***

Self-explanatory.

***Fix wall cutoff <= 0.0***

Self-explanatory.

***Fix wall/colloid requires atom style sphere***

Self-explanatory.

***Fix wall/colloid requires extended particles***

One of the particles has radius 0.0.

***Fix wall/gran is incompatible with Pair style***

Must use a granular pair style to define the parameters needed for this fix.

***Fix wall/gran requires atom style sphere***

Self-explanatory.

***Fix wall/piston command only available at zlo***

The face keyword must be zlo.

***Fix wall/region colloid requires atom style sphere***

Self-explanatory.

***Fix wall/region colloid requires extended particles***

One of the particles has radius 0.0.

***Fix wall/region cutoff <= 0.0***

Self-explanatory.

***Fix\_modify pressure ID does not compute pressure***

The compute ID assigned to the fix must compute pressure.

***Fix\_modify temperature ID does not compute temperature***

The compute ID assigned to the fix must compute temperature.

***For triclinic deformation, specified target stress must be hydrostatic***

Triclinic pressure control is allowed using the tri keyword, but non-hydrostatic pressure control can not be used in this case.

***Found no restart file matching pattern***

When using a "\*" in the restart file name, no matching file was found.

***GPU library not compiled for this accelerator***

Self-explanatory.

***GPU package does not (yet) work with atom\_style template***

Self-explanatory.

***GPU particle split must be set to 1 for this pair style.***

For this pair style, you cannot run part of the force calculation on the host. See the package command.

***GPUs are requested but Kokkos has not been compiled for CUDA***

Re-compile Kokkos with CUDA support to use GPUs.

***Ghost velocity forward comm not yet implemented with Kokkos***

This is a current restriction.

***Gmask function in equal-style variable formula***

Gmask is per-atom operation.

***Gravity changed since fix pour was created***

The gravity vector defined by fix gravity must be static.

***Gravity must point in -y to use with fix pour in 2d***

Self-explanatory.

***Gravity must point in -z to use with fix pour in 3d***

Self-explanatory.

***Gmask function in equal-style variable formula***

Gmask is per-atom operation.

***Group ID does not exist***

A group ID used in the group command does not exist.

***Group ID in variable formula does not exist***

Self-explanatory.

***Group all cannot be made dynamic***

This operation is not allowed.

***Group command before simulation box is defined***

The group command cannot be used before a read\_data, read\_restart, or create\_box command.

***Group dynamic cannot reference itself***

Self-explanatory.

***Group dynamic parent group cannot be dynamic***

Self-explanatory.

***Group dynamic parent group does not exist***

Self-explanatory.

***Group region ID does not exist***

A region ID used in the group command does not exist.

***If read\_dump purges it cannot replace or trim***

These operations are not compatible. See the read\_dump doc page for details.

***Illegal ... command***

Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

***Illegal COMB parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal COMB3 parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal Stillinger-Weber parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal Tersoff parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal Vashishta parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal compute voronoi/atom command (occupation and (surface or edges))***

Self-explanatory.

***Illegal coul/streitz parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal dump\_modify sfactor value (must be > 0.0)***

Self-explanatory.

***Illegal dump\_modify tfactor value (must be > 0.0)***

Self-explanatory.

***Illegal fix gcmc gas mass <= 0***

The computed mass of the designated gas molecule or atom type was less than or equal to zero.

***Illegal fix tfmc random seed***

Seeds can only be nonzero positive integers.

***Illegal fix wall/piston velocity***

The piston velocity must be positive.

***Illegal integrate style***

Self-explanatory.

***Illegal nb3b/harmonic parameter***

One or more of the coefficients defined in the potential file is invalid.

***Illegal number of angle table entries***

There must be at least 2 table entries.

***Illegal number of bond table entries***

There must be at least 2 table entries.

***Illegal number of pair table entries***

There must be at least 2 table entries.

***Illegal or unset periodicity in restart***

This error should not normally occur unless the restart file is invalid.

***Illegal range increment value***

The increment must be  $\geq 1$ .

***Illegal simulation box***

The lower bound of the simulation box is greater than the upper bound.

***Illegal size double vector read requested***

This error should not normally occur unless the restart file is invalid.

***Illegal size integer vector read requested***

This error should not normally occur unless the restart file is invalid.

***Illegal size string or corrupt restart***

This error should not normally occur unless the restart file is invalid.

***Imageint setting in lmptype.h is invalid***

Imageint must be as large or larger than smallint.

***Imageint setting in lmptype.h is not compatible***

Format of imageint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

***Improper atom missing in delete\_bonds***

The delete\_bonds command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

***Improper atom missing in set command***

The set command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

***Improper atoms %d %d %d %d missing on proc %d at step %ld***

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

***Improper atoms missing on proc %d at step %ld***

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

***Improper coeff for hybrid has invalid style***

Improper style hybrid uses another improper style as one of its coefficients. The improper style used in the improper\_coeff command or read from a restart file is not recognized.

***Improper coeffs are not set***

No improper coefficients have been assigned in the data file or via the improper\_coeff command.

***Improper style hybrid cannot have hybrid as an argument***

Self-explanatory.

***Improper style hybrid cannot have none as an argument***

Self-explanatory.

***Improper style hybrid cannot use same improper style twice***

Self-explanatory.

***Improper\_coeff command before improper\_style is defined***

Coefficients cannot be set in the data file or via the improper\_coeff command until an improper\_style has been assigned.

***Improper\_coeff command before simulation box is defined***

The improper\_coeff command cannot be used before a read\_data, read\_restart, or create\_box command.

***Improper\_coeff command when no impropers allowed***

The chosen atom style does not allow for impropers to be defined.

***Improper\_style command when no impropers allowed***

The chosen atom style does not allow for impropers to be defined.

***Impropers assigned incorrectly***

Impropers read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

***Impropers defined but no improper types***

The data file header lists improper but no improper types.

***Incompatible KIM Simulator Model***

The requested KIM Simulator Model was defined for a different MD code and thus is not compatible with LAMMPS.

***Incompatible units for KIM Simulator Model***

The selected unit style is not compatible with the requested KIM Simulator Model.

***Incomplete use of variables in create\_atoms command***

The var and set options must be used together.

***Inconsistent iparam/jparam values in fix bond/create command***

If itype and jtype are the same, then their maxbond and newtype settings must also be the same.

***Inconsistent line segment in data file***

The end points of the line segment are not equal distances from the center point which is the atom coordinate.

***Inconsistent triangle in data file***

The centroid of the triangle as defined by the corner points is not the atom coordinate.

***Inconsistent use of finite-size particles by molecule template molecules***

Not all of the molecules define a radius for their constituent particles.

***Incorrect # of floating-point values in Bodies section of data file***

See page for body style.

***Incorrect # of integer values in Bodies section of data file***

See page for body style.

***Incorrect %s format in data file***

A section of the data file being read by fix property/atom does not have the correct number of values per line.

***Incorrect SNAP parameter file***

The file cannot be parsed correctly, check its internal syntax.

***Incorrect args for angle coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect args for bond coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect args for dihedral coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect args for improper coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect args for pair coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect args in pair\_style command***

Self-explanatory.

***Incorrect atom format in data file***

Number of values per atom line in the data file is not consistent with the atom style.

***Incorrect atom format in neb file***

The number of fields per line is not what expected.

***Incorrect bonus data format in data file***

See the read\_data page for a description of how various kinds of bonus data must be formatted for certain atom styles.

***Incorrect boundaries with slab Ewald***

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

***Incorrect boundaries with slab EwaldDisp***

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

***Incorrect boundaries with slab PPPM***

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with PPPM.

***Incorrect boundaries with slab PPPMDisp***

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with ppm/dis.

***Incorrect conversion in format string***

A format style variable was not using either a %f, a %g, or a %e conversion. Or an immediate variable with format suffix was not using either a %f, a %g or a %e conversion in the format suffix.

***Incorrect element names in ADP potential file***

The element names in the ADP file do not match those requested.

***Incorrect element names in EAM potential file***

The element names in the EAM file do not match those requested.

***Incorrect format of ... section in data file***

Number or type of values per line in the given section of the data file is not consistent with the requirements for this section.

***Incorrect format in COMB potential file***

Incorrect number of words per line in the potential file.

***Incorrect format in COMB3 potential file***

Incorrect number of words per line in the potential file.

***Incorrect format in MEAM library file***

Incorrect number of words per line in the potential file.

***Incorrect format in SNAP coefficient file***

Incorrect number of words per line in the coefficient file.

***Incorrect format in SNAP parameter file***

Incorrect number of words per line in the parameter file.

***Incorrect format in Stillinger-Weber potential file***

Incorrect number of words per line in the potential file.

***Incorrect format in TMD target file***

Format of file read by fix tmd command is incorrect.

***Incorrect format in Tersoff potential file***

Incorrect number of words per line in the potential file.

***Incorrect format in Vashishta potential file***

Incorrect number of words per line in the potential file.

***Incorrect format in coul/streitz potential file***

Incorrect number of words per line in the potential file.

***Incorrect format in nb3b/harmonic potential file***

Incorrect number of words per line in the potential file.

***Incorrect integer value in Bodies section of data file***

See page for body style.

***Incorrect multiplicity arg for dihedral coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect number of elements in potential file***

Self-explanatory.

***Incorrect rigid body format in fix rigid file***

The number of fields per line is not what expected.

***Incorrect rigid body format in fix rigid/small file***

The number of fields per line is not what expected.

***Incorrect sign arg for dihedral coefficients***

Self-explanatory. Check the input script or data file.

***Incorrect table format check for element types***

Self-explanatory.

***Incorrect velocity format in data file***

Each atom style defines a format for the Velocity section of the data file. The read-in lines do not match.

***Incorrect weight arg for dihedral coefficients***

Self-explanatory. Check the input script or data file.

***Index between variable brackets must be positive***

Self-explanatory.

***Indexed per-atom vector in variable formula without atom map***

Accessing a value from an atom vector requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom\_modify map command will force an atom map to be created.

***Initial temperatures not all set in fix ttm***

Self-explanatory.

***Input line quote not followed by white-space***

An end quote must be followed by white-space.

***Insertion region extends outside simulation box***

Self-explanatory.

***Insufficient Jacobi rotations for POEMS body***

Eigensolve for rigid body was not sufficiently accurate.

***Insufficient Jacobi rotations for body nparticle***

Eigensolve for rigid body was not sufficiently accurate.

***Insufficient Jacobi rotations for rigid body***

Eigensolve for rigid body was not sufficiently accurate.

***Insufficient Jacobi rotations for rigid molecule***

Eigensolve for rigid body was not sufficiently accurate.

***Insufficient Jacobi rotations for triangle***

The calculation of the inertia tensor of the triangle failed. This should not happen if it is a reasonably shaped triangle.

***Insufficient memory on accelerator***

There is insufficient memory on one of the devices specified for the gpu package

***Internal error in atom\_style body***

This error should not occur. Contact the developers.

***Invalid -reorder N value***

Self-explanatory.

***Invalid Angles section in molecule file***

Self-explanatory.

***Invalid Bonds section in molecule file***

Self-explanatory.

***Invalid Boolean syntax in if command***

Self-explanatory.

***Invalid Charges section in molecule file***

Self-explanatory.

***Invalid Coords section in molecule file***

Self-explanatory.

***Invalid Diameters section in molecule file***

Self-explanatory.

***Invalid Dihedrals section in molecule file***

Self-explanatory.

***Invalid Improvers section in molecule file***

Self-explanatory.

***Invalid Kokkos command-line args***

Self-explanatory. See Section 2.7 of the manual for details.

***Invalid LAMMPS restart file***

The file does not appear to be a LAMMPS restart file since it does not contain the correct magic string at the beginning.

***Invalid Masses section in molecule file***

Self-explanatory.

***Invalid molecule ID in molecule file***

Molecule ID must be a non-zero positive integer.

***Invalid Molecules section in molecule file***

Self-explanatory.

***Invalid REAX atom type***

There is a mis-match between LAMMPS atom types and the elements listed in the ReaxFF force field file.

***Invalid Special Bond Counts section in molecule file***

Self-explanatory.

***Invalid Types section in molecule file***

Self-explanatory.

***Invalid angle count in molecule file***

Self-explanatory.

***Invalid angle table length***

Length must be 2 or greater.

***Invalid angle type in Angles section of data file***

Angle type must be positive integer and within range of specified angle types.

***Invalid angle type in Angles section of molecule file***

Self-explanatory.

***Invalid angle type index for fix shake***

Self-explanatory.

***Invalid args for non-hybrid pair coefficients***

“NULL” is only supported in pair\_coeff calls when using pair hybrid

***Invalid argument to factorial %d***

N must be  $\geq 0$  and  $\leq 167$ , otherwise the factorial result is too large.

***Invalid atom ID in %s section of data file***

An atom in a section of the data file being read by fix property/atom has an invalid atom ID that is  $\leq 0$  or  $>$  the maximum existing atom ID.

***Invalid atom ID in Angles section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in Angles section of molecule file***

Self-explanatory.

***Invalid atom ID in Atoms section of data file***

Atom IDs must be positive integers.

***Invalid atom ID in Bodies section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in Bonds section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in Bonds section of molecule file***

Self-explanatory.

***Invalid atom ID in Bonus section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in Dihedrals section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in Fragments section of molecule file***

Self-explanatory.

***Invalid atom ID in Improvers section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in Velocities section of data file***

Atom IDs must be positive integers and within range of defined atoms.

***Invalid atom ID in dihedrals section of molecule file***

Self-explanatory.

***Invalid atom ID in improvers section of molecule file***

Self-explanatory.

***Invalid atom ID in variable file***

Self-explanatory.

***Invalid atom IDs in neb file***

An ID in the file was not found in the system.

***Invalid atom diameter in molecule file***

Diameters must be  $\geq 0.0$ .

***Invalid atom mass for fix shake***

Mass specified in fix shake command must be  $> 0.0$ .

***Invalid atom mass in molecule file***

Masses must be  $> 0.0$ .

***Invalid atom type in Atoms section of data file***

Atom types must range from 1 to specified # of types.

***Invalid atom type in create\_atoms command***

The create\_box command specified the range of valid atom types. An invalid type is being requested.

***Invalid atom type in create\_atoms mol command***

The atom types in the defined molecule are added to the value specified in the create\_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

***Invalid atom type in fix atom/swap command***

The atom type specified in the atom/swap command does not exist.

***Invalid atom type in fix bond/create command***

Self-explanatory.

***Invalid atom type in fix deposit command***

Self-explanatory.

***Invalid atom type in fix deposit mol command***

The atom types in the defined molecule are added to the value specified in the create\_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

***Invalid atom type in fix gcmc command***

The atom type specified in the gcmc command does not exist.

***Invalid atom type in fix pour command***

Self-explanatory.

***Invalid atom type in fix pour mol command***

The atom types in the defined molecule are added to the value specified in the create\_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

***Invalid atom type in molecule file***

Atom types must range from 1 to specified # of types.

***Invalid atom type in neighbor exclusion list***

Atom types must range from 1 to Ntypes inclusive.

***Invalid atom type index for fix shake***

Atom types must range from 1 to Ntypes inclusive.

***Invalid atom types in pair\_write command***

Atom types must range from 1 to Ntypes inclusive.

***Invalid atom vector in variable formula***

The atom vector is not recognized.

***Invalid atom\_style body command***

No body style argument was provided.

***Invalid atom\_style command***

Self-explanatory.

***Invalid attribute in dump custom command***

Self-explanatory.

***Invalid attribute in dump local command***

Self-explanatory.

***Invalid attribute in dump modify command***

Self-explanatory.

***Invalid basis setting in create\_atoms command***

The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

***Invalid basis setting in fix append/atoms command***

The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

***Invalid bin bounds in compute chunk/atom***

The lo/hi values are inconsistent.

***Invalid bin bounds in fix ave/spatial***

The lo/hi values are inconsistent.

***Invalid body nparticle command***

Arguments in atom-style command are not correct.

***Invalid bond count in molecule file***

Self-explanatory.

***Invalid bond table length***

Length must be 2 or greater.

***Invalid bond type in Bonds section of data file***

Bond type must be positive integer and within range of specified bond types.

***Invalid bond type in Bonds section of molecule file***

Self-explanatory.

***Invalid bond type in create\_bonds command***

Self-explanatory.

***Invalid bond type in fix bond/break command***

Self-explanatory.

***Invalid bond type in fix bond/create command***

Self-explanatory.

***Invalid bond type index for fix shake***

Self-explanatory. Check the fix shake command in the input script.

***Invalid coeffs for this dihedral style***

Cannot set class 2 coeffs in data file for this dihedral style.

***Invalid color in dump\_modify command***

The specified color name was not in the list of recognized colors. See the dump\_modify doc page.

***Invalid color map min/max values***

The min/max values are not consistent with either each other or with values in the color map.

***Invalid command-line argument***

One or more command-line arguments is invalid. Check the syntax of the command you are using to launch LAMMPS.

***Invalid compute ID in variable formula***

The compute is not recognized.

***Invalid create\_atoms rotation vector for 2d model***

The rotation vector can only have a z component.

***Invalid custom OpenCL parameter string.***

There are not enough or too many parameters in the custom string for package GPU.

***Invalid cutoff in comm\_modify command***

Specified cutoff must be  $\geq 0.0$ .

***Invalid cutoffs in pair\_write command***

Inner cutoff must be larger than 0.0 and less than outer cutoff.

***Invalid d1 or d2 value for pair colloid coeff***

Neither d1 or d2 can be  $< 0$ .

***Invalid data file section: Angle Coeffs***

Atom style does not allow angles.

***Invalid data file section: AngleAngle Coeffs***

Atom style does not allow impropers.

***Invalid data file section: AngleAngleTorsion Coeffs***

Atom style does not allow dihedrals.

***Invalid data file section: AngleTorsion Coeffs***

Atom style does not allow dihedrals.

***Invalid data file section: Angles***

Atom style does not allow angles.

***Invalid data file section: Bodies***

Atom style does not allow bodies.

***Invalid data file section: Bond Coeffs***

Atom style does not allow bonds.

***Invalid data file section: BondAngle Coeffs***

Atom style does not allow angles.

***Invalid data file section: BondBond Coeffs***

Atom style does not allow angles.

***Invalid data file section: BondBond13 Coeffs***

Atom style does not allow dihedrals.

***Invalid data file section: Bonds***

Atom style does not allow bonds.

***Invalid data file section: Dihedral Coeffs***

Atom style does not allow dihedrals.

***Invalid data file section: Dihedrals***

Atom style does not allow dihedrals.

***Invalid data file section: Ellipsoids***

Atom style does not allow ellipsoids.

***Invalid data file section: EndBondTorsion Coeffs***

Atom style does not allow dihedrals.

***Invalid data file section: Improper Coeffs***

Atom style does not allow impropers.

***Invalid data file section: Impropers***

Atom style does not allow impropers.

***Invalid data file section: Lines***

Atom style does not allow lines.

***Invalid data file section: MiddleBondTorsion Coeffs***

Atom style does not allow dihedrals.

***Invalid data file section: Triangles***

Atom style does not allow triangles.

***Invalid delta\_conf in tad command***

The value must be between 0 and 1 inclusive.

***Invalid density in Atoms section of data file***

Density value cannot be  $\leq 0.0$ .

***Invalid density in set command***

Density must be  $> 0.0$ .

***Invalid diameter in set command***

Self-explanatory.

***Invalid dihedral count in molecule file***

Self-explanatory.

***Invalid dihedral type in Dihedrals section of data file***

Dihedral type must be positive integer and within range of specified dihedral types.

***Invalid dihedral type in dihedrals section of molecule file***

Self-explanatory.

***Invalid dipole length in set command***

Self-explanatory.

***Invalid displace\_atoms rotate axis for 2d***

Axis must be in z direction.

***Invalid dump dcd filename***

Filenames used with the dump dcd style cannot be binary or compressed or cause multiple files to be written.

***Invalid dump frequency***

Dump frequency must be 1 or greater.

***Invalid dump image element name***

The specified element name was not in the standard list of elements. See the dump\_modify doc page.

***Invalid dump image filename***

The file produced by dump image cannot be binary and must be for a single processor.

***Invalid dump image theta value***

Theta must be between 0.0 and 180.0 inclusive.

***Invalid dump image zoom value***

Zoom value must be > 0.0.

***Invalid dump movie filename***

The file produced by dump movie cannot be binary or compressed and must be a single file for a single processor.

***Invalid dump xtc filename***

Filenames used with the dump xtc style cannot be binary or compressed or cause multiple files to be written.

***Invalid dump xyz filename***

Filenames used with the dump xyz style cannot be binary or cause files to be written by each processor.

***Invalid dump\_modify threshold operator***

Operator keyword used for threshold specification in not recognized.

***Invalid entry in -reorder file***

Self-explanatory.

***Invalid fix ID in variable formula***

The fix is not recognized.

***Invalid fix ave/time off column***

Self-explanatory.

***Invalid fix box/relax command for a 2d simulation***

Fix box/relax styles involving the z dimension cannot be used in a 2d simulation.

***Invalid fix box/relax command pressure settings***

If multiple dimensions are coupled, those dimensions must be specified.

***Invalid fix box/relax pressure settings***

Settings for coupled dimensions must be the same.

***Invalid fix halt attribute***

Self-explanatory.

***Invalid fix halt operator***

Self-explanatory.

***Invalid fix nvt/npt/nph command for a 2d simulation***

Cannot control z dimension in a 2d model.

***Invalid fix nvt/npt/nph command pressure settings***

If multiple dimensions are coupled, those dimensions must be specified.

***Invalid fix nvt/npt/nph pressure settings***

Settings for coupled dimensions must be the same.

***Invalid fix press/berendsen for a 2d simulation***

The z component of pressure cannot be controlled for a 2d model.

***Invalid fix press/berendsen pressure settings***

Settings for coupled dimensions must be the same.

***Invalid fix qeq parameter file***

Element index > number of atom types.

***Invalid fix rigid npt/nph command for a 2d simulation***

Cannot control z dimension in a 2d model.

***Invalid fix rigid npt/nph command pressure settings***

If multiple dimensions are coupled, those dimensions must be specified.

***Invalid fix rigid/small npt/nph command for a 2d simulation***

Cannot control z dimension in a 2d model.

***Invalid fix rigid/small npt/nph command pressure settings***

If multiple dimensions are coupled, those dimensions must be specified.

***Invalid flag in force field section of restart file***

Unrecognized entry in restart file.

***Invalid flag in header section of restart file***

Unrecognized entry in restart file.

***Invalid flag in peratom section of restart file***

The format of this section of the file is not correct.

***Invalid flag in type arrays section of restart file***

Unrecognized entry in restart file.

***Invalid frequency in temper command***

Nevery must be > 0.

***Invalid group ID in neigh\_modify command***

A group ID used in the neigh\_modify command does not exist.

***Invalid group function in variable formula***

Group function is not recognized.

***Invalid group in comm\_modify command***

Self-explanatory.

***Invalid image up vector***

Up vector cannot be (0,0,0).

***Invalid immediate variable***

Syntax of immediate value is incorrect.

***Invalid improper count in molecule file***

Self-explanatory.

***Invalid improper type in Improvers section of data file***

Improper type must be positive integer and within range of specified improper types.

***Invalid improper type in improvers section of molecule file***

Self-explanatory.

***Invalid index for non-body particles in compute body/local command***

Only indices 1,2,3 can be used for non-body particles.

***Invalid index in compute body/local command***

Self-explanatory.

***Invalid is\_active() function in variable formula***

Self-explanatory.

***Invalid is\_available() function in variable formula***

Self-explanatory.

***Invalid is\_defined() function in variable formula***

Self-explanatory.

***Invalid keyword in angle table parameters***

Self-explanatory.

***Invalid keyword in bond table parameters***

Self-explanatory.

***Invalid keyword in compute angle/local command***

Self-explanatory.

***Invalid keyword in compute bond/local command***

Self-explanatory.

***Invalid keyword in compute dihedral/local command***

Self-explanatory.

***Invalid keyword in compute improper/local command***

Self-explanatory.

***Invalid keyword in compute pair/local command***

Self-explanatory.

***Invalid keyword in compute property/atom command***

Self-explanatory.

***Invalid keyword in compute property/chunk command***

Self-explanatory.

***Invalid keyword in compute property/local command***

Self-explanatory.

***Invalid keyword in dump cfg command***

Self-explanatory.

***Invalid keyword in pair table parameters***

Keyword used in list of table parameters is not recognized.

***Invalid length in set command***

Self-explanatory.

***Invalid mass in set command***

Self-explanatory.

***Invalid mass line in data file***

Self-explanatory.

***Invalid mass value***

Self-explanatory.

***Invalid math function in variable formula***

Self-explanatory.

***Invalid math/group/special function in variable formula***

Self-explanatory.

***Invalid option in lattice command for non-custom style***

Certain lattice keywords are not supported unless the lattice style is “custom”.

***Invalid order of forces within respa levels***

For respa, ordering of force computations within respa levels must obey certain rules. E.g. bonds cannot be compute less frequently than angles, pairwise forces cannot be computed less frequently than kspace, etc.

***Invalid pair table cutoff***

Cutoffs in pair\_coeff command are not valid with read-in pair table.

***Invalid pair table length***

Length of read-in pair table is invalid

***Invalid param file for fix qeq/shielded***

Invalid value of gamma.

***Invalid param file for fix qeq/slater***

Zeta value is 0.0.

***Invalid partitions in processors part command***

Valid partitions are numbered 1 to N and the sender and receiver cannot be the same partition.

***Invalid python command***

Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

***Invalid radius in Atoms section of data file***

Radius must be  $\geq 0.0$ .

***Invalid random number seed in fix ttm command***

Random number seed must be  $> 0$ .

***Invalid random number seed in set command***

Random number seed must be  $> 0$ .

***Invalid replace values in compute reduce***

Self-explanatory.

***Invalid rigid body ID in fix rigid file***

The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid command.

***Invalid rigid body ID in fix rigid/small file***

The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid/small command.

***Invalid run command N value***

The number of timesteps must fit in a 32-bit integer. If you want to run for more steps than this, perform multiple shorter runs.

***Invalid run command start/stop value***

Self-explanatory.

***Invalid run command upto value***

Self-explanatory.

***Invalid seed for Marsaglia random # generator***

The initial seed for this random number generator must be a positive integer less than or equal to 900 million.

***Invalid seed for Park random # generator***

The initial seed for this random number generator must be a positive integer.

***Invalid shake angle type in molecule file***

Self-explanatory.

***Invalid shake atom in molecule file***

Self-explanatory.

***Invalid shake bond type in molecule file***

Self-explanatory.

***Invalid shake flag in molecule file***

Self-explanatory.

***Invalid shape in Ellipsoids section of data file***

Self-explanatory.

***Invalid shape in Triangles section of data file***

Two or more of the triangle corners are duplicate points.

***Invalid shape in set command***

Self-explanatory.

***Invalid shear direction for fix wall/gran***

Self-explanatory.

***Invalid special atom index in molecule file***

Self-explanatory.

***Invalid special function in variable formula***

Self-explanatory.

***Invalid style in pair\_write command***

Self-explanatory. Check the input script.

***Invalid syntax in variable formula***

Self-explanatory.

***Invalid t\_event in prd command***

Self-explanatory.

***Invalid t\_event in tad command***

The value must be greater than 0.

***Invalid template atom in Atoms section of data file***

The atom indices must be between 1 to N, where N is the number of atoms in the template molecule the atom belongs to.

***Invalid template index in Atoms section of data file***

The template indices must be between 1 to N, where N is the number of molecules in the template.

***Invalid thermo keyword in variable formula***

The keyword is not recognized.

***Invalid threads\_per\_atom specified.***

For 3-body potentials on the GPU, the threads\_per\_atom setting cannot be greater than 4 for NVIDIA GPUs.

***Invalid timestep reset for fix ave/atom***

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

***Invalid timestep reset for fix ave/chunk***

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

***Invalid timestep reset for fix ave/correlate***

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

***Invalid timestep reset for fix ave/histo***

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

***Invalid timestep reset for fix ave/spatial***

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

***Invalid timestep reset for fix ave/time***

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

***Invalid tmax in tad command***

The value must be greater than 0.0.

***Invalid type for mass set***

Mass command must set a type from 1-N where N is the number of atom types.

***Invalid label2type() function syntax in variable formula***

The first argument must be a label map kind (atom, bond, angle, dihedral, or improper) and the second argument must be a valid type label that has been assigned to a numeric type.

***Invalid use of library file() function***

This function is called through the library interface. This error should not occur. Contact the developers if it does.

***Invalid value in set command***

The value specified for the setting is invalid, likely because it is too small or too large.

***Invalid variable evaluation in variable formula***

A variable used in a formula could not be evaluated.

***Invalid variable in next command***

Self-explanatory.

***Invalid variable name***

Variable name used in an input script line is invalid.

***Invalid variable name in variable formula***

Variable name is not recognized.

***Invalid variable style in special function next***

Only file-style or atomfile-style variables can be used with next().

***Invalid variable style with next command***

Variable styles *equal* and *world* cannot be used in a next command.

***Invalid volume in set command***

Volume must be > 0.0.

***Invalid wiggle direction for fix wall/gran***

Self-explanatory.

***Invoked angle equil angle on angle style none***

Self-explanatory.

***Invoked angle single on angle style none***

Self-explanatory.

***Invoked bond equil distance on bond style none***

Self-explanatory.

***Invoked bond single on bond style none***

Self-explanatory.

***Invoked pair single on pair style none***

A command (e.g. a dump) attempted to invoke the single() function on a pair style none, which is illegal. You are probably attempting to compute per-atom quantities with an undefined pair style.

***Invoking coulombic in pair style lj/coul requires atom attribute q***

The atom style defined does not have this attribute.

***Invoking coulombic in pair style lj/long/dipole/long requires atom attribute q***

The atom style defined does not have these attributes.

***KIM Simulator Model has no Model definition***

There is no model definition (key: model-defn) in the KIM Simulator Model. Please contact the OpenKIM database maintainers to verify and potentially correct this.

***KOKKOS package does not yet support comm\_style tiled***

Self-explanatory.

***KOKKOS package requires a kokkos enabled atom\_style***

Self-explanatory.

***KSpace accuracy must be > 0***

The kspace accuracy designated in the input must be greater than zero.

***KSpace accuracy too large to estimate G vector***

Reduce the accuracy request or specify gewald explicitly via the kspace\_modify command.

***KSpace accuracy too low***

Requested accuracy must be less than 1.0.

***KSpace solver requires a pair style***

No pair style is defined.

***KSpace style does not yet support triclinic geometries***

The specified kspace style does not allow for non-orthogonal simulation boxes.

***KSpace style has not yet been set***

Cannot use kspace\_modify command until a kspace style is set.

***KSpace style is incompatible with Pair style***

Setting a kspace style requires that a pair style with matching long-range Coulombic or dispersion components be used.

***Keyword %s in MEAM parameter file not recognized***

Self-explanatory.

***Kokkos has been compiled for CUDA but no GPUs are requested***

One or more GPUs must be used when Kokkos is compiled for CUDA.

***Kspace\_modify mesh parameter must be all zero or all positive***

Valid kspace mesh parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero (the default).

***Kspace\_modify mesh/disp parameter must be all zero or all positive***

Valid kspace mesh/disp parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero **and** the required accuracy via *force/disp/real* as well as *force/disp/kspace* is set.

***Kspace style does not support compute group/group***

Self-explanatory.

***Kspace style ppm/disp/tip4p requires newton on***

Self-explanatory.

***Kspace style ppm/tip4p requires newton on***

Self-explanatory.

***Kspace style requires atom attribute q***

The atom style defined does not have these attributes.

***Kspace\_modify eigtol must be smaller than one***

Self-explanatory.

***LAMMPS is not built with Python embedded***

This is done by including the PYTHON package before LAMMPS is built. This is required to use python-style variables.

***LAMMPS unit\_style lj not supported by KIM models***

Self-explanatory. Check the input script or data file.

***LJ6 off not supported in pair\_style buck/long/coul/long***

Self-explanatory.

***Label map is incomplete: all types must be assigned a unique type label***

For a given type-kind (atom types, bond types, etc.) to be written to the data file, all associated types must be assigned a type label, and each type label can be assigned to only one numeric type.

***Label wasn't found in input script***

Self-explanatory.

***Labelmap command before simulation box is defined***

The labelmap command cannot be used before a read\_data, read\_restart, or create\_box command.

***Lattice orient vectors are not orthogonal***

The three specified lattice orientation vectors must be mutually orthogonal.

***Lattice orient vectors are not right-handed***

The three specified lattice orientation vectors must create a right-handed coordinate system such that  $a_1 \times a_2 = a_3$ .

***Lattice primitive vectors are collinear***

The specified lattice primitive vectors do not form a unit cell with non-zero volume.

***Lattice settings are not compatible with 2d simulation***

One or more of the specified lattice vectors has a non-zero z component.

***Lattice spacings are invalid***

Each x,y,z spacing must be > 0.

***Lattice style incompatible with simulation dimension***

2d simulation can use sq, sq2, or hex lattice. 3d simulation can use sc, bcc, or fcc lattice.

***Log of zero/negative value in variable formula***

Self-explanatory.

***Lost atoms via balance: original %ld current %ld***

This should not occur. Report the problem to the developers.

***Lost atoms: original %ld current %ld***

Lost atoms are checked for each time thermo output is done. See the thermo\_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor's sub-domain away before reneighboring.

***MEAM library error %d***

A call to the MEAM Fortran library returned an error.

***MPI\_LMP\_BIGINT and bigint in lmptype.h are not compatible***

The size of the MPI datatype does not match the size of a bigint.

***MPI\_LMP\_TAGINT and tagint in lmptype.h are not compatible***

The size of the MPI datatype does not match the size of a tagint.

***MSM can only currently be used with comm\_style brick***

This is a current restriction in LAMMPS.

***MSM grid is too large***

The global MSM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 16384. You likely need to decrease the requested accuracy.

***MSM order must be 4, 6, 8, or 10***

This is a limitation of the MSM implementation in LAMMPS: the MSM order can only be 4, 6, 8, or 10.

***Mass command before simulation box is defined***

The mass command cannot be used before a read\_data, read\_restart, or create\_box command.

***Matrix factorization to split dispersion coefficients failed***

This should not normally happen. Contact the developers.

***Min\_style command before simulation box is defined***

The min\_style command cannot be used before a read\_data, read\_restart, or create\_box command.

***Minimization could not find thermo\_pe compute***

This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

***Minimize command before simulation box is defined***

The minimize command cannot be used before a read\_data, read\_restart, or create\_box command.

***Mismatched brackets in variable***

Self-explanatory.

***Mismatched compute in variable formula***

A compute is referenced incorrectly or a compute that produces per-atom values is used in an equal-style variable formula.

***Mismatched fix in variable formula***

A fix is referenced incorrectly or a fix that produces per-atom values is used in an equal-style variable formula.

***Mismatched parameter in MEAM library file: z!=lat***

The coordination number and lattice do not match, check that consistent values are given.

***Mismatched variable in variable formula***

A variable is referenced incorrectly or an atom-style variable that produces per-atom values is used in an equal-style variable formula.

***Modulo 0 in variable formula***

Self-explanatory.

***Molecule IDs too large for compute chunk/atom***

The IDs must not be larger than can be stored in a 32-bit integer since chunk IDs are 32-bit integers.

***Molecule auto special bond generation overflow***

Counts exceed maxspecial setting for other atoms in system.

***Molecule file has angles but no nangles setting***

Self-explanatory.

***Molecule file has body params but no setting for them***

Self-explanatory.

***Molecule file has bonds but no nbonds setting***

Self-explanatory.

***Molecule file has dihedrals but no ndihedrals setting***

Self-explanatory.

***Molecule file has fragments but no nfragments setting***

Self-explanatory.

***Molecule file has impropers but no nimpropers setting***

Self-explanatory.

***Molecule file has no Body Doubles section***

Self-explanatory.

***Molecule file has no Body Integers section***

Self-explanatory.

***Molecule file has no Fragments section***

Self-explanatory.

***Molecule file has special flags but no bonds***

Self-explanatory.

***Molecule file needs both Special Bond sections***

Self-explanatory.

***Molecule file requires atom style body***

Self-explanatory.

***Molecule file shake flags not before shake atoms***

The order of the two sections is important.

***Molecule file shake flags not before shake bonds***

The order of the two sections is important.

***Molecule file shake info is incomplete***

All 3 SHAKE sections are needed.

***Molecule file special list does not match special count***

The number of values in an atom's special list does not match count.

***Molecule file z center-of-mass must be 0.0 for 2d***

Self-explanatory.

***Molecule file z coord must be 0.0 for 2d***

Self-explanatory.

***Molecule natoms must be 1 for body particle***

Self-explanatory.

***Molecule sizescale must be 1.0 for body particle***

Self-explanatory.

***Molecule template ID for atom\_style template does not exist***

Self-explanatory.

***Molecule template ID for create\_atoms does not exist***

Self-explanatory.

***Molecule template ID for fix deposit does not exist***

Self-explanatory.

***Molecule template ID for fix gcmc does not exist***

Self-explanatory.

***Molecule template ID for fix pour does not exist***

Self-explanatory.

***Molecule template ID for fix rigid/small does not exist***

Self-explanatory.

***Molecule template ID for fix shake does not exist***

Self-explanatory.

***Molecule template ID must be alphanumeric or underscore characters***

Self-explanatory.

***Molecule topology/atom exceeds system topology/atom***

The number of bonds, angles, etc per-atom in the molecule exceeds the system setting. See the create\_box command for how to specify these values.

***Molecule topology type exceeds system topology type***

The number of bond, angle, etc types in the molecule exceeds the system setting. See the create\_box command for how to specify these values.

***More than one fix deform***

Only one fix deform can be defined at a time.

***More than one fix freeze***

Only one of these fixes can be defined, since the granular pair potentials access it.

***More than one fix shake***

Only one fix shake can be defined.

***Mu not allowed when not using semi-grand in fix atom/swap command***

Self-explanatory.

***Must define angle\_style before Angle Coeffs***

Must use an angle\_style command before reading a data file that defines Angle Coeffs.

***Must define angle\_style before BondAngle Coeffs***

Must use an angle\_style command before reading a data file that defines Angle Coeffs.

***Must define angle\_style before BondBond Coeffs***

Must use an angle\_style command before reading a data file that defines Angle Coeffs.

***Must define bond\_style before Bond Coeffs***

Must use a bond\_style command before reading a data file that defines Bond Coeffs.

***Must define dihedral\_style before AngleAngleTorsion Coeffs***

Must use a dihedral\_style command before reading a data file that defines AngleAngleTorsion Coeffs.

***Must define dihedral\_style before AngleTorsion Coeffs***

Must use a dihedral\_style command before reading a data file that defines AngleTorsion Coeffs.

***Must define dihedral\_style before BondBond13 Coeffs***

Must use a dihedral\_style command before reading a data file that defines BondBond13 Coeffs.

***Must define dihedral\_style before Dihedral Coeffs***

Must use a dihedral\_style command before reading a data file that defines Dihedral Coeffs.

***Must define dihedral\_style before EndBondTorsion Coeffs***

Must use a dihedral\_style command before reading a data file that defines EndBondTorsion Coeffs.

***Must define dihedral\_style before MiddleBondTorsion Coeffs***

Must use a dihedral\_style command before reading a data file that defines MiddleBondTorsion Coeffs.

***Must define improper\_style before AngleAngle Coeffs***

Must use an improper\_style command before reading a data file that defines AngleAngle Coeffs.

***Must define improper\_style before Improper Coeffs***

Must use an improper\_style command before reading a data file that defines Improper Coeffs.

***Must define pair\_style before Pair Coeffs***

Must use a pair\_style command before reading a data file that defines Pair Coeffs.

***Must define pair\_style before PairIJ Coeffs***

Must use a pair\_style command before reading a data file that defines PairIJ Coeffs.

***Must have more than one processor partition to temper***

Cannot use the temper command with only one processor partition. Use the -partition command-line option.

***Must not have multiple fixes change box parameter ...***

Self-explanatory.

***Must read Angle Type Labels before Angles***

An Angle Type Labels section of a data file must come before the Angles section.

***Must read Atom Type Labels before Atoms***

An Atom Type Labels section of a data file must come before the Atoms section.

***Must read Atoms before Angles***

The Atoms section of a data file must come before an Angles section.

***Must read Atoms before Bodies***

The Atoms section of a data file must come before a Bodies section.

***Must read Atoms before Bonds***

The Atoms section of a data file must come before a Bonds section.

***Must read Atoms before Dihedrals***

The Atoms section of a data file must come before a Dihedrals section.

***Must read Atoms before Ellipsoids***

The Atoms section of a data file must come before a Ellipsoids section.

***Must read Atoms before Improvers***

The Atoms section of a data file must come before an Improvers section.

***Must read Atoms before Lines***

The Atoms section of a data file must come before a Lines section.

***Must read Atoms before Triangles***

The Atoms section of a data file must come before a Triangles section.

***Must read Atoms before Velocities***

The Atoms section of a data file must come before a Velocities section.

***Must read Bond Type Labels before Bonds***

A Bond Type Labels section of a data file must come before the Bonds section.

***Must read Dihedral Type Labels before Dihedrals***

An Dihedral Type Labels section of a data file must come before the Dihedrals section.

***Must read Improper Type Labels before Improvers***

An Improper Type Labels section of a data file must come before the Improvers section.

***Must re-specify non-restarted pair style (xxx) after read\_restart***

For pair styles, that do not store their settings in a restart file, it must be defined with a new 'pair\_style' command after read\_restart.

***Must set both respa inner and outer***

Cannot use just the inner or outer option with respa without using the other.

***Must set number of threads via package omp command***

Because you are using the OPENMP package, set the number of threads via its settings, not by the pair\_style snap nthreads setting.

***Must shrink-wrap piston boundary***

The boundary style of the face where the piston is applied must be of type s (shrink-wrapped).

***Must specify a region in fix deposit***

The region keyword must be specified with this fix.

***Must specify a region in fix pour***

Self-explanatory.

***Must specify at least 2 types in fix atom/swap command***

Self-explanatory.

***Must use 'kim\_style init' command before simulation box is defined***

Self-explanatory.

***Must use 'kim\_style define' command after simulation box is defined***

Self-explanatory.

***Must use 'kim\_style init' command before 'kim\_style define'***

Self-explanatory.

***Must use 'kspace\_modify pressure/scalar no' for rRESPA with kspace\_style MSM***

The kspace scalar pressure option cannot (yet) be used with rRESPA.

***Must use 'kspace\_modify pressure/scalar no' for tensor components with kspace\_style msm***

Otherwise MSM will compute only a scalar pressure. See the kspace\_modify command for details on this setting.

***Must use 'kspace\_modify pressure/scalar no' to obtain per-atom virial with kspace\_style MSM***

The kspace scalar pressure option cannot be used to obtain per-atom virial.

***Must use 'kspace\_modify pressure/scalar no' with GPU MSM Pair styles***

The kspace scalar pressure option is not (yet) compatible with GPU MSM Pair styles.

***Must use 'kspace\_modify pressure/scalar no' with kspace\_style msm/cg***

The kspace scalar pressure option is not compatible with kspace\_style msm/cg.

***Must use -in switch with multiple partitions***

A multi-partition simulation cannot read the input script from stdin. The -in command-line option must be used to specify a file.

***Must use Kokkos half/thread or full neighbor list with threads or GPUs***

Using Kokkos half-neighbor lists with threading is not allowed.

***Must use a block or cylinder region with fix pour***

Self-explanatory.

***Must use a block region with fix pour for 2d simulations***

Self-explanatory.

***Must use a bond style with TIP4P potential***

TIP4P potentials assume bond lengths in water are constrained by a fix shake command.

***Must use a molecular atom style with fix poems molecule***

Self-explanatory.

***Must use a z-axis cylinder region with fix pour***

Self-explanatory.

***Must use an angle style with TIP4P potential***

TIP4P potentials assume angles in water are constrained by a fix shake command.

***Must use atom map style array with Kokkos***

See the atom\_modify map command.

***Must use atom style with molecule IDs with fix bond/swap***

Self-explanatory.

***Must use pair\_style comb or comb3 with fix qeq/comb***

Self-explanatory.

***Must use variable energy with fix addforce***

Must define an energy variable when applying a dynamic force during minimization.

***Must use variable energy with fix efield***

You must define an energy when performing a minimization with a variable E-field.

***NEB command before simulation box is defined***

Self-explanatory.

***NEB requires damped dynamics minimizer***

Use a different minimization style.

***NEB requires use of fix neb***

Self-explanatory.

***NL ramp in wall/piston only implemented in zlo for now***

The ramp keyword can only be used for piston applied to face zlo.

***Need nswaptypes mu values in fix atom/swap command***

Self-explanatory.

***Needed bonus data not in data file***

Some atom styles require bonus data. See the read\_data page for details.

***Needed molecular topology not in data file***

The header of the data file indicated bonds, angles, etc would be included, but they are not present.

***Neigh\_modify exclude molecule requires atom attribute molecule***

Self-explanatory.

***Neigh\_modify include group != atom\_modify first group***

Self-explanatory.

***Neighbor delay must be 0 or multiple of every setting***

The delay and every parameters set via the neigh\_modify command are inconsistent. If the delay setting is non-zero, then it must be a multiple of the every setting.

***Neighbor include group not allowed with ghost neighbors***

This is a current restriction within LAMMPS.

***Neighbor list overflow, boost neigh\_modify one***

There are too many neighbors of a single atom. Use the neigh\_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

***Neighbor multi not yet enabled for ghost neighbors***

This is a current restriction within LAMMPS.

***Neighbor multi not yet enabled for granular***

Self-explanatory.

***Neighbor multi not yet enabled for rRESPA***

Self-explanatory.

***Neighbor page size must be >= 10x the one atom setting***

This is required to prevent wasting too much memory.

***New atom IDs exceed maximum allowed ID***

See the setting for tagint in the src/lmptype.h file.

***New bond exceeded bonds per atom in create\_bonds*** See the read\_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

***New bond exceeded bonds per atom in fix bond/create***

See the read\_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

***New bond exceeded special list size in fix bond/create***

See the “read\_data extra/special/per/atom” command (or the “create\_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

***Newton bond change after simulation box is defined***

The newton command cannot be used to change the newton bond value after a read\_data, read\_restart, or create\_box command.

***Next command must list all universe and uloop variables***

This is to insure they stay in sync.

***No Kspace style defined for compute group/group***

Self-explanatory.

***No OpenMP support compiled in***

An OpenMP flag is set, but LAMMPS was not built with OpenMP support.

***No angle style is defined for compute angle/local***

Self-explanatory.

***No angles allowed with this atom style***

Self-explanatory.

***No atoms in data file***

The header of the data file indicated that atoms would be included, but they are not present.

***No basis atoms in lattice***

Basis atoms must be defined for lattice style user.

***No bodies allowed with this atom style***

Self-explanatory. Check data file.

***No bond style is defined for compute bond/local***

Self-explanatory.

***No bonds allowed with this atom style***

Self-explanatory.

***No box information in dump. You have to use 'box no'***

Self-explanatory.

***No count or invalid atom count in molecule file***

The number of atoms must be specified.

***No dihedral style is defined for compute dihedral/local***

Self-explanatory.

***No dihedrals allowed with this atom style***

Self-explanatory.

***No dump custom arguments specified***

The dump custom command requires that atom quantities be specified to output to dump file.

***No dump local arguments specified***

Self-explanatory.

***No ellipsoids allowed with this atom style***

Self-explanatory. Check data file.

***No fix gravity defined for fix pour***

Gravity is required to use fix pour.

***No improper style is defined for compute improper/local***

Self-explanatory.

***No impropers allowed with this atom style***

Self-explanatory.

***No input values for fix ave/spatial***

Self-explanatory.

***No lines allowed with this atom style***

Self-explanatory. Check data file.

***No matching element in ADP potential file***

The ADP potential file does not contain elements that match the requested elements.

***No matching element in EAM potential file***

The EAM potential file does not contain elements that match the requested elements.

***No molecule topology allowed with atom style template***

The data file cannot specify the number of bonds, angles, etc, because this info is inferred from the molecule templates.

***No overlap of box and region for create\_atoms***

Self-explanatory.

***No pair coul/streitz, for fix qeq/slater***

These commands must be used together.

***No pair hbond/dreiding coefficients set***

Self-explanatory.

***No pair style defined for compute group/group***

Cannot calculate group interactions without a pair style defined.

***No pair style is defined for compute pair/local***

Self-explanatory.

***No pair style is defined for compute property/local***

Self-explanatory.

***No rigid bodies defined***

The fix specification did not end up defining any rigid bodies.

***No triangles allowed with this atom style***

Self-explanatory. Check data file.

***No values in fix ave/chunk command***

Self-explanatory.

***No values in fix ave/time command***

Self-explanatory.

***Non digit character between brackets in variable***

Self-explanatory.

***Non integer # of swaps in temper command***

Swap frequency in temper command must evenly divide the total # of timesteps.

***Non-numeric box dimensions - simulation unstable***

The box size has apparently blown up.

***Non-zero atom IDs with atom\_modify id = no***

Self-explanatory.

***Non-zero read\_data shift z value for 2d simulation***

Self-explanatory.

***Nprocs not a multiple of N for -reorder***

Self-explanatory.

***Number of core atoms != number of shell atoms***

There must be a one-to-one pairing of core and shell atoms.

***Numeric index is out of bounds***

A command with an argument that specifies an integer or range of integers is using a value that is less than 1 or greater than the maximum allowed limit.

***One or more Atom IDs is negative***

Atom IDs must be positive integers.

***One or more atom IDs is too big***

The limit on atom IDs is set by the SMALLBIG, BIGBIG, SMALLSMALL setting in your LAMMPS build. See the [Build settings](#) page for more info.

***One or more atom IDs is zero***

Either all atoms IDs must be zero or none of them.

***One or more atoms belong to multiple rigid bodies***

Two or more rigid bodies defined by the fix rigid command cannot contain the same atom.

***One or more rigid bodies are a single particle***

Self-explanatory.

***One or zero atoms in rigid body***

Any rigid body defined by the fix rigid command must contain 2 or more atoms.

***Only 2 types allowed when not using semi-grand in fix atom/swap command***

Self-explanatory.

***Only one cut-off allowed when requesting all long***

Self-explanatory.

***Only one cutoff allowed when requesting all long***

Self-explanatory.

**Only zhi currently implemented for fix append/atoms**

Self-explanatory.

**Out of range atoms - cannot compute MSM**

One or more atoms are attempting to map their charge to a MSM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor's sub-domain has moved more than 1/2 the *neighbor skin distance* without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the *neigh\_modify* command. The safest settings are "delay 0 every 1 check yes". Second, it may mean that an atom has moved far outside a processor's sub-domain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

**Out of range atoms - cannot compute PPPM**

One or more atoms are attempting to map their charge to a PPPM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor's sub-domain has moved more than 1/2 the *neighbor skin distance* without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the *neigh\_modify* command. The safest settings are "delay 0 every 1 check yes". Second, it may mean that an atom has moved far outside a processor's sub-domain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

**Out of range atoms - cannot compute PPPMDisp**

One or more atoms are attempting to map their charge to a PPPM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor's sub-domain has moved more than 1/2 the *neighbor skin distance* without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the *neigh\_modify* command. The safest settings are "delay 0 every 1 check yes". Second, it may mean that an atom has moved far outside a processor's sub-domain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

**Overflow of allocated fix vector storage**

This should not normally happen if the fix correctly calculated how long the vector will grow to. Contact the developers.

**Overlapping large/large in pair colloid**

This potential is infinite when there is an overlap.

**Overlapping small/large in pair colloid**

This potential is infinite when there is an overlap.

**POEMS fix must come before NPT/NPH fix**

NPT/NPH fix must be defined in input script after all poems fixes, else the fix contribution to the pressure virial is incorrect.

**PPPM can only currently be used with comm\_style brick**

This is a current restriction in LAMMPS.

**PPPM grid is too large**

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

**PPPM grid stencil extends beyond nearest neighbor processor**

This is not allowed if the kspace\_modify overlap setting is no.

**PPPM order < minimum allowed order**

The default minimum order is 2. This can be reset by the kspace\_modify minorder command.

***PPPM order cannot be < 2 or > than %d***

This is a limitation of the PPPM implementation in LAMMPS.

***PPPMDisp Coulomb grid is too large***

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

***PPPMDisp Dispersion grid is too large***

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

***PPPMDisp can only currently be used with comm\_style brick***

This is a current restriction in LAMMPS.

***PPPMDisp coulomb order cannot be greater than %d***

This is a limitation of the PPPM implementation in LAMMPS.

***PPPMDisp used but no parameters set, for further information please see the pppm/disp documentation***

An efficient and accurate usage of the pppm/disp requires settings via the kspace\_modify command. Please see the pppm/disp documentation for further instructions.

***PRD command before simulation box is defined***

The prd command cannot be used before a read\_data, read\_restart, or create\_box command.

***PRD nsteps must be multiple of t\_event***

Self-explanatory.

***PRD t\_corr must be multiple of t\_event***

Self-explanatory.

***Package command after simulation box is defined***

The package command cannot be used after a read\_data, read\_restart, or create\_box command.

***Package gpu command without GPU package installed***

The GPU package must be installed via “make yes-gpu” before LAMMPS is built.

***Package intel command without INTEL package installed***

The INTEL package must be installed via “make yes-intel” before LAMMPS is built.

***Package kokkos command without KOKKOS package enabled***

The KOKKOS package must be installed via “make yes-kokkos” before LAMMPS is built, and the “-k on” must be used to enable the package.

***Package omp command without OPENMP package installed***

The OPENMP package must be installed via “make yes-openmp” before LAMMPS is built.

***Pair body requires atom style body***

Self-explanatory.

***Pair body requires body style nparticle***

This pair style is specific to the nparticle body style.

***Pair brownian requires atom style sphere***

Self-explanatory.

***Pair brownian requires extended particles***

One of the particles has radius 0.0.

***Pair brownian requires monodisperse particles***

All particles must be the same finite size.

***Pair brownian/poly requires atom style sphere***

Self-explanatory.

***Pair brownian/poly requires extended particles***

One of the particles has radius 0.0.

***Pair brownian/poly requires newton pair off***

Self-explanatory.

***Pair coeff for hybrid has invalid style***

Style in pair coeff must have been listed in pair\_style command.

***Pair coul/wolf requires atom attribute q***

The atom style defined does not have this attribute.

***Pair cutoff < Respa interior cutoff***

One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

***Pair dipole/cut requires atom attributes q, mu, torque***

The atom style defined does not have these attributes.

***Pair dipole/cut/gpu requires atom attributes q, mu, torque***

The atom style defined does not have this attribute.

***Pair dipole/long requires atom attributes q, mu, torque***

The atom style defined does not have these attributes.

***Pair dipole/sf/gpu requires atom attributes q, mu, torque***

The atom style defined does not one or more of these attributes.

***Pair distance < table inner cutoff***

Two atoms are closer together than the pairwise table allows.

***Pair distance > table outer cutoff***

Two atoms are further apart than the pairwise table allows.

***Pair dpd requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Pair gayberne epsilon a,b,c coeffs are not all set***

Each atom type involved in pair\_style gayberne must have these 3 coefficients set at least once.

***Pair gayberne requires atom style ellipsoid***

Self-explanatory.

***Pair gayberne requires atoms with same type have same shape***

Self-explanatory.

***Pair gayberne/gpu requires atom style ellipsoid***

Self-explanatory.

***Pair gayberne/gpu requires atoms with same type have same shape***

Self-explanatory.

***Pair granular requires atom attributes radius, rmass***

The atom style defined does not have these attributes.

***Pair granular requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Pair granular with shear history requires newton pair off***

This is a current restriction of the implementation of pair granular styles with history.

***Pair hybrid single calls do not support per sub-style special bond values***

Self-explanatory.

***Pair hybrid sub-style does not support single call***

You are attempting to invoke a single() call on a pair style that does not support it.

***Pair hybrid sub-style is not used***

No pair\_coeff command used a sub-style specified in the pair\_style command.

***Pair inner cutoff < Respa interior cutoff***

One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

***Pair inner cutoff >= Pair outer cutoff***

The specified cutoffs for the pair style are inconsistent.

***Pair line/lj requires atom style line***

Self-explanatory.

***Pair lj/long/dipole/long requires atom attributes mu, torque***

The atom style defined does not have these attributes.

***Pair lubricate requires atom style sphere***

Self-explanatory.

***Pair lubricate requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Pair lubricate requires monodisperse particles***

All particles must be the same finite size.

***Pair lubricate/poly requires atom style sphere***

Self-explanatory.

***Pair lubricate/poly requires extended particles***

One of the particles has radius 0.0.

***Pair lubricate/poly requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Pair lubricate/poly requires newton pair off***

Self-explanatory.

***Pair lubricateU requires atom style sphere***

Self-explanatory.

***Pair lubricateU requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Pair lubricateU requires monodisperse particles***

All particles must be the same finite size.

***Pair lubricateU/poly requires ghost atoms store velocity***

Use the comm\_modify vel yes command to enable this.

***Pair lubricateU/poly requires newton pair off***

Self-explanatory.

***Pair peri lattice is not identical in x, y, and z***

The lattice defined by the lattice command must be cubic.

***Pair peri requires a lattice be defined***

Use the lattice command for this purpose.

***Pair peri requires an atom map, see atom\_modify***

Even for atomic systems, an atom map is required to find Peridynamic bonds. Use the atom\_modify command to define one.

***Pair resquared epsilon a,b,c coeffs are not all set***

Self-explanatory.

***Pair resquared epsilon and sigma coeffs are not all set***

Self-explanatory.

***Pair resquared requires atom style ellipsoid***

Self-explanatory.

***Pair resquared requires atoms with same type have same shape***

Self-explanatory.

***Pair resquared/gpu requires atom style ellipsoid***

Self-explanatory.

***Pair resquared/gpu requires atoms with same type have same shape***

Self-explanatory.

***Pair style AIREBO requires atom IDs***

This is a requirement to use the AIREBO potential.

***Pair style AIREBO requires newton pair on***

See the newton command. This is a restriction to use the AIREBO potential.

***Pair style BOP requires atom IDs***

This is a requirement to use the BOP potential.

***Pair style BOP requires newton pair on***

See the newton command. This is a restriction to use the BOP potential.

***Pair style COMB requires atom IDs***

This is a requirement to use the AIREBO potential.

***Pair style COMB requires atom attribute q***

Self-explanatory.

***Pair style COMB requires newton pair on***

See the newton command. This is a restriction to use the COMB potential.

***Pair style COMB3 requires atom IDs***

This is a requirement to use the COMB3 potential.

***Pair style COMB3 requires atom attribute q***

Self-explanatory.

***Pair style COMB3 requires newton pair on***

See the newton command. This is a restriction to use the COMB3 potential.

***Pair style LCBOP requires atom IDs***

This is a requirement to use the LCBOP potential.

***Pair style LCBOP requires newton pair on***

See the newton command. This is a restriction to use the Tersoff potential.

***Pair style MEAM requires newton pair on***

See the newton command. This is a restriction to use the MEAM potential.

***Pair style SNAP requires newton pair on***

See the newton command. This is a restriction to use the SNAP potential.

***Pair style Stillinger-Weber requires atom IDs***

This is a requirement to use the SW potential.

***Pair style Stillinger-Weber requires newton pair on***

See the newton command. This is a restriction to use the SW potential.

***Pair style Tersoff requires atom IDs***

This is a requirement to use the Tersoff potential.

***Pair style Tersoff requires newton pair on***

See the newton command. This is a restriction to use the Tersoff potential.

***Pair style Vashishta requires atom IDs***

This is a requirement to use the Vashishta potential.

***Pair style Vashishta requires newton pair on***

See the newton command. This is a restriction to use the Vashishta potential.

***Pair style bop requires comm ghost cutoff at least 3x larger than %g***

Use the communicate ghost command to set this. See the pair bop page for more details.

***Pair style born/coul/long requires atom attribute q***

An atom style that defines this attribute must be used.

***Pair style born/coul/long/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style born/coul/wolf requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style buck/coul/cut requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style buck/coul/long requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style buck/coul/long/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style buck/long/coul/long requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style coul/cut requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style coul/cut/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style coul/debye/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style coul/dsf requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style coul/dsf/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style coul/long/gpu requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style coul/streitz requires atom attribute q***

Self-explanatory.

***Pair style does not have extra field requested by compute pair/local***

The pair style does not support the pN value requested by the compute pair/local command.

***Pair style does not support bond\_style quartic***

The pair style does not have a single() function, so it can not be invoked by bond\_style quartic.

***Pair style does not support compute group/group***

The pair\_style does not have a single() function, so it cannot be invoked by the compute group/group command.

***Pair style does not support compute pair/local***

The pair style does not have a single() function, so it can not be invoked by compute pair/local.

***Pair style does not support compute property/local***

The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

***Pair style does not support fix bond/swap***

The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

***Pair style does not support pair\_write***

The pair style does not have a single() function, so it can not be invoked by pair write.

***Pair style does not support rRESPA inner/middle/outer***

You are attempting to use rRESPA options with a pair style that does not support them.

***Pair style granular with history requires atoms have IDs***

Atoms in the simulation do not have IDs, so history effects cannot be tracked by the granular pair potential.

***Pair style hbond/dreiding requires an atom map, see atom\_modify***

Self-explanatory.

***Pair style hbond/dreiding requires atom IDs***

Self-explanatory.

***Pair style hbond/dreiding requires molecular system***

Self-explanatory.

***Pair style hbond/dreiding requires newton pair on***

See the newton command for details.

***Pair style hybrid cannot have hybrid as an argument***

Self-explanatory.

***Pair style hybrid cannot have none as an argument***

Self-explanatory.

***Pair style is incompatible with KSpace style***

If a pair style with a long-range Coulombic component is selected, then a kspace style must also be used.

***Pair style is incompatible with TIP4P KSpace style***

The pair style does not have the requires TIP4P settings.

***Pair style lj/charmm/coul/charmm requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style lj/charmm/coul/long requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style lj/charmm/coul/long/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/class2/coul/cut requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/class2/coul/long requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/class2/coul/long/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/coul/cut requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/coul/cut/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/coul/debye/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/coul/dsf requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style lj/cut/coul/dsf/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/coul/long requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/coul/long/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/tip4p/cut requires atom IDs***

This is a requirement to use this potential.

***Pair style lj/cut/tip4p/cut requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style lj/cut/tip4p/cut requires newton pair on***

See the newton command. This is a restriction to use this potential.

***Pair style lj/cut/tip4p/long requires atom IDs***

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

***Pair style lj/cut/tip4p/long requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style lj/cut/tip4p/long requires newton pair on***

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

***Pair style lj/gromacs/coul/gromacs requires atom attribute q***

An atom\_style with this attribute is needed.

***Pair style lj/long/dipole/long does not currently support respa***

This feature is not yet supported.

***Pair style lj/long/tip4p/long requires atom IDs***

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

***Pair style lj/long/tip4p/long requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style lj/long/tip4p/long requires newton pair on***

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

***Pair style lj/spica/coul/long/gpu requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style nb3b/harmonic requires atom IDs***

This is a requirement to use this potential.

***Pair style nb3b/harmonic requires newton pair on***

See the newton command. This is a restriction to use this potential.

***Pair style nm/cut/coul/cut requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style nm/cut/coul/long requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style peri requires atom style peri***

Self-explanatory.

***Pair style polymorphic requires atom IDs***

This is a requirement to use the polymorphic potential.

***Pair style polymorphic requires newton pair on***

See the newton command. This is a restriction to use the polymorphic potential.

***Pair style reax requires atom IDs***

This is a requirement to use the ReaxFF potential.

***Pair style reax requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style reax requires newton pair on***

This is a requirement to use the ReaxFF potential.

***Pair style requires a KSpace style***

No kspace style is defined.

***Pair style requires use of kspace\_style ewald/disp***

Self-explanatory.

***Pair style sw/gpu requires atom IDs***

This is a requirement to use this potential.

***Pair style sw/gpu requires newton pair off***

See the newton command. This is a restriction to use this potential.

***Pair style vashishta/gpu requires atom IDs***

This is a requirement to use this potential.

***Pair style vashishta/gpu requires newton pair off***

See the newton command. This is a restriction to use this potential.

***Pair style tersoff/gpu requires atom IDs***

This is a requirement to use the tersoff/gpu potential.

***Pair style tersoff/gpu requires newton pair off***

See the newton command. This is a restriction to use this pair style.

***Pair style tip4p/cut requires atom IDs***

This is a requirement to use this potential.

***Pair style tip4p/cut requires atom attribute q***

The atom style defined does not have this attribute.

***Pair style tip4p/cut requires newton pair on***

See the newton command. This is a restriction to use this potential.

***Pair style tip4p/long requires atom IDs***

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

***Pair style tip4p/long requires atom attribute q***

The atom style defined does not have these attributes.

***Pair style tip4p/long requires newton pair on***

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

***Pair table cutoffs must all be equal to use with KSpace***

When using pair style table with a long-range KSpace solver, the cutoffs for all atom type pairs must all be the same, since the long-range solver starts at that cutoff.

***Pair table parameters did not set N***

List of pair table parameters must include N setting.

***Pair tersoff/zbl requires metal or real units***

This is a current restriction of this pair potential.

***Pair tersoff/zbl/kk requires metal or real units***

This is a current restriction of this pair potential.

***Pair tri/lj requires atom style tri***

Self-explanatory.

***Pair yukawa/colloid requires atom style sphere***

Self-explanatory.

***Pair yukawa/colloid requires atoms with same type have same radius***

Self-explanatory.

***Pair yukawa/colloid/gpu requires atom style sphere***

Self-explanatory.

***PairKIM only works with 3D problems***

This is a current limitation.

***Pair\_coeff command before pair\_style is defined***

Self-explanatory.

***Pair\_coeff command before simulation box is defined***

The pair\_coeff command cannot be used before a read\_data, read\_restart, or create\_box command.

***Pair\_modify command before pair\_style is defined***

Self-explanatory.

***Pair\_modify special setting for pair hybrid incompatible with global special\_bonds setting***

Cannot override a setting of 0.0 or 1.0 or change a setting between 0.0 and 1.0.

***Pair\_write command before pair\_style is defined***

Self-explanatory.

***Particle on or inside fix wall surface***

Particles must be “exterior” to the wall in order for energy/force to be calculated.

***Particle outside surface of region used in fix wall/region***

Particles must be inside the region for energy/force to be calculated. A particle outside the region generates an error.

***Per-atom compute in equal-style variable formula***

Equal-style variables cannot use per-atom quantities.

***Per-atom energy was not tallied on needed timestep***

You are using a thermo keyword that requires potentials to have tallied energy, but they did not on this timestep. See the variable page for ideas on how to make this work.

***Per-atom fix in equal-style variable formula***

Equal-style variables cannot use per-atom quantities.

***Per-atom virial was not tallied on needed timestep***

You are using a thermo keyword that requires potentials to have tallied the virial, but they did not on this timestep. See the variable page for ideas on how to make this work.

***Per-processor system is too big***

The number of owned atoms plus ghost atoms on a single processor must fit in 32-bit integer.

***Potential energy ID for fix neb does not exist***

Self-explanatory.

***Potential energy ID for fix nvt/nph/npt does not exist***

A compute for potential energy must be defined.

***Potential file has duplicate entry***

The potential file has more than one entry for the same element.

***Potential file is missing an entry***

The potential file does not have a needed entry.

***Power by 0 in variable formula***

Self-explanatory.

***Pressure ID for fix box/relax does not exist***

The compute ID needed to compute pressure for the fix does not exist.

***Pressure ID for fix modify does not exist***

Self-explanatory.

***Pressure ID for fix npt/nph does not exist***

Self-explanatory.

***Pressure ID for fix press/berendsen does not exist***

The compute ID needed to compute pressure for the fix does not exist.

***Pressure ID for fix rigid npt/nph does not exist***

Self-explanatory.

***Pressure ID for thermo does not exist***

The compute ID needed to compute pressure for thermodynamics does not exist.

***Pressure control can not be used with fix nvt***

Self-explanatory.

***Pressure control can not be used with fix nvt/asphere***

Self-explanatory.

***Pressure control can not be used with fix nvt/body***

Self-explanatory.

***Pressure control can not be used with fix nvt/sllod***

Self-explanatory.

***Pressure control can not be used with fix nvt/sphere***

Self-explanatory.

***Pressure control must be used with fix nph***

Self-explanatory.

***Pressure control must be used with fix nph/asphere***

Self-explanatory.

***Pressure control must be used with fix nph/body***

Self-explanatory.

***Pressure control must be used with fix nph/small***

Self-explanatory.

***Pressure control must be used with fix nph/sphere***

Self-explanatory.

***Pressure control must be used with fix nphug***

A pressure control keyword (iso, aniso, tri, x, y, or z) must be provided.

***Pressure control must be used with fix npt***

Self-explanatory.

***Pressure control must be used with fix npt/asphere***

Self-explanatory.

***Pressure control must be used with fix npt/body***

Self-explanatory.

***Pressure control must be used with fix npt/sphere***

Self-explanatory.

***Processor count in z must be 1 for 2d simulation***

Self-explanatory.

***Processor partitions do not match number of allocated processors***

The total number of processors in all partitions must match the number of processors LAMMPS is running on.

***Processors command after simulation box is defined***

The processors command cannot be used after a read\_data, read\_restart, or create\_box command.

***Processors custom grid file is inconsistent***

The vales in the custom file are not consistent with the number of processors you are running on or the Px,Py,Pz settings of the processors command. Or there was not a setting for every processor.

***Processors grid numa and map style are incompatible***

Using numa for gstyle in the processors command requires using cart for the map option.

***Processors part option and grid style are incompatible***

Cannot use gstyle numa or custom with the part option.

***Processors twogrid requires proc count be a multiple of core count***

Self-explanatory.

***Pstart and Pstop must have the same value***

Self-explanatory.

***Python function evaluation failed***

The Python function did not run successfully and/or did not return a value (if it is supposed to return a value). This is probably due to some error condition in the function.

***Python function is not callable***

The provided Python code was run successfully, but it not define a callable function with the required name.

***Python invoke of undefined function***

Cannot invoke a function that has not been previously defined.

***Python variable does not match Python function***

This matching is defined by the python-style variable and the python command.

***Python variable has no function***

No python command was used to define the function associated with the python-style variable.

***QEQ with 'newton pair off' not supported***

See the newton command. This is a restriction to use the QEQ fixes.

***R0 < 0 for fix spring command***

Equilibrium spring length is invalid.

***RATTLE coordinate constraints are not satisfied up to desired tolerance***

Self-explanatory.

***RATTLE determinant = 0.0***

The determinant of the matrix being solved for a single cluster specified by the fix rattle command is numerically invalid.

***RATTLE failed***

Certain constraints were not satisfied.

***RATTLE velocity constraints are not satisfied up to desired tolerance***

Self-explanatory.

***Read data add offset is too big***

It cannot be larger than the size of atom IDs, e.g. the maximum 32-bit integer.

***Read dump of atom property that is not allocated***

Self-explanatory.

***Read rerun dump file timestep > specified stop***

Self-explanatory.

***Read restart MPI-IO input not allowed with % in filename***

This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

***Read\_data shrink wrap did not assign all atoms correctly***

This is typically because the box-size specified in the data file is large compared to the actual extent of atoms in a shrink-wrapped dimension. When LAMMPS shrink-wraps the box atoms will be lost if the processor they are re-assigned to is too far away. Choose a box size closer to the actual extent of the atoms.

***Read\_dump command before simulation box is defined***

The read\_dump command cannot be used before a read\_data, read\_restart, or create\_box command.

***Read\_dump field not found in dump file***

Self-explanatory.

***Read\_dump triclinic status does not match simulation***

Both the dump snapshot and the current LAMMPS simulation must be using either an orthogonal or triclinic box.

***Read\_dump xyz fields do not have consistent scaling/wrapping***

Self-explanatory.

***Reading from MPI-IO filename when MPIIO package is not installed***

Self-explanatory.

***Reax\_defs.h setting for NATDEF is too small***

Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

***Reax\_defs.h setting for NNEIGHMAXDEF is too small***

Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

***Receiving partition in processors part command is already a receiver***

Cannot specify a partition to be a receiver twice.

***Region ID for compute chunk/atom does not exist***

Self-explanatory.

***Region ID for compute reduce/region does not exist***

Self-explanatory.

***Region ID for compute temp/region does not exist***

Self-explanatory.

***Region ID for dump custom does not exist***

Self-explanatory.

***Region ID for fix addforce does not exist***

Self-explanatory.

***Region ID for fix atom/swap does not exist***

Self-explanatory.

***Region ID for fix ave/spatial does not exist***

Self-explanatory.

***Region ID for fix aveforce does not exist***

Self-explanatory.

***Region ID for fix deposit does not exist***

Self-explanatory.

***Region ID for fix efield does not exist***

Self-explanatory.

***Region ID for fix evaporate does not exist***

Self-explanatory.

***Region ID for fix gcmc does not exist***

Self-explanatory.

***Region ID for fix heat does not exist***

Self-explanatory.

***Region ID for fix setforce does not exist***

Self-explanatory.

***Region ID for fix wall/region does not exist***

Self-explanatory.

***Region ID for group dynamic does not exist***

Self-explanatory.

***Region ID in variable formula does not exist***

Self-explanatory.

***Region cannot have 0 length rotation vector***

Self-explanatory.

***Region for fix oneway does not exist***

Self-explanatory.

***Region intersect region ID does not exist***

Self-explanatory.

***Region union or intersect cannot be dynamic***

The sub-regions can be dynamic, but not the combined region.

***Region union region ID does not exist***

One or more of the region IDs specified by the region union command does not exist.

***Replacing a fix, but new style != old style***

A fix ID can be used a second time, but only if the style matches the previous fix. In this case it is assumed you wish to reset a fix's parameters. This error may mean you are mistakenly re-using a fix ID when you do not intend to.

***Replicate command before simulation box is defined***

The replicate command cannot be used before a read\_data, read\_restart, or create\_box command.

***Replicate did not assign all atoms correctly***

Atoms replicated by the replicate command were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

***Replicated system atom IDs are too big***

See the setting for tagint in the src/lmptype.h file.

***Replicated system is too big***

See the setting for bigint in the src/lmptype.h file.

***Required border comm not yet implemented with Kokkos***

There are various limitations in the communication options supported by Kokkos.

***Rerun command before simulation box is defined***

The rerun command cannot be used before a read\_data, read\_restart, or create\_box command.

***Rerun dump file does not contain requested snapshot***

Self-explanatory.

***Resetting timestep size is not allowed with fix move***

This is because fix move is moving atoms based on elapsed time.

***Respa inner cutoffs are invalid***

The first cutoff must be  $\leq$  the second cutoff.

***Respa levels must be  $\geq 1$*** 

Self-explanatory.

***Respa middle cutoffs are invalid***

The first cutoff must be  $\leq$  the second cutoff.

***Restart file MPI-IO output not allowed with % in filename***

This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

***Restart file byte ordering is not recognized***

The file does not appear to be a LAMMPS restart file since it does not contain a recognized byte-ordering flag at the beginning.

***Restart file byte ordering is swapped***

The file was written on a machine with different byte-ordering than the machine you are reading it on. Convert it to a text data file instead, on the machine you wrote it on.

***Restart file incompatible with current version***

This is probably because you are trying to read a file created with a version of LAMMPS that is too old compared to the current version. Use your older version of LAMMPS and convert the restart file to a data file.

***Restart file is a MPI-IO file***

The file is inconsistent with the filename you specified for it.

***Restart file is a multi-proc file***

The file is inconsistent with the filename you specified for it.

***Restart file is not a MPI-IO file***

The file is inconsistent with the filename you specified for it.

***Restart file is not a multi-proc file***

The file is inconsistent with the filename you specified for it.

***Restart variable returned a bad timestep***

The variable must return a timestep greater than the current timestep.

***Restrain atoms %d %d %d %d missing on proc %d at step %ld***

The 4 atoms in a restrain dihedral specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

***Restrain atoms %d %d %d missing on proc %d at step %ld***

The 3 atoms in a restrain angle specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

***Restrain atoms %d %d missing on proc %d at step %ld***

The 2 atoms in a restrain bond specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

***Reuse of compute ID***

A compute ID cannot be used twice.

***Reuse of dump ID***

A dump ID cannot be used twice.

***Reuse of molecule template ID***

The template IDs must be unique.

***Reuse of region ID***

A region ID cannot be used twice.

***Rigid body atoms %d %d missing on proc %d at step %ld***

This means that an atom cannot find the atom that owns the rigid body it is part of, or vice versa. The solution is to use the communicate cutoff command to insure ghost atoms are acquired from far enough away to encompass the max distance printed when the fix rigid/small command was invoked.

***Rigid body has degenerate moment of inertia***

Fix poems will only work with bodies (collections of atoms) that have non-zero principal moments of inertia. This means they must be 3 or more non-collinear atoms, even with joint atoms removed.

***Rigid fix must come before NPT/NPH fix***

NPT/NPH fix must be defined in input script after all rigid fixes, else the rigid fix contribution to the pressure virial is incorrect.

***Rmask function in equal-style variable formula***

Rmask is per-atom operation.

***Run command before simulation box is defined***

The run command cannot be used before a read\_data, read\_restart, or create\_box command.

***Run command start value is after start of run***

Self-explanatory.

***Run command stop value is before end of run***

Self-explanatory.

***Run\_style command before simulation box is defined***

The run\_style command cannot be used before a read\_data, read\_restart, or create\_box command.

***SRD bin size for fix srd differs from user request***

Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

***SRD bins for fix srd are not cubic enough***

The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

***SRD particle %d started inside big particle %d on step %ld bounce %d***

See the inside keyword if you want this message to be an error vs warning.

***SRD particle %d started inside wall %d on step %ld bounce %d***

See the inside keyword if you want this message to be an error vs warning.

***Same dimension twice in fix ave/spatial***

Self-explanatory.

***Sending partition in processors part command is already a sender***

Cannot specify a partition to be a sender twice.

***Set command before simulation box is defined***

The set command cannot be used before a read\_data, read\_restart, or create\_box command.

***Set command floating point vector does not exist***

Self-explanatory.

***Set command integer vector does not exist***

Self-explanatory.

***Set command with no atoms existing***

No atoms are yet defined so the set command cannot be used.

***Set region ID does not exist***

Region ID specified in set command does not exist.

***Shake angles have different bond types***

All 3-atom angle-constrained SHAKE clusters specified by the fix shake command that are the same angle type, must also have the same bond types for the 2 bonds in the angle.

***Shake atoms %d %d %d %d missing on proc %d at step %ld***

The 4 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

***Shake atoms %d %d %d missing on proc %d at step %ld***

The 3 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

***Shake atoms %d %d missing on proc %d at step %ld***

The 2 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

***Shake cluster of more than 4 atoms***

A single cluster specified by the fix shake command can have no more than 4 atoms.

***Shake clusters are connected***

A single cluster specified by the fix shake command must have a single central atom with up to 3 other atoms bonded to it.

***Shake determinant = 0.0***

The determinant of the matrix being solved for a single cluster specified by the fix shake command is numerically invalid.

***Shake fix must come before NPT/NPH fix***

NPT fix must be defined in input script after SHAKE fix, else the SHAKE fix contribution to the pressure virial is incorrect.

***Shear history overflow, boost neigh\_modify one***

There are too many neighbors of a single atom. Use the neigh\_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

***Small to big integers are not sized correctly***

This error occurs when the sizes of smallint, imageint, tagint, bigint, as defined in src/lmptype.h are not what is expected. Contact the developers if this occurs.

***Smallint setting in lmptype.h is invalid***

It has to be the size of an integer.

***Smallint setting in lmptype.h is not compatible***

Smallint stored in restart file is not consistent with LAMMPS version you are running.

***Special list size exceeded in fix bond/create***

See the “read\_data extra/special/per/atom” command (or the “create\_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

***Species XXX is not supported by this KIM Simulator Model***

The kim\_style define command was referencing a species that is not present in the requested KIM Simulator Model.

***Specified processors != physical processors***

The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

***Specified target stress must be uniaxial or hydrostatic***

Self-explanatory.

***Sqrt of negative value in variable formula***

Self-explanatory.

***Subsequent read data induced too many angles per atom***

See the extra/angle/per/atom keyword for the create\_box or the read\_data command to set this limit larger

***Subsequent read data induced too many bonds per atom***

See the extra/bond/per/atom keyword for the create\_box or the read\_data command to set this limit larger

***Subsequent read data induced too many dihedrals per atom***

See the extra/dihedral/per/atom keyword for the create\_box or the read\_data command to set this limit larger

***Subsequent read data induced too many improper per atom***

See the extra/improper/per/atom keyword for the create\_box or the read\_data command to set this limit larger

***Substitution for illegal variable***

Input script line contained a variable that could not be substituted for.

***Support for writing images in JPEG format not included***

LAMMPS was not built with the -DLAMMPS\_JPEG switch in the Makefile.

***Support for writing images in PNG format not included***

LAMMPS was not built with the -DLAMMPS\_PNG switch in the Makefile.

***Support for writing movies not included***

LAMMPS was not built with the -DLAMMPS\_FFmpeg switch in the Makefile

***System in data file is too big***

See the setting for bigint in the src/lmptype.h file.

***System is not charge neutral, net charge = %g***

The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is an error.

***TAD nsteps must be multiple of t\_event***

Self-explanatory.

***TIP4P hydrogen has incorrect atom type***

The TIP4P pairwise computation found an H atom whose type does not agree with the specified H type.

***TIP4P hydrogen is missing***

The TIP4P pairwise computation failed to find the correct H atom within a water molecule.

***TMD target file did not list all group atoms***

The target file for the fix tmd command did not list all atoms in the fix group.

***Tad command before simulation box is defined***

Self-explanatory.

***Tagint setting in lmptype.h is invalid***

Tagint must be as large or larger than smallint.

***Tagint setting in lmptype.h is not compatible***

Format of tagint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

***Target pressure for fix rigid/nph cannot be < 0.0***

Self-explanatory.

***Target pressure for fix rigid/npt/small cannot be < 0.0***

Self-explanatory.

***Target temperature for fix nvt/npt/nph cannot be 0.0***

Self-explanatory.

***Target temperature for fix rigid/npt cannot be 0.0***

Self-explanatory.

***Target temperature for fix rigid/npt/small cannot be 0.0***

Self-explanatory.

***Target temperature for fix rigid/nvt cannot be 0.0***

Self-explanatory.

***Target temperature for fix rigid/nvt/small cannot be 0.0***

Self-explanatory.

***Temper command before simulation box is defined***

The temper command cannot be used before a read\_data, read\_restart, or create\_box command.

***Temperature ID for fix bond/swap does not exist***

Self-explanatory.

***Temperature ID for fix box/relax does not exist***

Self-explanatory.

***Temperature ID for fix nvt/npt does not exist***

Self-explanatory.

***Temperature ID for fix press/berendsen does not exist***

Self-explanatory.

***Temperature ID for fix rigid nvt/npt/nph does not exist***

Self-explanatory.

***Temperature ID for fix temp/berendsen does not exist***

Self-explanatory.

***Temperature ID for fix temp/csld does not exist***

Self-explanatory.

***Temperature ID for fix temp/csvr does not exist***

Self-explanatory.

***Temperature ID for fix temp/rescale does not exist***

Self-explanatory.

***Temperature compute degrees of freedom < 0***

This should not happen if you are calculating the temperature on a valid set of atoms.

***Temperature control can not be used with fix nph***

Self-explanatory.

***Temperature control can not be used with fix nph/asphere***

Self-explanatory.

***Temperature control can not be used with fix nph/body***

Self-explanatory.

***Temperature control can not be used with fix nph/sphere***

Self-explanatory.

***Temperature control must be used with fix nphug***

The temp keyword must be provided.

***Temperature control must be used with fix npt***

Self-explanatory.

***Temperature control must be used with fix npt/asphere***

Self-explanatory.

***Temperature control must be used with fix npt/body***

Self-explanatory.

***Temperature control must be used with fix npt/sphere***

Self-explanatory.

***Temperature control must be used with fix nvt***

Self-explanatory.

***Temperature control must be used with fix nvt/asphere***

Self-explanatory.

***Temperature control must be used with fix nvt/body***

Self-explanatory.

***Temperature control must be used with fix nvt/sllod***

Self-explanatory.

***Temperature control must be used with fix nvt/sphere***

Self-explanatory.

***Temperature control must not be used with fix nph/small***

Self-explanatory.

***Temperature for fix nvt/sllod does not have a bias***

The specified compute must compute temperature with a bias.

***Tempering could not find thermo\_pe compute***

This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

***Tempering fix ID is not defined***

The fix ID specified by the temper command does not exist.

***Tempering temperature fix is not valid***

The fix specified by the temper command is not one that controls temperature (nvt or langevin).

***Test\_descriptor\_string already allocated***

This is an internal error. Contact the developers.

***The package gpu command is required for gpu styles***

Self-explanatory.

***Thermo and fix not computed at compatible times***

Fixes generate values on specific timesteps. The thermo output does not match these timesteps.

***Thermo compute array is accessed out-of-range***

Self-explanatory.

***Thermo compute does not compute array***

Self-explanatory.

***Thermo compute does not compute scalar***

Self-explanatory.

***Thermo compute does not compute vector***

Self-explanatory.

***Thermo compute vector is accessed out-of-range***

Self-explanatory.

***Thermo custom variable cannot be indexed***

Self-explanatory.

***Thermo custom variable is not equal-style variable***

Only equal-style variables can be output with thermodynamics, not atom-style variables.

***Thermo every variable returned a bad timestep***

The variable must return a timestep greater than the current timestep.

***Thermo fix array is accessed out-of-range***

Self-explanatory.

***Thermo fix does not compute array***

Self-explanatory.

***Thermo fix does not compute scalar***

Self-explanatory.

***Thermo fix does not compute vector***

Self-explanatory.

***Thermo fix vector is accessed out-of-range***

Self-explanatory.

***Thermo keyword in variable requires thermo to use/init pe***

You are using a thermo keyword in a variable that requires potential energy to be calculated, but your thermo output does not use it. Add it to your thermo output.

***Thermo keyword in variable requires thermo to use/init press***

You are using a thermo keyword in a variable that requires pressure to be calculated, but your thermo output does not use it. Add it to your thermo output.

***Thermo keyword in variable requires thermo to use/init temp***

You are using a thermo keyword in a variable that requires temperature to be calculated, but your thermo output does not use it. Add it to your thermo output.

***Thermo style does not use press***

Cannot use thermo\_modify to set this parameter since the thermo\_style is not computing this quantity.

***Thermo style does not use temp***

Cannot use thermo\_modify to set this parameter since the thermo\_style is not computing this quantity.

***Thermo\_modify every variable returned a bad timestep***

The returned timestep is less than or equal to the current timestep.

***Thermo\_modify int format does not contain d character***

Self-explanatory.

***Thermo\_modify pressure ID does not compute pressure***

The specified compute ID does not compute pressure.

***Thermo\_modify temperature ID does not compute temperature***

The specified compute ID does not compute temperature.

***Thermo\_style command before simulation box is defined***

The thermo\_style command cannot be used before a read\_data, read\_restart, or create\_box command.

***This variable thermo keyword cannot be used between runs***

Keywords that refer to time (such as cpu, elapsed) do not make sense in between runs.

***Threshold for an atom property that is not allocated***

A dump threshold has been requested on a quantity that is not defined by the atom style used in this simulation.

***Timestep must be >= 0***

Specified timestep is invalid.

***Too big a problem to use velocity create loop all***

The system size must fit in a 32-bit integer to use this option.

***Too big a timestep for dump dcd***

The timestep must fit in a 32-bit integer to use this dump style.

***Too big a timestep for dump xtc***

The timestep must fit in a 32-bit integer to use this dump style.

***Too few bits for lookup table***

Table size specified via pair\_modify command does not work with your machine's floating point representation.

***Too few lines in %s section of data file***

Self-explanatory.

***Too few values in body lines in data file***

Self-explanatory.

***Too few values in body section of molecule file***

Self-explanatory.

***Too many -pk arguments in command line***

The string formed by concatenating the arguments is too long. Use a package command in the input script instead.

***Too many MSM grid levels***

The max number of MSM grid levels is hardwired to 10.

***Too many args in variable function***

More args are used than any variable function allows.

***Too many atom pairs for pair bop***

The number of atomic pairs exceeds the expected number. Check your atomic structure to ensure that it is realistic.

***Too many atom sorting bins***

This is likely due to an immense simulation box that has blown up to a large size.

***Too many atom triplets for pair bop***

The number of three atom groups for angle determinations exceeds the expected number. Check your atomic structure to ensure that it is realistic.

***Too many atoms for dump dcd***

The system size must fit in a 32-bit integer to use this dump style.

***Too many atoms for dump xtc***

The system size must fit in a 32-bit integer to use this dump style.

***Too many elements extracted from MEAM library.***

Increase 'maxelt' in meam.h and recompile.

***Too many exponent bits for lookup table***

Table size specified via pair\_modify command does not work with your machine's floating point representation.

***Too many groups***

The maximum number of atom groups (including the "all" group) is given by MAX\_GROUP in group.cpp and is 32.

***Too many iterations***

You must use a number of iterations that fit in a 32-bit integer for minimization.

***Too many lines in one body in data file - boost MAXBODY***

MAXBODY is a setting at the top of the src/read\_data.cpp file. Set it larger and re-compile the code.

***Too many local+ghost atoms for neighbor list***

The number of nlocal + nghost atoms on a processor is limited by the size of a 32-bit integer with 2 bits removed for masking 1-2, 1-3, 1-4 neighbors.

***Too many mantissa bits for lookup table***

Table size specified via pair\_modify command does not work with your machine's floating point representation.

***Too many masses for fix shake***

The fix shake command cannot list more masses than there are atom types.

***Too many molecules for fix poems***

The limit is  $2^{31} = \sim 2$  billion molecules.

***Too many molecules for fix rigid***

The limit is  $2^{31} = \sim 2$  billion molecules.

***Too many neighbor bins***

This is likely due to an immense simulation box that has blown up to a large size.

***Too many timesteps***

The cumulative timesteps must fit in a 64-bit integer.

***Too many timesteps for NEB***

You must use a number of timesteps that fit in a 32-bit integer for NEB.

***Too many total atoms***

See the setting for bigint in the src/lmptype.h file.

***Too many total bits for bitmapped lookup table***

Table size specified via pair\_modify command is too large. Note that a value of N generates a  $2^N$  size table.

***Too many values in body lines in data file***

Self-explanatory.

***Too many values in body section of molecule file***

Self-explanatory.

***Too much buffered per-proc info for dump***

The size of the buffered string must fit in a 32-bit integer for a dump.

***Too much per-proc info for dump***

Number of local atoms times number of columns must fit in a 32-bit integer for dump.

***Topology type exceeds system topology type***

The number of bond, angle, etc types exceeds the system setting. See the create\_box or read\_data command for how to specify these values.

***Tree structure in joint connections***

Fix poems cannot (yet) work with coupled bodies whose joints connect the bodies in a tree structure.

***Triclinic box skew is too large***

The displacement in a skewed direction must be less than half the box length in that dimension. E.g. the xy tilt must be between -half and +half of the x box length. This constraint can be relaxed by using the box tilt command.

***Tried to convert a double to int, but input\_double > INT\_MAX***

Self-explanatory.

***Trying to build an occasional neighbor list before initialization completed***

This is not allowed. Source code caller needs to be modified.

***Two fix ave commands using same compute chunk/atom command in incompatible ways***

They are both attempting to “lock” the chunk/atom command so that the chunk assignments persist for some number of timesteps, but are doing it in different ways.

***Two groups cannot be the same in fix spring couple***

Self-explanatory.

***The %s type label %s is already in use for type %s***

For a given type-kind (atom types, bond types, etc.), a given type label can be assigned to only one numeric type.

***Type label string %s for %s type %s is invalid***

See the labelmap command documentation for valid type labels.

***Unable to initialize accelerator for use***

There was a problem initializing an accelerator for the gpu package

***Unbalanced quotes in input line***

No matching end double quote was found following a leading double quote.

***Unexpected end of -reorder file***

Self-explanatory.

***Unexpected empty line in Angle Coeffs section***

Read a blank line where there should be coefficient data.

***Unexpected empty line in Bond Coeffs section***

Read a blank line where there should be coefficient data.

***Unexpected empty line in Dihedral Coeffs section***

Read a blank line where there should be coefficient data.

***Unexpected empty line in Improper Coeffs section***

Read a blank line where there should be coefficient data.

***Unexpected empty line in Pair Coeffs section***

Read a blank line where there should be coefficient data.

***Unexpected end of custom file***

Self-explanatory.

***Unexpected end of data file***

LAMMPS hit the end of the data file while attempting to read a section. Something is wrong with the format of the data file.

***Unexpected end of dump file***

A read operation from the file failed.

***Unexpected end of fix rigid file***

A read operation from the file failed.

***Unexpected end of fix rigid/small file***

A read operation from the file failed.

***Unexpected end of molecule file***

Self-explanatory.

***Unexpected end of neb file***

A read operation from the file failed.

***Units command after simulation box is defined***

The units command cannot be used after a read\_data, read\_restart, or create\_box command.

***Universe/uloop variable count < # of partitions***

A universe or uloop style variable must specify a number of values  $\geq$  to the number of processor partitions.

***Unrecognized angle style***

The choice of angle style is unknown.

***Unrecognized atom style***

The choice of atom style is unknown.

***Unrecognized body style***

The choice of body style is unknown.

***Unrecognized bond style***

The choice of bond style is unknown.

***Unknown category for info is\_active()***

Self-explanatory.

***Unknown category for info is\_available()***

Self-explanatory.

***Unknown category for info is\_defined()***

Self-explanatory.

***Unrecognized command: %s***

The command is not known to LAMMPS. Check the input script.

***Unrecognized compute style***

The choice of compute style is unknown.

***Unrecognized dihedral style***

The choice of dihedral style is unknown.

***Unrecognized dump reader style***

The choice of dump reader style via the format keyword is unknown.

***Unrecognized dump style***

The choice of dump style is unknown.

***Unknown error in GPU library***

Self-explanatory.

***Unrecognized fix style***

The choice of fix style is unknown.

***Unknown identifier in data file: %s***

A section of the data file cannot be read by LAMMPS.

***Unrecognized improper style***

The choice of improper style is unknown.

***Unknown keyword in thermo\_style custom command***

One or more specified keywords are not recognized.

***Unrecognized kspace style***

The choice of kspace style is unknown.

***Unknown name for info newton category***

Self-explanatory.

***Unknown name for info package category***

Self-explanatory.

***Unknown name for info pair category***

Self-explanatory.

***Unrecognized pair style***

The choice of pair style is unknown.

***Unknown pair\_modify hybrid sub-style***

The choice of sub-style is unknown.

***Unrecognized region style***

The choice of region style is unknown.

***Unknown section in molecule file***

Self-explanatory.

***Unknown table style in angle style table***

Self-explanatory.

***Unknown table style in bond style table***

Self-explanatory.

***Unknown table style in pair\_style command***

Style of table is invalid for use with pair\_style table command.

***Unknown unit\_style***

Self-explanatory. Check the input script or data file.

***Unrecognized lattice type in MEAM library file***

The lattice type in an entry of the MEAM library file is not valid.

***Unrecognized lattice type in MEAM parameter file***

The lattice type in an entry of the MEAM parameter file is not valid.

***Unrecognized pair style in compute pair command***

Self-explanatory.

***Unsupported mixing rule in kspace\_style ewald/disp***

Only geometric mixing is supported.

***Unsupported order in kspace\_style ewald/disp***

Only  $1/r^6$  dispersion or dipole terms are supported.

***Unsupported order in kspace\_style ppm/disp, pair\_style %s***

Only pair styles with  $1/r$  and  $1/r^6$  dependence are currently supported.

***Unsupported parameter in MEAM library file***

Self-explanatory.

***Use cutoff keyword to set cutoff in single mode***

Mode is single so cutoff/multi keyword cannot be used.

***Use cutoff/multi keyword to set cutoff in multi mode***

Mode is multi so cutoff keyword cannot be used.

***Using fix nvt/sllod with inconsistent fix deform remap option***

Fix nvt/sllod requires that deforming atoms have a velocity profile provided by “remap v” as a fix deform option.

***Using fix nvt/sllod with no fix deform defined***

Self-explanatory.

***Using fix srd with inconsistent fix deform remap option***

When shearing the box in an SRD simulation, the remap v option for fix deform needs to be used.

***Using pair lubricate with inconsistent fix deform remap option***

Must use remap v option with fix deform with this pair style.

***Using pair lubricate/poly with inconsistent fix deform remap option***

If fix deform is used, the remap v option is required.

***Using suffix gpu without GPU package installed***

Self-explanatory.

***Using suffix intel without INTEL package installed***

Self-explanatory.

***Using suffix kk without KOKKOS package enabled***

Self-explanatory.

***Using suffix omp without OPENMP package installed***

Self-explanatory.

***Using update dipole flag requires atom attribute mu***

Self-explanatory.

***Using update dipole flag requires atom style sphere***

Self-explanatory.

***Variable ID in variable formula does not exist***

Self-explanatory.

***Variable atom ID is too large***

Specified ID is larger than the maximum allowed atom ID.

***Variable evaluation before simulation box is defined***

Cannot evaluate a compute or fix or atom-based value in a variable before the simulation has been setup.

***Variable evaluation in fix wall gave bad value***

The returned value for epsilon or sigma < 0.0.

***Variable evaluation in region gave bad value***

Variable returned a radius < 0.0.

***Variable for compute ti is invalid style***

Self-explanatory.

***Variable for create\_atoms is invalid style***

The variables must be equal-style variables.

***Variable for displace\_atoms is invalid style***

It must be an equal-style or atom-style variable.

***Variable for dump every is invalid style***

Only equal-style variables can be used.

***Variable for dump image center is invalid style***

Must be an equal-style variable.

***Variable for dump image phi is invalid style***

Must be an equal-style variable.

***Variable for dump image theta is invalid style***

Must be an equal-style variable.

***Variable for dump image zoom is invalid style***

Must be an equal-style variable.

***Variable for fix adapt is invalid style***

Only equal-style variables can be used.

***Variable for fix addforce is invalid style***

Self-explanatory.

***Variable for fix aveforce is invalid style***

Only equal-style variables can be used.

***Variable for fix deform is invalid style***

The variable must be an equal-style variable.

***Variable for fix efield is invalid style***

The variable must be an equal- or atom-style variable.

***Variable for fix gravity is invalid style***

Only equal-style variables can be used.

***Variable for fix heat is invalid style***

Only equal-style or atom-style variables can be used.

***Variable for fix indent is invalid style***

Only equal-style variables can be used.

***Variable for fix indent is not equal style***

Only equal-style variables can be used.

***Variable for fix langevin is invalid style***

It must be an equal-style variable.

***Variable for fix move is invalid style***

Only equal-style variables can be used.

***Variable for fix setforce is invalid style***

Only equal-style variables can be used.

***Variable for fix temp/berendsen is invalid style***

Only equal-style variables can be used.

***Variable for fix temp/csld is invalid style***

Only equal-style variables can be used.

***Variable for fix temp/csvr is invalid style***

Only equal-style variables can be used.

***Variable for fix temp/rescale is invalid style***

Only equal-style variables can be used.

***Variable for fix wall is invalid style***

Only equal-style variables can be used.

***Variable for fix wall/reflect is invalid style***

Only equal-style variables can be used.

***Variable for fix wall/srd is invalid style***

Only equal-style variables can be used.

***Variable for group dynamic is invalid style***

The variable must be an atom-style variable.

***Variable for group is invalid style***

Only atom-style variables can be used.

***Variable for region cylinder is invalid style***

Only equal-style variables are allowed.

***Variable for region is invalid style***

Only equal-style variables can be used.

***Variable for region is not equal style***

Self-explanatory.

***Variable for region sphere is invalid style***

Only equal-style variables are allowed.

***Variable for restart is invalid style***

Only equal-style variables can be used.

***Variable for set command is invalid style***

Only atom-style variables can be used.

***Variable for thermo every is invalid style***

Only equal-style variables can be used.

***Variable for velocity set is invalid style***

Only atom-style variables can be used.

***Variable for voronoi radius is not atom style***

Self-explanatory.

***Variable formula compute array is accessed out-of-range***

Self-explanatory.

***Variable formula compute vector is accessed out-of-range***

Self-explanatory.

***Variable formula fix array is accessed out-of-range***

Self-explanatory.

***Variable formula fix vector is accessed out-of-range***

Self-explanatory.

***Variable has circular dependency***

A circular dependency is when variable “a” is used by variable “b” and variable “b” is also used by variable “a”. Circular dependencies with longer chains of dependence are also not allowed.

***Variable name between brackets must be alphanumeric or underscore characters***

Self-explanatory.

***Variable name for compute chunk/atom does not exist***

Self-explanatory.

***Variable name for compute reduce does not exist***

Self-explanatory.

***Variable name for compute ti does not exist***

Self-explanatory.

***Variable name for create\_atoms does not exist***

Self-explanatory.

***Variable name for displace\_atoms does not exist***

Self-explanatory.

***Variable name for dump every does not exist***

Self-explanatory.

***Variable name for dump image center does not exist***

Self-explanatory.

***Variable name for dump image phi does not exist***

Self-explanatory.

***Variable name for dump image theta does not exist***

Self-explanatory.

***Variable name for dump image zoom does not exist***

Self-explanatory.

***Variable name for fix adapt does not exist***

Self-explanatory.

***Variable name for fix addforce does not exist***

Self-explanatory.

***Variable name for fix ave/atom does not exist***

Self-explanatory.

***Variable name for fix ave/chunk does not exist***

Self-explanatory.

***Variable name for fix ave/correlate does not exist***

Self-explanatory.

***Variable name for fix ave/histo does not exist***

Self-explanatory.

***Variable name for fix ave/spatial does not exist***

Self-explanatory.

***Variable name for fix ave/time does not exist***

Self-explanatory.

*Variable name for fix aveforce does not exist*

Self-explanatory.

*Variable name for fix deform does not exist*

Self-explanatory.

*Variable name for fix efield does not exist*

Self-explanatory.

*Variable name for fix gravity does not exist*

Self-explanatory.

*Variable name for fix heat does not exist*

Self-explanatory.

*Variable name for fix indent does not exist*

Self-explanatory.

*Variable name for fix langevin does not exist*

Self-explanatory.

*Variable name for fix move does not exist*

Self-explanatory.

*Variable name for fix setforce does not exist*

Self-explanatory.

*Variable name for fix store/state does not exist*

Self-explanatory.

*Variable name for fix temp/berendsen does not exist*

Self-explanatory.

*Variable name for fix temp/csld does not exist*

Self-explanatory.

*Variable name for fix temp/csvr does not exist*

Self-explanatory.

*Variable name for fix temp/rescale does not exist*

Self-explanatory.

Self-explanatory.

*Variable name for fix wall does not exist*

Self-explanatory.

*Variable name for fix wall/reflect does not exist*

Self-explanatory.

*Variable name for fix wall/srd does not exist*

Self-explanatory.

*Variable name for group does not exist*

Self-explanatory.

*Variable name for group dynamic does not exist*

Self-explanatory.

*Variable name for region cylinder does not exist*

Self-explanatory.

***Variable name for region does not exist***

Self-explanatory.

***Variable name for region sphere does not exist***

Self-explanatory.

***Variable name for restart does not exist***

Self-explanatory.

***Variable name for set command does not exist***

Self-explanatory.

***Variable name for thermo every does not exist***

Self-explanatory.

***Variable name for velocity set does not exist***

Self-explanatory.

***Variable name for voronoi radius does not exist***

Self-explanatory.

***Variable name must be alphanumeric or underscore characters***

Self-explanatory.

***Variable uses atom property that is not allocated***

Self-explanatory.

***Velocity command before simulation box is defined***

The velocity command cannot be used before a read\_data, read\_restart, or create\_box command.

***Velocity command with no atoms existing***

A velocity command has been used, but no atoms yet exist.

***Velocity ramp in z for a 2d problem***

Self-explanatory.

***Velocity rigid used with non-rigid fix-ID***

Self-explanatory.

***Velocity temperature ID does calculate a velocity bias***

The specified compute must compute a bias for temperature.

***Velocity temperature ID does not compute temperature***

The compute ID given to the velocity command must compute temperature.

***Verlet/split can only currently be used with comm\_style brick***

This is a current restriction in LAMMPS.

***Verlet/split does not yet support TIP4P***

This is a current limitation.

***Verlet/split requires 2 partitions***

See the -partition command-line switch.

***Verlet/split requires Rspace partition layout be multiple of Kspace partition layout in each dim***

This is controlled by the processors command.

***Verlet/split requires Rspace partition size be multiple of Kspace partition size***

This is so there is an equal number of Rspace processors for every Kspace processor.

***Virial was not tallied on needed timestep***

You are using a thermo keyword that requires potentials to have tallied the virial, but they did not on this timestep. See the variable page for ideas on how to make this work.

**Voro++ error: narea and neigh have a different size**

This error is returned by the Voro++ library.

**Wall defined twice in fix wall command**

Self-explanatory.

**Wall defined twice in fix wall/reflect command**

Self-explanatory.

**Wall defined twice in fix wall/srd command**

Self-explanatory.

**Water H epsilon must be 0.0 for pair style lj/cut/tip4p/cut**

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

**Water H epsilon must be 0.0 for pair style lj/cut/tip4p/long**

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

**Water H epsilon must be 0.0 for pair style lj/long/tip4p/long**

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

**World variable count does not match # of partitions**

A world-style variable must specify a number of values equal to the number of processor partitions.

**Write \_data command before simulation box is defined**

Self-explanatory.

**Write \_restart command before simulation box is defined**

The write\_restart command cannot be used before a read\_data, read\_restart, or create\_box command.

**Writing to MPI-IO filename when MPIIO package is not installed**

Self-explanatory.

**Zero length rotation vector with displace\_atoms**

Self-explanatory.

**Zero length rotation vector with fix move**

Self-explanatory.

**Zero-length lattice orient vector**

Self-explanatory.

## 11.6 Warning messages

This is an alphabetic list of the WARNING messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. Warning messages also list the source file and line number where the warning was generated. For example, a message like this:

```
WARNING: Bond atom missing in box size check (domain.cpp:187)
```

means that line #187 in the file src/domain.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Doc page with [ERROR messages](#)

***Adjusting Coulombic cutoff for MSM, new cutoff = %cg***

The adjust/cutoff command is turned on and the Coulombic cutoff has been adjusted to match the user-specified accuracy.

***Angle atoms missing at step %ld***

One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

***Angle style in data file differs from currently defined angle style***

Self-explanatory.

***Angles are defined but no angle style is set***

The topology contains angles, but there are no angle forces computed since there was no angle\_style command.

***Atom style in data file differs from currently defined atom style***

Self-explanatory.

***Bond atom missing in box size check***

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond atom missing in image check***

The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond atoms missing at step %ld***

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

***Bond style in data file differs from currently defined bond style***

Self-explanatory.

***Bonds are defined but no bond style is set***

The topology contains bonds, but there are no bond forces computed since there was no bond\_style command.

***Bond/angle/dihedral extent > half of periodic box length***

This is a restriction because LAMMPS can be confused about which image of an atom in the bonded interaction is the correct one to use. “Extent” in this context means the maximum end-to-end length of the bond/angle/dihedral. LAMMPS computes this by taking the maximum bond length, multiplying by the number of bonds in the interaction (e.g. 3 for a dihedral) and adding a small amount of stretch.

***Both groups in compute group/group have a net charge; the Kspace boundary correction to energy will be non-zero***

Self-explanatory.

***Calling write\_dump before a full system init.***

The write\_dump command is used before the system has been fully initialized as part of a ‘run’ or ‘minimize’ command. Not all dump styles and features are fully supported at this point and thus the command may fail or produce incomplete or incorrect output. Insert a “run 0” command, if a full system init is required.

***Cannot count rigid body degrees-of-freedom before bodies are fully initialized***

This means the temperature associated with the rigid bodies may be incorrect on this timestep.

***Cannot count rigid body degrees-of-freedom before bodies are initialized***

This means the temperature associated with the rigid bodies may be incorrect on this timestep.

***Cannot include log terms without 1/r terms; setting flagHI to 1***

Self-explanatory.

***Cannot include log terms without 1/r terms; setting flagHI to 1.***

Self-explanatory.

**Charges are set, but coulombic solver is not used**

Self-explanatory.

**Charges did not converge at step %ld: %lg**

Self-explanatory.

**Communication cutoff is 0.0. No ghost atoms will be generated. Atoms may get lost**

The communication cutoff defaults to the maximum of what is inferred from pair and bond styles (will be zero, if none are defined) and what is specified via `comm_modify cutoff` (defaults to 0.0). If this results to 0.0, no ghost atoms will be generated and LAMMPS may lose atoms or use incorrect periodic images of atoms in interaction lists. To avoid, either use `pair style zero` with a suitable cutoff or use `comm_modify cutoff`.

**Communication cutoff is shorter than a bond length based estimate. This may lead to errors.**

Since LAMMPS stores topology data with individual atoms, all atoms comprising a bond, angle, dihedral or improper must be present on any sub-domain that “owns” the atom with the information, either as a local or a ghost atom. The communication cutoff is what determines up to what distance from a sub-domain boundary ghost atoms are created. The communication cutoff is by default the largest non-bonded cutoff plus the neighbor skin distance, but for short or non-bonded cutoffs and/or long bonds, this may not be sufficient. This warning indicates that there is an increased risk of a simulation stopping unexpectedly because of Bond/Angle/Dihedral/Improper atoms missing. It can be silenced by manually setting the communication cutoff via `comm_modify cutoff`. However, since the heuristic used to determine the estimate is not always accurate, it is not changed automatically and the warning may be ignored depending on the specific system being simulated.

**Communication cutoff is too small for SNAP micro load balancing, increased to %lf**

Self-explanatory.

**Compute cna/atom cutoff may be too large to find ghost atom neighbors**

The neighbor cutoff used may not encompass enough ghost atoms to perform this operation correctly.

**Computing temperature of portions of rigid bodies**

The group defined by the temperature compute does not encompass all the atoms in one or more rigid bodies, so the change in degrees-of-freedom for the atoms in those partial rigid bodies will not be accounted for.

**Create\_bonds max distance > minimum neighbor cutoff**

This means atom pairs for some atom types may not be in the neighbor list and thus no bond can be created between them.

**Delete\_atoms cutoff > minimum neighbor cutoff**

This means atom pairs for some atom types may not be in the neighbor list and thus an atom in that pair cannot be deleted.

**Dihedral atoms missing at step %ld**

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

**Dihedral problem**

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

**Dihedral problem: %d %ld %d %d %d %d**

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

**Dihedral style in data file differs from currently defined dihedral style**

Self-explanatory.

**Dihedrals are defined but no dihedral style is set**

The topology contains dihedrals, but there are no dihedral forces computed since there was no `dihedral_style` command.

**Dump dcd/xtc timestamp may be wrong with fix dt/reset**

If the fix changes the timestep, the dump dcd file will not reflect the change.

***Energy due to X extra global DOFs will be included in minimizer energies***

When using fixes like box/relax, the potential energy used by the minimizer is augmented by an additional energy provided by the fix. Thus the printed converged energy may be different from the total potential energy.

***Estimated error in splitting of dispersion coeffs is %g***

Error is greater than 0.0001 percent.

***Ewald/disp Newton solver failed, using old method to estimate g\_ewald***

Self-explanatory. Choosing a different cutoff value may help.

***FENE bond too long***

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

***FENE bond too long: %ld %d %d %g***

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

***FENE bond too long: %ld %g***

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

***Fix halt condition for fix-id %s met on step %ld with value %g***

Self explanatory.

***Fix SRD walls overlap but fix srd overlap not set***

You likely want to set this in your input script.

***Fix bond/create is used multiple times or with fix bond/break - may not work as expected***

When using fix bond/create multiple times or in combination with fix bond/break, the individual fix instances do not share information about changes they made at the same time step and thus it may result in unexpected behavior.

***Fix bond/react: Atom affected by reaction too close to template edge***

This means an atom which changes type or connectivity during the reaction is too close to an 'edge' atom defined in the superimpose file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

***Fix bond/swap will ignore defined angles***

See the page for fix bond/swap for more info on this restriction.

***Fix deposit near setting < possible overlap separation %g***

This test is performed for finite size particles with a diameter, not for point particles. The near setting is smaller than the particle diameter which can lead to overlaps.

***Fix evaporate may delete atom with non-zero molecule ID***

This is probably an error, since you should not delete only one atom of a molecule.

***Fix gcmc using full\_energy option***

Fix gcmc has automatically turned on the full\_energy option since it is required for systems like the one specified by the user. User input included one or more of the following: kspace, triclinic, a hybrid pair style, an eam pair style, or no "single" function for the pair style.

***Fix langevin gif using random gaussians is not implemented with kokkos*** This will most likely cause errors in kinetic fluctuations.

***Fix property/atom mol or charge w/out ghost communication***

A model typically needs these properties defined for ghost atoms.

***Fix qeq CG convergence failed (%g) after %d iterations at %ld step***

Self-explanatory.

***Fix qeq has non-zero lower Taper radius cutoff***

Absolute value must be  $\leq 0.01$ .

***Fix qeq has very low Taper radius cutoff***

Value should typically be  $\geq 5.0$ .

***Fix qeq/dynamic tolerance may be too small for damped dynamics***

Self-explanatory.

***Fix qeq/fire tolerance may be too small for damped fires***

Self-explanatory.

***Fix rattle should come after all other integration fixes***

This fix is designed to work after all other integration fixes change atom positions. Thus it should be the last integration fix specified. If not, it will not satisfy the desired constraints as well as it otherwise would.

***Fix recenter should come after all other integration fixes***

Other fixes may change the position of the center-of-mass, so fix recenter should come last.

***Fix srd SRD moves may trigger frequent reneighboring***

This is because the SRD particles may move long distances.

***Fix srd grid size > 1/4 of big particle diameter***

This may cause accuracy problems.

***Fix srd particle moved outside valid domain***

This may indicate a problem with your simulation parameters.

***Fix srd particles may move > big particle diameter***

This may cause accuracy problems.

***Fix srd viscosity < 0.0 due to low SRD density***

This may cause accuracy problems.

***Fixes cannot send data in Kokkos communication, switching to classic communication***

This is current restriction with Kokkos.

***For better accuracy use 'pair\_modify table 0'***

The user-specified force accuracy cannot be achieved unless the table feature is disabled by using 'pair\_modify table 0'.

***Geometric mixing assumed for  $1/r^6$  coefficients***

Self-explanatory.

***Group for fix\_modify temp != fix group***

The fix\_modify command is specifying a temperature computation that computes a temperature on a different group of atoms than the fix itself operates on. This is probably not what you want to do.

***H matrix size has been exceeded: m\_fill=%d H.m=%dn***

This is the size of the matrix.

***Ignoring unknown or incorrect info command flag***

Self-explanatory. An unknown argument was given to the info command. Compare your input with the documentation.

***Improper atoms missing at step %ld***

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

***Improper problem: %d %ld %d %d %d %d***

Conformation of the 4 listed improper atoms is extreme; you may want to check your simulation geometry.

***Improper style in data file differs from currently defined improper style***

Self-explanatory.

***Improper style is defined but no improper style is set***

The topology contains improper style, but there are no improper forces computed since there was no `improper_style` command.

***Inconsistent image flags***

The image flags for a pair on bonded atoms appear to be inconsistent. Inconsistent means that when the coordinates of the two atoms are unwrapped using the image flags, the two atoms are far apart. Specifically they are further apart than half a periodic box length. Or they are more than a box length apart in a non-periodic dimension. This is usually due to the initial data file not having correct image flags for the 2 atoms in a bond that straddles a periodic boundary. They should be different by 1 in that case. This is a warning because inconsistent image flags will not cause problems for dynamics or most LAMMPS simulations. However they can cause problems when such atoms are used with the `fix rigid` or `replicate` commands. Note that if you have an infinite periodic crystal with bonds then it is impossible to have fully consistent image flags, since some bonds will cross periodic boundaries and connect two atoms with the same image flag.

***Increasing communication cutoff for GPU style***

The pair style has increased the communication cutoff to be consistent with the communication cutoff requirements for this pair style when run on the GPU.

***KIM Model does not provide 'energy'; Potential energy will be zero***

Self-explanatory.

***KIM Model does not provide 'forces'; Forces will be zero***

Self-explanatory.

***KIM Model does not provide 'particleEnergy'; energy per atom will be zero***

Self-explanatory.

***KIM Model does not provide 'particleVirial'; virial per atom will be zero***

Self-explanatory.

***Kspace\_modify slab param < 2.0 may cause unphysical behavior***

The `kspace_modify slab` parameter should be larger to insure periodic grids padded with empty space do not overlap.

***Less insertions than requested***

The `fix pour` command was unsuccessful at finding open space for as many particles as it tried to insert.

***Library error in lammmps\_gather\_atoms***

This library function cannot be used if atom IDs are not defined or are not consecutively numbered.

***Library error in lammmps\_scatter\_atoms***

This library function cannot be used if atom IDs are not defined or are not consecutively numbered, or if no atom map is defined. See the `atom_modify` command for details about atom maps.

***Likewise 1-2 special neighbor interactions != 1.0***

The topology contains bonds, but there is no bond style defined and a 1-2 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the bond style.

***Likewise 1-3 special neighbor interactions != 1.0***

The topology contains angles, but there is no angle style defined and a 1-3 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the angle style.

***Likewise 1-4 special neighbor interactions != 1.0***

The topology contains dihedrals, but there is no dihedral style defined and a 1-4 special neighbor scaling factor

was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the dihedral style.

***Lost atoms via change\_box: original %ld current %ld***

The command options you have used caused atoms to be lost.

***Lost atoms via displace\_atoms: original %ld current %ld***

The command options you have used caused atoms to be lost.

***Lost atoms: original %ld current %ld***

Lost atoms are checked for each time thermo output is done. See the thermo\_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor's sub-domain away before reneighboring.

***MSM mesh too small, increasing to 2 points in each direction***

Self-explanatory.

***Mismatch between velocity and compute groups***

The temperature computation used by the velocity command will not be on the same group of atoms that velocities are being set for.

***Mixing forced for lj coefficients***

Self-explanatory.

***Molecule attributes do not match system attributes***

An attribute is specified (e.g. diameter, charge) that is not defined for the specified atom style.

***Molecule has bond topology but no special bond settings***

This means the bonded atoms will not be excluded in pairwise interactions.

***Molecule template for create\_atoms has multiple molecules***

The create\_atoms command will only create molecules of a single type, i.e. the first molecule in the template.

***Molecule template for fix gcmc has multiple molecules***

The fix gcmc command will only create molecules of a single type, i.e. the first molecule in the template.

***Molecule template for fix shake has multiple molecules***

The fix shake command will only recognize molecules of a single type, i.e. the first molecule in the template.

***More than one compute centro/atom***

It is not efficient to use compute centro/atom more than once.

***More than one compute cluster/atom***

It is not efficient to use compute cluster/atom more than once.

***More than one compute cna/atom defined***

It is not efficient to use compute cna/atom more than once.

***More than one compute contact/atom***

It is not efficient to use compute contact/atom more than once.

***More than one compute coord/atom***

It is not efficient to use compute coord/atom more than once.

***More than one compute damage/atom***

It is not efficient to use compute ke/atom more than once.

***More than one compute dilatation/atom***

Self-explanatory.

***More than one compute erotate/sphere/atom***

It is not efficient to use compute erotate/sphere/atom more than once.

***More than one compute hexorder/atom***

It is not efficient to use compute hexorder/atom more than once.

***More than one compute ke/atom***

It is not efficient to use compute ke/atom more than once.

***More than one compute orientorder/atom***

It is not efficient to use compute orientorder/atom more than once.

***More than one compute plasticity/atom***

Self-explanatory.

***More than one compute sna/atom***

Self-explanatory.

***More than one compute sna/grid***

Self-explanatory.

***More than one compute sna/grid/local***

Self-explanatory.

***More than one compute snad/atom***

Self-explanatory.

***More than one compute snav/atom***

Self-explanatory.

***More than one fix poems***

It is not efficient to use fix poems more than once.

***More than one fix rigid***

It is not efficient to use fix rigid more than once.

***Neighbor exclusions used with KSpace solver may give inconsistent Coulombic energies***

This is because excluding specific pair interactions also excludes them from long-range interactions which may not be the desired effect. The special\_bonds command handles this consistently by insuring excluded (or weighted) 1-2, 1-3, 1-4 interactions are treated consistently by both the short-range pair style and the long-range solver. This is not done for exclusions of charged atom pairs via the neigh\_modify exclude command.

***New thermo\_style command, previous thermo\_modify settings will be lost***

If a thermo\_style command is used after a thermo\_modify command, the settings changed by the thermo\_modify command will be reset to their default values. This is because the thermo\_modify command acts on the currently defined thermo style, and a thermo\_style command creates a new style.

***No Kspace calculation with verlet/split***

The second partition performs a kspace calculation so the kspace\_style command must be used.

***No automatic unit conversion to XTC file format conventions possible for units lj***

This means no scaling will be performed.

***No fixes defined, atoms won't move***

If you are not using a fix like nve, nvt, npt then atom velocities and coordinates will not be updated during timestepping.

***No joints between rigid bodies, use fix rigid instead***

The bodies defined by fix poems are not connected by joints. POEMS will integrate the body motion, but it would be more efficient to use fix rigid.

***Not using real units with pair reaxff***

This is most likely an error, unless you have created your own ReaxFF parameter file in a different set of units.

***Number of MSM mesh points changed to be a multiple of 2***

MSM requires that the number of grid points in each direction be a multiple of two and the number of grid points in one or more directions have been adjusted to meet this requirement.

***OMP\_NUM\_THREADS environment is not set.***

This environment variable must be set appropriately to use the OPENMP package.

***One or more atoms are time integrated more than once***

This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep.

***One or more chunks do not contain all atoms in molecule***

This may not be what you intended.

***One or more dynamic groups may not be updated at correct point in timestep***

If there are other fixes that act immediately after the initial stage of time integration within a timestep (i.e. after atoms move), then the command that sets up the dynamic group should appear after those fixes. This will insure that dynamic group assignments are made after all atoms have moved.

***One or more respa levels compute no forces***

This is computationally inefficient.

***Pair COMB charge %.10f with force %.10f hit max barrier***

Something is possibly wrong with your model.

***Pair COMB charge %.10f with force %.10f hit min barrier***

Something is possibly wrong with your model.

***Pair brownian needs newton pair on for momentum conservation***

Self-explanatory.

***Pair dpd needs newton pair on for momentum conservation***

Self-explanatory.

***Pair dsmc: num\_of\_collisions > number\_of\_A***

Collision model in DSMC is breaking down.

***Pair dsmc: num\_of\_collisions > number\_of\_B***

Collision model in DSMC is breaking down.

***Pair style in data file differs from currently defined pair style***

Self-explanatory.

***Pair style restartinfo set but has no restart support***

This pair style has a bug, where it does not support reading and writing information to a restart file, but does not set the member variable “restartinfo” to 0 as required in that case.

***Particle deposition was unsuccessful***

The fix deposit command was not able to insert as many atoms as needed. The requested volume fraction may be too high, or other atoms may be in the insertion region.

***Proc sub-domain size < neighbor skin, could lead to lost atoms***

The decomposition of the physical domain (likely due to load balancing) has led to a processor’s sub-domain being smaller than the neighbor skin in one or more dimensions. Since reneighboring is triggered by atoms moving the skin distance, this may lead to lost atoms, if an atom moves all the way across a neighboring processor’s sub-domain before reneighboring is triggered.

***Reducing PPPM order b/c stencil extends beyond nearest neighbor processor***

This may lead to a larger grid than desired. See the kspace\_modify overlap command to prevent changing of the PPPM order.

***Reducing PPPMDisp Coulomb order b/c stencil extends beyond neighbor processor***

This may lead to a larger grid than desired. See the `kpace_modify overlap` command to prevent changing of the PPPM order.

***Reducing PPPMDisp dispersion order b/c stencil extends beyond neighbor processor***

This may lead to a larger grid than desired. See the `kpace_modify overlap` command to prevent changing of the PPPM order.

***Replacing a fix, but new group != old group***

The ID and style of a fix match for a fix you are changing with a fix command, but the new group you are specifying does not match the old group.

***Replicating in a non-periodic dimension***

The parameters for a replicate command will cause a non-periodic dimension to be replicated; this may cause unwanted behavior.

***Resetting reneighboring criteria during PRD***

A PRD simulation requires that `neigh_modify` settings be `delay = 0`, `every = 1`, `check = yes`. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

***Resetting reneighboring criteria during TAD***

A TAD simulation requires that `neigh_modify` settings be `delay = 0`, `every = 1`, `check = yes`. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

***Resetting reneighboring criteria during minimization***

Minimization requires that `neigh_modify` settings be `delay = 0`, `every = 1`, `check = yes`. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the minimization.

***Restart file used different # of processors***

The restart file was written out by a LAMMPS simulation running on a different number of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

***Restart file used different 3d processor grid***

The restart file was written out by a LAMMPS simulation running on a different 3d grid of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

***Restart file used different boundary settings, using restart file values***

Your input script cannot change these restart file settings.

***Restart file used different newton bond setting, using restart file value***

The restart file value will override the setting in the input script.

***Restart file used different newton pair setting, using input script value***

The input script value will override the setting in the restart file.

***Restrain problem: %d %ld %d %d %d %d***

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

***Running PRD with only one replica***

This is allowed, but you will get no parallel speed-up.

***SRD bin shifting turned on due to small lamda***

This is done to try to preserve accuracy.

***SRD bin size for fix srd differs from user request***

Fix SRD had to adjust the bin size to fit the simulation box. See the `cubic` keyword if you want this message to be an error vs warning.

***SRD bins for fix srd are not cubic enough***

The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

***SRD particle %d started inside big particle %d on step %ld bounce %d***

See the inside keyword if you want this message to be an error vs warning.

***SRD particle %d started inside wall %d on step %ld bounce %d***

See the inside keyword if you want this message to be an error vs warning.

***Shake determinant < 0.0***

The determinant of the quadratic equation being solved for a single cluster specified by the fix shake command is numerically suspect. LAMMPS will set it to 0.0 and continue.

***Shell command '%s' failed with error '%s'***

Self-explanatory.

***Shell command returned with non-zero status***

This may indicate the shell command did not operate as expected.

***Should not allow rigid bodies to bounce off reflecting walls***

LAMMPS allows this, but their dynamics are not computed correctly.

***Should not use fix nve/limit with fix shake or fix rattle***

This will lead to invalid constraint forces in the SHAKE/RATTLE computation.

***Simulations might be very slow because of large number of structure factors***

Self-explanatory.

***Slab correction not needed for MSM***

Slab correction is intended to be used with Ewald or PPPM and is not needed by MSM.

***Specifying an 'subset' value of '0' is equivalent to no 'subset' keyword***

Self-explanatory.

***System is not charge neutral, net charge = %g***

The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is only a warning.

***Table inner cutoff >= outer cutoff***

You specified an inner cutoff for a Coulombic table that is longer than the global cutoff. Probably not what you wanted.

***Temperature for MSST is not for group all***

User-assigned temperature to MSST fix does not compute temperature for all atoms. Since MSST computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by MSST could be inaccurate.

***Temperature for NPT is not for group all***

User-assigned temperature to NPT fix does not compute temperature for all atoms. Since NPT computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by NPT could be inaccurate.

***Temperature for fix modify is not for group all***

The temperature compute is being used with a pressure calculation which does operate on group all, so this may be inconsistent.

***Temperature for thermo pressure is not for group all***

User-assigned temperature to thermo via the thermo\_modify command does not compute temperature for all atoms. Since thermo computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure printed by thermo could be inaccurate.

***The fix ave/spatial command has been replaced by the more flexible fix ave/chunk and compute chunk/atom commands – fix ave/spatial will be removed in the summer of 2015***

Self-explanatory.

***The minimizer does not re-orient dipoles when using fix efield***

This means that only the atom coordinates will be minimized, not the orientation of the dipoles.

***Too many common neighbors in CNA %d times***

More than the maximum # of neighbors was found multiple times. This was unexpected.

***Too many inner timesteps in fix ttm***

Self-explanatory.

***Too many neighbors in CNA for %d atoms***

More than the maximum # of neighbors was found multiple times. This was unexpected.

***Triclinic box skew is large***

The displacement in a skewed direction is normally required to be less than half the box length in that dimension. E.g. the xy tilt must be between -half and +half of the x box length. You have relaxed the constraint using the box tilt command, but the warning means that a LAMMPS simulation may be inefficient as a result.

***Use special bonds = 0,1,1 with bond style fene***

Most FENE models need this setting for the special\_bonds command.

***Use special bonds = 0,1,1 with bond style fene/expand***

Most FENE models need this setting for the special\_bonds command.

***Using a many-body potential with bonds/angles/dihedrals and special\_bond exclusions***

This is likely not what you want to do. The exclusion settings will eliminate neighbors in the neighbor list, which the many-body potential needs to calculate its terms correctly.

***Using compute temp/deform with inconsistent fix deform remap option***

Fix nvt/sllod assumes deforming atoms have a velocity profile provided by “remap v” or “remap none” as a fix deform option.

***Using compute temp/deform with no fix deform defined***

This is probably an error, since it makes little sense to use compute temp/deform in this case.

***Using fix srd with box deformation but no SRD thermostat***

The deformation will heat the SRD particles so this can be dangerous.

***Using kspace solver on system with no charge***

Self-explanatory.

***Using largest cut-off for lj/long/dipole/long long long***

Self-explanatory.

***Using largest cutoff for buck/long/coul/long***

Self-explanatory.

***Using largest cutoff for lj/long/coul/long***

Self-explanatory.

***Using largest cutoff for pair\_style lj/long/tip4p/long***

Self-explanatory.

***Using package gpu without any pair style defined***

Self-explanatory.

***Using pair potential shift with pair\_modify compute no***

The shift effects will thus not be computed.

*Using pair tail corrections with nonperiodic system*

This is probably a bogus thing to do, since tail corrections are computed by integrating the density of a periodic system out to infinity.

*Using pair tail corrections with pair\_modify compute no*

The tail corrections will thus not be computed.

**Part II**

**Programmer Guide**

## LAMMPS LIBRARY INTERFACES

As described on the *library interface to LAMMPS* page, LAMMPS can be built as a library (static or shared), so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python script*. Even the LAMMPS standalone executable is essentially a thin wrapper on top of the LAMMPS library, creating a LAMMPS instance, processing input and then existing.

Most of the APIs described below are based on C language wrapper functions in the files `src/library.h` and `src/library.cpp`, but it is also possible to use C++ directly. The basic procedure is always the same: you create one or more instances of *LAMMPS*, pass commands as strings or from files to that LAMMPS instance to execute calculations, and/or call functions that read, manipulate, and update data from the active class instances inside LAMMPS to do analysis or perform operations that are not possible with existing input script commands.

---

### Thread-safety

LAMMPS was initially not conceived as a thread-safe program, but over the years changes have been applied to replace operations that collide with creating multiple LAMMPS instances from multiple-threads of the same process with thread-safe alternatives. This primarily applies to the core LAMMPS code and less so on add-on packages, especially when those packages require additional code in the *lib* folder, interface LAMMPS to Fortran libraries, or the code uses static variables (like the COLVARS package).

Another major issue to deal with is to correctly handle MPI. Creating a LAMMPS instance requires passing an MPI communicator, or it assumes the `MPI_COMM_WORLD` communicator, which spans all MPI processor ranks. When creating multiple LAMMPS object instances from different threads, this communicator has to be different for each thread or else collisions can happen. Or it has to be guaranteed, that only one thread at a time is active. MPI communicators, however, are not a problem, if LAMMPS is compiled with the MPI STUBS library, which implies that there is no MPI communication and only 1 MPI rank.

---

---

## 12.1 LAMMPS C Library API

The C library interface is the most commonly used path to manage LAMMPS instances from a compiled code and it is the basis for the *Python* and *Fortran* modules. Almost all functions of the C language API require an argument containing a “handle” in the form of a `void *` type variable, which points to the location of a LAMMPS class instance.

The `library.h` header file by default does not include the `mpi.h` header file and thus hides the `lammps_open()` function which requires the declaration of the `MPI_comm` data type. This is only a problem when the communicator that would be passed is different from `MPI_COMM_WORLD`. Otherwise calling `lammps_open_no_mpi()` will work just as well. To make `lammps_open()` available, you need to compile the code with `-DLAMMPS_LIB_MPI` or add the line `#define LAMMPS_LIB_MPI` before `#include "library.h"`.

Please note the `mpi.h` file must usually be the same (and thus the MPI library in use) for the LAMMPS code and library and the calling code. The exception is when LAMMPS was compiled in serial mode using the STUBS MPI library. In that case the calling code may be compiled with a different MPI library so long as `lammps_open_no_mpi()` is called to create a LAMMPS instance. In that case each MPI rank will run LAMMPS in serial mode.

---

### Errors versus exceptions

If the LAMMPS executable encounters an error condition, it will abort after printing an error message. For a library interface this is usually not desirable. Thus LAMMPS can be compiled to *throw a C++ exception* instead. If enabled, the library functions will catch those exceptions and return. The error status *can be queried* and an *error message retrieved*. We thus recommend enabling C++ exceptions when using the library interface,

---

**Warning:** No checks are made on the arguments of the function calls of the C library interface. *All* function arguments must be non-NULL unless *explicitly* allowed, and must point to consistent and valid data. Buffers for storing returned data must be allocated to a suitable size. Passing invalid or unsuitable information will likely cause crashes or corrupt data.

---

## 12.1.1 Creating or deleting a LAMMPS object

This section documents the following functions:

- `lammps_open()`
  - `lammps_open_no_mpi()`
  - `lammps_open_fortran()`
  - `lammps_close()`
  - `lammps_mpi_init()`
  - `lammps_mpi_finalize()`
  - `lammps_kokkos_finalize()`
  - `lammps_python_finalize()`
- 

The `lammps_open()` and `lammps_open_no_mpi()` functions are used to create and initialize a `LAMMPS()` instance. They return a reference to this instance as a `void *` pointer to be used as the “handle” argument in subsequent function calls until that instance is destroyed by calling `lammps_close()`. Here is a simple example demonstrating its use:

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int version;
    const char *lmpargv[] = { "liblammps", "-log", "none" };
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);
```

(continues on next page)

(continued from previous page)

```

/* create LAMMPS instance */
handle = lammps_open_no_mpi(lmpargc, (char **)lmpargv, NULL);
if (handle == NULL) {
    printf("LAMMPS initialization failed");
    lammps_mpi_finalize();
    return 1;
}

/* get and print numerical version code */
version = lammps_version(handle);
printf("LAMMPS Version: %d\n", version);

/* delete LAMMPS instance and shut down MPI */
lammps_close(handle);
lammps_mpi_finalize();
return 0;
}

```

The LAMMPS library uses the MPI library it was compiled with and will either run on all processors in the `MPI_COMM_WORLD` communicator or on the set of processors in the communicator passed as the `comm` argument of `lammps_open()`. This means the calling code can run LAMMPS on all or a subset of processors. For example, a wrapper code might decide to alternate between LAMMPS and another code, allowing them both to run on all the processors. Or it might allocate part of the processors to LAMMPS and the rest to the other code by creating a custom communicator with `MPI_Comm_split()` and running both codes concurrently before syncing them up periodically. Or it might instantiate multiple instances of LAMMPS to perform different calculations and either alternate between them, run them concurrently on split communicators, or run them one after the other. The `lammps_open()` function may be called multiple times for this latter purpose.

The `lammps_close()` function is used to shut down the LAMMPS class pointed to by the handle passed as an argument and free all its memory. This has to be called for every instance created with one of the `lammps_open()` functions. It will, however, **not** call `MPI_Finalize()`, since that may only be called once. See `lammps_mpi_finalize()` for an alternative to invoking `MPI_Finalize()` explicitly from the calling program.

---

```
void *lammps_open(int argc, char **argv, MPI_Comm comm, void **ptr)
```

Create instance of the LAMMPS class and return pointer to it.

The `lammps_open()` function creates a new LAMMPS class instance while passing in a list of strings as if they were *command-line arguments* for the LAMMPS executable, and an MPI communicator for LAMMPS to run under. Since the list of arguments is **exactly** as when called from the command line, the first argument would be the name of the executable and thus is otherwise ignored. However `argc` may be set to 0 and then `argv` may be NULL. If MPI is not yet initialized, `MPI_Init()` will be called during creation of the LAMMPS class instance.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument `ptr`.

Deprecated since version 18Sep2020: The `ptr` argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

**See also**

`lammps_open_no_mpi()`, `lammps_open_fortran()`

**Note:** This function is **only** declared when the code using the LAMMPS `library.h` include file is compiled with `-DLAMMPS_LIB_MPI`, or contains a `#define LAMMPS_LIB_MPI 1` statement before `#include "library.h"`. Otherwise you can only use the `lammps_open_no_mpi()` or `lammps_open_fortran()` functions.

---

#### Parameters

- **argc** – number of command line arguments
- **argv** – list of command line argument strings
- **comm** – MPI communicator for this LAMMPS instance
- **ptr** – pointer to a void pointer variable which serves as a handle; may be NULL

#### Returns

pointer to new LAMMPS instance cast to void \*

---

void \***lammps\_open\_no\_mpi**(int argc, char \*\*argv, void \*\*ptr)

Variant of `lammps_open()` that implicitly uses `MPI_COMM_WORLD`.

This function is a version of `lammps_open()`, that is missing the MPI communicator argument. It will use `MPI_COMM_WORLD` instead. The type and purpose of arguments and return value are otherwise the same.

Outside of the convenience, this function is useful, when the LAMMPS library was compiled in serial mode, but the calling code runs in parallel and the `MPI_Comm` data type of the STUBS library would not be compatible with that of the calling code.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

#### See also

`lammps_open()`, `lammps_open_fortran()`

#### Parameters

- **argc** – number of command line arguments
- **argv** – list of command line argument strings
- **ptr** – pointer to a void pointer variable which serves as a handle; may be NULL

#### Returns

pointer to new LAMMPS instance cast to void \*

---

void \***lammmps\_open\_fortran**(int argc, char \*\*argv, int f\_comm)

Variant of `lammmps_open()` using a Fortran MPI communicator.

This function is a version of `lammmps_open()`, that uses an integer for the MPI communicator as the MPI Fortran interface does. It is used in the `lammmps()` constructor of the LAMMPS Fortran module. Internally it converts the `f_comm` argument into a C-style MPI communicator with `MPI_Comm_f2c()` and then calls `lammmps_open()`.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

New in version 18Sep2020.

*See also*

`lammmps_open_fortran()`, `lammmps_open_no_mpi()`

#### Parameters

- **argc** – number of command line arguments
- **argv** – list of command line argument strings
- **f\_comm** – Fortran style MPI communicator for this LAMMPS instance

#### Returns

pointer to new LAMMPS instance cast to void \*

---

void **lammmps\_close**(void \*handle)

Delete a LAMMPS instance created by `lammmps_open()` or its variants.

This function deletes the LAMMPS class instance pointed to by `handle` that was created by one of the `lammmps_open()` variants. It does **not** call `MPI_Finalize()` to allow creating and deleting multiple LAMMPS instances concurrently or sequentially. See `lammmps_mpi_finalize()` for a function performing this operation.

#### Parameters

**handle** – pointer to a previously created LAMMPS instance

---

void **lammmps\_mpi\_init**()

Ensure the MPI environment is initialized.

The MPI standard requires that any MPI application must call `MPI_Init()` exactly once before performing any other MPI function calls. This function checks, whether MPI is already initialized and calls `MPI_Init()` in case it is not.

New in version 18Sep2020.

---

void **lammmps\_mpi\_finalize**()

Shut down the MPI infrastructure.

The MPI standard requires that any MPI application calls `MPI_Finalize()` before exiting. Even if a calling program does not do any MPI calls, MPI is still initialized internally to avoid errors accessing any MPI functions. This function should then be called right before exiting the program to wait until all (parallel) tasks are completed and then MPI is cleanly shut down. After calling this function no more MPI calls may be made.

New in version 18Sep2020.

*See also*

`lammps_kokkos_finalize()`, `lammps_python_finalize()`

---

void `lammps_kokkos_finalize()`

Shut down the Kokkos library environment.

The Kokkos library may only be initialized once during the execution of a process. This is done automatically the first time Kokkos functionality is used. This requires that the Kokkos environment must be explicitly shut down after any LAMMPS instance using it is closed (to release associated resources). After calling this function no Kokkos functionality may be used.

New in version 2Jul2021.

*See also*

`lammps_mpi_finalize()`, `lammps_python_finalize()`

---

void `lammps_python_finalize()`

Clear the embedded Python environment

This function resets and clears an embedded Python environment by calling the `Py_Finalize()` function of the embedded Python library, if enabled. This call would free up all allocated resources and release loaded shared objects.

However, this is **not** done when a LAMMPS instance is deleted because a) LAMMPS may have been used through the Python module and thus the Python interpreter is external and not embedded into LAMMPS and therefore may not be reset by LAMMPS b) some Python modules and extensions, most notably NumPy, are not compatible with being initialized multiple times, which would happen if additional LAMMPS instances using Python would be created *after* after calling `Py_Finalize()`.

This function can be called to explicitly clear the Python environment in case it is safe to do so.

New in version 20Sep2021.

*See also*

`lammps_mpi_finalize()`, `lammps_kokkos_finalize()`

---

## 12.1.2 Executing commands

This section documents the following functions:

- `lammps_file()`
- `lammps_command()`
- `lammps_commands_list()`
- `lammps_commands_string()`

Once a LAMMPS instance is created, there are multiple ways to “drive” a simulation. In most cases it is easiest to process single or multiple LAMMPS commands like in an input file. This can be done through reading a file or passing single commands or lists of commands or blocks of commands with the following functions.

Via these functions, the calling code can have LAMMPS act on a series of *input file commands* that are either read from a file or passed as strings. For example, this allows setup of a problem from an input script, and then running it in stages while performing other operations in between or concurrently. The caller can interleave the LAMMPS function calls with operations it performs, such as calls to extract information from or set information within LAMMPS, or calls to another code’s library.

Just as with *input script parsing* comments can be included in the file or strings, and expansion of variables with `${name}` or `$(expression)` syntax is performed. Below is a short example using some of these functions.

```
/* define to make the otherwise hidden prototype for "lammps_open()" visible */
#define LAMMPS_LIB_MPI
#include "library.h"

#include <mpi.h>
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int i;

    MPI_Init(&argc, &argv);
    handle = lammps_open(0, NULL, MPI_COMM_WORLD, NULL);
    lammps_file(handle, "in.sysinit");
    lammps_command(handle, "run 1000 post no");

    for (i=0; i < 100; ++i) {
        lammps_commands_string(handle, "run 100 pre no post no\n"
                                   "print 'PE = $(pe)'\n"
                                   "print 'KE = $(ke)'\n");
    }
    lammps_close(handle);
    MPI_Finalize();
    return 0;
}
```

void **lammers\_file**(void \*handle, const char \*file)

Process LAMMPS input from a file.

This function processes commands in the file pointed to by *filename* line by line and thus functions very similar to the *include* command. The function returns when the end of the file is reached and the commands have completed.

The actual work is done by the functions *Input::file(const char \*)* and *Input::file()*.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
  - **filename** – name of a file with LAMMPS input
- 

char \***lammers\_command**(void \*handle, const char \*cmd)

Process a single LAMMPS input command from a string.

This function tells LAMMPS to execute the single command in the string *cmd*. The entire string is considered as command and need not have a (final) newline character. Newline characters in the body of the string, however, will be treated as part of the command and will **not** start a second command. The function *lammers\_commands\_string()* processes a string with multiple command lines.

The function returns the name of the command on success or NULL when passing a string without a command.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **cmd** – string with a single LAMMPS command

### Returns

string with parsed command name or NULL

---

void **lammers\_commands\_list**(void \*handle, int ncmd, const char \*\*cmds)

Process multiple LAMMPS input commands from list of strings.

This function processes multiple commands from a list of strings by first concatenating the individual strings in *cmds* into a single string, inserting newline characters as needed. The combined string is passed to *lammers\_commands\_string()* for processing.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
  - **ncmd** – number of lines in *cmds*
  - **cmds** – list of strings with LAMMPS commands
-

void **lammops\_commands\_string**(void \*handle, const char \*str)

Process a block of LAMMPS input commands from a single string.

This function processes a multi-line string similar to a block of commands from a file. The string may have multiple lines (separated by newline characters) and also single commands may be distributed over multiple lines with continuation characters ('&'). Those lines are combined by removing the '&' and the following newline character. After this processing the string is handed to LAMMPS for parsing and executing.

---

**Note:** Multi-line commands enabled by triple quotes will NOT work with this function.

---

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **str** – string with block of LAMMPS input commands

### 12.1.3 System properties

This section documents the following functions:

- *lammops\_get\_natoms()*
- *lammops\_get\_thermo()*
- *lammops\_extract\_box()*
- *lammops\_reset\_box()*
- *lammops\_memory\_usage()*
- *lammops\_get\_mpi\_comm()*
- *lammops\_extract\_setting()*
- *lammops\_extract\_global\_datatype()*
- *lammops\_extract\_global()*

The library interface allows extraction of different kinds of information about the active simulation instance and also modifications to it. This enables combining of a LAMMPS simulation with other processing and simulation methods computed by the calling code, or by another code that is coupled to LAMMPS via the library interface. In some cases the data returned is direct reference to the original data inside LAMMPS, cast to a void pointer. In that case the data needs to be cast to a suitable pointer for the calling program to access it, and you may need to know the correct dimensions and lengths. This also means you can directly change those value(s) from the calling program, e.g. to modify atom positions. Of course, this should be done with care. When accessing per-atom data, please note that this data is the per-processor **local** data and is indexed accordingly. Per-atom data can change sizes and ordering at every neighbor list rebuild or atom sort event as atoms migrate between sub-domains and processors.

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int i;
```

(continues on next page)

(continued from previous page)

```

handle = lammps_open_no_mpi(0, NULL, NULL);
lammps_file(handle, "in.sysinit");
printf("Running a simulation with %g atoms.\n",
       lammps_get_natoms(handle));

printf(" %d local and %d ghost atoms. %d atom types\n",
       lammps_extract_setting(handle, "nlocal"),
       lammps_extract_setting(handle, "nghost"),
       lammps_extract_setting(handle, "ntypes"));

double *dt = (double *)lammps_extract_global(handle, "dt");
printf("Changing timestep from %g to 0.5\n", *dt);
*dt = 0.5;

lammps_command(handle, "run 1000 post no");

for (i=0; i < 10; ++i) {
  lammps_command(handle, "run 100 pre no post no");
  printf("PE = %g\nKE = %g\n",
        lammps_get_thermo(handle, "pe"),
        lammps_get_thermo(handle, "ke"));
}
lammps_close(handle);
return 0;
}

```

double **lammps\_get\_natoms**(void \*handle)

Return the total number of atoms in the system.

This number may be very large when running large simulations across multiple processors. Depending on compile time choices, LAMMPS may be using either 32-bit or a 64-bit integer to store this number. For portability this function returns thus a double precision floating point number, which can represent up to a 53-bit signed integer exactly ( $\approx 10^{16}$ ).

As an alternative, you can use `lammps_extract_global()` and cast the resulting pointer to an integer pointer of the correct size and dereference it. The size of that integer (in bytes) can be queried by calling `lammps_extract_setting()` to return the size of a `bigint` integer.

Changed in version 18Sep2020: The type of the return value was changed from `int` to `double` to accommodate reporting atom counts for larger systems that would overflow a 32-bit `int` without having to depend on a 64-bit integer type definition.

#### Parameters

**handle** – pointer to a previously created LAMMPS instance

#### Returns

total number of atoms or 0 if value is too large

double **lammops\_get\_thermo**(void \*handle, const char \*keyword)

Get current value of a thermo keyword.

This function returns the current value of a *thermo keyword*. Unlike *lammops\_extract\_global()* it does not give access to the storage of the desired data but returns its value as a `double`, so it can also return information that is computed on-the-fly.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **keyword** – string with the name of the thermo keyword

#### Returns

value of the requested thermo property or 0.0

---

void **lammops\_extract\_box**(void \*handle, double \*boxlo, double \*boxhi, double \*xy, double \*yz, double \*xz, int \*pflags, int \*boxflag)

Extract simulation box parameters.

This function (re-)initializes the simulation box and boundary information and then assign the designated data to the locations in the pointers passed as arguments. Any argument (except the first) may be a NULL pointer and then will not be assigned.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance
  - **boxlo** – pointer to 3 doubles where the lower box boundary is stored
  - **boxhi** – pointer to 3 doubles where the upper box boundary is stored
  - **xy** – pointer to a double where the xy tilt factor is stored
  - **yz** – pointer to a double where the yz tilt factor is stored
  - **xz** – pointer to a double where the xz tilt factor is stored
  - **pflags** – pointer to 3 ints, set to 1 for periodic boundaries and 0 for non-periodic
  - **boxflag** – pointer to an int, which is set to 1 if the box will be changed during a simulation by a fix and 0 if not.
- 

void **lammops\_reset\_box**(void \*handle, double \*boxlo, double \*boxhi, double xy, double yz, double xz)

Reset simulation box parameters.

This function sets the simulation box dimensions (upper and lower bounds and tilt factors) from the provided data and then re-initializes the box information and all derived settings. It may only be called before atoms are created.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **boxlo** – pointer to 3 doubles containing the lower box boundary
- **boxhi** – pointer to 3 doubles containing the upper box boundary
- **xy** – xy tilt factor
- **yz** – yz tilt factor

- **xz** – xz tilt factor
- 

void **lammops\_memory\_usage**(void \*handle, double \*meminfo)

Get memory usage information

This function will retrieve memory usage information for the current LAMMPS instance or process. The *meminfo* buffer will be filled with 3 different numbers (if supported by the operating system). The first is the tally (in MBytes) of all large memory allocations made by LAMMPS. This is a lower boundary of how much memory is requested and does not account for memory allocated on the stack or allocations via *new*. The second number is the current memory allocation of the current process as returned by a memory allocation reporting in the system library. The third number is the maximum amount of RAM (not swap) used by the process so far. If any of the two latter parameters is not supported by the operating system it will be set to zero.

New in version 18Sep2020.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance
  - **meminfo** – buffer with space for at least 3 double to store data in.
- 

int **lammops\_get\_mpi\_comm**(void \*handle)

Return current LAMMPS world communicator as integer

This will take the LAMMPS “world” communicator and convert it to an integer using `MPI_Comm_c2f()`, so it is equivalent to the corresponding MPI communicator in Fortran. This way it can be safely passed around between different programming languages. To convert it to the C language representation use `MPI_Comm_f2c()`.

If LAMMPS was compiled with `MPI_STUBS`, this function returns -1.

New in version 18Sep2020.

#### See also

[\*lammops\\_open\\_fortran\(\)\*](#)

#### Parameters

**handle** – pointer to a previously created LAMMPS instance

#### Returns

Fortran representation of the LAMMPS world communicator

---

int **lammops\_extract\_setting**(void \*handle, const char \*keyword)

Query LAMMPS about global settings.

This function will retrieve or compute global properties. In contrast to [\*lammops\\_get\\_thermo\(\)\*](#) this function returns an `int`. The following tables list the currently supported keyword. If a keyword is not recognized, the function returns -1.

- *Integer sizes*
-

- *System status*
- *System sizes*
- *Atom style flags*

### Integer sizes

Keyword	Description / Return value
bigint	size of the bigint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
tagint	size of the tagint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
imageint	size of the imageint integer type, 4 or 8 bytes. Set at <i>compile time</i> .

### System status

Keyword	Description / Return value
dimension	Number of dimensions: 2 or 3. See <i>dimension command</i> .
box_exist	1 if the simulation box is defined, 0 if not. See <i>create_box command</i> .
nthreads	Number of requested OpenMP threads for LAMMPS' execution
newton_bond	1 if Newton's 3rd law is applied to bonded interactions, 0 if not.
newton_pair	1 if Newton's 3rd law is applied to non-bonded interactions, 0 if not.
triclinic	1 if the the simulation box is triclinic, 0 if orthogonal. See <i>change_box command</i> .
universe_rank	MPI rank on LAMMPS' universe communicator (0 <= universe_rank < universe_size)
universe_size	Number of ranks on LAMMPS' universe communicator (world_size <= universe_size)
world_rank	MPI rank on LAMMPS' world communicator (0 <= world_rank < world_size)
world_size	Number of ranks on LAMMPS' world communicator

### System sizes

Keyword	Description / Return value
nlocal	number of "owned" atoms of the current MPI rank.
nghost	number of "ghost" atoms of the current MPI rank.
nall	number of all "owned" and "ghost" atoms of the current MPI rank.
nmax	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
ntypes	number of atom types
nbondtypes	number of bond types
nangletypes	number of angle types
ndihedraltypes	number of dihedral types
nimproptypes	number of improper types
nellipsoids	number of atoms that have ellipsoid data
nlines	number of atoms that have line data (see <i>pair style line/lj</i> )
ntris	number of atoms that have triangle data (see <i>pair style tri/lj</i> )
nbodies	number of atoms that have body data (see <i>the Body particle HowTo</i> )

### Atom style flags

Keyword	Description / Return value
molecule_flag	1 if the atom style includes molecular topology data. See <i>atom_style command</i> .
q_flag	1 if the atom style includes point charges. See <i>atom_style command</i> .
mu_flag	1 if the atom style includes point dipoles. See <i>atom_style command</i> .
rmass_flag	1 if the atom style includes per-atom masses, 0 if there are per-type masses. See <i>atom_style command</i> .
radius_flag	1 if the atom style includes a per-atom radius. See <i>atom_style command</i> .
sphere_flag	1 if the atom style describes extended particles that can rotate. See <i>atom_style command</i> .
ellipsoid_flag	1 if the atom style describes extended particles that may be ellipsoidal. See <i>atom_style command</i> .
omega_flag	1 if the atom style can store per-atom rotational velocities. See <i>atom_style command</i> .
torque_flag	1 if the atom style can store per-atom torques. See <i>atom_style command</i> .
angmom_flag	1 if the atom style can store per-atom angular momentum. See <i>atom_style command</i> .

*See also*

*lammps\_extract\_global()*

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance
- **keyword** – string with the name of the thermo keyword

**Returns**

value of the queried setting or -1 if unknown

---

int **lammps\_extract\_global\_datatype**(void \*handle, const char \*name)

Get data type of internal global LAMMPS variables or arrays.

This function returns an integer that encodes the data type of the global property with the specified name. See *\_LMP\_DATATYPE\_CONST* for valid values. Callers of *lammps\_extract\_global()* can use this information to then decide how to cast the (void\*) pointer and access the data.

New in version 18Sep2020.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance (unused)
- **name** – string with the name of the extracted property

**Returns**

integer constant encoding the data type of the property or -1 if not found.

---

void \***lammps\_extract\_global**(void \*handle, const char \*name)

Get pointer to internal global LAMMPS variables or arrays.

This function returns a pointer to the location of some global property stored in one of the constituent classes of a LAMMPS instance. The returned pointer is cast to `void *` and needs to be cast to a pointer of the type that the entity represents. The pointers returned by this function are generally persistent; therefore it is not necessary to

---

call the function again, unless a *clear command* command is issued which wipes out and recreates the contents of the *LAMMPS* class.

Please also see *lammps\_extract\_setting()*, *lammps\_get\_thermo()*, and *lammps\_extract\_box()*.

The following tables list the supported names, their data types, length of the data area, and a short description. The data type can also be queried through calling *lammps\_extract\_global\_datatype()*. The *bigint* type may be defined to be either an *int* or an *int64\_t*. This is set at *compile time* of the LAMMPS library and can be queried through calling *lammps\_extract\_setting()*. The function *lammps\_extract\_global\_datatype()* will directly report the “native” data type. The following tables are provided:

- *Timestep settings*
- *Simulation box settings*
- *System property settings*
- *Unit settings*

### Timestep settings

Name	Type	Length	Description
dt	double	1	length of the time step. See <i>timestep command</i> .
ntimestep	bigint	1	current time step number. See <i>reset_timestep command</i> .
atime	double	1	accumulated simulation time in time units.
atimestep	bigint	1	the number of the timestep when “atime” was last updated.
respa_levels	int	1	number of r-RESPA levels. See <i>run_style command</i> .
respa_dt	double	number of r-RESPA levels	length of the time steps with r-RESPA. See <i>run_style command</i> .

### Simulation box settings

Name	Type	Length	Description
boxlo	double	3	lower box boundaries. See <i>create_box command</i> .
boxhi	double	3	upper box boundaries. See <i>create_box command</i> .
boxxlo	double	1	lower box boundary in x-direction. See <i>create_box command</i> .
boxxhi	double	1	upper box boundary in x-direction. See <i>create_box command</i> .
boxylo	double	1	lower box boundary in y-direction. See <i>create_box command</i> .
boxyhi	double	1	upper box boundary in y-direction. See <i>create_box command</i> .
boxzlo	double	1	lower box boundary in z-direction. See <i>create_box command</i> .
boxzhi	double	1	upper box boundary in z-direction. See <i>create_box command</i> .
sublo	double	3	subbox lower boundaries
subhi	double	3	subbox upper boundaries
sublo_lambda	double	3	subbox lower boundaries in fractional coordinates (for triclinic cells)
subhi_lambda	double	3	subbox upper boundaries in fractional coordinates (for triclinic cells)
periodicity	int	3	0 if non-periodic, 1 if periodic for x, y, and z; See <i>boundary command</i> .
triclinic	int	1	1 if the the simulation box is triclinic, 0 if orthogonal; See <i>change_box command</i> .
xy	double	1	triclinic tilt factor. See <i>Triclinic (non-orthogonal) simulation boxes</i> .
yz	double	1	triclinic tilt factor. See <i>Triclinic (non-orthogonal) simulation boxes</i> .
xz	double	1	triclinic tilt factor. See <i>Triclinic (non-orthogonal) simulation boxes</i> .

### System property settings

Name	Type	Length	Description
ntypes	int	1	number of atom types
nbonds	big-int	1	total number of bonds in the simulation.
nangles	big-int	1	total number of angles in the simulation.
ndihedrals	big-int	1	total number of dihedrals in the simulation.
nimpropers	big-int	1	total number of impropers in the simulation.
natoms	big-int	1	total number of atoms in the simulation.
nlocal	int	1	number of “owned” atoms of the current MPI rank.
nghost	int	1	number of “ghost” atoms of the current MPI rank.
nmax	int	1	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
q_flag	int	1	<b>deprecated.</b> Use <code>lammops_extract_setting()</code> instead.

### Unit settings

Name	Type	Length	Description
units	char *	1	string with the current unit style. See <i>units command</i> .
boltz	double	1	value of the “boltz” constant. See <i>units command</i> .
hplanck	double	1	value of the “hplanck” constant. See <i>units command</i> .
mvv2e	double	1	factor to convert $\frac{1}{2}mv^2$ for a particle to the current energy unit; See <i>units command</i> .
ftm2v	double	1	(description missing) See <i>units command</i> .
mv2d	double	1	(description missing) See <i>units command</i> .
nktv2p	double	1	(description missing) See <i>units command</i> .
qqr2e	double	1	factor to convert $\frac{q_i q_j}{r}$ to energy units; See <i>units command</i> .
qe2f	double	1	(description missing) See <i>units command</i> .
vxmu2f	double	1	(description missing) See <i>units command</i> .
xxt2kmu	double	1	(description missing) See <i>units command</i> .
dielectric	double	1	value of the dielectric constant. See <i>dielectric command</i> .
qqr2e	double	1	(description missing) See <i>units command</i> .
e_mass	double	1	(description missing) See <i>units command</i> .
hhmrr2e	double	1	(description missing) See <i>units command</i> .
mvh2r	double	1	(description missing) See <i>units command</i> .
angstrom	double	1	constant to convert current length unit to angstroms; 1.0 for reduced (aka “lj”) units. See <i>units command</i> .
fem- tosecond	double	1	constant to convert current time unit to femtoseconds; 1.0 for reduced (aka “lj”) units
qelectron	double	1	(description missing) See <i>units command</i> .

**Warning:** Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures or crashes or bogus simulations. In general it is thus usually better to use a LAMMPS input command that sets or changes these parameters. Those will takes care of all side effects and necessary updates of settings derived from such settings. Where possible a reference to such a command or a relevant section of the manual is given below.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted property

**Returns**

pointer (cast to `void *`) to the location of the requested property. NULL if name is not known.

### 12.1.4 Per-atom properties

This section documents the following functions:

- `lammmps_extract_atom_datatype()`
- `lammmps_extract_atom()`

---

```
int lammmps_extract_atom_datatype(void *handle, const char *name)
```

Get data type of a LAMMPS per-atom property

This function returns an integer that encodes the data type of the per-atom property with the specified name. See `_LMP_DATATYPE_CONST` for valid values. Callers of `lammmps_extract_atom()` can use this information to then decide how to cast the (`void*`) pointer and access the data.

New in version 18Sep2020.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted property

**Returns**

integer constant encoding the data type of the property or -1 if not found.

---

```
void *lammmps_extract_atom(void *handle, const char *name)
```

Get pointer to a LAMMPS per-atom property.

This function returns a pointer to the location of per-atom properties (and per-atom-type properties in the case of the ‘mass’ keyword). Per-atom data is distributed across sub-domains and thus MPI ranks. The returned pointer is cast to `void *` and needs to be cast to a pointer of data type that the entity represents.

A table with supported keywords is included in the documentation of the `Atom::extract()` function.

**Warning:** The pointers returned by this function are generally not persistent since per-atom data may be re-distributed, re-allocated, and re-ordered at every re-neighborhood operation.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted property

**Returns**

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

## 12.1.5 Compute, fixes, variables

This section documents accessing or modifying data stored by computes, fixes, or variables in LAMMPS using the following functions:

- `lammops_extract_compute()`
- `lammops_extract_fix()`
- `lammops_extract_variable()`
- `lammops_set_variable()`

---

```
void *lammops_extract_compute(void *handle, const char*, int, int)
```

Get pointer to data from a LAMMPS compute.

This function returns a pointer to the location of data provided by a *compute command* instance identified by the compute-ID. Computes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array or they may provide the information about the dimensions of the respective data. Since computes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns NULL if the compute ID is not found or the requested data is not available or current. The following table lists the available options.

Style (see <code>_LMP_STYLE_CONST</code> )	Type (see <code>_LMP_TYPE_CONST</code> )	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Global vector
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double **	Global array
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows of global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns of global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns in per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_VECTOR	int *	Alias for using LMP_SIZE_ROWS
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local array rows or length of vector
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local array columns, 0 if vector

---

**Note:** If the compute's data is not computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time, if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.

---

**Warning:** The pointers returned by this function are generally not persistent since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data is accessed, or make a copy if the data shall be used after other LAMMPS commands have been issued.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **id** – string with ID of the compute
- **style** – constant indicating the style of data requested (global, per-atom, or local)
- **type** – constant indicating type of data (scalar, vector, or array) or size of rows or columns

### Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

---

```
void *lammops_extract_fix(void *handle, const char*, int, int, int, int)
```

Get pointer to data from a LAMMPS fix.

This function returns a pointer to data provided by a *fix command* instance identified by its fix-ID. Fixes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array, or they may provide the information about the dimensions of the respective data. Since individual fixes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns NULL if the fix ID is not found or the requested data is not available.

The following table lists the available options.

Style (see <a href="#">_LMP_STYLE_CONST</a> )	Type (see <a href="#">_LMP_TYPE_CONST</a> )	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Copy of global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Copy of global vector element at index nrow
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double *	Copy of global array element at nrow, ncol
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows in global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns in global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns of per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local data rows
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local data columns

---

**Note:** When requesting global data, the fix data can only be accessed one item at a time without access to the pointer itself. Thus this function will allocate storage for a single double value, copy the returned value to it,

and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_fix(handle,name,0,1,0,0);
double value = *dptr;
lammps_free((void *)dptr);
```

---

**Note:** LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error. The caller has to avoid such an error.

---

**Warning:** The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data is accessed, or make a copy, if the data shall be used after other LAMMPS commands have been issued.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **id** – string with ID of the fix
- **style** – constant indicating the style of data requested (global, per-atom, or local)
- **type** – constant indicating type of data (scalar, vector, or array) or size of rows or columns
- **nrow** – row index (only used for global vectors and arrays)
- **ncol** – column index (only used for global arrays)

### Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

---

`void *lammps_extract_variable(void *handle, const char*, const char*)`

Get pointer to data from a LAMMPS variable.

This function returns a pointer to data from a LAMMPS *variable command* identified by its name. When the variable is either an *equal*-style compatible or an *atom*-style variable the variable is evaluated and the corresponding value(s) returned. Variables of style *internal* are compatible with *equal*-style variables and so are *python*-style variables, if they return a numeric value. For other variable styles their string value is returned. The function returns NULL when a variable of the provided *name* is not found or of an incompatible style. The *group* argument is only used for *atom*-style variables and ignored otherwise. If set to NULL when extracting data from an *atom*-style variable, the group is assumed to be “all”.

When requesting data from an *equal*-style or compatible variable this function allocates storage for a single double value, copies the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_variable(handle,name,NULL);
double value = *dptr;
lammps_free((void *)dptr);
```

For *atom*-style variables the data returned is a pointer to an allocated block of storage of double of the length `atom->nlocal`. Since the data is returned a copy, the location will persist, but its content will not be updated, in case the variable is re-evaluated. To avoid a memory leak this pointer needs to be freed after use in the calling program.

For other variable styles the returned pointer needs to be cast to a char pointer.

```
const char *cptr = (const char *) lammps_extract_variable(handle,name,NULL);
printf("The value of variable %s is %s\n", name, cptr);
```

---

**Note:** LAMMPS cannot easily check if it is valid to access the data referenced by the variables, e.g. computes or fixes or thermodynamic info, so it may fail with an error. The caller has to make certain, that the data is extracted only when it safe to evaluate the variable and thus an error and crash is avoided.

---

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – name of the variable
- **group** – group-ID for atom style variable or NULL

### Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

---

int **lammps\_set\_variable**(void\*, char\*, char\*)

Set the value of a string-style variable.

This function assigns a new value from the string `str` to the string-style variable `name`. Returns -1 if a variable of that name does not exist or is not a string-style variable, otherwise 0.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – name of the variable
- **str** – new value of the variable

### Returns

0 on success or -1 on failure

---

enum **\_LMP\_DATATYPE\_CONST**

Data type constants for extracting data from atoms, computes and fixes

Must be kept in sync with the equivalent constants in `lammps/constants.py`

*Values:*

enumerator **LAMMPS\_INT**

32-bit integer (array)

enumerator **LAMMPS\_INT\_2D**

two-dimensional 32-bit integer array

---

enumerator **LAMMPS\_DOUBLE**

64-bit double (array)

enumerator **LAMMPS\_DOUBLE\_2D**

two-dimensional 64-bit double array

enumerator **LAMMPS\_INT64**

64-bit integer (array)

enumerator **LAMMPS\_INT64\_2D**

two-dimensional 64-bit integer array

enumerator **LAMMPS\_STRING**

C-String

enum **\_LMP\_STYLE\_CONST**

Style constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in lammps/constants.py

*Values:*

enumerator **LMP\_STYLE\_GLOBAL**

return global data

enumerator **LMP\_STYLE\_ATOM**

return per-atom data

enumerator **LMP\_STYLE\_LOCAL**

return local data

enum **\_LMP\_TYPE\_CONST**

Type and size constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in lammps/constants.py

*Values:*

enumerator **LMP\_TYPE\_SCALAR**

return scalar

enumerator **LMP\_TYPE\_VECTOR**

return vector

enumerator **LMP\_TYPE\_ARRAY**

return array

enumerator **LMP\_SIZE\_VECTOR**

return length of vector

enumerator **LMP\_SIZE\_ROWS**

return number of rows

enumerator **LMP\_SIZE\_COLS**

return number of columns

## 12.1.6 Scatter/gather operations

This section has functions which gather per-atom data from one or more processors into a contiguous global list ordered by atom ID. The same list is returned to all calling processors. It also contains functions which scatter per-atom data from a contiguous global list across the processors that own those atom IDs. It also has a `create_atoms()` function which can create new atoms by scattering them appropriately to owning processors in the LAMMPS spatial decomposition.

It documents the following functions:

- `lammgs_gather_atoms()`
- `lammgs_gather_atoms_concat()`
- `lammgs_gather_atoms_subset()`
- `lammgs_scatter_atoms()`
- `lammgs_scatter_atoms_subset()`
- `lammgs_gather_bonds()`
- `lammgs_gather()`
- `lammgs_gather_concat()`
- `lammgs_gather_subset()`
- `lammgs_scatter()`
- `lammgs_scatter_subset()`
- `lammgs_create_atoms()`

---

void **lammgs\_gather\_atoms**(void \*handle, char \*name, int type, int count, void \*data)

---

void **lammgs\_gather\_atoms\_concat**(void \*handle, char \*name, int type, int count, void \*data)

---

void **lammgs\_gather\_atoms\_subset**(void \*handle, char \*name, int type, int count, int ndata, int \*ids, void \*data)

---

void **lammgs\_scatter\_atoms**(void \*handle, char \*name, int type, int count, void \*data)

---

void `lammops_scatter_atoms_subset`(void \*handle, char \*name, int type, int count, int ndata, int \*ids, void \*data)

---

void `lammops_gather_bonds`(void \*handle, void \*data)

Gather type and constituent atom info for all bonds

This function copies the list of all bonds into a buffer provided by the calling code. The buffer will be filled with bond type, bond atom 1, bond atom 2 for each bond. Thus the buffer has to be allocated to the dimension of 3 times the **total** number of bonds times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling `lammops_extract_setting()` with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** bonds in the system.

New in version 28Jul2021.

Below is a brief C code demonstrating accessing this collected bond information.

```
#include <stdio.h>
#include <stdlib.h>
#include <stdint.h>
#include "library.h"

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nbonds;
    void *handle, *bonds;

    handle = lammops_open_no_mpi(0, NULL, NULL);
    lammops_file(handle, "in.some_input");

    tagintsize = lammops_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nbonds = *(int32_t *)lammops_extract_global(handle, "nbonds");
    else
        nbonds = *(int64_t *)lammops_extract_global(handle, "nbonds");
    bonds = malloc(nbonds * 3 * tagintsize);

    lammops_gather_bonds(handle, bonds);

    if (lammops_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *bonds_real = (int32_t *)bonds;
            for (i = 0; i < nbonds; ++i) {
                printf("bond % 4ld: type = %d, atoms: % 4d % 4d\n", i,
                    bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
            }
        } else {
            int64_t *bonds_real = (int64_t *)bonds;
            for (i = 0; i < nbonds; ++i) {
```

(continues on next page)

(continued from previous page)

```

        printf("bond % 4ld: type = %ld, atoms: % 4ld % 4ld\n",i,
              bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
    }
}

lammps_close(handle);
lammps_mpi_finalize();
free(bonds);
return 0;
}

```

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance
- **data** – pointer to data to copy the result to

---

void **lammps\_gather**(void \*handle, char \*name, int type, int count, void \*data)

---

void **lammps\_gather\_concat**(void \*handle, char \*name, int type, int count, void \*data)

---

void **lammps\_gather\_subset**(void \*handle, char \*name, int type, int count, int ndata, int \*ids, void \*data)

---

void **lammps\_scatter**(void \*handle, char \*name, int type, int count, void \*data)

---

void **lammps\_scatter\_subset**(void \*handle, char \*name, int type, int count, int ndata, int \*ids, void \*data)

---

int **lammps\_create\_atoms**(void \*handle, int n, const int \*id, const int \*type, const double \*x, const double \*v, const int \*image, int bexpand)

Create N atoms from list of coordinates

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```

int lammps_create_atoms(void *handle, int n, int64_t *id, int *type, double *x,
↳double *v, int64_t *image, int bexpand);

```

This function creates additional atoms from a given list of coordinates and a list of atom types. Additionally the atom-IDs, velocities, and image flags may be provided. If atom-IDs are not provided, they will be automatically created as a sequence following the largest existing atom-ID.

This function is useful to add atoms to a simulation or - in tandem with `lammps_reset_box()` - to restore a previously extracted and saved state of a simulation. Additional properties for the new atoms can then be assigned via the `lammps_scatter_atoms()` `lammps_extract_atom()` functions.

For non-periodic boundaries, atoms will **not** be created that have coordinates outside the box unless it is a shrink-wrap boundary and the shrinkexceed flag has been set to a non-zero value. For periodic boundaries atoms will be wrapped back into the simulation cell and its image flags adjusted accordingly, unless explicit image flags are provided.

The function returns the number of atoms created or -1 on failure, e.g. when called before a box has been created.

Coordinates and velocities have to be given in a 1d-array in the order X(1),Y(1),Z(1),X(2),Y(2),Z(2),...,X(N),Y(N),Z(N).

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **n** – number of atoms, N, to be added to the system
- **id** – pointer to N atom IDs; NULL will generate IDs
- **type** – pointer to N atom types (required)
- **x** – pointer to 3N doubles with x-,y-,z- positions of the new atoms (required)
- **v** – pointer to 3N doubles with x-,y-,z- velocities of the new atoms (set to 0.0 if NULL)
- **image** – pointer to N imageint sets of image flags, or NULL
- **bexpand** – if 1, atoms outside of shrink-wrap boundaries will still be created and not dropped and the box extended

#### Returns

number of atoms created on success; -1 on failure (no box, no atom IDs, etc.)

### 12.1.7 Neighbor list access

The following functions enable access to neighbor lists generated by LAMMPS or querying of their properties:

- `lammps_find_compute_neighlist()`
- `lammps_find_fix_neighlist()`
- `lammps_find_pair_neighlist()`
- `lammps_neighlist_num_elements()`
- `lammps_neighlist_element_neighbors()`

---

int **lammps\_find\_compute\_neighlist**(void \*handle, const char \*id, int request)

Find index of a neighbor list requested by a compute

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically 0, but will be

0 in case a compute has multiple neighbor list requests.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **id** – Identifier of compute instance
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same compute

**Returns**

return neighbor list index if found, otherwise -1

---

int **lammops\_find\_fix\_neighlist**(void \*handle, const char \*id, int request)

Find index of a neighbor list requested by a fix

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically 0, but will be > 0 in case a fix has multiple neighbor list requests.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **id** – Identifier of fix instance
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same fix

**Returns**

return neighbor list index if found, otherwise -1

---

int **lammops\_find\_pair\_neighlist**(void \*handle, const char \*style, int exact, int nsub, int request)

Find index of a neighbor list requested by a pair style

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If exact is 1 the name must match exactly, if exact is 0, a regular expression or sub-string match is done. If the pair style is hybrid or hybrid/overlay the style is matched against the sub styles instead. If a the same pair style is used multiple times as a sub-style, the nsub argument must be > 0 and represents the nth instance of the sub-style (same as for the pair\_coeff command, for example). In that case nsub=0 will not produce a match and this function will return -1.

The final condition to be checked is the request ID (reqid). This will normally be 0, but some pair styles request multiple neighbor lists and set the request ID to a value > 0.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **style** – String used to search for pair style instance
- **exact** – Flag to control whether style should match exactly or only a regular expression / sub-string match is applied.
- **nsub** – match nsub-th hybrid sub-style instance of the same style
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same pair style instance

**Returns**

return neighbor list index if found, otherwise -1

---

int **lammops\_neighlist\_num\_elements**(void \*handle, int idx)

Return the number of entries in the neighbor list with given index

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.
- **idx** – neighbor list index

**Returns**

return number of entries in neighbor list, -1 if idx is not a valid index

---

void **lammops\_neighlist\_element\_neighbors**(void \*handle, int idx, int element, int \*iatom, int \*numneigh, int \*\*neighbors)

Return atom local index, number of neighbors, and array of neighbor local atom indices of neighbor list entry

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.
- **idx** – index of this neighbor list in the list of all neighbor lists
- **element** – index of this neighbor list entry
- **iatom** – [out] local atom index (i.e. in the range [0, nlocal + nghost), -1 if invalid idx or element value
- **numneigh** – [out] number of neighbors of atom iatom or 0
- **neighbors** – [out] pointer to array of neighbor atom local indices or NULL

## 12.1.8 Configuration information

This section documents the following functions:

- *lammops\_version()*
- *lammops\_get\_os\_info()*
- *lammops\_config\_has\_mpi\_support()*
- *lammops\_config\_has\_gzip\_support()*
- *lammops\_config\_has\_png\_support()*
- *lammops\_config\_has\_jpeg\_support()*
- *lammops\_config\_has\_ffmpeg\_support()*
- *lammops\_config\_has\_exceptions()*
- *lammops\_config\_has\_package()*
- *lammops\_config\_package\_count()*
- *lammops\_config\_package\_name()*
- *lammops\_config\_accelerator()*
- *lammops\_has\_gpu\_device()*
- *lammops\_gpu\_device\_info()*
- *lammops\_has\_style()*

- `lammmps_style_count()`
- `lammmps_style_name()`
- `lammmps_has_id()`
- `lammmps_id_count()`
- `lammmps_id_name()`

These library functions can be used to query the LAMMPS library for compile time settings and included packages and styles. This enables programs that use the library interface to determine whether the linked LAMMPS library is compatible with the requirements of the application without crashing during the LAMMPS functions (e.g. due to missing pair styles from packages) or to choose between different options (e.g. whether to use `lj/cut`, `lj/cut/opt`, `lj/cut/omp` or `lj/cut/intel`). Most of the functions can be called directly without first creating a LAMMPS instance. While crashes within LAMMPS may be recovered from by enabling *exceptions*, avoiding them proactively is a safer approach.

Listing 1: Example for using configuration settings functions

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;

    handle = lammmps_open_no_mpi(0, NULL, NULL);
    lammmps_file(handle, "in.missing");
    if (lammmps_has_error(handle)) {
        char errmsg[256];
        int errtype;
        errtype = lammmps_get_last_error_message(handle, errmsg, 256);
        fprintf(stderr, "LAMMPS failed with error: %s\n", errmsg);
        return 1;
    }
    /* write compressed dump file depending on available of options */
    if (lammmps_has_style(handle, "dump", "atom/zstd")) {
        lammmps_command(handle, "dump d1 all atom/zstd 100 dump.zst");
    } else if (lammmps_has_style(handle, "dump", "atom/gz")) {
        lammmps_command(handle, "dump d1 all atom/gz 100 dump.gz");
    } else if (lammmps_config_has_gzip_support()) {
        lammmps_command(handle, "dump d1 all atom 100 dump.gz");
    } else {
        lammmps_command(handle, "dump d1 all atom 100 dump");
    }
    lammmps_close(handle);
    return 0;
}
```

```
int lammmps_version(void *handle)
```

Get numerical representation of the LAMMPS version date.

The `lammops_version()` function returns an integer representing the version of the LAMMPS code in the format YYYYMMDD. This can be used to implement backward compatibility in software using the LAMMPS library interface. The specific format guarantees, that this version number is growing with every new LAMMPS release.

**Parameters**

**handle** – pointer to a previously created LAMMPS instance

**Returns**

an integer representing the version data in the format YYYYMMDD

---

void `lammops_get_os_info`(char \*buffer, int buf\_size)

Get operating system and architecture information

The `lammops_get_os_info()` function can be used to retrieve detailed information about the hosting operating system and compiler/runtime.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. The string is typically a few hundred bytes long.

New in version 9Oct2020.

**Parameters**

- **buffer** – string buffer to copy the information to
  - **buf\_size** – size of the provided string buffer
- 

int `lammops_config_has_mpi_support`()

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial. For the real MPI library it reports the size of the MPI communicator in bytes (4 or 8), which allows to check for compatibility with a hosting code.

**Returns**

0 when compiled with MPI STUBS, otherwise the MPI\_Comm size in bytes

---

int `lammops_config_has_gzip_support`()

Check if the LAMMPS library supports reading or writing compressed files via a pipe to gzip or similar compression programs

Several LAMMPS commands (e.g. *read\_data command*, *write\_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the `gzip` program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether `gzip` or any other supported compression programs themselves are installed and usable.

**Returns**

1 if yes, otherwise 0

---

int `lammops_config_has_png_support()`

Check if the LAMMPS library supports writing PNG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them need, however, support from an external library and using that has to be *enabled at compile time*. This function checks whether support for the *PNG image file format* is available in the current LAMMPS library.

**Returns**

1 if yes, otherwise 0

---

int `lammops_config_has_jpeg_support()`

Check if the LAMMPS library supports writing JPEG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them need, however, support from an external library and using that has to be *enabled at compile time*. This function checks whether support for the *JPEG image file format* is available in the current LAMMPS library.

**Returns**

1 if yes, otherwise 0

---

int `lammops_config_has_ffmpeg_support()`

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the *ffmpeg* program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the *ffmpeg* itself is installed and usable.

**Returns**

1 if yes, otherwise 0

---

int `lammops_config_has_exceptions()`

Check whether LAMMPS errors will throw a C++ exception

In case of errors LAMMPS will either abort or throw a C++ exception. The latter has to be *enabled at compile time*. This function checks if exceptions were enabled.

When using the library interface and C++ exceptions are enabled, the library interface functions will “catch” them and the error status can then be checked by calling *lammops\_has\_error()* and the most recent error message can be retrieved via *lammops\_get\_last\_error\_message()*. This can allow to restart a calculation or delete and recreate the LAMMPS instance when C++ exceptions are enabled. One application of using exceptions this way is the *LAMMPS shell*. If C++ exceptions are disabled and an error happens during a call to LAMMPS, the application will terminate.

**Returns**

1 if yes, otherwise 0

---

int **lammers\_config\_has\_package**(const char\*)

Check if a specific package has been included in LAMMPS

This function checks if the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

**Parameters**

**name** – string with the name of the package

**Returns**

1 if included, 0 if not.

---

int **lammers\_config\_package\_count**()

Count the number of installed packages in the LAMMPS library.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use.

**Returns**

number of packages included

---

int **lammers\_config\_package\_name**(int, char\*, int)

Get the name of a package in the list of installed packages in the LAMMPS library.

This function copies the name of the package with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf\_size* argument. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1;

**Parameters**

- **idx** – index of the package in the list of included packages ( $0 \leq \text{idx} < \text{package count}$ )
- **buffer** – string buffer to copy the name of the package to
- **buf\_size** – size of the provided string buffer

**Returns**

1 if successful, otherwise 0

---

int **lammers\_config\_accelerator**(const char\*, const char\*, const char\*)

Check for compile time settings in accelerator packages included in LAMMPS.

This function checks availability of compile time settings of included *accelerator packages* in LAMMPS. Supported packages names are “GPU”, “KOKKOS”, “INTEL”, and “OPENMP”. Supported categories are “api” with possible settings “cuda”, “hip”, “phi”, “pthreads”, “opencl”, “openmp”, and “serial”, and “precision” with possible settings “double”, “mixed”, and “single”. If the combination of package, category, and setting is available, the function returns 1, otherwise 0.

**Parameters**

- **package** – string with the name of the accelerator package
- **category** – string with the category name of the setting
- **setting** – string with the name of the specific setting

**Returns**

1 if available, 0 if not.

---

int **lammops\_has\_gpu\_device()**

Check for presence of a viable GPU package device

The *lammops\_has\_gpu\_device()* function checks at runtime if an accelerator device is present that can be used with the *GPU package*. If at least one suitable device is present the function will return 1, otherwise 0.

More detailed information about the available device or devices can be obtained by calling the *lammops\_get\_gpu\_device\_info()* function.

New in version 14May2021.

#### Returns

1 if viable device is available, 0 if not.

---

void **lammops\_get\_gpu\_device\_info**(char \*buffer, int buf\_size)

Get GPU package device information

The *lammops\_get\_gpu\_device\_info()* function can be used to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will produce a string that is equivalent to the output of the *nvc\_get\_device* or *ocl\_get\_device* or *hip\_get\_device* tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. This string can be several kilobytes long, if multiple devices are present.

New in version 14May2021.

#### Parameters

- **buffer** – string buffer to copy the information to
  - **buf\_size** – size of the provided string buffer
- 

int **lammops\_has\_style**(void\*, const char\*, const char\*)

Check if a specific style has been included in LAMMPS

This function checks if the LAMMPS library in use includes the specific *style* of a specific *category* provided as an argument. Valid categories are: *atom*, *integrate*, *minimize*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kpace*, *compute*, *fix*, *region*, *dump*, and *command*.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **category** – category of the style
- **name** – name of the style

#### Returns

1 if included, 0 if not.

---

int **lammops\_style\_count**(void\*, const char\*)

Count the number of styles of category in the LAMMPS library.

This function counts how many styles in the provided *category* are included in the LAMMPS library in use. Please see *lammops\_has\_style()* for a list of valid categories.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **category** – category of styles

**Returns**

number of styles in category

---

int **lammops\_style\_name**(void\*, const char\*, int, char\*, int)

Look up the name of a style by index in the list of style of a given category in the LAMMPS library.

This function copies the name of the *category* style with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf\_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **category** – category of styles
- **idx** – index of the style in the list of *category* styles ( $0 \leq \text{idx} < \text{style count}$ )
- **buffer** – string buffer to copy the name of the style to
- **buf\_size** – size of the provided string buffer

**Returns**

1 if successful, otherwise 0

---

int **lammops\_has\_id**(void\*, const char\*, const char\*)

Check if a specific ID exists in the current LAMMPS instance

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

New in version 9Oct2020.

**Parameters**

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **category** – category of the id
- **name** – name of the id

**Returns**

1 if included, 0 if not.

---

int **lammops\_id\_count**(void\*, const char\*)

Count the number of IDs of a category.

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see *lammops\_has\_id()* for a list of valid categories.

New in version 9Oct2020.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **category** – category of IDs

#### Returns

number of IDs in category

---

int **lammops\_id\_name**(void\*, const char\*, int, char\*, int)

Look up the name of an ID by index in the list of IDs of a given category.

This function copies the name of the *category* ID with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf\_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

New in version 9Oct2020.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **category** – category of IDs
- **idx** – index of the ID in the list of *category* styles (0 <= idx < count)
- **buffer** – string buffer to copy the name of the style to
- **buf\_size** – size of the provided string buffer

#### Returns

1 if successful, otherwise 0

## 12.1.9 Utility functions

To simplify some tasks, the library interface contains these utility functions. They do not directly call the LAMMPS library.

- *lammops\_encode\_image\_flags()*
- *lammops\_decode\_image\_flags()*
- *lammops\_set\_fix\_external\_callback()*
- *lammops\_fix\_external\_set\_energy\_global()*
- *lammops\_fix\_external\_set\_energy\_peratom()*

- `lammps_fix_external_set_virial_global()`
- `lammps_fix_external_set_virial_peratom()`
- `lammps_fix_external_set_vector_length()`
- `lammps_fix_external_set_vector()`
- `lammps_flush_buffers()`
- `lammps_free()`
- `lammps_is_running()`
- `lammps_force_timeout()`
- `lammps_has_error()`
- `lammps_get_last_error_message()`

The `lammps_free()` function is a clean-up function to free memory that the library had allocated previously via other function calls. Look for notes in the descriptions of the individual commands where such memory buffers were allocated that require the use of `lammps_free()`.

---

int **lammps\_encode\_image\_flags**(int ix, int iy, int iz)

Encode three integer image flags into a single imageint.

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
int64_t lammps_encode_image_flags(int ix, int iy, int iz);
```

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in x-, y-, and z-direction. Unless LAMMPS is compiled with `-DLAMMPS_BIGBIG`, those integers are limited 10-bit signed integers [-512, 511]. Otherwise the return type changes from `int` to `int64_t` and the valid range for the individual image flags becomes [-1048576,1048575], i.e. that of a 21-bit signed integer. There is no check on whether the arguments conform to these requirements.

#### Parameters

- **ix** – image flag value in x
- **iy** – image flag value in y
- **iz** – image flag value in z

#### Returns

encoded image flag integer

---

void **lammps\_decode\_image\_flags**(int image, int \*flags)

Decode a single image flag integer into three regular integers

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
void lammps_decode_image_flags(int64_t image, int *flags);
```

This function does the reverse operation of `lammps_encode_image_flags()` and takes an image flag integer does the bit-shift and bit-masking operations to decode it and stores the resulting three regular integers into the buffer pointed to by `flags`.

#### Parameters

- **image** – encoded image flag integer
- **flags** – pointer to storage where the decoded image flags are stored.

---

```
void lammps_set_fix_external_callback(void *handle, const char *id, FixExternalFnPtr funcptr, void *ptr)
```

Set up the callback function for a fix external instance with the given ID.

Fix *external* allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function sets the callback function for use with the “pf/callback” mode. The function has to have C language bindings with the prototype:

```
void func(void *ptr, bigint timestep, int nlocal, tagint *ids, double **x, double_
↪ **fexternal);
```

The argument *ptr* to this function will be stored in fix external and the passed as the first argument calling the callback function *func()*. This would usually be a pointer to the active LAMMPS instance, i.e. the same pointer as the *handle* argument. This would be needed to call functions that set the global or per-atom energy or virial contributions from within the callback function.

The callback mechanism is one of the two modes of how forces and can be applied to a simulation with the help of fix external. The alternative is the array mode where you call `lammps_fix_external_get_force()`.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Changed in version 28Jul2021.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **id** – fix ID of fix external instance
- **funcptr** – pointer to callback function
- **ptr** – pointer to object in calling code, passed to callback function as first argument

---

```
void lammps_fix_external_set_energy_global(void *handle, const char *id, double eng)
```

Set the global energy contribution for a fix external instance with the given ID.

This is a companion function to `lammps_set_fix_external_callback()` and `lammps_fix_external_get_force()` to also set the contribution to the global energy from the external code. The value of the *eng* argument will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus when running in parallel all MPI

processes have to call this function with the **same** value and this will be returned as scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

New in version 28Jul2021.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.
- **id** – fix ID of fix external instance
- **eng** – total energy to be added to the global energy

---

void **lammops\_fix\_external\_set\_energy\_peratom**(void \*handle, const char \*id, double \*eng)

Set the per-atom energy contribution for a fix external instance with the given ID.

This is a companion function to *lammops\_set\_fix\_external\_callback()* to set the per-atom energy contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

New in version 28Jul2021.

---

**Note:** This function is fully independent from *lammops\_fix\_external\_set\_energy\_global()* and will **NOT** add any contributions to the global energy tally and **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

---

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.
- **id** – fix ID of fix external instance
- **eng** – pointer to array of length nlocal with the energy to be added to the per-atom energy

---

void **lammops\_fix\_external\_set\_virial\_global**(void \*handle, const char \*id, double \*virial)

Set the global virial contribution for a fix external instance with the given ID.

This is a companion function to *lammops\_set\_fix\_external\_callback()* and *lammops\_fix\_external\_get\_force()* to set the contribution to the global virial from the external code.

The 6 values of the *virial* array will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The components of the virial need to be stored in the order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS the virial is stored internally as *stress\*volume* in units of *pressure\*volume* as determined by the current *units* settings and is the **total** contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will then be added by fix external.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

New in version 28Jul2021.

### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **id** – fix ID of fix external instance
- **virial** – the 6 global stress tensor components to be added to the global virial

---

```
void lammps_fix_external_set_virial_peratom(void *handle, const char *id, double **virial)
```

Set the per-atom virial contribution for a fix external instance with the given ID.

This is a companion function to `lammps_set_fix_external_callback()` to set the per-atom virial contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The code in fix external assumes the dimensions of the per-atom virial array is `double virial[nlocal][6]`.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

New in version 28Jul2021.

---

**Note:** This function is fully independent from `lammps_fix_external_set_virial_global()` and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

---

### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **id** – fix ID of fix external instance
- **virial** – a list of `nlocal` entries with the 6 per-atom stress tensor components to be added to the per-atom virial

---

```
void lammps_fix_external_set_vector_length(void *handle, const char *id, int len)
```

Set the vector length for a global vector stored with fix external for analysis

This is a companion function to `lammps_set_fix_external_callback()` and `lammps_fix_external_get_force()` to set the length of a global vector of properties that will be stored with the fix via `lammps_fix_external_set_vector()`.

This function needs to be called **before** a call to `lammps_fix_external_set_vector()` and **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the same length parameter.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

New in version 28Jul2021.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.
- **id** – fix ID of fix external instance
- **len** – length of the global vector to be stored with the fix

---

void **lammops\_fix\_external\_set\_vector**(void \*handle, const char \*id, int idx, double val)

Store a global vector value for a fix external instance with the given ID.

This is a companion function to *lammops\_set\_fix\_external\_callback()* and *lammops\_fix\_external\_get\_force()* to set the values of a global vector of properties that will be stored with the fix. And can be accessed from within LAMMPS input commands (e.g. fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to *lammops\_fix\_external\_set\_vector\_length()* and the and **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the **same** index and value parameters. The value is assumed to be extensive.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

New in version 28Jul2021.

---

**Note:** The index in the *idx* parameter is 1-based, i.e. the first element is set with *idx* = 1 and the last element of the vector with *idx* = N, where N is the value of the *len* parameter of the call to *lammops\_fix\_external\_set\_vector\_length()*.

---

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.
- **id** – fix ID of fix external instance
- **idx** – 1-based index of in global vector
- **val** – value to be stored in global vector

---

void **lammops\_flush\_buffers**(void \*ptr)

Flush output buffers

This function can be used to flush buffered output to be written to screen and logfile pointers to simplify capturing output from LAMMPS library calls.

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*.

void **lammgs\_free**(void \*ptr)

Free memory buffer allocated by LAMMPS.

Some of the LAMMPS C library interface functions return data as pointer to a buffer that has been allocated by LAMMPS or the library interface. This function can be used to delete those in order to avoid memory leaks.

**Parameters**

**ptr** – pointer to data allocated by LAMMPS

---

int **lammgs\_is\_running**(void \*handle)

Check if LAMMPS is currently inside a run or minimization

This function can be used from signal handlers or multi-threaded applications to determine if the LAMMPS instance is currently active.

**Parameters**

**handle** – pointer to a previously created LAMMPS instance cast to void \*.

**Returns**

0 if idle or >0 if active

---

void **lammgs\_force\_timeout**(void \*handle)

Force a timeout to cleanly stop an ongoing run

This function can be used from signal handlers or multi-threaded applications to cleanly terminate an ongoing run.

**Parameters**

**handle** – pointer to a previously created LAMMPS instance cast to void \*

---

int **lammgs\_has\_error**(void \*handle)

Check if there is a (new) error message available

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

---

**Note:** This function will always report “no error” when the LAMMPS library has been compiled without `-DLAMMPS_EXCEPTIONS` which turns fatal errors aborting LAMMPS into a C++ exceptions. You can use the library function `lammgs_config_has_exceptions()` to check if this is the case.

---

**Parameters**

**handle** – pointer to a previously created LAMMPS instance cast to void \*.

**Returns**

0 on no error, 1 on error.

---

```
int lammops_get_last_error_message(void *handle, char *buffer, int buf_size)
```

Copy the last error message into the provided buffer

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS which resulted in a C++ *exception*. A suitable buffer for a C-style string has to be provided and its length. If the internally stored error message is longer, it will be truncated accordingly. The return value of the function corresponds to the kind of error: a “1” indicates an error that occurred on all MPI ranks and is often recoverable, while a “2” indicates an abort that would happen only in a single MPI rank and thus may not be recoverable as other MPI ranks may be waiting on the failing MPI ranks to send messages.

---

**Note:** This function will do nothing when the LAMMPS library has been compiled without `-DLAMMPS_EXCEPTIONS` which turns errors aborting LAMMPS into a C++ exceptions. You can use the library function `lammops_config_has_exceptions()` to check if this is the case.

---

#### Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void \*
- **buffer** – string buffer to copy the error message to
- **buf\_size** – size of the provided string buffer

#### Returns

1 when all ranks had the error, 2 on a single rank error.

### 12.1.10 Extending the C API

The functionality of the LAMMPS library interface has historically been motivated by the needs of its users. Functions have been added or expanded as they were needed and used. Contributions to the interface are always welcome. However with a refactoring of the library interface and its documentation that started in Spring 2020, there are now a few requirements for including new changes or extensions.

- New functions should be orthogonal to existing ones and not implement functionality that can already be achieved with the existing APIs.
- All changes and additions should be documented with [Doxygen](#) style comments and references to those functions added to the corresponding files in the `doc/src` folder.
- If possible, new unit tests to test those new features should be added.
- New features should also be implemented and documented not just for the C interface, but also the Python and Fortran interfaces.
- All additions should work and be compatible with `-DLAMMPS_BIGBIG`, `-DLAMMPS_SMALLBIG`, `-DLAMMPS_SMALLSMALL` as well as when compiling with and without MPI support.
- The `library.h` file should be kept compatible to C code at a level similar to C89. Its interfaces may not reference any custom data types (e.g. `bigint`, `tagint`, and so on) that are only known inside of LAMMPS; instead `int` and `int64_t` should be used.
- only use C style comments, not C++ style

Please note that these are not **strict** requirements, but the LAMMPS developers very much appreciate, if they are followed and can assist with implementing what is missing. It helps maintaining the code base and keeping it consistent.

---

## 12.2 LAMMPS Python APIs

The LAMMPS Python module enables calling the LAMMPS C library API from Python by dynamically loading functions in the LAMMPS shared library through the Python `ctypes` module. Because of the dynamic loading, it is **required** that LAMMPS is compiled in “*shared*” mode. The Python interface is object oriented, but otherwise tries to be very similar to the C library API. Three different Python classes to run LAMMPS are available and they build on each other. More information on this is in the *Use Python with LAMMPS* section of the manual. Use of the LAMMPS Python module is described in *The lammmps Python module*.

---

## 12.3 LAMMPS Fortran API

The LAMMPS Fortran module is a wrapper around calling functions from the LAMMPS C library API. This is done using the `ISO_C_BINDING` feature in Fortran 2003. The interface is object oriented but otherwise tries to be very similar to the C library API and the basic Python module.

### 12.3.1 The LIBLAMMPS Fortran Module

The LIBLAMMPS module provides an interface to call LAMMPS from a Fortran code. It is based on the LAMMPS C-library interface and requires a Fortran 2003 compatible compiler to be compiled.

While C libraries have a defined binary interface (ABI) and can thus be used from multiple compiler versions from different vendors for as long as they are compatible with the hosting operating system, the same is not true for Fortran codes. Thus the LAMMPS Fortran module needs to be compiled alongside the code using it from the source code in `fortran/lammmps.f90`. When linking, you also need to *link to the LAMMPS library*. A typical command line for a simple program using the Fortran interface would be:

```
mpifort -o testlib.x lammmps.f90 testlib.f90 -L. -llammmps
```

Please note, that the MPI compiler wrapper is only required when the calling the library from an MPI parallel code. Please also note the order of the source files: the `lammmps.f90` file needs to be compiled first, since it provides the LIBLAMMPS module that is imported by the Fortran code using the interface. A working example code can be found together with equivalent examples in C and C++ in the `examples/COUPLE/simple` folder of the LAMMPS distribution.

New in version 9Oct2020.

---

### Work in Progress

This Fortran module is work in progress and only the documented functionality is currently available. The final implementation should cover the entire range of functionality available in the C and Python library interfaces.

---

**Note:** A contributed (and more complete!) Fortran interface that more closely resembles the C-library interface is available in the `examples/COUPLE/fortran2` folder. Please see the README file in that folder for more information about it and how to contact its author and maintainer.

---

---

### 12.3.2 Creating or deleting a LAMMPS object

With the Fortran interface the creation of a *LAMMPS* instance is included in the constructor for creating the `lammps()` derived type. To import the definition of that type and its type bound procedures you need to add a `USE LIBLAMMPS` statement. Internally it will call either `lammps_open_fortran()` or `lammps_open_no_mpi()` from the C library API to create the class instance. All arguments are optional and `lammps_mpi_init()` will be called automatically, if it is needed. Similarly, a possible call to `lammps_finalize()` is integrated into the `close()` function and triggered with the optional logical argument set to `.true.`. Here is a simple example:

```
PROGRAM testlib
  USE LIBLAMMPS           ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps)           :: lmp      ! derived type to hold LAMMPS instance
  CHARACTER(len=*) , PARAMETER :: args(3) = &
    [ CHARACTER(len=12) :: 'liblammps', '-log', 'none' ]

  ! create a LAMMPS instance (and initialize MPI)
  lmp = lammps(args)
  ! get and print numerical version code
  PRINT*, 'LAMMPS Version: ', lmp%version()
  ! delete LAMMPS instance (and shuts down MPI)
  CALL lmp%close(.true.)

END PROGRAM testlib
```

It is also possible to pass command line flags from Fortran to C/C++ and thus make the resulting executable behave similar to the standalone executable (it will ignore the `-in/-i` flag, though). This allows to use the command line to configure accelerator and suffix settings, configure screen and logfile output, or to set index style variables from the command line and more. Here is a correspondingly adapted version of the previous example:

```
PROGRAM testlib2
  USE LIBLAMMPS           ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps)           :: lmp      ! derived type to hold LAMMPS instance
  CHARACTER(len=128) , ALLOCATABLE :: command_args(:)
  INTEGER :: i, argc

  ! copy command line flags to `command_args()`
  argc = COMMAND_ARGUMENT_COUNT()
  ALLOCATE(command_args(0:argc))
  DO i=0, argc
    CALL GET_COMMAND_ARGUMENT(i, command_args(i))
  END DO

  ! create a LAMMPS instance (and initialize MPI)
  lmp = lammps(command_args)
  ! get and print numerical version code
  PRINT*, 'Program name: ', command_args(0)
  PRINT*, 'LAMMPS Version: ', lmp%version()
  ! delete LAMMPS instance (and shuts down MPI)
  CALL lmp%close(.TRUE.)
  DEALLOCATE(command_args)

END PROGRAM testlib2
```

## Executing LAMMPS commands

Once a LAMMPS instance is created, it is possible to “drive” the LAMMPS simulation by telling LAMMPS to read commands from a file, or pass individual or multiple commands from strings or lists of strings. This is done similar to how it is implemented in the *C-library* `<pg_lib_execute>` interface. Before handing off the calls to the C-library interface, the corresponding Fortran versions of the calls (`file()`, `command()`, `commands_list()`, and `commands_string()`) have to make a copy of the strings passed as arguments so that they can be modified to be compatible with the requirements of strings in C without affecting the original strings. Those copies are automatically deleted after the functions return. Below is a small demonstration of the uses of the different functions:

```
PROGRAM testcmd
  USE LIBLAMMPS
  TYPE(lammps)      :: lmp
  CHARACTER(len=512) :: cmds
  CHARACTER(len=40), ALLOCATABLE :: cmdlist(:)
  CHARACTER(len=10)  :: trimmed
  INTEGER           :: i

  lmp = lammps()
  CALL lmp%file('in.melt')
  CALL lmp%command('variable zpos index 1.0')
  ! define 10 groups of 10 atoms each
  ALLOCATE(cmdlist(10))
  DO i=1, 10
    WRITE(trimmed,'(I10)') 10*i
    WRITE(cmdlist(i),'(A,I1,A,I10,A,A)')      &
      'group g', i-1, ' id ', 10*(i-1)+1, ':', ADJUSTL(trimmed)
  END DO
  CALL lmp%commands_list(cmdlist)
  ! run multiple commands from multi-line string
  cmds = 'clear' // NEW_LINE('A') // &
        'region box block 0 2 0 2 0 2' // NEW_LINE('A') // &
        'create_box 1 box' // NEW_LINE('A') // &
        'create_atoms 1 single 1.0 1.0 ${zpos}'
  CALL lmp%commands_string(cmds)
  CALL lmp%close(.TRUE.)

END PROGRAM testcmd
```

### 12.3.3 The LIBLAMMPS module API

Below are the detailed descriptions of definitions and interfaces of the contents of the LIBLAMMPS Fortran interface to LAMMPS.

#### type `lammps`

Derived type that is the general class of the Fortran interface. It holds a reference to the `LAMMPS` class instance that any of the included calls are forwarded to.

##### Type fields

- `% handle [c_ptr]` :: reference to the LAMMPS class
- `% close` :: `close()`
- `% version` :: `version()`
- `% file` :: `file()`
- `% command` :: `command()`
- `% commands_list` :: `commands_list()`
- `% commands_string` :: `commands_string()`

#### function `lammps`(*args*[, *comm*])

This is the constructor for the Fortran class and will forward the arguments to a call to either `lammps_open_fortran()` or `lammps_open_no_mpi()`. If the LAMMPS library has been compiled with MPI support, it will also initialize MPI, if it has not already been initialized before.

The *args* argument with the list of command line parameters is optional and so is the *comm* argument with the MPI communicator. If *comm* is not provided, `MPI_COMM_WORLD` is assumed. For more details please see the documentation of `lammps_open()`.

##### Parameters

`args (*) [character(len=*),optional]` :: arguments as list of strings

##### Options

`comm [integer,optional]` :: MPI communicator

##### Return

`lammps` :: an instance of the `lammps` derived type

#### subroutine `close`([*finalize*])

This method will close down the LAMMPS instance through calling `lammps_close()`. If the *finalize* argument is present and has a value of `.true.`, then this subroutine also calls `lammps_mpi_finalize()`.

##### Options

`finalize [logical,optional]` :: shut down the MPI environment of the LAMMPS library if true.

#### function `version`()

This method returns the numeric LAMMPS version like `lammps_version()`

##### Return

`integer` :: LAMMPS version

---

#### subroutine `file`(*filename*)

This method will call `lammps_file()` to have LAMMPS read and process commands from a file.

##### Parameters

`filename [character(len=*)]` :: name of file with LAMMPS commands

**subroutine `command(cmd)`**

This method will call `lammers_command()` to have LAMMPS execute a single command.

**Parameters**

`cmd` [*character(len=\*)*] :: single LAMMPS command

**subroutine `commands_list(cmds)`**

This method will call `lammers_commands_list()` to have LAMMPS execute a list of input lines.

**Parameters**

`cmd` (\*) [*character(len=\*)*] :: list of LAMMPS input lines

**subroutine `commands_string(str)`**

This method will call `lammers_commands_string()` to have LAMMPS execute a block of commands from a string.

**Parameters**

`str` [*character(len=\*)*] :: LAMMPS input in string

## 12.4 LAMMPS C++ API

It is also possible to invoke the LAMMPS C++ API directly in your code. It lacks some of the convenience of the C library API, but it allows more direct access to simulation data and thus more low-level manipulations. The following links provide some examples and references to the C++ API.

### 12.4.1 Using the C++ API directly

Using the C++ classes of the LAMMPS library is lacking some of the convenience of the C library API, but it allows a more direct access to simulation data and thus more low-level manipulations and tighter integration of LAMMPS into another code. While for the complete C library API is provided in the `library.h` header file, for using the C++ API it is required to include the individual header files defining the individual classes in use. Typically the name of the class and the name of the header follow some simple rule. Examples are given below.

### 12.4.2 Creating or deleting a LAMMPS object

When using the LAMMPS library interfaces, the core task is to create an instance of the `LAMMPS_NS::LAMMPS` class. In C++ this can be done directly through the `new` operator. All further operations are then initiated through calling member functions of some of the components of the LAMMPS class or accessing their data members. The destruction of the LAMMPS instance is correspondingly initiated by using the `delete` operator. Here is a simple example:

```
#include "lammps.h"

#include <mpi.h>
#include <iostream>

int main(int argc, char **argv)
{
    LAMMPS_NS::LAMMPS *lmp;
    // custom argument vector for LAMMPS library
    const char *lmpargv[] {"liblammps", "-log", "none"};
```

(continues on next page)

(continued from previous page)

```

int lmpargc = sizeof(lmpargv)/sizeof(const char *);

// explicitly initialize MPI
MPI_Init(&argc, &argv);

// create LAMMPS instance
lmp = new LAMMPS_NS::LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
// output numerical version string
std::cout << "LAMMPS version ID: " << lmp->num_ver << std::endl;
// delete LAMMPS instance
delete lmp;

// stop MPI environment
MPI_Finalize();
return 0;
}

```

This minimal example only requires to include the `lammps.h` header file since it only accesses a non-pointer member of the LAMMPS class.

### 12.4.3 Executing LAMMPS commands

Once a LAMMPS instance is created by your C++ code, you need to set up a simulation and that is most conveniently done by “driving” it through issuing commands like you would do when running a LAMMPS simulation from an input script. Processing of input in LAMMPS is handled by the `Input` class an instance of which is a member of the `LAMMPS` class. You have two options: reading commands from a file, or executing a single command from a string. See below for a small example:

```

#include "lammps.h"
#include "input.h"
#include <mpi.h>

using namespace LAMMPS_NS;

int main(int argc, char **argv)
{
    const char *lmpargv[] {"liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    MPI_Init(&argc, &argv);
    LAMMPS *lmp = new LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    lmp->input->file("in.melt");
    lmp->input->one("run 100 post no");
    delete lmp;
    return 0;
}

```

## USE PYTHON WITH LAMMPS

These pages describe various ways that LAMMPS and Python can be used together.

### 13.1 Overview

The LAMMPS distribution includes a `python` directory with the Python code needed to run LAMMPS from Python. The `python/lammps` package contains *the “lammps” Python module* that wraps the LAMMPS C-library interface. This module makes it possible to do the following either from a Python script, or interactively from a Python prompt:

- create one or more instances of LAMMPS
- invoke LAMMPS commands or read them from an input script
- run LAMMPS incrementally
- extract LAMMPS results
- and modify internal LAMMPS data structures.

From a Python script you can do this in serial or in parallel. Running Python interactively in parallel does not generally work, unless you have a version of Python that extends Python to enable multiple instances of Python to read what you type.

To do all of this, you must build LAMMPS in *“shared” mode* and make certain that your Python interpreter can find the `lammps` Python package and the LAMMPS shared library file.

The Python wrapper for LAMMPS uses the `ctypes` package in Python, which auto-generates the interface code needed between Python and a set of C-style library functions. `Ctypes` has been part of the standard Python distribution since version 2.5. You can check which version of Python you have by simply typing “python” at a shell prompt. Below is an example output for Python version 3.8.5.

```
$ python
Python 3.8.5 (default, Aug 12 2020, 00:00:00)
[GCC 10.2.1 20200723 (Red Hat 10.2.1-1)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

**Warning:** The options described in this section of the manual for using Python with LAMMPS currently support either Python 2 or 3. Specifically version 2.7 or later and 3.6 or later. Since the Python community no longer maintains Python 2 (see [this notice](#)), we recommend use of Python 3 with LAMMPS. While Python 2 code should continue to work, that is not something we can guarantee long-term.

LAMMPS can work together with Python in three ways. First, Python can wrap LAMMPS through the its *library interface*, so that a Python script can create one or more instances of LAMMPS and launch one or more simulations. In Python terms, this is referred to as “extending” Python with a LAMMPS module.

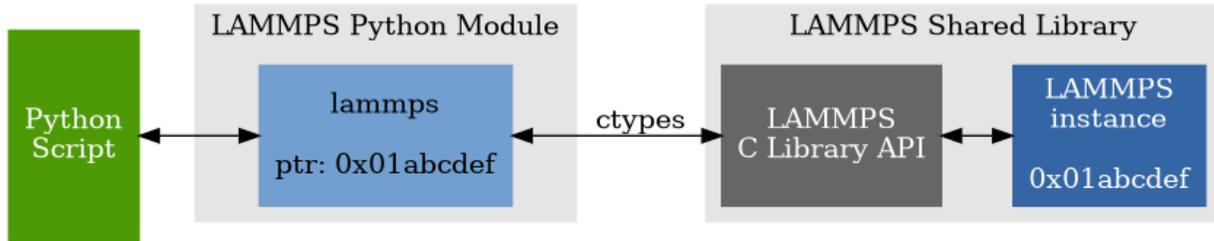

Fig. 1: Launching LAMMPS via Python

Second, the lower-level Python interface in the *lammmps Python class* can be used indirectly through the provided *PyLammmps* and *IPyLammmps* wrapper classes, also written in Python. These wrappers try to simplify the usage of LAMMPS in Python by providing a more object-based interface to common LAMMPS functionality. They also reduce the amount of code necessary to parameterize LAMMPS scripts through Python and make variables and computes directly accessible.

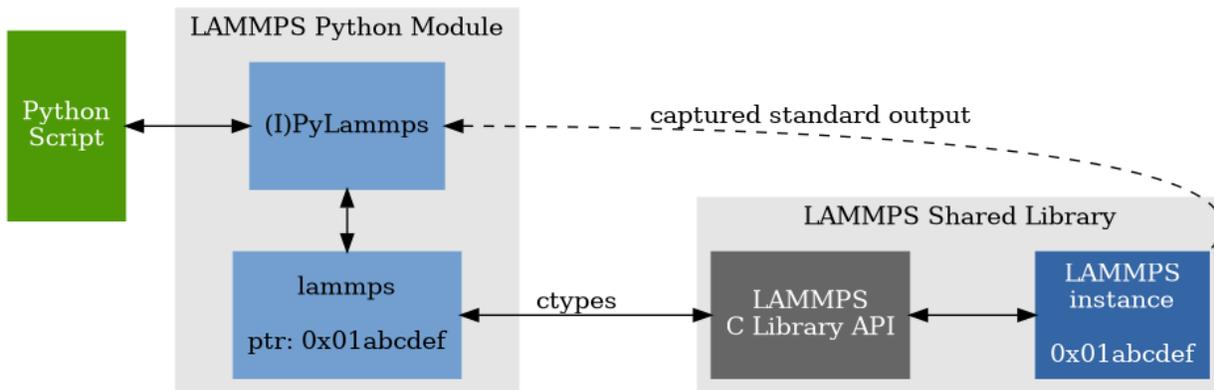

Fig. 2: Using the PyLammmps / IPyLammmps wrappers

Third, LAMMPS can use the Python interpreter, so that a LAMMPS input script or styles can invoke Python code directly, and pass information back-and-forth between the input script and Python functions you write. This Python code can also call back to LAMMPS to query or change its attributes through the LAMMPS Python module mentioned above. In Python terms, this is called “embedding” Python into LAMMPS. When used in this mode, Python can perform script operations that the simple LAMMPS input script syntax can not.

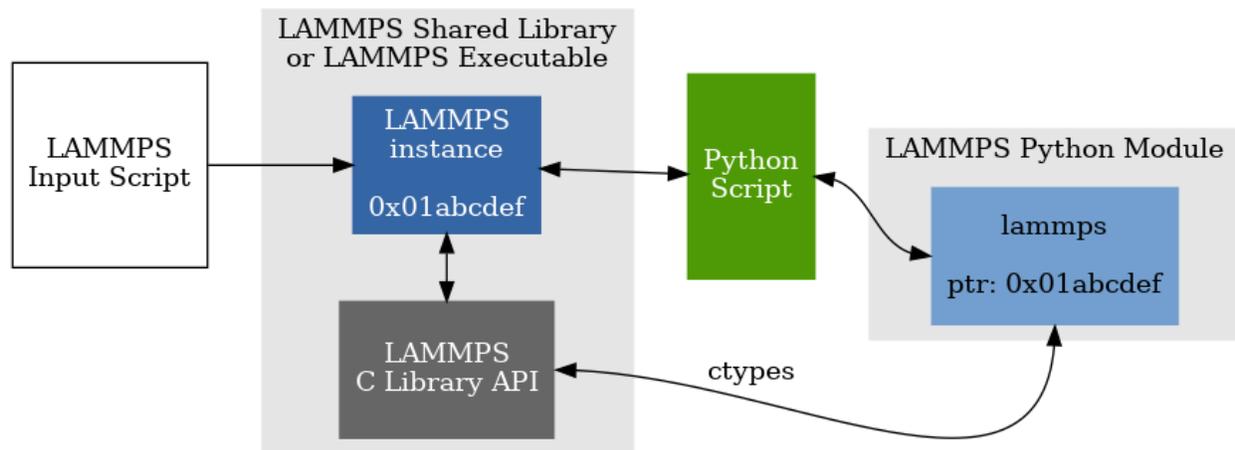

Fig. 3: Calling Python code from LAMMPS

## 13.2 Installation

The LAMMPS Python module enables calling the *LAMMPS C library API* from Python by dynamically loading functions in the LAMMPS shared library through the Python `ctypes` module. Because of the dynamic loading, it is required that LAMMPS is compiled in “*shared*” mode. It is also recommended to compile LAMMPS with *C++ exceptions* enabled.

Two components are necessary for Python to be able to invoke LAMMPS code:

- The LAMMPS Python Package (`lammmps`) from the `python` folder
- The LAMMPS Shared Library (`liblammmps.so`, `liblammmps.dylib` or `liblammmps.dll`) from the folder where you compiled LAMMPS.

### 13.2.1 Installing the LAMMPS Python Module and Shared Library

Making LAMMPS usable within Python and vice versa requires putting the LAMMPS Python package (`lammmps`) into a location where the Python interpreter can find it and installing the LAMMPS shared library into a folder that the dynamic loader searches or inside of the installed `lammmps` package folder. There are multiple ways to achieve this.

1. Do a full LAMMPS installation of libraries, executables, selected headers, documentation (if enabled), and supporting files (only available via CMake), which can also be either system-wide or into user specific folders.
2. Install both components into a Python `site-packages` folder, either system-wide or in the corresponding user-specific folder. This way no additional environment variables need to be set, but the shared library is otherwise not accessible.
3. Do an installation into a virtual environment. This can either be an installation of the Python package only or a full installation of LAMMPS.
4. Leave the files where they are in the source/development tree and adjust some environment variables.

#### Full install (CMake-only)

*Build the LAMMPS executable and library* with `-DBUILD_SHARED_LIBS=on`, `-DLAMMPS_EXCEPTIONS=on` and `-DPKG_PYTHON=on` (The first option is required, the other two are optional by recommended). The exact file name of the shared library depends on the platform (Unix/Linux, MacOS, Windows) and the build configuration

being used. The installation base folder is already set by default to the `$HOME/.local` directory, but it can be changed to a custom location defined by the `CMAKE_INSTALL_PREFIX` CMake variable. This uses a folder called `build` to store files generated during compilation.

```
# create build folder
mkdir build
cd build

# configure LAMMPS compilation
cmake -C ../cmake/presets/basic.cmake -D BUILD_SHARED_LIBS=on \
      -D LAMMPS_EXCEPTIONS=on -D PKG_PYTHON=on ../cmake

# compile LAMMPS
cmake --build .

# install LAMMPS into $HOME/.local
cmake --install .
```

This leads to an installation to the following locations:

File	Location	Notes
LAMMPS Python package	<ul style="list-style-type: none"> <li><code>\$HOME/.local/lib/pythonX.Y/site-packages/lammps</code> (32bit)</li> <li><code>\$HOME/.local/lib64/pythonX.Y/site-packages/lammps</code> (64bit)</li> </ul>	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> <li><code>\$HOME/.local/lib/</code> (32bit)</li> <li><code>\$HOME/.local/lib64/</code> (64bit)</li> </ul>	Set shared loader environment variable to this path (see below for more info on this)
LAMMPS executable	<ul style="list-style-type: none"> <li><code>\$HOME/.local/bin/</code></li> </ul>	
LAMMPS potential files	<ul style="list-style-type: none"> <li><code>\$HOME/.local/share/lammps/potentials/</code></li> </ul>	Set <code>LAMMPS_POTENTIALS</code> environment variable to this path

For a system-wide installation you need to set `CMAKE_INSTALL_PREFIX` to a system folder like `/usr` (or `/usr/local`); the default is `${HOME}/.local`. The installation step for a system folder installation (**not** the configuration/compilation) needs to be done with superuser privilege, e.g. by using `sudo cmake --install ..`. The installation folders will then be changed to (assuming `/usr` as prefix):

File	Location	Notes
LAMMPS Python package	<ul style="list-style-type: none"> <li>• /usr/lib/pythonX.Y/site-packages/lammps (32bit)</li> <li>• /usr/lib64/pythonX.Y/site-packages/lammps (64bit)</li> </ul>	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> <li>• /usr/lib/ (32bit)</li> <li>• /usr/lib64/ (64bit)</li> </ul>	
LAMMPS executable	<ul style="list-style-type: none"> <li>• /usr/bin/</li> </ul>	
LAMMPS potential files	<ul style="list-style-type: none"> <li>• /usr/share/lammps/potentials/</li> </ul>	

To be able to use the “user” installation you have to ensure that the folder containing the LAMMPS shared library is either included in a path searched by the shared linker (e.g. like /usr/lib64/) or part of the LD\_LIBRARY\_PATH environment variable (or DYLD\_LIBRARY\_PATH on MacOS). Otherwise you will get an error when trying to create a LAMMPS object through the Python module.

```
# Unix/Linux
export LD_LIBRARY_PATH=$HOME/.local/lib:$LD_LIBRARY_PATH

# MacOS
export DYLD_LIBRARY_PATH=$HOME/.local/lib:$DYLD_LIBRARY_PATH
```

If you plan to use the LAMMPS executable (e.g., lmp), you may also need to adjust the PATH environment variable (but many newer Linux distributions already have \$HOME/.local/bin included). Example:

```
export PATH=$HOME/.local/bin:$PATH
```

To make those changes permanent, you can add the commands to your \$HOME/.bashrc file. For a system-wide installation it is not necessary due to files installed in system folders that are loaded automatically when a login shell is started.

### Python package only

Compile LAMMPS with either *CMake* or the *traditional make* procedure in *shared mode*. After compilation has finished type (in the compilation folder):

```
make install-python
```

This will try to build a so-called (binary) ‘wheel’, a compressed binary python package and then install it with the python package manager ‘pip’. Installation will be attempted into a system-wide site-packages folder and if that fails into the corresponding folder in the user’s home directory. For a system-wide installation you would have to gain superuser privilege, e.g. through `sudo`

File	Location	Notes
LAMMPS Python package	<ul style="list-style-type: none"> <li>• \$HOME/.local/lib/pythonX.Y/site-packages/lammps</li> </ul>	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> <li>• \$HOME/.local/lib/pythonX.Y/site-packages/lammps</li> </ul>	X.Y depends on the installed Python version

For a system-wide installation those folders would then become.

File	Location	Notes
LAMMPS Python package	<ul style="list-style-type: none"> <li>• /usr/lib/pythonX.Y/site-packages/lammps</li> </ul>	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> <li>• /usr/lib/pythonX.Y/site-packages/lammps</li> </ul>	X.Y depends on the installed Python version

No environment variables need to be set for those, as those folders are searched by default by Python or the LAMMPS Python package.

Changed in version 24Mar2022.

---

**Note:** If there is an existing installation of the LAMMPS python module, `make install-python` will try to update it. However, that will fail if the older version of the module was installed by LAMMPS versions until 17Feb2022. Those were using the `distutils` package, which does not create a “manifest” that allows a clean uninstall. The `make install-python` command will always produce a `lammps-<version>-<python>-<abi>-<os>-<arch>.whl` file (the ‘wheel’). And this file can be later installed directly with `python -m pip install <wheel file>.whl` without having to type `make install-python` again and repeating the build step, too.

---

For the traditional `make` process you can override the python version to version `x.y` when calling `make` with `PYTHON=pythonX.Y`. For a CMake based compilation this choice has to be made during the CMake configuration step.

If the default settings of `make install-python` are not what you want, you can invoke `install.py` from the python directory manually as

```
$ python install.py -p <python package> -l <shared library> [-n]
```

- The `-p` flag points to the `lammps` Python package folder to be installed,
  - the `-l` flag points to the LAMMPS shared library file to be installed,
  - and the optional `-n` instructs the script to only build a wheel file but not attempt to install it.
- 

## Virtual environment

A virtual environment is a minimal Python installation inside of a folder. It allows isolating and customizing a Python environment that is mostly independent from a user or system installation. For the core Python environment, it uses symbolic links to the system installation and thus it can be set up quickly and will not take up much disk space. This gives you the flexibility to install (newer/different) versions of Python packages that would potentially conflict with already installed system packages. It also does not require any superuser privileges. See [PEP 405: Python Virtual Environments](#) for more information.

To create a virtual environment in the folder `$HOME/myenv`, use the `venv` module as follows.

```
# create virtual environment in folder $HOME/myenv
python3 -m venv $HOME/myenv
```

For Python versions prior 3.3 you can use `virtualenv` command instead of “`python3 -m venv`”. This step has to be done only once.

To activate the virtual environment type:

```
source $HOME/myenv/bin/activate
```

This has to be done every time you log in or open a new terminal window and after you turn off the virtual environment with the `deactivate` command.

When using CMake to build LAMMPS, you need to set `CMAKE_INSTALL_PREFIX` to the value of the `$VIRTUAL_ENV` environment variable during the configuration step. For the traditional make procedure, no additional steps are needed. After compiling LAMMPS you can do a “Python package only” installation with `make install-python` and the LAMMPS Python package and the shared library file are installed into the following locations:

File	Location	Notes
LAMMPS Python Module	<ul style="list-style-type: none"> <li><code>\$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</code></li> </ul>	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> <li><code>\$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</code></li> </ul>	X.Y depends on the installed Python version

If you do a full installation (CMake only) with “`install`”, this leads to the following installation locations:

File	Location	Notes
LAMMPS Python Module	<ul style="list-style-type: none"> <li>• \$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</li> </ul>	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> <li>• \$VIRTUAL_ENV/lib/ (32bit)</li> <li>• \$VIRTUAL_ENV/lib64/ (64bit)</li> </ul>	Set shared loader environment variable to this path (see below for more info on this)
LAMMPS executable	<ul style="list-style-type: none"> <li>• \$VIRTUAL_ENV/bin/</li> </ul>	
LAMMPS potential files	<ul style="list-style-type: none"> <li>• \$VIRTUAL_ENV/share/lammps/potentials/</li> </ul>	Set LAMMPS_POTENTIALS environment variable to this path

In that case you need to modify the \$HOME/myenv/bin/activate script in a similar fashion you need to update your \$HOME/.bashrc file to include the shared library and executable locations in LD\_LIBRARY\_PATH (or DYLD\_LIBRARY\_PATH on MacOS) and PATH, respectively.

For example with:

```
# Unix/Linux
echo 'export LD_LIBRARY_PATH=$VIRTUAL_ENV/lib:$LD_LIBRARY_PATH' >> $HOME/myenv/bin/
↪activate

# MacOS
echo 'export DYLD_LIBRARY_PATH=$VIRTUAL_ENV/lib:$DYLD_LIBRARY_PATH' >> $HOME/myenv/
↪bin/activate
```

### In place usage

You can also *compile LAMMPS* as usual in “*shared*” mode leave the shared library and Python package inside the source/compilation folders. Instead of copying the files where they can be found, you need to set the environment variables PYTHONPATH (for the Python package) and LD\_LIBRARY\_PATH (or DYLD\_LIBRARY\_PATH on MacOS

For Bourne shells (bash, ksh and similar) the commands are:

```
export PYTHONPATH=${PYTHONPATH}:${HOME}/lammps/python
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

For the C-shells like csh or tcsh the commands are:

```
setenv PYTHONPATH ${PYTHONPATH}:${HOME}/lammps/python
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

On MacOS you may also need to set DYLD\_LIBRARY\_PATH accordingly. You can make those changes permanent by editing your \$HOME/.bashrc or \$HOME/.login files, respectively.

---

**Note:** The PYTHONPATH needs to point to the parent folder that contains the lammps package!

---

To verify if LAMMPS can be successfully started from Python, start the Python interpreter, load the lammps Python module and create a LAMMPS instance. This should not generate an error message and produce output similar to the following:

```
$ python
Python 3.8.5 (default, Sep  5 2020, 10:50:12)
[GCC 10.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import lammps
>>> lmp = lammps.lammps()
LAMMPS (18 Sep 2020)
using 1 OpenMP thread(s) per MPI task
>>>
```

---

**Note:** Unless you opted for “In place use”, you will have to rerun the installation any time you recompile LAMMPS to ensure the latest Python package and shared library are installed and used.

---

---

**Note:** If you want Python to be able to load different versions of the LAMMPS shared library with different settings, you will need to manually copy the files under different names (e.g. liblammps\_mpi.so or liblammps\_gpu.so) into the appropriate folder as indicated above. You can then select the desired library through the *name* argument of the LAMMPS object constructor (see *Creating or deleting a LAMMPS object*).

---

### 13.2.2 Extending Python to run in parallel

If you wish to run LAMMPS in parallel from Python, you need to extend your Python with an interface to MPI. This also allows you to make MPI calls directly from Python in your script, if you desire.

We have tested this with [MPI for Python](#) (aka mpi4py) and you will find installation instruction for it below.

Installation of mpi4py (version 3.0.3 as of Sep 2020) can be done as follows:

- Via pip into a local user folder with:

```
pip install --user mpi4py
```

- Via dnf into a system folder for RedHat/Fedora systems:

```
# for use with OpenMPI
sudo dnf install python3-mpi4py-openmpi
# for use with MPICH
sudo dnf install python3-mpi4py-openmpi
```

- Via pip into a virtual environment (see above):

```
$ source $HOME/myenv/activate
(myenv)$ pip install mpi4py
```

- Via pip into a system folder (not recommended):

```
sudo pip install mpi4py
```

For more detailed installation instructions and additional options, please see the [mpi4py installation](#) page.

To use mpi4py and LAMMPS in parallel from Python, you **must** make certain that **both** are using the **same** implementation and version of MPI library. If you only have one MPI library installed on your system this is not an issue, but it can be if you have multiple MPI installations (e.g. on an HPC cluster to be selected through environment modules). Your LAMMPS build is explicit about which MPI it is using, since it is either detected during CMake configuration or in the traditional make build system you specify the details in your low-level `src/MAKE/Makefile.foo` file. The installation process of mpi4py uses the `mpicc` command to find information about the MPI it uses to build against. And it tries to load “libmpi.so” from the `LD_LIBRARY_PATH`. This may or may not find the MPI library that LAMMPS is using. If you have problems running both mpi4py and LAMMPS together, this is an issue you may need to address, e.g. by loading the module for different MPI installation so that mpi4py finds the right one.

If you have successfully installed mpi4py, you should be able to run Python and type

```
from mpi4py import MPI
```

without error. You should also be able to run Python in parallel on a simple test script

```
$ mpirun -np 4 python3 test.py
```

where `test.py` contains the lines

```
from mpi4py import MPI
comm = MPI.COMM_WORLD
print("Proc %d out of %d procs" % (comm.Get_rank(), comm.Get_size()))
```

and see one line of output for each processor you run on.

```
# NOTE: the line order is not deterministic
$ mpirun -np 4 python3 test.py
Proc 0 out of 4 procs
Proc 1 out of 4 procs
Proc 2 out of 4 procs
Proc 3 out of 4 procs
```

## 13.3 Run LAMMPS from Python

After compiling the LAMMPS shared library and making it ready to use, you can now write and run Python scripts that import the LAMMPS Python module and launch LAMMPS simulations through Python scripts. The following pages take you through the various steps necessary, what functionality is available and give some examples how to use it.

---

### 13.3.1 Running LAMMPS and Python in serial

To run a LAMMPS in serial, type these lines into Python interactively from the bench directory:

```
>>> from lammps import lammps
>>> lmp = lammps()
>>> lmp.file("in.lj")
```

Or put the same lines in the file `test.py` and run it as

```
$ python3 test.py
```

Either way, you should see the results of running the `in.lj` benchmark on a single processor appear on the screen, the same as if you had typed something like:

```
lmp_serial -in in.lj
```

### 13.3.2 Running LAMMPS and Python in parallel with MPI

To run LAMMPS in parallel, assuming you have installed the `mpi4py` package as discussed *Extending Python to run in parallel*, create a `test.py` file containing these lines:

```
from mpi4py import MPI
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
me = MPI.COMM_WORLD.Get_rank()
nprocs = MPI.COMM_WORLD.Get_size()
print("Proc %d out of %d procs has" % (me,nprocs),lmp)
MPI.Finalize()
```

You can run the script in parallel as:

```
$ mpirun -np 4 python3 test.py
```

and you should see the same output as if you had typed

```
$ mpirun -np 4 lmp_mpi -in in.lj
```

Note that without the `mpi4py` specific lines from `test.py`

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

running the script with `mpirun` on  $P$  processors would lead to  $P$  independent simulations to run parallel, each with a single processor. Therefore, if you use the `mpi4py` lines and you see multiple LAMMPS single processor outputs, `mpi4py` is not working correctly.

Also note that once you import the `mpi4py` module, `mpi4py` initializes MPI for you, and you can use MPI calls directly in your Python script, as described in the `mpi4py` documentation. The last line of your Python script should be `MPI.finalize()`, to insure MPI is shut down correctly.

### 13.3.3 Running Python scripts

Note that any Python script (not just for LAMMPS) can be invoked in one of several ways:

```
$ python script.py
$ python -i script.py
$ ./script.py
```

The last command requires that the first line of the script be something like this:

```
#!/usr/bin/python
#!/usr/bin/python -i
```

where the path points to where you have Python installed, and that you have made the script file executable:

```
$ chmod +x script.py
```

Without the `-i` flag, Python will exit when the script finishes. With the `-i` flag, you will be left in the Python interpreter when the script finishes, so you can type subsequent commands. As mentioned above, you can only run Python interactively when running Python on a single processor, not in parallel.

---

### 13.3.4 Creating or deleting a LAMMPS object

With the Python interface the creation of a *LAMMPS* instance is included in the constructors for the *lammps*, *PyLammps*, and *IPyLammps* classes. Internally it will call either *lammps\_open()* or *lammps\_open\_no\_mpi()* from the C library API to create the class instance.

All arguments are optional. The *name* argument allows loading a LAMMPS shared library that is named *liblammps\_machine.so* instead of the default name of *liblammps.so*. In most cases the latter will be installed or used. The *ptr* argument is for use of the *lammps* module from inside a LAMMPS instance, e.g. with the *python* command, where a pointer to the already existing *LAMMPS* class instance can be passed to the Python class and used instead of creating a new instance. The *comm* argument may be used in combination with the *mpi4py* module to pass an MPI communicator to LAMMPS and thus it is possible to run the Python module like the library interface on a subset of the MPI ranks after splitting the communicator.

Here are simple examples using all three Python interfaces:

---

#### lammps API

```
from lammps import lammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]

# create LAMMPS instance
lmp = lammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", lmp.version())

# explicitly close and delete LAMMPS instance (optional)
lmp.close()
```

---

## PyLammps API

The `PyLammps` class is a wrapper around the `lammps` class and all of its lower level functions. By default, it will create a new instance of `lammps` passing along all arguments to the constructor of `lammps`.

```
from lammps import PyLammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]

# create LAMMPS instance
L = PyLammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", L.version())

# explicitly close and delete LAMMPS instance (optional)
L.close()
```

`PyLammps` objects can also be created on top of an existing `lammps` object:

```
from lammps import lammps, PyLammps
...
# create LAMMPS instance
lmp = lammps(cmdargs=args)

# create PyLammps instance using previously created LAMMPS instance
L = PyLammps(ptr=lmp)
```

This is useful if you have to create the `lammps` instance in a specific way, but want to take advantage of the `PyLammps` interface.

---

## IPyLammps API

The `IPyLammps` class is an extension of the `PyLammps` class. It has the same construction behavior. By default, it will create a new instance of `lammps` passing along all arguments to the constructor of `lammps`.

```
from lammps import IPyLammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]

# create LAMMPS instance
L = IPyLammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", L.version())

# explicitly close and delete LAMMPS instance (optional)
L.close()
```

You can also initialize `IPyLammps` on top of an existing `lammps` or `PyLammps` object:

```
from lammps import lammps, IPyLammps
...
# create LAMMPS instance
lmp = lammps(cmdargs=args)

# create PyLammps instance using previously created LAMMPS instance
L = PyLammps(ptr=lmp)
```

This is useful if you have to create the `lammps` instance in a specific way, but want to take advantage of the `IPyLammps` interface.

---

In all of the above cases, same as with the *C library API*, this will use the `MPI_COMM_WORLD` communicator for the MPI library that LAMMPS was compiled with.

The `lmp.close()` call is optional since the LAMMPS class instance will also be deleted automatically during the `lammps` class destructor. Instead of `lmp.close()` it is also possible to call `lmp.finalize()`; this will destruct the LAMMPS instance, but also finalized and release the MPI and/or Kokkos environment if enabled and active.

Note that you can create multiple LAMMPS objects in your Python script, and coordinate and run multiple simulations, e.g.

```
from lammps import lammps
lmp1 = lammps()
lmp2 = lammps()
lmp1.file("in.file1")
lmp2.file("in.file2")
```

### 13.3.5 Executing commands

Once an instance of the `lammps`, `PyLammps`, or `IPyLammps` class is created, there are multiple ways to “feed” it commands. In a way that is not very different from running a LAMMPS input script, except that Python has many more facilities for structured programming than the LAMMPS input script syntax. Furthermore it is possible to “compute” what the next LAMMPS command should be.

---

#### lammps API

Same as in the equivalent *C library functions*, commands can be read from a file, a single string, a list of strings and a block of commands in a single multi-line string. They are processed under the same boundary conditions as the C library counterparts. The example below demonstrates the use of `lammps.file()`, `lammps.command()`, `lammps.commands_list()`, and `lammps.commands_string()`:

```
from lammps import lammps
lmp = lammps()

# read commands from file 'in.melt'
lmp.file('in.melt')

# issue a single command
lmp.command('variable zpos index 1.0')

# create 10 groups with 10 atoms each
cmds = ["group g{} id {}:{}".format(i,10*i+1,10*(i+1)) for i in range(10)]
```

(continues on next page)

(continued from previous page)

```

Imp.commands_list(cmds)

# run commands from a multi-line string
block = """
clear
region box block 0 2 0 2 0 2
create_box 1 box
create_atoms 1 single 1.0 1.0 ${zpos}
"""
Imp.commands_string(block)

```

### PyLammps/IPyLammps API

Unlike the lammps API, the PyLammps/IPyLammps APIs allow running LAMMPS commands by calling equivalent member functions of *PyLammps* and *IPyLammps* instances.

For instance, the following LAMMPS command

```
region box block 0 10 0 5 -0.5 0.5
```

can be executed using with the lammps API with the following Python code if `Imp` is an instance of *lammps*:

```

from lammps import lammps

Imp = lammps()
Imp.command("region box block 0 10 0 5 -0.5 0.5")

```

With the PyLammps interface, any LAMMPS command can be split up into arbitrary parts. These parts are then passed to a member function with the name of the *command*. For the *region* command that means the `region()` method can be called. The arguments of the command can be passed as one string, or individually.

```

from lammps import PyLammps

L = PyLammps()

# pass command parameters as one string
L.region("box block 0 10 0 5 -0.5 0.5")

# OR pass them individually
L.region("box block", 0, 10, 0, 5, -0.5, 0.5)

```

In the latter example, all parameters except the first are Python floating-point literals. The member function takes the entire parameter list and transparently merges it to a single command string.

The benefit of this approach is avoiding redundant command calls and easier parameterization. In the lammps API parameterization needed to be done manually by creating formatted command strings.

```

Imp.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo,
↪zhi))

```

In contrast, methods of PyLammps accept parameters directly and will convert them automatically to a final command string.

```
L.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Using these facilities, the example shown for the lammps API can be rewritten as follows:

```
from lammps import PyLammps
L = PyLammps()

# read commands from file 'in.melt'
L.file('in.melt')

# issue a single command
L.variable('zpos', 'index', 1.0)

# create 10 groups with 10 atoms each
for i in range(10):
    L.group(f"g{i}", "id", f"{10*i+1}:{10*(i+1)}")

L.clear()
L.region("box block", 0, 2, 0, 2, 0, 2)
L.create_box(1, "box")
L.create_atoms(1, "single", 1.0, 1.0, "${zpos}")
```

### 13.3.6 System properties

Similar to what is described in *System properties*, the instances of *lammps*, *PyLammps*, or *IPyLammps* can be used to extract different kinds of information about the active LAMMPS instance and also to modify some of it. The main difference between the interfaces is how the information is exposed.

While the *lammps* is just a thin layer that wraps C API calls, *PyLammps* and *IPyLammps* expose information as objects and properties.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to ctypes pointers. Where possible, the wrappers will determine the ctypes data type and cast pointers accordingly. If numpy is installed arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

**Warning:** When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between sub-domains.

---

#### lammps API

```
from lammps import lammps

lmp = lammps()
lmp.file("in.sysinit")

natoms = lmp.get_natoms()
print(f"running simulation with {natoms} atoms")

lmp.command("run 1000 post no");
```

```

for i in range(10):
    lmp.command("run 100 pre no post no")
    pe = lmp.get_thermo("pe")
    ke = lmp.get_thermo("ke")
    print(f"PE = {pe}\nKE = {ke}")

```

```
lmp.close()
```

#### Methods:

- `version()`: return the numerical version id, e.g. LAMMPS 2 Sep 2015 -> 20150902
- `get_thermo()`: return current value of a thermo keyword
- `get_natoms()`: total # of atoms as int
- `reset_box()`: reset the simulation box size
- `extract_setting()`: return a global setting
- `extract_global()`: extract a global quantity
- `extract_box()`: extract box info
- `create_atoms()`: create N atoms with IDs, types, x, v, and image flags

---

#### PyLammps/IPyLammps API

In addition to the functions provided by `lammps`, `PyLammps` objects have several properties which allow you to query the system state:

##### **L.system**

Is a dictionary describing the system such as the bounding box or number of atoms

##### **L.system.xlo, L.system.xhi**

bounding box limits along x-axis

##### **L.system.ylo, L.system.yhi**

bounding box limits along y-axis

##### **L.system.zlo, L.system.zhi**

bounding box limits along z-axis

##### **L.communication**

configuration of communication subsystem, such as the number of threads or processors

##### **L.communication.nthreads**

number of threads used by each LAMMPS process

##### **L.communication.nprocs**

number of MPI processes used by LAMMPS

##### **L.fixes**

List of fixes in the current system

##### **L.computes**

List of active computes in the current system

##### **L.dump**

List of active dumps in the current system

**L.groups**

List of groups present in the current system

**Retrieving the value of an arbitrary LAMMPS expressions**

LAMMPS expressions can be immediately evaluated by using the `eval` method. The passed string parameter can be any expression containing global *thermo command* values, variables, compute or fix data (see *Output from LAMMPS (thermo, dumps, computes, fixes, variables)*):

```
result = L.eval("ke") # kinetic energy
result = L.eval("pe") # potential energy

result = L.eval("v_t/2.0")
```

**Example**

```
from lammps import PyLammps

L = PyLammps()
L.file("in.sysinit")

print(f"running simulation with {L.system.natoms} atoms")

L.run(1000, "post no");

for i in range(10):
    L.run(100, "pre no post no")
    pe = L.eval("pe")
    ke = L.eval("ke")
    print(f"PE = {pe}\nKE = {ke}")
```

### 13.3.7 Per-atom properties

Similar to what is described in *Per-atom properties*, the instances of *lammps*, *PyLammps*, or *IPyLammps* can be used to extract atom quantities and modify some of them. The main difference between the interfaces is how the information is exposed.

While the *lammps* is just a thin layer that wraps C API calls, *PyLammps* and *IPyLammps* expose information as objects and properties.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to ctypes pointers. Where possible, the wrappers will determine the ctypes data type and cast pointers accordingly. If numpy is installed arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

**Warning:** When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between sub-domains.

**lammps API**

```
from lammps import lammps
```

```

lmp = lammps()
lmp.file("in.sysinit")

nlocal = lmp.extract_global("nlocal")
x = lmp.extract_atom("x")

for i in range(nlocal):
    print("(x,y,z) = (" + x[i][0], x[i][1], x[i][2], ")")

lmp.close()

```

**Methods:**

- `extract_atom()`: extract a per-atom quantity

**Numpy Methods:**

- `numpy.extract_atom()`: extract a per-atom quantity as numpy array

**PyLammps/IPyLammps API**

All atoms in the current simulation can be accessed by using the `PyLammps.atoms` property. Each element of this list is a `Atom` or `Atom2D` object. The attributes of these objects provide access to their data (id, type, position, velocity, force, etc.):

```

# access first atom
L.atoms[0].id
L.atoms[0].type

# access second atom
L.atoms[1].position
L.atoms[1].velocity
L.atoms[1].force

```

Some attributes can be changed:

```

# set position in 2D simulation
L.atoms[0].position = (1.0, 0.0)

# set position in 3D simulation
L.atoms[0].position = (1.0, 0.0, 1.0)

```

### 13.3.8 Compute, fixes, variables

This section documents accessing or modifying data from objects like computes, fixes, or variables in LAMMPS using the `lammps` module.

**lammps API**

For `lammps.extract_compute()` and `lammps.extract_fix()`, the global, per-atom, or local data calculated by the compute or fix can be accessed. What is returned depends on whether the compute or fix calculates a scalar or vector or array. For a scalar, a single double value is returned. If the compute or fix calculates a vector or array, a pointer to the internal LAMMPS data is returned, which you can use via

normal Python subscripting.

The one exception is that for a fix that calculates a global vector or array, a single double value from the vector or array is returned, indexed by I (vector) or I and J (array). I,J are zero-based indices. See the [Howto output](#) page for a discussion of global, per-atom, and local data, and of scalar, vector, and array data types. See the doc pages for individual *computes* and *fixes* for a description of what they calculate and store.

For `lammops.extract_variable()`, an *equal-style or atom-style variable* is evaluated and its result returned.

For equal-style variables a single `c_double` value is returned and the group argument is ignored. For atom-style variables, a vector of `c_double` is returned, one value per atom, which you can use via normal Python subscripting. The values will be zero for atoms not in the specified group.

`lammops.numpy.extract_compute()`, `lammops.numpy.extract_fix()`, and `lammops.numpy.extract_variable()` are equivalent NumPy implementations that return NumPy arrays instead of ctypes pointers.

The `lammops.set_variable()` method sets an existing string-style variable to a new string value, so that subsequent LAMMPS commands can access the variable.

#### Methods:

- `lammops.extract_compute()`: extract value(s) from a compute
- `lammops.extract_fix()`: extract value(s) from a fix
- `lammops.extract_variable()`: extract value(s) from a variable
- `lammops.set_variable()`: set existing named string-style variable to value

#### NumPy Methods:

- `lammops.numpy.extract_compute()`: extract value(s) from a compute, return arrays as numpy arrays
  - `lammops.numpy.extract_fix()`: extract value(s) from a fix, return arrays as numpy arrays
  - `lammops.numpy.extract_variable()`: extract value(s) from a variable, return arrays as numpy arrays
- 

### PyLammps/IPyLammps API

PyLammps and IPyLammps classes currently do not add any additional ways of retrieving information out of computes and fixes. This information can still be accessed by using the lammps API:

```
L.lmp.extract_compute(...)  
L.lmp.extract_fix(...)  
# OR  
L.lmp.numpy.extract_compute(...)  
L.lmp.numpy.extract_fix(...)
```

LAMMPS variables can be both defined and accessed via the `PyLammps` interface.

To define a variable you can use the `variable` command:

```
L.variable("a index 2")
```

A dictionary of all variables is returned by the `PyLammps.variables` property:

you can access an individual variable by retrieving a variable object from the `L.variables` dictionary by name

```
a = L.variables['a']
```

The variable value can then be easily read and written by accessing the `value` property of this object.

```
print(a.value)
a.value = 4
```

### 13.3.9 Scatter/gather operations

```
data = lmp.gather_atoms(name,type,count) # return per-atom property of all atoms.
↳gathered into data, ordered by atom ID
                                     # name = "x", "charge", "type", etc
data = lmp.gather_atoms_concat(name,type,count) # ditto, but concatenated atom values.
↳from each proc (unordered)
data = lmp.gather_atoms_subset(name,type,count,ndata,ids) # ditto, but for subset of.
↳Ndata atoms with IDs

lmp.scatter_atoms(name,type,count,data) # scatter per-atom property to all atoms from.
↳data, ordered by atom ID
                                     # name = "x", "charge", "type", etc
                                     # count = # of per-atom values, 1 or 3, etc

lmp.scatter_atoms_subset(name,type,count,ndata,ids,data) # ditto, but for subset of.
↳Ndata atoms with IDs
```

The gather methods collect peratom info of the requested type (atom coords, atom types, forces, etc) from all processors, and returns the same vector of values to each calling processor. The scatter functions do the inverse. They distribute a vector of peratom values, passed by all calling processors, to individual atoms, which may be owned by different processors.

Note that the data returned by the gather methods, e.g. `gather_atoms("x")`, is different from the data structure returned by `extract_atom("x")` in four ways. (1) `Gather_atoms()` returns a vector which you index as `x[i]`; `extract_atom()` returns an array which you index as `x[i][j]`. (2) `Gather_atoms()` orders the atoms by atom ID while `extract_atom()` does not. (3) `Gather_atoms()` returns a list of all atoms in the simulation; `extract_atoms()` returns just the atoms local to each processor. (4) Finally, the `gather_atoms()` data structure is a copy of the atom coords stored internally in LAMMPS, whereas `extract_atom()` returns an array that effectively points directly to the internal data. This means you can change values inside LAMMPS from Python by assigning a new values to the `extract_atom()` array. To do this with the `gather_atoms()` vector, you need to change values in the vector, then invoke the `scatter_atoms()` method.

For the scatter methods, the array of coordinates passed to must be a ctypes vector of ints or doubles, allocated and initialized something like this:

```
from ctypes import c_double
natoms = lmp.get_natoms()
n3 = 3*natoms
x = (n3*c_double)()
x[0] = x coord of atom with ID 1
x[1] = y coord of atom with ID 1
x[2] = z coord of atom with ID 1
```

(continues on next page)

(continued from previous page)

```
x[3] = x coord of atom with ID 2
...
x[n3-1] = z coord of atom with ID natoms
lmp.scatter_atoms("x",1,3,x)
```

Alternatively, you can just change values in the vector returned by the gather methods, since they are also ctypes vectors.

### 13.3.10 Neighbor list access

Access to neighbor lists is handled through a couple of wrapper classes that allows to treat it like either a python list or a NumPy array. The access procedure is similar to that of the C-library interface: use one of the “find” functions to look up the index of the neighbor list in the global table of neighbor lists and then get access to the neighbor list data. The code sample below demonstrates reading the neighbor list data using the NumPy access method.

```
from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box
create_atoms 1 box
mass 1 1.0
pair_style lj/cut 2.5
pair_coeff 1 1 1.0 1.0
run 0 post no""")

# look up the neighbor list
nlidx = lmp.find_pair_neighlist('lj/cut')
nl = lmp.numpy.get_neighlist(nlidx)
tags = lmp.extract_atom('id')
print("half neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            print(" atom {} with ID {}".format(n,tags[n]))
```

#### Methods:

- `lammps.get_neighlist()`: Get neighbor list for given index
- `lammps.get_neighlist_size()`: Get number of elements in neighbor list
- `lammps.get_neighlist_element_neighbors()`: Get element in neighbor list and its neighbors
- `lammps.find_pair_neighlist()`: Find neighbor list of pair style
- `lammps.find_fix_neighlist()`: Find neighbor list of pair style
- `lammps.find_compute_neighlist()`: Find neighbor list of pair style

#### NumPy Methods:

- `lammps.numpy.get_neighlist()`: Get neighbor list for given index, which uses NumPy arrays for its element neighbor arrays
- `lammps.numpy.get_neighlist_element_neighbors()`: Get element in neighbor list and its neighbors (as numpy array)

### 13.3.11 Configuration information

The following methods can be used to query the LAMMPS library about compile time settings and included packages and styles.

Listing 1: Example for using configuration settings functions

```

from lammps import lammps

lmp = lammps()

try:
    lmp.file("in.missing")
except Exception as e:
    print("LAMMPS failed with error:", e)

# write compressed dump file depending on available of options

if lmp.has_style("dump", "atom/zstd"):
    lmp.command("dump d1 all atom/zstd 100 dump.zst")
elif lmp.has_style("dump", "atom/gz"):
    lmp.command("dump d1 all atom/gz 100 dump.gz")
elif lmp.has_gzip_support():
    lmp.command("dump d1 all atom 100 dump.gz")
else:
    lmp.command("dump d1 all atom 100 dump")

```

#### Methods:

- `lammps.has_mpi_support`
- `lammps.has_exceptions`
- `lammps.has_gzip_support`
- `lammps.has_png_support`
- `lammps.has_jpeg_support`
- `lammps.has_ffmpeg_support`
- `lammps.installed_packages`
- `lammps.get_accelerator_config`
- `lammps.has_style()`
- `lammps.available_styles()`

## 13.4 The `lammps` Python module

The LAMMPS Python interface is implemented as a module called `lammps` which is defined in the `lammps` package in the `python` folder of the LAMMPS source code distribution. After compilation of LAMMPS, the module can be installed into a Python system folder or a user folder with `make install-python`. Components of the module can then be loaded into a Python session with the `import` command.

There are multiple Python interface classes in the `lammps` module:

- the `lammps` class. This is a wrapper around the C-library interface and its member functions try to replicate the *C-library API* closely. This is the most feature-complete Python API.
- the `PyLammps` class. This is a more high-level and more Python style class implemented on top of the `lammps` class.
- the `IPyLammps` class is derived from `PyLammps` and adds embedded graphics features to conveniently include LAMMPS into Jupyter notebooks.

---

### Version check

The `lammps` module stores the version number of the LAMMPS version it is installed from. When initializing the `lammps` class, this version is checked to be the same as the result from `lammps.version()`, the version of the LAMMPS shared library that the module interfaces to. If they are not the same an `AttributeError` exception is raised since a mismatch of versions (e.g. due to incorrect use of the `LD_LIBRARY_PATH` or `PYTHONPATH` environment variables) can lead to crashes or data corruption and otherwise incorrect behavior.

---

LAMMPS module global members:

`lammps.__version__`

Numerical representation of the LAMMPS version this module was taken from. Has the same format as the result of `lammps.version()`.

---

### 13.4.1 The `lammps` class API

The `lammps` class is the core of the LAMMPS Python interfaces. It is a wrapper around the *LAMMPS C library API* using the `Python ctypes` module and a shared library compiled from the LAMMPS source code. The individual methods in this class try to closely follow the corresponding C functions. The handle argument that needs to be passed to the C functions is stored internally in the class and automatically added when calling the C library functions. Below is a detailed documentation of the API.

**class** `lammps.lammps`(*name=""*, *cmdargs=None*, *ptr=None*, *comm=None*)

Create an instance of the LAMMPS Python class.

This is a Python wrapper class that exposes the LAMMPS C-library interface to Python. It either requires that LAMMPS has been compiled as shared library which is then dynamically loaded via the `ctypes` Python module or that this module is called from a Python function that is called from a Python interpreter embedded into a LAMMPS executable, for example through the `python invoke` command. When the class is instantiated it calls the `lammps_open()` function of the LAMMPS C-library interface, which in turn will create an instance of the *LAMMPS C++* class. The handle to this C++ class is stored internally and automatically passed to the calls to the C library interface.

#### Parameters

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads `liblammps_mpi.so`, “” loads `liblammps.so`)

- **cmdargs** (*list*) – list of command line arguments to be passed to the `lammps_open()` function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI\_Comm*) – MPI communicator (as provided by `mpi4py`). None means use `MPI_COMM_WORLD` implicitly.

#### property `numpy`

Return object to access numpy versions of API

It provides alternative implementations of API functions that return numpy arrays instead of ctypes pointers. If numpy is not installed, accessing this property will lead to an ImportError.

##### Returns

instance of numpy wrapper object

##### Return type

`numpy_wrapper`

#### `close()`

Explicitly delete a LAMMPS instance through the C-library interface.

This is a wrapper around the `lammps_close()` function of the C-library interface.

#### `finalize()`

Shut down the MPI communication and Kokkos environment (if active) through the library interface by calling `lammps_mpi_finalize()` and `lammps_kokkos_finalize()`.

You cannot create or use any LAMMPS instances after this function is called unless LAMMPS was compiled without MPI and without Kokkos support.

#### `version()`

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the `lammps_version()` function of the C-library interface.

##### Returns

version number

##### Return type

int

#### `get_os_info()`

Return a string with information about the OS and compiler runtime

This is a wrapper around the `lammps_get_os_info()` function of the C-library interface.

##### Returns

OS info string

##### Return type

string

#### `get_mpi_comm()`

Get the MPI communicator in use by the current LAMMPS instance

This is a wrapper around the `lammps_get_mpi_comm()` function of the C-library interface. It will return None if either the LAMMPS library was compiled without MPI support or the `mpi4py` Python module is not available.

**Returns**

MPI communicator

**Return type**

MPI\_Comm

**file(*path*)**

Read LAMMPS commands from a file.

This is a wrapper around the `lammps_file()` function of the C-library interface. It will open the file with the name/path *file* and process the LAMMPS commands line by line until the end. The function will return when the end of the file is reached.

**Parameters****path** (*string*) – Name of the file/path with LAMMPS commands**command(*cmd*)**

Process a single LAMMPS input command from a string.

This is a wrapper around the `lammps_command()` function of the C-library interface.

**Parameters****cmd** (*string*) – a single lammps command**commands\_list(*cmdlist*)**

Process multiple LAMMPS input commands from a list of strings.

This is a wrapper around the `lammps_commands_list()` function of the C-library interface.

**Parameters****cmdlist** (*list of strings*) – a single lammps command**commands\_string(*multicmd*)**

Process a block of LAMMPS input commands from a string.

This is a wrapper around the `lammps_commands_string()` function of the C-library interface.

**Parameters****multicmd** (*string*) – text block of lammps commands**get\_natoms()**

Get the total number of atoms in the LAMMPS instance.

Will be precise up to 53-bit signed integer due to the underlying `lammps_get_natoms()` function returning a double.

**Returns**

number of atoms

**Return type**

int

**extract\_box()**

Extract simulation box parameters

This is a wrapper around the `lammps_extract_box()` function of the C-library interface. Unlike in the C function, the result is returned as a list.

**Returns**

list of the extracted data: boxlo, boxhi, xy, yz, xz, periodicity, box\_change

**Return type**

[ 3\*double, 3\*double, double, double, 3\*int, int]

**reset\_box**(*boxlo*, *boxhi*, *xy*, *yz*, *xz*)

Reset simulation box parameters

This is a wrapper around the `lammps_reset_box()` function of the C-library interface.

**Parameters**

- **boxlo** (*list of 3 floating point numbers*) – new lower box boundaries
- **boxhi** (*list of 3 floating point numbers*) – new upper box boundaries
- **xy** (*float*) – xy tilt factor
- **yz** (*float*) – yz tilt factor
- **xz** (*float*) – xz tilt factor

**get\_thermo**(*name*)

Get current value of a thermo keyword

This is a wrapper around the `lammps_get_thermo()` function of the C-library interface.

**Parameters**

**name** (*string*) – name of thermo keyword

**Returns**

value of thermo keyword

**Return type**

double or None

**extract\_setting**(*name*)

Query LAMMPS about global settings that can be expressed as an integer.

This is a wrapper around the `lammps_extract_setting()` function of the C-library interface. Its documentation includes a list of the supported keywords.

**Parameters**

**name** (*string*) – name of the setting

**Returns**

value of the setting

**Return type**

int

**extract\_global\_datatype**(*name*)

Retrieve global property datatype from LAMMPS

This is a wrapper around the `lammps_extract_global_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is not recognized. Otherwise it will return a positive integer value that corresponds to one of the *data type* constants define in the `lammps` module.

**Parameters**

**name** (*string*) – name of the property

**Returns**

data type of global property, see *Data Types*

**Return type**

int

**extract\_global**(*name*, *dtype=None*)

Query LAMMPS about global settings of different types.

This is a wrapper around the `lammps_extract_global()` function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. The `lammps_extract_global()` documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type. For that purpose the `lammps` module contains *data type* constants. This function returns `None` if either the keyword is not recognized, or an invalid data type constant is used.

**Parameters**

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – data type of the returned data (see *Data Types*)

**Returns**

value of the property or list of values or `None`

**Return type**

`int`, `float`, `list`, or `NoneType`

**extract\_atom\_datatype**(*name*)

Retrieve per-atom property datatype from LAMMPS

This is a wrapper around the `lammps_extract_atom_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns `None` if the keyword is not recognized. Otherwise it will return an integer value that corresponds to one of the *data type* constants defined in the `lammps` module.

**Parameters**

**name** (*string*) – name of the property

**Returns**

data type of per-atom property (see *Data Types*)

**Return type**

`int`

**extract\_atom**(*name*, *dtype=None*)

Retrieve per-atom properties from LAMMPS

This is a wrapper around the `lammps_extract_atom()` function of the C-library interface. Its documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type by setting `dtype` to one of the *data type* constants defined in the `lammps` module. This function returns `None` if either the keyword is not recognized, or an invalid data type constant is used.

---

**Note:** While the returned arrays of per-atom data are dimensioned for the range `[0:nmax]` - as is the underlying storage - the data is usually only valid for the range of `[0:nlocal]`, unless the property of interest is also updated for ghost atoms. In some cases, this depends on a LAMMPS setting, see for example `comm_modify vel yes`.

---

**Parameters**

- **name** (*string*) – name of the property

- **dtype** (*int*, *optional*) – data type of the returned data (see *Data Types*)

**Returns**

requested data or None

**Return type**

ctypes.POINTER(ctypes.c\_int32), ctypes.POINTER(ctypes.POINTER(ctypes.c\_int32)),  
 ctypes.POINTER(ctypes.c\_int64), ctypes.POINTER(ctypes.POINTER(ctypes.c\_int64)),  
 ctypes.POINTER(ctypes.c\_double), ctypes.POINTER(ctypes.POINTER(ctypes.c\_double)),  
 or NoneType

**extract\_compute**(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the `lammers_extract_compute()` function of the C-library interface. This function returns None if either the compute id is not recognized, or an invalid combination of *cstyle* and *ctype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, otherwise a pointer.

**Parameters**

- **cid** (*string*) – compute ID
- **cstyle** (*int*) – style of the data retrieve (global, atom, or local), see *Style Constants*
- **ctype** (*int*) – type or size of the returned data (scalar, vector, or array), see *Type Constants*

**Returns**

requested data as scalar, pointer to 1d or 2d double array, or None

**Return type**

c\_double, ctypes.POINTER(c\_double), ctypes.POINTER(ctypes.POINTER(c\_double)), or  
 NoneType

**extract\_fix**(*fid*, *fstyle*, *ftype*, *nrow=0*, *ncol=0*)

Retrieve data from a LAMMPS fix

This is a wrapper around the `lammers_extract_fix()` function of the C-library interface. This function returns None if either the fix id is not recognized, or an invalid combination of *fstyle* and *ftype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, also when accessing global vectors or arrays, otherwise a pointer.

**Parameters**

- **fid** (*string*) – fix ID
- **fstyle** (*int*) – style of the data retrieve (global, atom, or local), see *Style Constants*
- **ftype** (*int*) – type or size of the returned data (scalar, vector, or array), see *Type Constants*
- **nrow** (*int*) – index of global vector element or row index of global array element
- **ncol** (*int*) – column index of global array element

**Returns**

requested data or None

**Return type**

c\_double, ctypes.POINTER(c\_double), ctypes.POINTER(ctypes.POINTER(c\_double)), or  
 NoneType

**extract\_variable**(*name*, *group=None*, *vartype=0*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function `lammps_extract_variable()` of the C-library interface, evaluates variable name and returns a copy of the computed data. The memory temporarily allocated by the C-interface is deleted after the data is copied to a Python variable or list. The variable must be either an equal-style (or equivalent) variable or an atom-style variable. The variable type has to be provided as `vartype` parameter which may be one of two constants: `LMP_VAR_EQUAL` or `LMP_VAR_ATOM`; it defaults to equal-style variables. The `group` parameter is only used for atom-style variables and defaults to the group “all” if set to `None`, which is the default.

**Parameters**

- **name** (*string*) – name of the variable to execute
- **group** (*string*, *only for atom-style variables*) – name of group for atom-style variable
- **vartype** (*int*) – type of variable, see *Variable Type Constants*

**Returns**

the requested data

**Return type**

`c_double`, (`c_double`), or `NoneType`

**flush\_buffers**()

Flush output buffers

This is a wrapper around the `lammps_flush_buffers()` function of the C-library interface.

**set\_variable**(*name*, *value*)

Set a new value for a LAMMPS string style variable

This is a wrapper around the `lammps_set_variable()` function of the C-library interface.

**Parameters**

- **name** (*string*) – name of the variable
- **value** (*any. will be converted to a string*) – new variable value

**Returns**

either 0 on success or -1 on failure

**Return type**

`int`

**gather\_bonds**()

Retrieve global list of bonds

This is a wrapper around the `lammps_gather_bonds()` function of the C-library interface.

This function returns a tuple with the number of bonds and a flat list of ctypes integer values with the bond type, bond atom1, bond atom2 for each bond.

New in version 28Jul2021.

**Returns**

a tuple with the number of bonds and a list of `c_int` or `c_long`

**Return type**

(`int`, `3*nbonds*c_tagint`)

**encode\_image\_flags**(*ix, iy, iz*)

convert 3 integers with image flags for x-, y-, and z-direction into a single integer like it is used internally in LAMMPS

This method is a wrapper around the `lammeps_encode_image_flags()` function of library interface.

**Parameters**

- **ix** (*int*) – x-direction image flag
- **iy** (*int*) – y-direction image flag
- **iz** (*int*) – z-direction image flag

**Returns**

encoded image flags

**Return type**

`lammeps.c_imageint`

**decode\_image\_flags**(*image*)

Convert encoded image flag integer into list of three regular integers.

This method is a wrapper around the `lammeps_decode_image_flags()` function of library interface.

**Parameters**

**image** (`lammeps.c_imageint`) – encoded image flags

**Returns**

list of three image flags in x-, y-, and z- direction

**Return type**

list of 3 int

**create\_atoms**(*n, id, type, x, v=None, image=None, shrinkexceed=False*)

Create N atoms from list of coordinates and properties

This function is a wrapper around the `lammeps_create_atoms()` function of the C-library interface, and the behavior is similar except that the *v*, *image*, and *shrinkexceed* arguments are optional and default to *None*, *None*, and *False*, respectively. With *None* being equivalent to a NULL pointer in C.

The lists of coordinates, types, atom IDs, velocities, image flags can be provided in any format that may be converted into the required internal data types. Also the list may contain more than *N* entries, but not fewer. In the latter case, the function will return without attempting to create atoms. You may use the `encode_image_flags` method to properly combine three integers with image flags into a single integer.

**Parameters**

- **n** (*int*) – number of atoms for which data is provided
- **id** (*list of lammeps.tagint*) – list of atom IDs with at least n elements or None
- **type** (*list of int*) – list of atom types
- **x** (*list of float*) – list of coordinates for x-, y-, and z (flat list of 3n entries)
- **v** (*list of float*) – list of velocities for x-, y-, and z (flat list of 3n entries) or None (optional)
- **image** (*list of lammeps.imageint*) – list of encoded image flags (optional)
- **shrinkexceed** (*bool*) – whether to expand shrink-wrap boundaries if atoms are outside the box (optional)

**Returns**

number of atoms created. 0 if insufficient or invalid data

**Return type**

int

**property has\_mpi\_support**

Report whether the LAMMPS shared library was compiled with a real MPI library or in serial.

This is a wrapper around the `lammops_config_has_mpi_support()` function of the library interface.

**Returns**

False when compiled with MPI STUBS, otherwise True

**Return type**

bool

**property is\_running**

Report whether being called from a function during a run or a minimization

Various LAMMPS commands must not be called during an ongoing run or minimization. This property allows to check for that. This is a wrapper around the `lammops_is_running()` function of the library interface.

New in version 9Oct2020.

**Returns**

True when called during a run otherwise false

**Return type**

bool

**force\_timeout()**

Trigger an immediate timeout, i.e. a “soft stop” of a run.

This function allows to cleanly stop an ongoing run or minimization at the next loop iteration. This is a wrapper around the `lammops_force_timeout()` function of the library interface.

New in version 9Oct2020.

**property has\_exceptions**

Report whether the LAMMPS shared library was compiled with C++ exceptions handling enabled

This is a wrapper around the `lammops_config_has_exceptions()` function of the library interface.

**Returns**

state of C++ exception support

**Return type**

bool

**property has\_gzip\_support**

Report whether the LAMMPS shared library was compiled with support for reading and writing compressed files through gzip.

This is a wrapper around the `lammops_config_has_gzip_support()` function of the library interface.

**Returns**

state of gzip support

**Return type**

bool

**property has\_png\_support**

Report whether the LAMMPS shared library was compiled with support for writing images in PNG format.

This is a wrapper around the `lammops_config_has_png_support()` function of the library interface.

**Returns**

state of PNG support

**Return type**

bool

**property has\_jpeg\_support**

Report whether the LAMMPS shared library was compiled with support for writing images in JPEG format.

This is a wrapper around the `lammops_config_has_jpeg_support()` function of the library interface.

**Returns**

state of JPEG support

**Return type**

bool

**property has\_ffmpeg\_support**

State of support for writing movies with ffmpeg in the LAMMPS shared library

This is a wrapper around the `lammops_config_has_ffmpeg_support()` function of the library interface.

**Returns**

state of ffmpeg support

**Return type**

bool

**property accelerator\_config**

Return table with available accelerator configuration settings.

This is a wrapper around the `lammops_config_accelerator()` function of the library interface which loops over all known packages and categories and returns enabled features as a nested dictionary with all enabled settings as list of strings.

**Returns**

nested dictionary with all known enabled settings as list of strings

**Return type**

dictionary

**property has\_gpu\_device**

Availability of GPU package compatible device

This is a wrapper around the `lammops_has_gpu_device()` function of the C library interface.

**Returns**

True if a GPU package compatible device is present, otherwise False

**Return type**

bool

**get\_gpu\_device\_info()**

Return a string with detailed information about any devices that are usable by the GPU package.

This is a wrapper around the `lammops_get_gpu_device_info()` function of the C-library interface.

**Returns**

GPU device info string

**Return type**

string

**property installed\_packages**

List of the names of enabled packages in the LAMMPS shared library

This is a wrapper around the functions `lammps_config_package_count()` and `:cpp:func`lammps_config_package_name`` of the library interface.

:return

**has\_style(category, name)**

Returns whether a given style name is available in a given category

This is a wrapper around the function `lammps_has_style()` of the library interface.

**Parameters**

- **category** (*string*) – name of category
- **name** (*string*) – name of the style

**Returns**

true if style is available in given category

**Return type**

bool

**available\_styles(category)**

Returns a list of styles available for a given category

This is a wrapper around the functions `lammps_style_count()` and `lammps_style_name()` of the library interface.

**Parameters**

**category** (*string*) – name of category

**Returns**

list of style names in given category

**Return type**

list

**has\_id(category, name)**

Returns whether a given ID name is available in a given category

This is a wrapper around the function `lammps_has_id()` of the library interface.

New in version 9Oct2020.

**Parameters**

- **category** (*string*) – name of category
- **name** (*string*) – name of the ID

**Returns**

true if ID is available in given category

**Return type**

bool

**available\_ids**(*category*)

Returns a list of IDs available for a given category

This is a wrapper around the functions `lammops_id_count()` and `lammops_id_name()` of the library interface.

New in version 9Oct2020.

**Parameters**

**category** (*string*) – name of category

**Returns**

list of id names in given category

**Return type**

list

**available\_plugins**(*category*)

Returns a list of plugins available for a given category

This is a wrapper around the functions `lammops_plugin_count()` and `lammops_plugin_name()` of the library interface.

New in version 10Mar2021.

**Returns**

list of style/name pairs of loaded plugins

**Return type**

list

**set\_fix\_external\_callback**(*fix\_id*, *callback*, *caller=None*)

Set the callback function for a fix external instance with a given fix ID.

Optionally also set a reference to the calling object.

This is a wrapper around the `lammops_set_fix_external_callback()` function of the C-library interface. However this is set up to call a Python function with the following arguments.

- object is the value of the “caller” argument
- n timestep is the current timestep
- nlocal is the number of local atoms on the current MPI process
- tag is a 1d NumPy array of integers representing the atom IDs of the local atoms
- x is a 2d NumPy array of doubles of the coordinates of the local atoms
- f is a 2d NumPy array of doubles of the forces on the local atoms that will be added

Changed in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **callback** – Python function that will be called from fix external
- **caller** – reference to some object passed to the callback function

**Type**

string

**Type**

function

**Type**

object, optional

**fix\_external\_get\_force**(*fix\_id*)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

This is a wrapper around the `lammops_fix_external_get_force()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

**fix\_id** – Fix-ID of a fix external instance

**Type**

string

**Returns**

requested data

**Return type**`ctypes.POINTER(ctypes.POINTER(ctypes.double))`**fix\_external\_set\_energy\_global**(*fix\_id, eng*)

Set the global energy contribution for a fix external instance with the given ID.

This is a wrapper around the `lammops_fix_external_set_energy_global()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **eng** – potential energy value to be added by fix external

**Type**

string

**Type**

float

**fix\_external\_set\_virial\_global**(*fix\_id, virial*)

Set the global virial contribution for a fix external instance with the given ID.

This is a wrapper around the `lammops_fix_external_set_virial_global()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **eng** – list of 6 floating point numbers with the virial to be added by fix external

**Type**

string

**Type**

float

**fix\_external\_set\_energy\_peratom**(*fix\_id, eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

This is a wrapper around the `lammops_fix_external_set_energy_peratom()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **eatom** – list of potential energy values for local atoms to be added by fix external

**Type**

string

**Type**

float

**fix\_external\_set\_virial\_peratom**(*fix\_id, vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

This is a wrapper around the `lammops_fix_external_set_virial_peratom()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **vatom** – list of natoms lists with 6 floating point numbers to be added by fix external

**Type**

string

**Type**

float

**fix\_external\_set\_vector\_length**(*fix\_id, length*)

Set the vector length for a global vector stored with fix external for analysis

This is a wrapper around the `lammops_fix_external_set_vector_length()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **length** – length of the global vector

**Type**

string

**Type**

int

**fix\_external\_set\_vector**(*fix\_id, idx, val*)

Store a global vector value for a fix external instance with the given ID.

This is a wrapper around the `lammops_fix_external_set_vector()` function of the C-library interface.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **idx** – 1-based index of the value in the global vector
- **val** – value to be stored in the global vector

**Type**

string

**Type**

int

**Type**

float

**get\_neighlist(*idx*)**

Returns an instance of *NeighList* which wraps access to the neighbor list with the given index

See *lammps.numpy.get\_neighlist()* if you want to use NumPy arrays instead of *c\_int* pointers.

**Parameters**

**idx** (*int*) – index of neighbor list

**Returns**

an instance of *NeighList* wrapping access to neighbor list data

**Return type**

*NeighList*

**get\_neighlist\_size(*idx*)**

Return the number of elements in neighbor list with the given index

**Parameters**

**idx** (*int*) – neighbor list index

**Returns**

number of elements in neighbor list with index *idx*

**Return type**

int

**get\_neighlist\_element\_neighbors(*idx*, *element*)**

Return data of neighbor list entry

**Parameters**

- **element** (*int*) – neighbor list index
- **element** – neighbor list element index

**Returns**

tuple with atom local index, number of neighbors and array of neighbor local atom indices

**Return type**

(int, int, POINTER(c\_int))

**find\_pair\_neighlist(*style*, *exact=True*, *nsub=0*, *reqid=0*)**

Find neighbor list index of pair style neighbor list

Search for a neighbor list requested by a pair style instance that matches “style”. If *exact* is True, the pair style name must match exactly. If *exact* is False, the pair style name is matched against “style” as regular expression or sub-string. If the pair style is a hybrid pair style, the style is instead matched against the

hybrid sub-styles. If the same pair style is used as sub-style multiple types, you must set `nsub` to a value `n > 0` which indicates the `n`th instance of that sub-style to be used (same as for the `pair_coeff` command). The default value of 0 will fail to match in that case.

Once the pair style instance has been identified, it may have requested multiple neighbor lists. Those are uniquely identified by a request ID `> 0` as set by the pair style. Otherwise the request ID is 0.

#### Parameters

- **style** (*string*) – name of pair style that should be searched for
- **exact** (*bool, optional*) – controls whether style should match exactly or only must be contained in pair style name, defaults to True
- **nsub** (*int, optional*) – match `nsub`-th hybrid sub-style, defaults to 0
- **reqid** (*int, optional*) – list request id, `> 0` in case there are more than one, defaults to 0

#### Returns

neighbor list index if found, otherwise -1

#### Return type

int

#### **find\_fix\_neighlist** (*fixid, reqid=0*)

Find neighbor list index of fix neighbor list

The fix instance requesting the neighbor list is uniquely identified by the fix ID. In case the fix has requested multiple neighbor lists, those are uniquely identified by a request ID `> 0` as set by the fix. Otherwise the request ID is 0 (the default).

#### Parameters

- **fixid** (*string*) – name of fix
- **reqid** (*int, optional*) – id of neighbor list request, in case there are more than one request, defaults to 0

#### Returns

neighbor list index if found, otherwise -1

#### Return type

int

#### **find\_compute\_neighlist** (*computeid, reqid=0*)

Find neighbor list index of compute neighbor list

The compute instance requesting the neighbor list is uniquely identified by the compute ID. In case the compute has requested multiple neighbor lists, those are uniquely identified by a request ID `> 0` as set by the compute. Otherwise the request ID is 0 (the default).

#### Parameters

- **computeid** (*string*) – name of compute
- **reqid** (*int, optional*) – index of neighbor list request, in case there are more than one request, defaults to 0

#### Returns

neighbor list index if found, otherwise -1

#### Return type

int

```
class lammps.numpy_wrapper.numpy_wrapper(lmp)
```

lammps API NumPy Wrapper

This is a wrapper class that provides additional methods on top of an existing *lammps* instance. The methods transform raw ctypes pointers into NumPy arrays, which give direct access to the original data while protecting against out-of-bounds accesses.

There is no need to explicitly instantiate this class. Each instance of *lammps* has a `numpy` property that returns an instance.

#### Parameters

**lmp** (*Lammps*) – instance of the *lammps* class

```
extract_atom(name, dtype=None, nelem=None, dim=None)
```

Retrieve per-atom properties from LAMMPS as NumPy arrays

This is a wrapper around the `lammps.extract_atom()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

---

**Note:** While the returned arrays of per-atom data are dimensioned for the range `[0:nmax]` - as is the underlying storage - the data is usually only valid for the range of `[0:nlocal]`, unless the property of interest is also updated for ghost atoms. In some cases, this depends on a LAMMPS setting, see for example *comm\_modify vel yes*.

---

#### Parameters

- **name** (*string*) – name of the property
- **dtype** (*int, optional*) – type of the returned data (see *Data Types*)
- **nelem** (*int, optional*) – number of elements in array
- **dim** (*int, optional*) – dimension of each element

#### Returns

requested data as NumPy array with direct access to C data or None

#### Return type

numpy.array or NoneType

```
extract_compute(cid, cstyle, ctype)
```

Retrieve data from a LAMMPS compute

This is a wrapper around the `lammps.extract_compute()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

#### Parameters

- **cid** (*string*) – compute ID
- **cstyle** (*int*) – style of the data retrieve (global, atom, or local), see *Style Constants*
- **ctype** (*int*) – type of the returned data (scalar, vector, or array), see *Type Constants*

#### Returns

requested data either as float, as NumPy array with direct access to C data, or None

#### Return type

float, numpy.array, or NoneType

**extract\_fix**(*fid, fstyle, ftype, nrow=0, ncol=0*)

Retrieve data from a LAMMPS fix

This is a wrapper around the `lammops.extract_fix()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

**Parameters**

- **fid** (*string*) – fix ID
- **fstyle** (*int*) – style of the data retrieve (global, atom, or local), see *Style Constants*
- **ftype** (*int*) – type or size of the returned data (scalar, vector, or array), see *Type Constants*
- **nrow** (*int*) – index of global vector element or row index of global array element
- **ncol** (*int*) – column index of global array element

**Returns**

requested data

**Return type**

integer or double value, pointer to 1d or 2d double array or None

**extract\_variable**(*name, group=None, vartype=0*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function `lammops.extract_variable()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

**Parameters**

- **name** (*string*) – name of the variable to execute
- **group** (*string*) – name of group for atom-style variable (ignored for equal-style variables)
- **vartype** (*int*) – type of variable, see *Variable Type Constants*

**Returns**

the requested data or None

**Return type**

c\_double, numpy.array, or NoneType

**gather\_bonds**()

Retrieve global list of bonds as NumPy array

This is a wrapper around `lammops.gather_bonds()` It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

New in version 28Jul2021.

**Returns**

the requested data as a 2d-integer numpy array

**Return type**

numpy.array(nbonds,3)

**fix\_external\_get\_force**(*fix\_id*)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

This function is a wrapper around the `lammops.fix_external_get_force()` method. It behaves the same as the original method, but returns a NumPy array instead of a ctypes pointer.

Changed in version 28Jul2021.

**Parameters**

**fix\_id** – Fix-ID of a fix external instance

**Type**

string

**Returns**

requested data

**Return type**

numpy.array

**fix\_external\_set\_energy\_peratom**(*fix\_id, eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

This function is an alternative to `lammops.fix_external_set_energy_peratom()` method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **eatom** – per-atom potential energy

**Type**

string

**Type**

numpy.array

**fix\_external\_set\_virial\_peratom**(*fix\_id, vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

This function is an alternative to `lammops.fix_external_set_virial_peratom()` method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

New in version 28Jul2021.

**Parameters**

- **fix\_id** – Fix-ID of a fix external instance
- **eatom** – per-atom potential energy

**Type**

string

**Type**

numpy.array

**get\_neighlist**(*idx*)

Returns an instance of `NumPyNeighList` which wraps access to the neighbor list with the given index

**Parameters**

**idx** (*int*) – index of neighbor list

**Returns**

an instance of `NumPyNeighList` wrapping access to neighbor list data

**Return type**

`NumPyNeighList`

**get\_neighlist\_element\_neighbors**(*idx, element*)

Return data of neighbor list entry

This function is a wrapper around the function `lammops.get_neighlist_element_neighbors()` method. It behaves the same as the original method, but returns a NumPy array containing the neighbors instead of a ctypes pointer.

**Parameters**

- **element** (*int*) – neighbor list index
- **element** – neighbor list element index

**Returns**

tuple with atom local index and numpy array of neighbor local atom indices

**Return type**

(int, numpy.array)

### 13.4.2 The PyLammps class API

The `PyLammps` class is a wrapper that creates a simpler, more “Pythonic” interface to common LAMMPS functionality. LAMMPS data structures are exposed through objects and properties. This makes Python scripts shorter and more concise. See the *PyLammps Tutorial* for an introduction on how to use this interface.

```
class lammops.PyLammps(name="", cmdargs=None, ptr=None, comm=None, verbose=False)
```

This is a Python wrapper class around the lower-level `lammops` class, exposing a more Python-like, object-oriented interface for prototyping system inside of IPython and Jupyter notebooks.

It either creates its own instance of `lammops` or can be initialized with an existing instance. The arguments are the same of the lower-level interface. The original interface can still be accessed via `PyLammps.lmp`.

**Parameters**

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads `liblammops_mpi.so`, “” loads `liblammops.so`)
- **cmdargs** (*list*) – list of command line arguments to be passed to the `lammops_open()` function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI\_Comm*) – MPI communicator (as provided by `mpi4py`). None means use `MPI_COMM_WORLD` implicitly.
- **verbose** (*bool*) – print all LAMMPS output to stdout

**Variables**

- **lmp** (*lammops*) – instance of original LAMMPS Python interface
- **runs** – list of completed runs, each storing the thermo output

**close()**

Explicitly delete a LAMMPS instance

This is a wrapper around the `lammops.close()` of the Python interface.

**version()**

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the `lammps.version()` function of the Python interface.

**Returns**

version number

**Return type**

int

**file(*file*)**

Read LAMMPS commands from a file.

This is a wrapper around the `lammps.file()` function of the Python interface.

**Parameters**

**path** (*string*) – Name of the file/path with LAMMPS commands

**property enable\_cmd\_history****Getter**

Return whether command history is saved

**Setter**

Set if command history should be saved

**Type**

bool

**write\_script(*filepath*)**

Write LAMMPS script file containing all commands executed up until now

**Parameters**

**filepath** (*string*) – path to script file that should be written

**clear\_cmd\_history()**

Clear LAMMPS command history up to this point

**command(*cmd*)**

Execute LAMMPS command

If `PyLammps.enable_cmd_history` is set to `True`, commands executed will be recorded. The entire command history can be written to a file using `PyLammps.write_script()`. To clear the command history, use `PyLammps.clear_cmd_history()`.

**Parameters**

**cmd** – command string that should be executed

**Type**

cmd: string

**run(\*args, \*\*kwargs)**

Execute LAMMPS run command with given arguments

All thermo output during the run is captured and saved as new entry in `PyLammps.runs`. The latest run can be retrieved by `PyLammps.last_run`.

**property last\_run**

Return data produced of last completed run command

**Getter**

Returns an object containing information about the last run command

**Type**  
dict

**property atoms**

All atoms of this LAMMPS instance

**Getter**  
Returns a list of atoms currently in the system

**Type**  
*AtomList*

**property system**

The system state of this LAMMPS instance

**Getter**  
Returns an object with properties storing the current system state

**Type**  
namedtuple

**property communication**

The communication state of this LAMMPS instance

**Getter**  
Returns an object with properties storing the current communication state

**Type**  
namedtuple

**property computes**

The list of active computes of this LAMMPS instance

**Getter**  
Returns a list of computes that are currently active in this LAMMPS instance

**Type**  
list

**property dumps**

The list of active dumps of this LAMMPS instance

**Getter**  
Returns a list of dumps that are currently active in this LAMMPS instance

**Type**  
list

**property fixes**

The list of active fixes of this LAMMPS instance

**Getter**  
Returns a list of fixes that are currently active in this LAMMPS instance

**Type**  
list

**property groups**

The list of active atom groups of this LAMMPS instance

**Getter**  
Returns a list of atom groups that are currently active in this LAMMPS instance

**Type**  
list

**property variables**

Returns a dictionary of all variables defined in the current LAMMPS instance

**Getter**  
Returns a dictionary of all variables that are defined in this LAMMPS instance

**Type**  
dict

**eval(*expr*)**

Evaluate expression

**Parameters**

**expr** (*string*) – the expression string that should be evaluated inside of LAMMPS

**Returns**

the value of the evaluated expression

**Return type**

float if numeric, string otherwise

**lmp\_print(*s*)**

needed for Python2 compatibility, since print is a reserved keyword

**class** `lammmps.AtomList(pylammmps_instance)`

A dynamic list of atoms that returns either an `Atom` or `Atom2D` instance for each atom. Instances are only allocated when accessed.

**Variables**

- **natoms** – total number of atoms
- **dimensions** – number of dimensions in system

**class** `lammmps.Atom(pylammmps_instance, index)`

A wrapper class then represents a single atom inside of LAMMPS

It provides access to properties of the atom and allows you to change some of them.

**property id**

Return the atom ID

**Type**  
int

**property type**

Return the atom type

**Type**  
int

**property mol**

Return the atom molecule index

**Type**  
int

**property mass**

Return the atom mass

**Type**

float

**property radius**

Return the particle radius

**Type**

float

**property position****Getter**

Return position of atom

**Setter**

Set position of atom

**Type**

numpy.array (float, float, float)

**property velocity****Getter**

Return velocity of atom

**Setter**

Set velocity of atom

**Type**

numpy.array (float, float, float)

**property force**

Return the total force acting on the atom

**Type**

numpy.array (float, float, float)

**property omega**

Return the rotational velocity of the particle

**Type**

numpy.array (float, float, float)

**property torque**

Return the total torque acting on the particle

**Type**

numpy.array (float, float, float)

**property angular\_momentum**

Return the angular momentum of the particle

**Type**

numpy.array (float, float, float)

**property charge**

Return the atom charge

**Type**

float

**class** `lammops.Atom2D`(*pylammops\_instance, index*)

A wrapper class then represents a single 2D atom inside of LAMMPS

Inherits all properties from the `Atom` class, but returns 2D versions of position, velocity, and force.

It provides access to properties of the atom and allows you to change some of them.

**property position**

Access to coordinates of an atom

**Getter**

Return position of atom

**Setter**

Set position of atom

**Type**

`numpy.array` (float, float)

**property velocity**

Access to velocity of an atom :getter: Return velocity of atom :setter: Set velocity of atom :type: `numpy.array` (float, float)

**property force**

Access to force of an atom :getter: Return force of atom :setter: Set force of atom :type: `numpy.array` (float, float)

---

### 13.4.3 The `IPyLammops` class API

The `IPyLammops` class is an extension of `PyLammops`, adding additional functions to quickly display visualizations such as images and videos inside of IPython. See the [PyLammops Tutorial](#) for examples.

**class** `lammops.IPyLammops`(*name=""*, *cmdargs=None*, *ptr=None*, *comm=None*)

IPython wrapper for LAMMPS which adds embedded graphics capabilities to PyLammops interface

It either creates its own instance of `lammops` or can be initialized with an existing instance. The arguments are the same of the lower-level interface. The original interface can still be accessed via `PyLammops.lmp`.

**Parameters**

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads `liblammops_mpi.so`, “” loads `liblammops.so`)
- **cmdargs** (*list*) – list of command line arguments to be passed to the `lammops_open()` function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI\_Comm*) – MPI communicator (as provided by `mpi4py`). None means use `MPI_COMM_WORLD` implicitly.

**image**(*filename='snapshot.png'*, *group='all'*, *color='type'*, *diameter='type'*, *size=None*, *view=None*, *center=None*, *up=None*, *zoom=1.0*, *background\_color='white'*)

Generate image using `write_dump` command and display it

See [dump image](#) for more information.

**Parameters**

- **filename** (*string*) – Name of the image file that should be generated. The extension determines whether it is PNG or JPEG
- **group** (*string*) – the group of atoms `write_image` should use
- **color** (*string*) – name of property used to determine color
- **diameter** (*string*) – name of property used to determine atom diameter
- **size** (*tuple (width, height)*) – dimensions of image
- **view** (*tuple (theta, phi)*) – view parameters
- **center** (*tuple (flag, center\_x, center\_y, center\_z)*) – center parameters
- **up** (*tuple (up\_x, up\_y, up\_z)*) – vector pointing to up direction
- **zoom** (*float*) – zoom factor
- **background\_color** (*string*) – background color of scene

**Returns**

Image instance used to display image in notebook

**Return type**

`IPython.core.display.Image`

**video**(*filename*)

Load video from file

Can be used to visualize videos from *dump movie*.

**Parameters**

**filename** (*string*) – Path to video file

**Returns**

HTML Video Tag used by notebook to embed a video

**Return type**

`IPython.display.HTML`

---

### 13.4.4 Additional components of the `lammmps` module

The `lammmps` module additionally contains several constants and the `NeighList` class:

#### Data Types

`LAMMPS_INT`, `LAMMPS_INT_2D`, `LAMMPS_DOUBLE`, `LAMMPS_DOUBLE_2D`, `LAMMPS_INT64`,  
`LAMMPS_INT64_2D`, `LAMMPS_STRING`

Constants in the `lammmps` module to indicate how to cast data when the C library function returns a void pointer. Used in `lammmps.extract_global()` and `lammmps.extract_atom()`. See `_LMP_DATATYPE_CONST` for the equivalent constants in the C library interface.

## Style Constants

### LMP\_STYLE\_GLOBAL, LMP\_STYLE\_ATOM, LMP\_STYLE\_LOCAL

Constants in the *lammps* module to select what style of data to request from computes or fixes. See *\_LMP\_STYLE\_CONST* for the equivalent constants in the C library interface. Used in *lammps.extract\_compute()*, *lammps.extract\_fix()*, and their NumPy variants *lammps.numpy.extract\_compute()* and *lammps.numpy.extract\_fix()*.

## Type Constants

### LMP\_TYPE\_SCALAR, LMP\_TYPE\_VECTOR, LMP\_TYPE\_ARRAY, LMP\_SIZE\_VECTOR, LMP\_SIZE\_ROWS, LMP\_SIZE\_COLS

Constants in the *lammps* module to select what type of data to request from computes or fixes. See *\_LMP\_TYPE\_CONST* for the equivalent constants in the C library interface. Used in *lammps.extract\_compute()*, *lammps.extract\_fix()*, and their NumPy variants *lammps.numpy.extract\_compute()* and *lammps.numpy.extract\_fix()*.

## Variable Type Constants

### LMP\_VAR\_EQUAL, LMP\_VAR\_ATOM

Constants in the *lammps* module to select what type of variable to query when calling *lammps.extract\_variable()*. See also: *variable command*.

## Classes representing internal objects

### `class lammps.NeighList(lmp, idx)`

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- its number of neighbors
- and a pointer to an `c_int` array containing local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

#### Parameters

- **`lmp`** (`lammps`) – reference to instance of *lammps*
- **`idx`** (`int`) – neighbor list index

#### property `size`

##### Returns

number of elements in neighbor list

#### `get(element)`

Access a specific neighbor list entry. “element” must be a number from 0 to the size-1 of the list

##### Returns

tuple with atom local index, number of neighbors and ctypes pointer to neighbor’s local atom indices

**Return type**

(int, int, ctypes.POINTER(c\_int))

**find**(*iatom*)

Find the neighbor list for a specific (local) atom *iatom*. If there is no list for *iatom*, (-1, None) is returned.

**Returns**

tuple with number of neighbors and ctypes pointer to neighbor's local atom indices

**Return type**

(int, ctypes.POINTER(c\_int))

**class** `lammops.numpy_wrapper.NumPyNeighList`(*lmp*, *idx*)

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- a NumPy array containing the local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

**Parameters**

- **lmp** (`lammops`) – reference to instance of `lammops`
- **idx** (`int`) – neighbor list index

**get**(*element*)

Access a specific neighbor list entry. “element” must be a number from 0 to the size-1 of the list

**Returns**

tuple with atom local index, numpy array of neighbor local atom indices

**Return type**

(int, numpy.array)

**find**(*iatom*)

Find the neighbor list for a specific (local) atom *iatom*. If there is no list for *iatom*, None is returned.

**Returns**

numpy array of neighbor local atom indices

**Return type**

numpy.array or None

## 13.5 Extending the Python interface

As noted previously, most of the `lammops` Python class methods correspond one-to-one with the functions in the LAMMPS library interface in `src/library.cpp` and `library.h`. This means you can extend the Python wrapper by following these steps:

- Add a new interface function to `src/library.cpp` and `src/library.h`.
- Rebuild LAMMPS as a shared library.
- Add a wrapper method to `python/lammops/core.py` for this interface function.
- Define the corresponding `argtypes` list and `restype` in the `lammops.__init__()` function.
- Re-install the shared library and the python module, if needed

- You should now be able to invoke the new interface function from a Python script.

## 13.6 Calling Python from LAMMPS

LAMMPS has several commands which can be used to invoke Python code directly from an input script:

- *python*
- *variable python*
- *fix python/invoke*
- *pair\_style python*

The *python* command which can be used to define and execute a Python function that you write the code for. The Python function can also be assigned to a LAMMPS python-style variable via the *variable* command. Each time the variable is evaluated, either in the LAMMPS input script itself, or by another LAMMPS command that uses the variable, this will trigger the Python function to be invoked.

The Python code for the function can be included directly in the input script or in an auxiliary file. The function can have arguments which are mapped to LAMMPS variables (also defined in the input script) and it can return a value to a LAMMPS variable. This is thus a mechanism for your input script to pass information to a piece of Python code, ask Python to execute the code, and return information to your input script.

Note that a Python function can be arbitrarily complex. It can import other Python modules, instantiate Python classes, call other Python functions, etc. The Python code that you provide can contain more code than the single function. It can contain other functions or Python classes, as well as global variables or other mechanisms for storing state between calls from LAMMPS to the function.

The Python function you provide can consist of “pure” Python code that only performs operations provided by standard Python. However, the Python function can also “call back” to LAMMPS through its Python-wrapped library interface, in the manner described in the *Python run* doc page. This means it can issue LAMMPS input script commands or query and set internal LAMMPS state. As an example, this can be useful in an input script to create a more complex loop with branching logic, than can be created using the simple looping and branching logic enabled by the *next* and *if* commands.

See the *python* page and the *variable* doc page for its python-style variables for more info, including examples of Python code you can write for both pure Python operations and callbacks to LAMMPS.

## 13.7 Output Readers

The Python package contains the *lammops.formats* module, which provides classes to post-process some of the output files generated by LAMMPS.

**class** `lammops.formats.LogFile(filename)`

Reads LAMMPS log files and extracts the thermo information

It supports the line, multi, and yaml thermo output styles.

### Parameters

**filename** (*str*) – path to log file

### Variables

- **runs** – List of LAMMPS runs in log file. Each run is a dictionary with thermo fields as keys, storing the values over time
- **errors** – List of error lines in log file

```
class lammops.formats.AvgChunkFile(filename)
```

Reads files generated by fix ave/chunk

#### Parameters

**filename** (*str*) – path to ave/chunk file

#### Variables

- **timesteps** – List of timesteps stored in file
- **total\_count** – total count over time
- **chunks** – List of chunks. Each chunk is a dictionary containing its ID, the coordinates, and the averaged quantities

## 13.8 Example Python scripts

The `python/examples` directory has Python scripts which show how Python can run LAMMPS, grab data, change it, and put it back into LAMMPS.

These are the Python scripts included as demos in the `python/examples` directory of the LAMMPS distribution, to illustrate the kinds of things that are possible when Python wraps LAMMPS. If you create your own scripts, send them to us and we can include them in the LAMMPS distribution.

<code>trivial.py</code>	read/run a LAMMPS input script through Python
<code>demo.py</code>	invoke various LAMMPS library interface routines
<code>simple.py</code>	run in parallel, similar to <code>examples/COUPLE/simple/simple.cpp</code>
<code>split.py</code>	same as <code>simple.py</code> but running in parallel on a subset of procs
<code>gui.py</code>	GUI go/stop/temperature-slider to control LAMMPS
<code>plot.py</code>	real-time temperature plot with GnuPlot via Pizza.py
<code>viz_TOOL.py</code>	real-time viz via some viz package
<code>vizplotgui_TOOL.py</code>	combination of <code>viz_TOOL.py</code> and <code>plot.py</code> and <code>gui.py</code>

For the `viz_TOOL.py` and `vizplotgui_TOOL.py` commands, replace `TOOL` with `gl` or `atomeye` or `pymol` or `vmd`, depending on what visualization package you have installed.

Note that for GL, you need to be able to run the Pizza.py GL tool, which is included in the `pizza` sub-directory. See the Pizza.py doc pages for more info:

- <https://lammops.github.io/pizza>

Note that for AtomEye, you need version 3, and there is a line in the scripts that specifies the path and name of the executable. See the AtomEye web pages for more details:

- <http://li.mit.edu/Archive/Graphics/A/>
- <http://li.mit.edu/Archive/Graphics/A3/A3.html>

The latter link is to AtomEye 3 which has the scripting capability needed by these Python scripts.

Note that for PyMol, you need to have built and installed the open-source version of PyMol in your Python, so that you can import it from a Python script. See the PyMol web pages for more details:

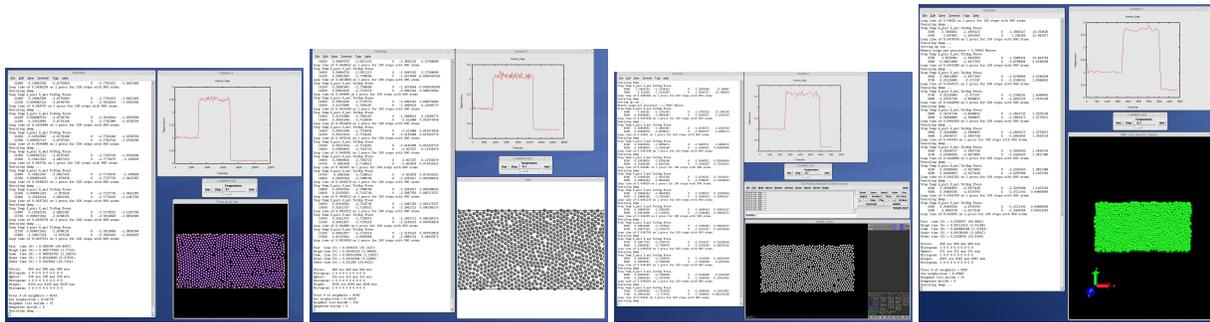

- <https://www.pymol.org>
- <https://github.com/schrodinger/pymol-open-source>

The latter link is to the open-source version.

Note that for VMD, you need a fairly current version (1.8.7 works for me) and there are some lines in the `pizza/vmd.py` script for 4 PIZZA variables that have to match the VMD installation on your system.

See the `python/README` file for instructions on how to run them and the source code for individual scripts for comments about what they do.

Here are screenshots of the `vizplotgui_tool.py` script in action for different visualization package options:

## 13.9 Handling LAMMPS errors

Compiling the shared library with *C++ exception support* provides a better error handling experience. Without exceptions the LAMMPS code will terminate the current Python process with an error message. C++ exceptions allow capturing them on the C++ side and rethrowing them on the Python side. This way LAMMPS errors can be handled through the Python exception handling mechanism.

```
from lammps import lammps, MPIAbortException

lmp = lammps()

try:
    # LAMMPS will normally terminate itself and the running process if an error
    # occurs. This would kill the Python interpreter. To avoid this, make sure to
    # compile with LAMMPS_EXCEPTIONS enabled. This ensures the library API calls
    # will not terminate the parent process. Instead, the library wrapper will
    # detect that an error has occurred and throw a Python exception

    lmp.command('unknown')
except MPIAbortException as ae:
    # Single MPI process got killed. This would normally be handled by an MPI abort
    pass
except Exception as e:
    # All (MPI) processes have reached this error
    pass
```

**Warning:** Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible.

## 13.10 Troubleshooting

### 13.10.1 Testing if Python can launch LAMMPS

To test if LAMMPS is callable from Python, launch Python interactively and type:

```
>>> from lammps import lammps
>>> lmp = lammps()
```

If you get no errors, you're ready to use LAMMPS from Python. If the second command fails, the most common error to see is

```
OSError: Could not load LAMMPS dynamic library
```

which means Python was unable to load the LAMMPS shared library. This typically occurs if the system can't find the LAMMPS shared library or one of the auxiliary shared libraries it depends on, or if something about the library is incompatible with your Python. The error message should give you an indication of what went wrong.

If your shared library uses a suffix, such as `liblammps_mpi.so`, change the constructor call as follows (see [Creating or deleting a LAMMPS object](#) for more details):

```
>>> lmp = lammps(name='mpi')
```

You can also test the load directly in Python as follows, without first importing from the `lammps` module:

```
>>> from ctypes import CDLL
>>> CDLL("liblammps.so")
```

If an error occurs, carefully go through the steps in [Installing the LAMMPS Python Module and Shared Library](#) and on the [Build\\_basics](#) page about building a shared library.

If you are not familiar with [Python](#), it is a powerful scripting and programming language which can do almost everything that compiled languages like C, C++, or Fortran can do in fewer lines of code. It also comes with a large collection of add-on modules for many purposes (either bundled or easily installed from Python code repositories). The major drawback is slower execution speed of the script code compared to compiled programming languages. But when the script code is interfaced to optimized compiled code, performance can be on par with a standalone executable, for as long as the scripting is restricted to high-level operations. Thus Python is also convenient to use as a “glue” language to “drive” a program through its library interface, or to hook multiple pieces of software together, such as a simulation code and a visualization tool, or to run a coupled multi-scale or multi-physics model.

See the [Coupling LAMMPS to other codes](#) page for more ideas about coupling LAMMPS to other codes. See the [LAMMPS Library Interfaces](#) page for a description of the LAMMPS library interfaces. That interface is exposed to Python either when calling LAMMPS from Python or when calling Python from a LAMMPS input script and then calling back to LAMMPS from Python code. The C-library interface is designed to be easy to add functionality to, thus the Python interface to LAMMPS is easy to extend as well.

If you create interesting Python scripts that run LAMMPS or interesting Python functions that can be called from a LAMMPS input script, that you think would be generally useful, please post them as a pull request to our [GitHub site](#), and they can be added to the LAMMPS distribution or web page.

## MODIFYING & EXTENDING LAMMPS

LAMMPS is designed in a modular fashion and to be easy to modify or extend with new functionality. In fact, about 95% of its source code are optional. The following pages give basic instructions on what is required when adding new styles of different kinds to LAMMPS.

If you add a new feature to LAMMPS and think it will be of general interest to other users, we encourage you to submit it for inclusion in LAMMPS as a pull request on our [GitHub site](#), after reading about *how to prepare your code for submission* and *the style requirements and recommendations*.

### 14.1 Overview

The best way to add a new feature to LAMMPS is to find a similar feature and look at the corresponding source and header files to figure out what it does. You will need some knowledge of C++ to be able to understand the high-level structure of LAMMPS and its class organization, but functions (class methods) that do actual computations are mostly written in C-style code and operate on simple C-style data structures (vectors and arrays). A high-level overview of the programming style choices in LAMMPS is *given elsewhere*.

Most of the new features described on the *Modify* doc page require you to write a new C++ derived class (except for exceptions described below, where you can make small edits to existing files). Creating a new class requires 2 files, a source code file (\*.cpp) and a header file (\*.h). The derived class must provide certain methods to work as a new option. Depending on how different your new feature is compared to existing features, you can either derive from the base class itself, or from a derived class that already exists. Enabling LAMMPS to invoke the new class is as simple as putting the two source files in the src directory and re-building LAMMPS.

The advantage of C++ and its object-orientation is that all the code and variables needed to define the new feature are in the 2 files you write, and thus should not make the rest of LAMMPS more complex or cause side-effect bugs.

Here is a concrete example. Suppose you write 2 files `pair_foo.cpp` and `pair_foo.h` that define a new class `PairFoo` that computes pairwise potentials described in the classic 1997 *paper* by Foo, et al. If you wish to invoke those potentials in a LAMMPS input script with a command like

```
pair_style foo 0.1 3.5
```

then your `pair_foo.h` file should be structured as follows:

```
#ifndef PAIR_CLASS
// clang-format off
PairStyle(foo,PairFoo);
#else
// clang-format on
...
(class definition for PairFoo)
```

(continues on next page)

```
...  
#endif
```

where “foo” is the style keyword in the pair\_style command, and PairFoo is the class name defined in your pair\_foo.cpp and pair\_foo.h files.

When you re-build LAMMPS, your new pairwise potential becomes part of the executable and can be invoked with a pair\_style command like the example above. Arguments like 0.1 and 3.5 can be defined and processed by your new class.

---

**Note:** With the traditional make process, simply adding the new files to the src folder and compiling LAMMPS again for the desired configuration with “make machine” is sufficient. When using CMake, you need to re-run CMake with “cmake .” in the build folder to have it recognize the added files and include them into the build system.

---

As illustrated by this example pair style, many kinds of options are referred to in the LAMMPS documentation as the “style” of a particular command.

The *Modify page* lists all the common styles in LAMMPS, and discusses the header file for the base class that these styles are derived from. Public variables in that file are ones used and set by the derived classes which are also used by the base class. Sometimes they are also used by the rest of LAMMPS. Pure functions, which means functions declared as virtual in the base class header file which are also set to 0, are functions you **must** implement in your new derived class to give it the functionality LAMMPS expects. Virtual functions that are not set to 0 are functions you may override or not. Those are usually defined with an empty function body.

Additionally, new output options can be added directly to the thermo.cpp, dump\_custom.cpp, and variable.cpp files. These are also listed on the *Modify page*.

Here are additional guidelines for modifying LAMMPS and adding new functionality:

- Think about whether what you want to do would be better as a pre- or post-processing step. Many computations are more easily and more quickly done that way.
- Do not try to do anything within the timestepping of a run that is not parallel. For example do not accumulate a bunch of data on a single processor and analyze it. You run the risk of seriously degrading the parallel efficiency this way.
- If your new feature reads arguments or writes output, make sure you follow the unit conventions discussed by the *units* command.

---

(Foo) Foo, Morefoo, and Maxfoo, J of Classic Potentials, 75, 345 (1997).

## 14.2 Submitting new features for inclusion in LAMMPS

We encourage LAMMPS users to submit new features they wrote for LAMMPS to be included into the LAMMPS distribution and thus become easily accessible to all LAMMPS users. The LAMMPS source code is managed with git and public development is hosted on [GitHub](#). You can monitor the repository to be notified of releases, follow the ongoing development, and comment on topics of interest to you.

### 14.2.1 Communication with the LAMMPS developers

For any larger modifications or programming project, you are encouraged to contact the LAMMPS developers ahead of time in order to discuss implementation strategies and coding guidelines. That will make it easier to integrate your contribution and results in less work for everybody involved. You are also encouraged to search through the list of [open issues on GitHub](#) and submit a new issue for a planned feature, so you would not duplicate the work of others (and possibly get scooped by them) or have your work duplicated by others.

For informal communication with the LAMMPS developers you may ask to join the [LAMMPS developers on Slack](#). This slack work space is by invitation only. Thus for access, please send an e-mail to [slack@lammips.org](mailto:slack@lammips.org) explaining what part of LAMMPS you are working on. Only discussions related to LAMMPS development are tolerated in that work space, so this is **NOT** for people that look for help with compiling, installing, or using LAMMPS. Please post a message to the [LAMMPS forum](#) for those purposes.

### 14.2.2 Packages versus individual files

The remainder of this chapter describes how to add new “style” files of various kinds to LAMMPS. Packages are simply collections of one or more such new class files which are invoked as a new style within a LAMMPS input script. In some cases also collections of supporting functions or classes are included as separate files in a package, especially when they can be shared between multiple styles. If designed correctly, these additions typically do not require any changes to the core code of LAMMPS; they are simply add-on files that are compiled with the rest of LAMMPS. To make those styles work, you may need some trivial changes to the core code; an example of a trivial change is making a parent-class method “virtual” when you derive a new child class from it.

If you think your new feature or package requires some non-trivial changes in core LAMMPS files, you should communicate with the LAMMPS developers [on Slack](#), [on GitHub](#), or [via email](#), since we may have recommendations about what changes to do where, or may not want to include certain changes for some reason and thus you would need to look for alternatives.

### 14.2.3 Time and effort required

How quickly your contribution will be integrated can vary a lot. It depends largely on how much effort it will cause the LAMMPS developers to integrate and test it, how many and what kind of changes to the core code are required, how quickly you can address them and of how much interest it is to the larger LAMMPS community. Please see the section on [LAMMPS programming style and requirements](#) for instructions, recommendations, and formal requirements. A small, modular, well written contribution may be integrated within hours, but a complex change that will require a redesign of some core functionality in LAMMPS for a clean integration can take many months until it is considered ready for inclusion (though this is rare).

### 14.2.4 Submission procedure

All changes to LAMMPS (including those from LAMMPS developers) are integrated via pull requests on GitHub and cannot be merged without passing the automated testing and an approving review by a LAMMPS core developer. Thus before submitting your contribution, you should first make certain, that your added or modified code compiles and works correctly with the latest patch-level or development version of LAMMPS and contains all bug fixes from it.

Once you have prepared everything, see the [LAMMPS GitHub Tutorial](#) page for instructions on how to submit your changes or new files through a GitHub pull request yourself. If you are unable or unwilling to submit via GitHub yourself, you may also submit patch files or full files to the LAMMPS developers and ask them to submit a pull request on GitHub on your behalf. Then create a gzipped tar file of all changed or added files or a corresponding patch file using ‘diff -u’ or ‘diff -c’ format and compress it with gzip. Please only use gzip compression, as this works well and is available on all platforms.

If the new features/files are broadly useful we may add them as core files to LAMMPS or as part of a *package*. All packages are listed and described on the *Packages details* doc page.

### 14.2.5 Licensing

Note that by providing us files to release, you agree to make them open-source, i.e. we can release them under the terms of the GPL (version 2) with the rest of LAMMPS. And similarly as part of a LGPL (version 2.1) distribution of LAMMPS that we make available to developers on request only and with files that are not authorized for that kind of distribution removed (e.g. interface to FFTW). See the *LAMMPS license* page for details.

### 14.2.6 External contributions

If you prefer to do so, you can also develop and support your add-on feature **without** having it included in the LAMMPS distribution, for example as a download from a website of your own. See the [External LAMMPS packages and tools](#) page of the LAMMPS website for examples of groups that do this. We are happy to advertise your package and website from that page. Simply email the [developers](#) with info about your package and we will post it there. We recommend to name external packages USER-<name> so they can be easily distinguished from bundled packages that do not have the USER- prefix.

## 14.3 LAMMPS programming style and requirements for contributions

The following is a summary of the current requirements and recommendations for including contributed source code or documentation into the LAMMPS software distribution.

### 14.3.1 Motivation

The LAMMPS developers are committed to providing a software package that is versatile, reliable, high-quality, efficient, portable, and easy to maintain and modify. Achieving all of these goals is challenging since a large part of LAMMPS consists of contributed code from many different authors and not many of them are professionally trained programmers and familiar with the idiosyncrasies of maintaining a large software package. In addition, changes that interfere with the parallel efficiency of the core code must be avoided. As LAMMPS continues to grow and more features and functionality are added, it becomes a necessity to be more discriminating with new contributions while also working at the same time to improve the existing code.

The following requirements and recommendations are provided to help maintaining or improving that status. Where possible we utilize available continuous integration tools to search for common programming mistakes, portability limitations, incompatible formatting, and undesired side effects. It is indicated which requirements are strict, and which represent a preference and thus are negotiable or optional.

Please feel free to contact the LAMMPS core developers in case you need additional explanations or clarifications or in case you need assistance in realizing the (strict) requirements for your contributions.

### 14.3.2 Licensing requirements (strict)

Contributing authors agree when submitting a pull request that their contributions can be distributed under the LAMMPS license conditions. This is the GNU public license in version 2 (not 3 or later) for the publicly distributed versions, e.g. on the LAMMPS homepage or on GitHub. On request we also make a version of LAMMPS available under LGPL 2.1 terms; this will usually be the latest available or a previous stable version with a few LGPL 2.1 incompatible files removed.

Your new source files should have the LAMMPS copyright, GPL notice, and your name and email address at the top, like other user-contributed LAMMPS source files.

Contributions may be under a different license for long as that license does not conflict with the aforementioned terms. Contributions that use code with a conflicting license can be split into two parts:

1. the core parts (i.e. parts that must be in the *src* tree) that are licensed under compatible terms and bundled with the LAMMPS sources
2. an external library that must be downloaded and compiled (either separately or as part of the LAMMPS compilation)

Please note, that this split licensed mode may complicate including the contribution in binary packages.

### 14.3.3 Using Pull Requests on GitHub (preferred)

All contributions to LAMMPS are processed as pull requests on GitHub (this also applies to the work of the core LAMMPS developers). A [tutorial for submitting pull requests on GitHub](#) is provided. If this is still problematic, contributors may contact any of the core LAMMPS developers for help or to create a pull request on their behalf. This latter way of submission may delay the integration as it depends on the amount of time required to prepare the pull request and free time available by the LAMMPS developer in question to spend on this task.

### 14.3.4 Integration Testing (strict)

Contributed code, like all pull requests, must pass the automated tests on GitHub before it can be merged with the LAMMPS distribution. These tests compile LAMMPS in a variety of environments and settings and run the bundled unit tests. At the discretion of the LAMMPS developer managing the pull request, additional tests may be activated that test for “side effects” on running a collection of input decks and create consistent results. Also, the translation of the documentation to HTML and PDF is tested for.

More specifically, this means that contributed source code **must** compile with the most current version of LAMMPS with `-DLAMMPS_BIGBIG` in addition to the default setting of `-DLAMMPS_SMALLBIG`. The code needs to work correctly in both cases and also in serial and parallel using MPI.

Some “disruptive” changes may break tests and require updates to the testing tools or scripts or tests themselves. This is rare. If in doubt, contact the LAMMPS developer that is assigned to the pull request for further details and explanations and suggestions of what needs to be done.

### 14.3.5 Documentation (strict)

Contributions that add new styles or commands or augment existing ones must include the corresponding new or modified documentation in `ReStructuredText` format (.rst files in the `doc/src/` folder). The documentation shall be written in American English and the .rst file must use only ASCII characters so it can be cleanly translated to PDF files (via `sphinx` and PDFLaTeX). Special characters may be included via embedded math expression typeset in a LaTeX subset.

When adding new commands, they need to be integrated into the `sphinx` documentation system, and the corresponding command tables and lists updated. When translating the documentation into html files there should be no warnings. When adding a new package also some lists describing packages must be updated as well as a package specific description added and, if necessary, some package specific build instructions included.

As appropriate, the text files with the documentation can include inline mathematical expression or figures (see `doc/JPG` for examples). Additional PDF files with further details (see `doc/PDF` for examples) may also be included. The page should also include literature citations as appropriate; see the bottom of `doc/fix_nh.rst` for examples and the earlier part of the same file for how to format the cite itself. Citation labels must be unique across **all** .rst files. The “Restrictions” section of the page should indicate if your command is only available if LAMMPS is built with the appropriate FOO package. See other package doc files for examples of how to do this.

Please run at least “make html” and “make spelling” and carefully inspect and proofread the resulting HTML format doc page before submitting your code. Upon submission of a pull request, checks for error free completion of the HTML and PDF build will be performed and also a spell check, a check for correct anchors and labels, and a check for completeness of references all styles in their corresponding tables and lists is run. In case the spell check reports false positives they can be added to the file `doc/utils/sphinx-config/false_positives.txt`

Contributions that add or modify the library interface or “public” APIs from the C++ code or the Fortran module must include suitable doxygen comments in the source and corresponding changes to the documentation sources for the “Programmer Guide” guide section of the LAMMPS manual.

### 14.3.6 Examples (preferred)

In most cases, it is preferred that example scripts (simple, small, fast to complete on 1 CPU) are included that demonstrate the use of new or extended functionality. These are typically under the `examples` or `examples/PACKAGES` directory. A few guidelines for such example input decks.

- commands that generate output should be commented out (except when the output is the sole purpose or the feature, e.g. for a new compute).
- commands like `log`, `echo`, `package`, `processors`, `suffix` may **not** be used in the input file (exception: “processors \* \* 1” or similar is acceptable when used to avoid unwanted domain decomposition of empty volumes).
- outside of the log files no generated output should be included
- custom `thermo_style` settings may not include output measuring CPU or other time as that makes comparing the thermo output between different runs more complicated.
- input files should be named `in.name`, data files should be named `data.name` and log files should be named `log.version.name.<compiler>.<ncpu>`
- the total file size of all the inputs and outputs should be small
- where possible potential files from the “potentials” folder or data file from other folders should be re-used through symbolic links

### 14.3.7 Howto document (optional)

If your feature requires some more complex steps and explanations to be used correctly or some external or bundled tools or scripts, we recommend that you also contribute a *Howto document* providing some more background information and some tutorial material. This can also be used to provide more in-depth explanations for bundled examples.

As a general rule-of-thumb, the more clear and self-explanatory you make your documentation, README files and examples, and the easier you make it for people to get started, the more likely it is that users will try out your new feature.

### 14.3.8 Programming Style Requirements (varied)

The LAMMPS developers aim to employ a consistent programming style and naming conventions across the entire code base, as this helps with maintenance, debugging, and understanding the code, both for developers and users.

The files *pair\_lj\_cut.h*, *pair\_lj\_cut.cpp*, *utils.h*, and *utils.cpp* may serve as representative examples.

#### Command or Style names, file names, and keywords (mostly strict)

All user-visible command or style names should be all lower case and should only use letters, numbers, or forward slashes. They should be descriptive and initialisms should be avoided unless they are well established (e.g. lj for Lennard-Jones). For a compute style “some/name” the source files must be called *compute\_some\_name.h* and *compute\_some\_name.cpp*. The “include guard” would then be *LMP\_COMPUTE\_SOME\_NAME\_H* and the class name *ComputeSomeName*.

#### Whitespace and permissions (preferred)

Source files should not contain TAB characters unless required by the syntax (e.g. in makefiles) and no trailing whitespace. Text files should be added with Unix-style line endings (LF-only). Git will automatically convert those in both directions when running on Windows; use *dos2unix* on Linux machines to convert files. Text files should have a line ending on the last line.

All files should have 0644 permissions, i.e. writable to the user only and readable by all and no executable permissions. Executable permissions (0755) should only be on shell scripts or python or similar scripts for interpreted script languages.

You can check for these issues with the python scripts in the “*tools/coding\_standard*” folder. When run normally with a source file or a source folder as argument, they will list all non-conforming lines. By adding the *-f* flag to the command line, they will modify the flagged files to try removing the detected issues.

#### Indentation and Placement of Braces (strongly preferred)

LAMMPS uses 2 characters per indentation level and lines should be kept within 100 characters wide.

For new files added to the “src” tree, a *clang-format* configuration file is provided under the name *.clang-format*. This file is compatible with clang-format version 8 and later. With that file present files can be reformatted according to the configuration with a command like: *clang-format -i new-file.cpp*. Ideally, this is done while writing the code or before a pull request is submitted. Blocks of code where the reformatting from clang-format yields undesirable output may be protected with placing a pair *// clang-format off* and *// clang-format on* comments around that block.

## Error or warning messages and explanations (preferred)

Changed in version 4May2022.

Starting with LAMMPS version 4 May 2022 the LAMMPS developers have agreed on a new policy for error and warning messages.

Previously, all error and warning strings were supposed to be listed in the class header files with an explanation. Those would then be regularly “harvested” and transferred to alphabetically sorted lists in the manual. To avoid excessively long lists and to reduce effort, this came with a requirement to have rather generic error messages (e.g. “Illegal ... command”). To identify the specific cause, the name of the source file and the line number of the error location would be printed, so that one could look up the cause by reading the source code.

The new policy encourages more specific error messages that ideally indicate the cause directly and no further lookup would be needed. This is aided by using the `{fmt}` library to convert the Error class commands so that they take a variable number of arguments and error text will be treated like a `{fmt}` syntax format string. Error messages should still kept to a single line or two lines at the most.

For more complex explanations or errors that have multiple possible reasons, a paragraph should be added to the *Error\_details* page with an error code reference (e.g. `.. _err0001:`) then the utility function `utils::errorurl()` can be used to generate an URL that will directly lead to that paragraph. An error for missing arguments can be easily generated using the `utils::missing_cmd_args()` convenience function.

The transformation of existing LAMMPS code to this new scheme is ongoing and - given the size of the LAMMPS source code - will take a significant amount of time until completion. However, for new code following the new approach is strongly preferred. The expectation is that the new scheme will make it easier for LAMMPS users, developers, and maintainers.

An example for this approach would be the `src/read_data.cpp` and `src/atom.cpp` files that implement the *read\_data* and *atom\_modify* commands and that may create “*Unknown identifier in data file*” errors that seem difficult to debug for users because they may have one of multiple possible reasons, and thus require some additional explanations.

## Programming language standards (required)

The core of LAMMPS is written in C++11 in a style that can be mostly described as “C with classes”. Advanced C++ features like operator overloading or excessive use of templates are avoided with the intent to keep the code readable to programmers that have limited C++ programming experience. C++ constructs are acceptable when they help improving the readability and reliability of the code, e.g. when using the `std::string` class instead of manipulating pointers and calling the string functions of the C library. In addition a collection of convenient *utility functions and classes* for recurring tasks and a collection of *platform neutral functions* for improved portability are provided.

Included Fortran code has to be compatible with the Fortran 2003 standard. Python code must be compatible with Python 3.5. Large parts of LAMMPS (including the *PYTHON package*) are also compatible with Python 2.7. Compatibility with Python 2.7 is desirable, but compatibility with Python 3.5 is **required**.

Compatibility with these older programming language standards is very important to maintain portability and availability of LAMMPS on many platforms. This applies especially to HPC cluster environments, which tend to be running older software stacks and LAMMPS users may be required to use those older tools for access to advanced hardware features or not have the option to install newer compilers or libraries.

## Programming conventions (varied)

The following is a collection of conventions that should be applied when writing code for LAMMPS. Following these steps will make it much easier to integrate your contribution. Please have a look at the existing files in packages in the src directory for examples. As a demonstration for how can be adapted to these conventions you may compare the REAXFF package with the what it looked like when it was called USER-REAXC. If you are uncertain, please ask.

- system headers or from installed libraries are include with angular brackets (example: `#include <vector>`), while local include file use double quotes (example: `#include "atom.h"`).
- **when including system header files from the C library use the C++-style names** (`<cstdlib>` or `<cstring>`) instead of the C-style names (`<stdlib.h>` or `<string.h>`)
- the order of `#include` statements in a file `some_name.cpp` that implements a class `SomeName` defined in a header file `some_name.h` should be as follows:
  - `#include "some_name.h"` followed by an empty line
  - LAMMPS include files e.g. `#include "comm.h"` or `#include "modify.h"` in alphabetical order followed by an empty line
  - system header files from the C++ or C standard library followed by an empty line
  - `using namespace LAMMPS_NS` or other namespace imports.
- I/O is done via the C-style `stdio` library and **not** `iostreams`.
- Output to the screen and the logfile should be using the corresponding `FILE` pointers and only be done on MPI rank 0. Use the `utils::logmsg()` convenience function where possible.
- Usage of C++11 *virtual*, *override*, *final* keywords: Please follow the [C++ Core Guideline C.128](#). That means, you should only use *virtual* to declare a new virtual function, *override* to indicate you are overriding an existing virtual function, and *final* to prevent any further overriding.
- Trivial destructors: Prefer not writing destructors when they are empty and *default*.

```
// don't write destructors for A or B like this
class A : protected Pointers {
public:
    A();
    ~A() override {}
};

class B : protected Pointers {
public:
    B();
    ~B() override = default;
};

// instead, let the compiler create the implicit default destructor by not writing
→it
class A : protected Pointers {
public:
    A();
};

class B : protected Pointers {
public:
```

(continues on next page)

(continued from previous page)

```

    B();
};

```

- Header files, especially those defining a “style”, should only use the absolute minimum number of include files and **must not** contain any `using` statements. Typically that would be only the header for the base class. Instead any include statements should be put into the corresponding implementation files and forward declarations be used. For implementation files, the “include what you use” principle should be employed. However, there is the notable exception that when the `pointers.h` header is included (or one of the base classes derived from it) certain headers will always be included and thus do not need to be explicitly specified. These are: `mpi.h`, `cstddef`, `cstdio`, `cstdlib`, `string`, `utils.h`, `vector`, `fmt/format.h`, `climits`, `cinttypes`. This also means any such file can assume that `FILE`, `NULL`, and `INT_MAX` are defined.
- Header files that define a new LAMMPS style (i.e. that have a `SomeStyle(some/name, SomeName);` macro in them) should only use the include file for the base class and otherwise use forward declarations and pointers; when interfacing to a library use the PIMPL (pointer to implementation) approach where you have a pointer to a struct that contains all library specific data (and thus requires the library header) but use a forward declaration and define the struct only in the implementation file. This is a **strict** requirement since this is where type clashes between packages and hard to find bugs have regularly manifested in the past.
- Please use `clang-format` only to reformat files that you have contributed. For header files containing a `SomeStyle(keyword, ClassName)` macros it is required to have this macro embedded with a pair of `// clang-format off, // clang-format on` comments and the line must be terminated with a semi-colon (;). Example:

```

#ifdef COMMAND_CLASS
// clang-format off
CommandStyle(run, Run);
// clang-format on
#else

#ifdef LMP_RUN_H
[...]
```

You may also use `// clang-format on/off` throughout your files to protect individual sections from being reformatted.

- We rarely accept new styles in the core `src` folder. Thus please review the list of [available Packages](#) to see if your contribution could be added to be added to one of them. It should fit into the general purposed of that package. If it does not fit well, it may be added to one of the EXTRA- packages or the MISC package.

### 14.3.9 Contributing a package

If your contribution has several related features that are not covered by one of the existing packages or is dependent on a library (bundled or external), it is best to make it a package directory with a name like FOO. In addition to your new files, the directory should contain a README text file. The README should contain your name and contact information and a brief description of what your new package does.

#### 14.3.10 Build system (strongly preferred)

LAMMPS currently supports two build systems: one that is based on *traditional Makefiles* and one that is based on *CMake*. Thus your contribution must be compatible with and support both.

For a single pair of header and implementation files that are an independent feature, it is usually only required to add them to `src/.gitignore`.

For traditional make, if your contributed files or package depend on other LAMMPS style files or packages also being installed (e.g. because your file is a derived class from the other LAMMPS class), then an `Install.sh` file is also needed to check for those dependencies and modifications to `src/Depend.sh` to trigger the checks. See other README and `Install.sh` files in other directories as examples.

Similarly for CMake support, changes may need to be made to `cmake/CMakeLists.txt`, some of the files in `cmake/presets`, and possibly a file with specific instructions needs to be added to `cmake/Modules/Packages/`. Please check out how this is handled for existing packages and ask the LAMMPS developers if you need assistance.

#### 14.3.11 Citation reminder (suggested)

If there is a paper of yours describing your feature (either the algorithm/science behind the feature itself, or its initial usage, or its implementation in LAMMPS), you can add the citation to the `*.cpp` source file. See `src/DIFFRACTION/compute_saed.cpp` for an example. A BibTeX format citation is stored in a string variable at the top of the file and a single line of code registering this variable is added to the constructor of the class. When your feature is used, by default, LAMMPS will print the brief info and the DOI in the first line to the screen and the full citation to the log file.

If there is additional functionality (which may have been added later) described in a different publication, additional citation descriptions may be added for as long as they are only registered when the corresponding keyword activating this functionality is used. With these options it is possible to have LAMMPS output a specific citation reminder whenever a user invokes your feature from their input script. Please note that you should *only* use this for the *most* relevant paper for a feature and a publication that you or your group authored. E.g. adding a citation in the code for a paper by Nose and Hoover if you write a fix that implements their integrator is not the intended usage. That latter kind of citation should just be included in the documentation page you provide describing your contribution. If you are not sure what the best option would be, please contact the LAMMPS developers for advice.

#### 14.3.12 Testing (optional)

If your contribution contains new utility functions or a supporting class (i.e. anything that does not depend on a LAMMPS object), new unit tests should be added to a suitable folder in the `unittest` tree. When adding a new LAMMPS style computing forces or selected fixes, a `.yaml` file with a test configuration and reference data should be added for the styles where a suitable tester program already exists (e.g. pair styles, bond styles, etc.). Please see *this section in the manual* for more information on how to enable, run, and expand testing.

## 14.4 Atom styles

Classes that define an *atom style* are derived from the AtomVec class and managed by the Atom class. The atom style determines what attributes are associated with an atom and communicated when it is a ghost atom or migrates to a new processor. A new atom style can be created if one of the existing atom styles does not define all the attributes you need to store and communicate with atoms.

The file `atom_vec_atomic.cpp` is the simplest example of an atom style. Examining the code for others will make these instructions more clear.

Note that the *atom style hybrid* command can be used to define atoms or particles which have the union of properties of individual styles. Also the *fix property/atom* command can be used to add a single property (e.g. charge or a molecule ID) to a style that does not have it. It can also be used to add custom properties to an atom, with options to communicate them with ghost atoms or read them from a data file. Other LAMMPS commands can access these custom properties, as can new pair, fix, compute styles that are written to work with these properties. For example, the *set* command can be used to set the values of custom per-atom properties from an input script. All of these methods are less work than writing and testing(!) code for a new atom style.

If you follow these directions your new style will automatically work in tandem with others via the *atom\_style hybrid* command.

The first step is to define a set of string lists in the constructor of the new derived class. Each list will have zero or more comma-separated strings that correspond to the variable names used in the `atom.h` header file for per-atom properties. Note that some represent per-atom vectors (q, molecule) while other are per-atom arrays (x,v). For all but the last two lists you do not need to specify any of (id,type,x,v,f). Those are included automatically as needed in the other lists.

<code>fields_grow</code>	full list of properties which is allocated and stored
<code>fields_copy</code>	list of properties to copy atoms are rearranged on-processor
<code>fields_comm</code>	list of properties communicated to ghost atoms every step
<code>fields_comm_vel</code>	additional properties communicated if <i>comm_modify vel</i> is used
<code>fields_reverse</code>	list of properties summed from ghost atoms every step
<code>fields_border</code>	list of properties communicated with ghost atoms every reneighboring step
<code>fields_border_vel</code>	additional properties communicated if <i>comm_modify vel</i> is used
<code>fields_exchange</code>	list of properties communicated when an atom migrates to another processor
<code>fields_restart</code>	list of properties written/read to/from a restart file
<code>fields_create</code>	list of properties defined when an atom is created by <i>create_atoms</i>
<code>fields_data_atom</code>	list of properties (in order) in the Atoms section of a data file, as read by <i>read_data</i>
<code>fields_data_vel</code>	list of properties (in order) in the Velocities section of a data file, as read by <i>read_data</i>

In these lists you can list variable names which LAMMPS already defines (in some other atom style), or you can create new variable names. You should not re-use a LAMMPS variable in your atom style that is used for something with a different meaning in another atom style. If the meaning is related, but interpreted differently by your atom style, then using the same variable name means a user must not use your style and the other style together in a *atom\_style hybrid* command. Because there will only be one value of the variable and different parts of LAMMPS will then likely use it differently. LAMMPS has no way of checking for this.

If you are defining new variable names then make them descriptive and unique to your new atom style. For example choosing “e” for energy is a bad choice; it is too generic. A better choice would be “e\_foo”, where “foo” is specific to your style.

If any of the variable names in your new atom style do not exist in LAMMPS, you need to add them to the `src/atom.h` and `atom.cpp` files.

Search for the word “customize” or “customization” in these 2 files to see where to add your variable. Adding a flag to the 2nd customization section in `atom.h` is only necessary if your code (e.g. a pair style) needs to check that a per-atom property is defined. These flags should also be set in the constructor of the atom style child class.

In `atom.cpp`, aside from the constructor and destructor, there are 3 methods that a new variable name or flag needs to be added to.

In `Atom::peratom_create()` when using the `Atom::add_peratom()` method, a `cols` argument of 0 is for per-atom vectors, a length > 1 is for per-atom arrays. Note the use of the extra per-thread flag and the `add_peratom_vary()` method when last dimension of the array is variable-length.

Adding the variable name to `Atom::extract()` enables the per-atom data to be accessed through the *LAMMPS library interface* by a calling code, including from *Python*.

The constructor of the new atom style will also typically set a few flags which are defined at the top of `atom_vec.h`. If these are unclear, see how other atom styles use them.

The `grow_pointers()` method is also required to make a copy of peratom data pointers, as explained in the code.

There are a number of other optional methods which your atom style can implement. These are only needed if you need to do something out-of-the-ordinary which the default operation of the `AtomVec` parent class does not take care of. The best way to figure out why they are sometimes useful is to look at how other atom styles use them.

- `process_args` = use if the atom style has arguments
- `init` = called before each run
- `force_clear` = called before force computations each timestep

A few atom styles define “bonus” data associated with some or all of their particles, such as *atom\_style ellipsoid* or *tri*. These methods work with that data:

- `copy_bonus`
- `clear_bonus`
- `pack_comm_bonus`
- `unpack_comm_bonus`
- `pack_border_bonus`
- `unpack_border_bonus`
- `pack_exchange_bonus`
- `unpack_exchange_bonus`
- `size_restart_bonus`
- `pack_restart_bonus`
- `unpack_restart_bonus`
- `data_atom_bonus`
- `memory_usage_bonus`

The *atom\_style body* command can define a particle geometry with an arbitrary number of values. This method reads it from a data file:

- `data_body`

These methods are called before or after operations handled by the parent `AtomVec` class. They allow an atom style to do customized operations on the per-atom values. For example *atom\_style sphere* reads a diameter and density of each particle from a data file. But these need to be converted internally to a radius and mass. That operation is done in the `data_atom_post()` method.

- `pack_restart_pre`
- `pack_restart_post`

- `unpack_restart_init`
- `create_atom_post`
- `data_atom_post`
- `pack_data_pre`
- `pack_data_post`

These methods enable the *compute property/atom* command to access per-atom variables it does not already define as arguments, so that they can be written to a dump file or used by other LAMMPS commands.

- `property_atom`
- `pack_property_atom`

## 14.5 Pair styles

Classes that compute pairwise interactions are derived from the Pair class. In LAMMPS, pairwise calculation include many-body potentials such as EAM or Tersoff where particles interact without a static bond topology. New styles can be created to add new pair potentials to LAMMPS.

`Pair_lj_cut.cpp` is a simple example of a Pair class, though it includes some optional methods to enable its use with rRESPA.

Here is a brief description of the class methods in `pair.h`:

<code>compute</code>	workhorse routine that computes pairwise interactions
<code>settings</code>	reads the input script line with arguments you define
<code>coeff</code>	set coefficients for one i,j type pair
<code>init_one</code>	perform initialization for one i,j type pair
<code>init_style</code>	initialization specific to this pair style
<code>write &amp; read_restart</code>	write/read i,j pair coeffs to restart files
<code>write &amp; read_restart_settings</code>	write/read global settings to restart files
<code>single</code>	force/r and energy of a single pairwise interaction between 2 atoms
<code>compute_inner/middle/outer</code>	versions of compute used by rRESPA

The inner/middle/outer routines are optional.

## 14.6 Bond, angle, dihedral, improper styles

Classes that compute molecular interactions are derived from the Bond, Angle, Dihedral, and Improper classes. New styles can be created to add new potentials to LAMMPS.

`Bond_harmonic.cpp` is the simplest example of a bond style. Ditto for the harmonic forms of the angle, dihedral, and improper style commands.

Here is a brief description of common methods you define in your new derived class. See `bond.h`, `angle.h`, `dihedral.h`, and `improper.h` for details and specific additional methods.

init	check if all coefficients are set, calls <i>init_style</i> (optional)
init_style	check if style specific conditions are met (optional)
compute	compute the molecular interactions (required)
settings	apply global settings for all types (optional)
coeff	set coefficients for one type (required)
equilibrium_distance	length of bond, used by SHAKE (required, bond only)
equilibrium_angle	opening of angle, used by SHAKE (required, angle only)
write & read_restart	writes/reads coeffs to restart files (required)
single	force (bond only) and energy of a single bond or angle (required, bond or angle only)
memory_usage	tally memory allocated by the style (optional)

## 14.7 Compute styles

Classes that compute scalar and vector quantities like temperature and the pressure tensor, as well as classes that compute per-atom quantities like kinetic energy and the centro-symmetry parameter are derived from the Compute class. New styles can be created to add new calculations to LAMMPS.

Compute\_temp.cpp is a simple example of computing a scalar temperature. Compute\_ke\_atom.cpp is a simple example of computing per-atom kinetic energy.

Here is a brief description of methods you define in your new derived class. See compute.h for details.

init	perform one time setup (required)
init_list	neighbor list setup, if needed (optional)
compute_scalar	compute a scalar quantity (optional)
compute_vector	compute a vector of quantities (optional)
compute_peratom	compute one or more quantities per atom (optional)
compute_local	compute one or more quantities per processor (optional)
pack_comm	pack a buffer with items to communicate (optional)
unpack_comm	unpack the buffer (optional)
pack_reverse	pack a buffer with items to reverse communicate (optional)
unpack_reverse	unpack the buffer (optional)
remove_bias	remove velocity bias from one atom (optional)
remove_bias_all	remove velocity bias from all atoms in group (optional)
restore_bias	restore velocity bias for one atom after remove_bias (optional)
restore_bias_all	same as before, but for all atoms in group (optional)
pair_tally_callback	callback function for <i>tally</i> -style computes (optional).
memory_usage	tally memory usage (optional)

Tally-style computes are a special case, as their computation is done in two stages: the callback function is registered with the pair style and then called from the Pair::ev\_tally() function, which is called for each pair after force and energy has been computed for this pair. Then the tallied values are retrieved with the standard compute\_scalar or compute\_vector or compute\_peratom methods. The *compute styles in the TALLY package* provide *examples* for utilizing this mechanism.

## 14.8 Fix styles

In LAMMPS, a “fix” is any operation that is computed during timestepping that alters some property of the system. Essentially everything that happens during a simulation besides force computation, neighbor list construction, and output, is a “fix”. This includes time integration (update of coordinates and velocities), force constraints or boundary conditions (SHAKE or walls), and diagnostics (compute a diffusion coefficient). New styles can be created to add new options to LAMMPS.

Fix\_setforce.cpp is a simple example of setting forces on atoms to prescribed values. There are dozens of fix options already in LAMMPS; choose one as a template that is similar to what you want to implement.

Here is a brief description of methods you can define in your new derived class. See fix.h for details.

setmask	determines when the fix is called during the timestep (required)
init	initialization before a run (optional)
init_list	store pointer to neighbor list; called by neighbor list code (optional)
setup_pre_exchange	called before atom exchange in setup (optional)
setup_pre_force	called before force computation in setup (optional)
setup	called immediately before the first timestep and after forces are computed (optional)
min_setup_pre_force	like setup_pre_force, but for minimizations instead of MD runs (optional)
min_setup	like setup, but for minimizations instead of MD runs (optional)
initial_integrate	called at very beginning of each timestep (optional)
pre_exchange	called before atom exchange on re-neighboring steps (optional)
pre_neighbor	called before neighbor list build (optional)
pre_force	called before pair & molecular forces are computed (optional)
post_force	called after pair & molecular forces are computed and communicated (optional)
final_integrate	called at end of each timestep (optional)
end_of_step	called at very end of timestep (optional)
write_restart	dumps fix info to restart file (optional)
restart	uses info from restart file to re-initialize the fix (optional)
grow_arrays	allocate memory for atom-based arrays used by fix (optional)
copy_arrays	copy atom info when an atom migrates to a new processor (optional)
pack_exchange	store atom’s data in a buffer (optional)
unpack_exchange	retrieve atom’s data from a buffer (optional)
pack_restart	store atom’s data for writing to restart file (optional)
unpack_restart	retrieve atom’s data from a restart file buffer (optional)
size_restart	size of atom’s data (optional)
maxsize_restart	max size of atom’s data (optional)
setup_pre_force_respa	same as setup_pre_force, but for rRESPA (optional)
initial_integrate_respa	same as initial_integrate, but for rRESPA (optional)
post_integrate_respa	called after the first half integration step is done in rRESPA (optional)
pre_force_respa	same as pre_force, but for rRESPA (optional)
post_force_respa	same as post_force, but for rRESPA (optional)
final_integrate_respa	same as final_integrate, but for rRESPA (optional)
min_pre_force	called after pair & molecular forces are computed in minimizer (optional)
min_post_force	called after pair & molecular forces are computed and communicated in minimizer (optional)
min_store	store extra data for linesearch based minimization on a LIFO stack (optional)
min_pushstore	push the minimization LIFO stack one element down (optional)
min_popstore	pop the minimization LIFO stack one element up (optional)
min_clearstore	clear minimization LIFO stack (optional)
min_step	reset or move forward on line search minimization (optional)
min_dof	report number of degrees of freedom <i>added</i> by this fix in minimization (optional)

continues on next page

Table 1 – continued from previous page

max_alpha	report maximum allowed step size during linesearch minimization (optional)
pack_comm	pack a buffer to communicate a per-atom quantity (optional)
unpack_comm	unpack a buffer to communicate a per-atom quantity (optional)
pack_reverse_comm	pack a buffer to reverse communicate a per-atom quantity (optional)
unpack_reverse_comm	unpack a buffer to reverse communicate a per-atom quantity (optional)
dof	report number of degrees of freedom <i>removed</i> by this fix during MD (optional)
compute_scalar	return a global scalar property that the fix computes (optional)
compute_vector	return a component of a vector property that the fix computes (optional)
compute_array	return a component of an array property that the fix computes (optional)
deform	called when the box size is changed (optional)
reset_target	called when a change of the target temperature is requested during a run (optional)
reset_dt	is called when a change of the time step is requested during a run (optional)
modify_param	called when a fix_modify request is executed (optional)
memory_usage	report memory used by fix (optional)
thermo	compute quantities for thermodynamic output (optional)

Typically, only a small fraction of these methods are defined for a particular fix. Setmask is mandatory, as it determines when the fix will be invoked during the timestep. Fixes that perform time integration (*nve*, *nvt*, *npt*) implement `initial_integrate()` and `final_integrate()` to perform velocity Verlet updates. Fixes that constrain forces implement `post_force()`.

Fixes that perform diagnostics typically implement `end_of_step()`. For an `end_of_step` fix, one of your fix arguments must be the variable “nevery” which is used to determine when to call the fix and you must set this variable in the constructor of your fix. By convention, this is the first argument the fix defines (after the ID, group-ID, style).

If the fix needs to store information for each atom that persists from timestep to timestep, it can manage that memory and migrate the info with the atoms as they move from processors to processor by implementing the `grow_arrays`, `copy_arrays`, `pack_exchange`, and `unpack_exchange` methods. Similarly, the `pack_restart` and `unpack_restart` methods can be implemented to store information about the fix in restart files. If you wish an integrator or force constraint fix to work with rRESPA (see the `run_style` command), the `initial_integrate`, `post_force_integrate`, and `final_integrate_respa` methods can be implemented. The `thermo` method enables a fix to contribute values to thermodynamic output, as printed quantities and/or to be summed to the potential energy of the system.

## 14.9 Input script command style

New commands can be added to LAMMPS input scripts by adding new classes that are derived from the `Command` class and thus must have a “command” method. For example, the `create_atoms`, `read_data`, `velocity`, and `run` commands are all implemented in this fashion. When such a command is encountered in the LAMMPS input script, LAMMPS simply creates a class instance with the corresponding name, invokes the “command” method of the class, and passes it the arguments from the input script. The command method can perform whatever operations it wishes on LAMMPS data structures.

The single method your new class must define is as follows:

command	operations performed by the new command
---------	---

Of course, the new class can define other methods and variables as needed.

## 14.10 Dump styles

Classes that dump per-atom info to files are derived from the Dump class. To dump new quantities or in a new format, a new derived dump class can be added, but it is typically simpler to modify the DumpCustom class contained in the dump\_custom.cpp file.

Dump\_atom.cpp is a simple example of a derived dump class.

Here is a brief description of methods you define in your new derived class. See dump.h for details.

write_header	write the header section of a snapshot of atoms
count	count the number of lines a processor will output
pack	pack a proc's output data into a buffer
write_data	write a proc's data to a file

See the *dump* command and its *custom* style for a list of keywords for atom information that can already be dumped by DumpCustom. It includes options to dump per-atom info from Compute classes, so adding a new derived Compute class is one way to calculate new quantities to dump.

Note that new keywords for atom properties are not typically added to the *dump custom* command. Instead they are added to the *compute property/atom* command.

## 14.11 Kspace styles

Classes that compute long-range Coulombic interactions via K-space representations (Ewald, PPPM) are derived from the KSpace class. New styles can be created to add new K-space options to LAMMPS.

Ewald.cpp is an example of computing K-space interactions.

Here is a brief description of methods you define in your new derived class. See kspace.h for details.

init	initialize the calculation before a run
setup	computation before the first timestep of a run
compute	every-timestep computation
memory_usage	tally of memory usage

## 14.12 Minimization styles

Classes that perform energy minimization derived from the Min class. New styles can be created to add new minimization algorithms to LAMMPS.

Min\_cg.cpp is an example of conjugate gradient minimization.

Here is a brief description of methods you define in your new derived class. See min.h for details.

init	initialize the minimization before a run
run	perform the minimization
memory_usage	tally of memory usage

## 14.13 Region styles

Classes that define geometric regions are derived from the Region class. Regions are used elsewhere in LAMMPS to group atoms, delete atoms to create a void, insert atoms in a specified region, etc. New styles can be created to add new region shapes to LAMMPS.

Region\_sphere.cpp is an example of a spherical region.

Here is a brief description of methods you define in your new derived class. See region.h for details.

inside	determine whether a point is in the region
surface_interior	determine if a point is within a cutoff distance inside of surface
surface_exterior	determine if a point is within a cutoff distance outside of surface
shape_update	change region shape if set by time-dependent variable

## 14.14 Body styles

Classes that define body particles are derived from the Body class. Body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc.

See the [Howto body](#) page for an overview of using body particles and the various body styles LAMMPS supports. New styles can be created to add new kinds of body particles to LAMMPS.

Body\_nparticle.cpp is an example of a body particle that is treated as a rigid body containing N sub-particles.

Here is a brief description of methods you define in your new derived class. See body.h for details.

data_body	process a line from the Bodies section of a data file
noutrow	number of sub-particles output is generated for
noutcol	number of values per-sub-particle output is generated for
output	output values for the Mth sub-particle
pack_comm_body	body attributes to communicate every timestep
unpack_comm_body	unpacking of those attributes
pack_border_body	body attributes to communicate when reneighboring is done
unpack_border_body	unpacking of those attributes

## 14.15 Thermodynamic output options

The Thermo class computes and prints thermodynamic information to the screen and log file; see the files thermo.cpp and thermo.h.

There are four styles defined in thermo.cpp: “one”, “multi”, “yaml”, and “custom”. The “custom” style allows the user to explicitly list keywords for individual quantities to print when thermodynamic output is generated. The others have a fixed list of keywords. See the [thermo\\_style](#) command for a list of available quantities. The formatting of the “custom” style defaults to the “one” style, but can be adapted using [thermo\\_modify line](#).

The thermo styles (one, multi, etc) are defined by lists of keywords with associated formats for integer and floating point numbers and identified but an enumerator constant. Adding a new style thus mostly requires defining a new list of keywords and the associated formats and then inserting the required output processing where the enumerators are identified. Search for the word “CUSTOMIZATION” with references to “thermo style” in the thermo.cpp file to see the locations where code will need to be added. The member function Thermo::header() prints output at the very beginning of a thermodynamic output block and can be used to print column headers or other front matter. The

member function `Thermo::footer()` prints output at the end of a thermodynamic output block. The formatting of the output is done by assembling a “line” (which may span multiple lines if the style inserts newline characters (“n” as in the “multi” style).

New thermodynamic keywords can also be added to `thermo.cpp` to compute new quantities for output. Search for the word “CUSTOMIZATION” with references to “keyword” in `thermo.cpp` to see the several locations where code will need to be added. Effectively, you need to define a member function that computes the property, add an if statement in `Thermo::parse_fields()` where the corresponding header string for the keyword and the function pointer is registered by calling the `Thermo::addfield()` method, and add an if statement in `Thermo::evaluate_keyword()` which is called from the `Variable` class when a thermo keyword is encountered.

---

**Note:** The third argument to `Thermo::addfield()` is a flag indicating whether the function for the keyword computes a floating point (FLOAT), regular integer (INT), or big integer (BIGINT) value. This information is used for formatting the thermodynamic output. Inside the function the result must then be stored either in the `dvalue`, `ivalue` or `bivalue` member variable, respectively.

---

Since the `thermo_style custom` command allows to use output of quantities calculated by `fixes`, `computes`, and `variables`, it may often be simpler to compute what you wish via one of those constructs, rather than by adding a new keyword to the `thermo_style` command.

## 14.16 Variable options

The `Variable` class computes and stores *variable* information in LAMMPS; see the file `variable.cpp`. The value associated with a variable can be periodically printed to the screen via the `print`, `fix print`, or `thermo_style custom` commands. Variables of style “equal” can compute complex equations that involve the following types of arguments:

```
thermo keywords = ke, vol, atoms, ...
other variables = v_a, v_myvar, ...
math functions = div(x,y), mult(x,y), add(x,y), ...
group functions = mass(group), xcm(group,x), ...
atom values = x[123], y[3], vx[34], ...
compute values = c_mytemp[0], c_thermo_press[3], ...
```

Adding keywords for the `thermo_style custom` command (which can then be accessed by variables) is discussed in the [Modify thermo](#) documentation.

Adding a new math function of one or two arguments can be done by editing one section of the `Variable::evaluate()` method. Search for the word “customize” to find the appropriate location.

Adding a new group function can be done by editing one section of the `Variable::evaluate()` method. Search for the word “customize” to find the appropriate location. You may need to add a new method to the `Group` class as well (see the `group.cpp` file).

Accessing a new atom-based vector can be done by editing one section of the `Variable::evaluate()` method. Search for the word “customize” to find the appropriate location.

Adding new *compute styles* (whose calculated values can then be accessed by variables) is discussed in the [Modify compute](#) documentation.

## INFORMATION FOR DEVELOPERS

This section describes the internal structure and basic algorithms of the LAMMPS code. This is a work in progress and additional information will be added incrementally depending on availability of time and requests from the LAMMPS user community.

### 15.1 Source files

The source files of the LAMMPS code are found in two directories of the distribution: `src` and `lib`. Most of the code is written in C++ but there are small a number of files in several other languages like C, Fortran, Shell script, or Python.

The core of the code is located in the `src` folder and its sub-directories. A sizable number of these files are in the `src` directory itself, but there are plenty of *packages*, which can be included or excluded when LAMMPS is built. See the *Include packages in build* section of the manual for more information about that part of the build process. LAMMPS currently supports building with *conventional makefiles* and through *CMake*. Those procedures differ in how packages are enabled or disabled for inclusion into a LAMMPS binary so they cannot be mixed. The source files for each package are in all-uppercase sub-directories of the `src` folder, for example `src/MOLECULE` or `src/EXTRA-MOLECULE`. The `src/STUBS` sub-directory is not a package but contains a dummy MPI library, that is used when building a serial version of the code. The `src/MAKE` directory and its sub-directories contain makefiles with settings and flags for a variety of configuration and machines for the build process with traditional makefiles.

The `lib` directory contains the source code for several supporting libraries or files with configuration settings to use globally installed libraries, that are required by some of the optional packages. They may include python scripts that can transparently download additional source code on request. Each sub-directory, like `lib/poems` or `lib/gpu`, contains the source files, some of which are in different languages such as Fortran or CUDA. These libraries included in the LAMMPS build, if the corresponding package is installed.

LAMMPS C++ source files almost always come in pairs, such as `src/run.cpp` (implementation file) and `src/run.h` (header file). Each pair of files defines a C++ class, for example the `LAMMPS_NS::Run` class which contains the code invoked by the `run` command in a LAMMPS input script. As this example illustrates, source file and class names often have a one-to-one correspondence with a command used in a LAMMPS input script. Some source files and classes do not have a corresponding input script command, e.g. `src/force.cpp` and the `LAMMPS_NS::Force` class. They are discussed in the next section.

The names of all source files are in lower case and may use the underscore character ‘`_`’ to separate words. Outside of bundled libraries which may have different conventions, all C and C++ header files have a `.h` extension, all C++ files have a `.cpp` extension, and C files a `.c` extension. A small number of C++ classes and utility functions are implemented with only a `.h` file. Examples are the Pointers and Commands classes or the MathVec functions.

## 15.2 Class topology

Though LAMMPS has a lot of source files and classes, its class topology is not very deep, which can be seen from the *LAMMPS class topology* figure. In that figure, each name refers to a class and has a pair of associated source files in the `src` folder, for example the class `LAMMPS_NS::Memory` corresponds to the files `memory.cpp` and `memory.h`, or the class `LAMMPS_NS::AtomVec` corresponds to the files `atom_vec.cpp` and `atom_vec.h`. Full lines in the figure represent compositing: that is the class at the base of the arrow holds a pointer to an instance of the class at the tip. Dashed lines instead represent inheritance: the class to the tip of the arrow is derived from the class at the base. Classes with a red boundary are not instantiated directly, but they represent the base classes for “styles”. Those “styles” make up the bulk of the LAMMPS code and only a few representative examples are included in the figure so it remains readable.

The `LAMMPS_NS::LAMMPS` class is the topmost class and represents what is generally referred to an “instance” of LAMMPS. It is a composite holding pointers to instances of other core classes providing the core functionality of the MD engine in LAMMPS and through them abstractions of the required operations. The constructor of the LAMMPS class will instantiate those instances, process the command line flags, initialize MPI (if not already done) and set up file pointers for input and output. The destructor will shut everything down and free all associated memory. Thus code for the standalone LAMMPS executable in `main.cpp` simply initializes MPI, instantiates a single instance of LAMMPS while passing it the command line flags and input script. It deletes the LAMMPS instance after the method reading the input returns and shuts down the MPI environment before it exits the executable.

The `LAMMPS_NS::Pointers` is not shown in the *LAMMPS class topology* figure for clarity. It holds references to many of the members of the `LAMMPS_NS::LAMMPS`, so that all classes derived from `LAMMPS_NS::Pointers` have direct access to those reference. From the class topology all classes with blue boundary are referenced in the Pointers class and all classes in the second and third columns, that are not listed as derived classes are instead derived from `LAMMPS_NS::Pointers`. To initialize the pointer references in Pointers, a pointer to the LAMMPS class instance needs to be passed to the constructor and thus all constructors for classes derived from it must do so and pass this pointer to the constructor for Pointers.

Since all storage is supposed to be encapsulated (there are a few exceptions), the LAMMPS class can also be instantiated multiple times by a calling code. Outside of the aforementioned exceptions, those LAMMPS instances can be used alternately. As of the time of this writing (early 2021) LAMMPS is not yet sufficiently thread-safe for concurrent execution. When running in parallel with MPI, care has to be taken, that suitable copies of communicators are used to not create conflicts between different instances.

The LAMMPS class currently (early 2021) holds instances of 19 classes representing the core functionality. There are a handful of virtual parent classes in LAMMPS that define what LAMMPS calls *styles*. They are shaded red in the *LAMMPS class topology* figure. Each of these are parents of a number of child classes that implement the interface defined by the parent class. There are two main categories of these *styles*: some may only have one instance active at a time (e.g. `atom`, `pair`, `bond`, `angle`, `dihedral`, `improper`, `kpace`, `comm`) and there is a dedicated pointer variable for each of them in the composite class. Setups that require a mix of different such styles have to use a *hybrid* class that takes the place of the one allowed instance and then manages and forwards calls to the corresponding sub-styles for the designated subset of atoms or data. The composite class may also have lists of class instances, e.g. `Modify` handles lists of compute and fix styles, while `Output` handles a list of dump class instances.

The exception to this scheme are the `command` style classes. These implement specific commands that can be invoked before, after, or in between runs. For these an instance of the class is created, its `command()` method called and then, after completion, the class instance deleted. Examples for this are the `create_box`, `create_atoms`, `minimize`, `run`, `set`, or `velocity` command styles.

For all those *styles* certain naming conventions are employed: for the `fix nve` command the class is called `FixNVE` and the source files are `fix_nve.h` and `fix_nve.cpp`. Similarly for `fix ave/time` we have `FixAveTime` and `fix_ave_time.h` and `fix_ave_time.cpp`. Style names are lower case and without spaces or special characters. A suffix or words are appended with a forward slash `'/'` which denotes a variant of the corresponding class without the suffix. To connect the style name and the class name, LAMMPS uses macros like: `AtomStyle()`, `PairStyle()`, `BondStyle()`, `RegionStyle()`, and so on in the corresponding header file. During configuration or compilation files

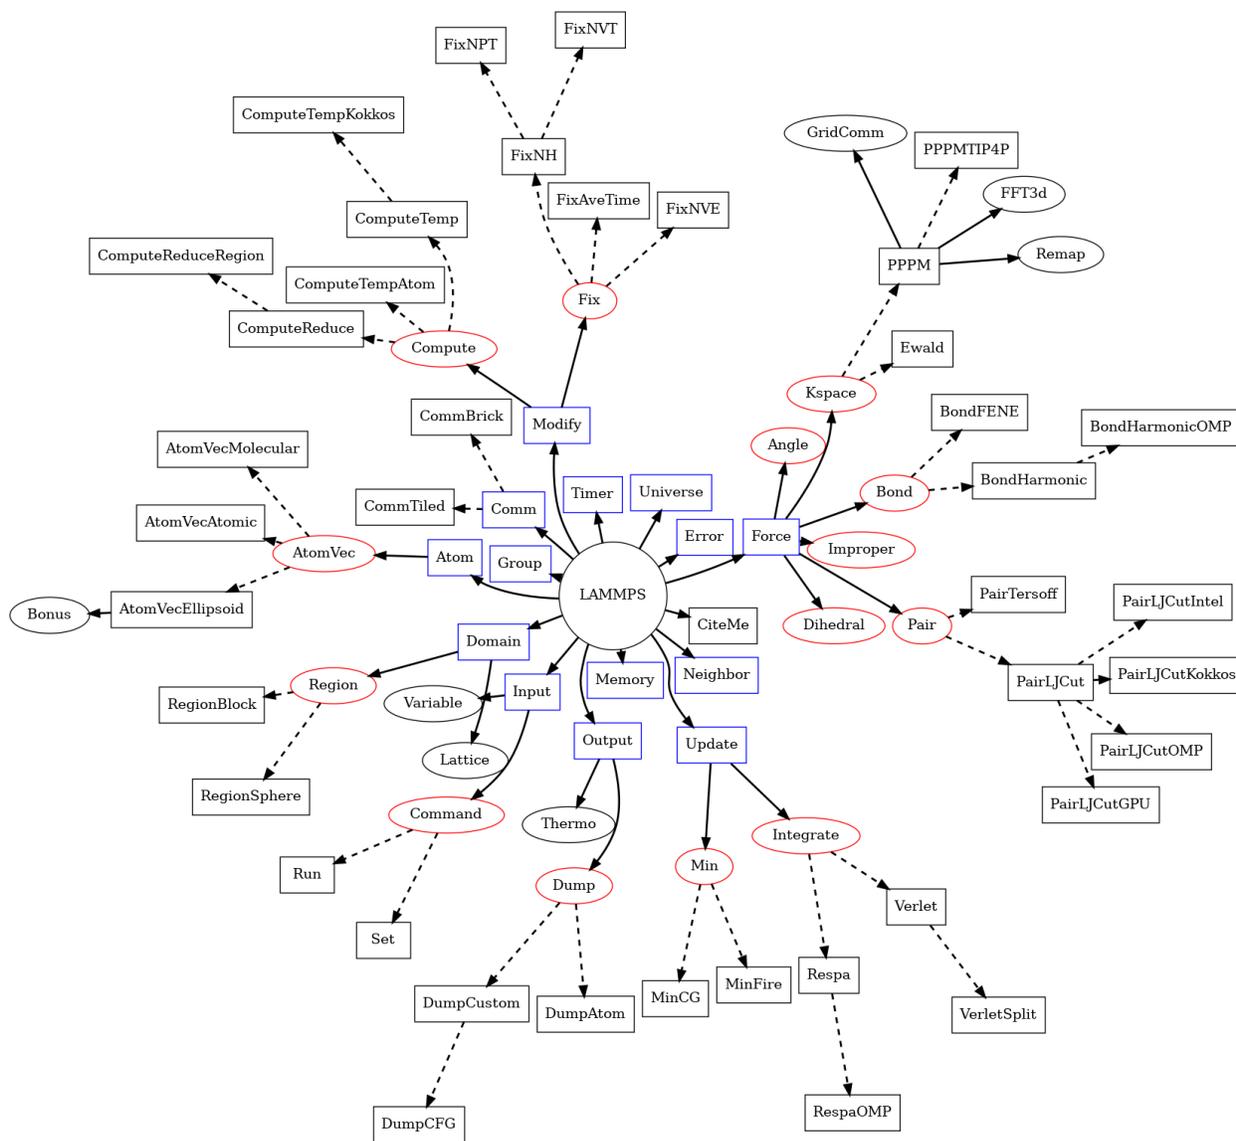

Fig. 1: LAMMPS class topology

This figure shows some of the relations of the base classes of the LAMMPS simulation package. Full lines indicate that a class holds an instance of the class it is pointing to; dashed lines point to derived classes that are given as examples of what classes may be instantiated during a LAMMPS run based on the input commands and accessed through the API define by their respective base classes. At the core is the *LAMMPS* class, which holds pointers to class instances with specific purposes. Those may hold instances of other classes, sometimes directly, or only temporarily, sometimes as derived classes or derived classes of derived classes, which may also hold instances of other classes.

with the pattern `style_<name>.h` are created that consist of a list of include statements including all headers of all styles of a given type that are currently active (or “installed”).

More details on individual classes in the *LAMMPS class topology* are as follows:

- The Memory class handles allocation of all large vectors and arrays.
- The Error class prints all (terminal) error and warning messages.
- The Universe class sets up one or more partitions of processors so that one or multiple simulations can be run, on the processors allocated for a run, e.g. by the `mpirun` command.
- The Input class reads and processes input strings and files, stores variables, and invokes *commands*.
- Command style classes are derived from the Command class. They provide input script commands that perform one-time operations before/after/between simulations or which invoke a simulation. They are usually instantiated from within the Input class, its `command` method invoked, and then immediately destructed.
- The Finish class is instantiated to print statistics to the screen after a simulation is performed, by commands like `run` and `minimize`.
- The Special class walks the bond topology of a molecular system to find first, second, third neighbors of each atom. It is invoked by several commands, like `read_data`, `read_restart`, or `replicate`.
- The Atom class stores per-atom properties associated with atom styles. More precisely, they are allocated and managed by a class derived from the AtomVec class, and the Atom class simply stores pointers to them. The classes derived from AtomVec represent the different atom styles and they are instantiated through the `atom_style` command.
- The Update class holds instances of an integrator and a minimizer class. The Integrate class is a parent style for the Verlet and r-RESPA time integrators, as defined by the `run_style` command. The Min class is a parent style for various energy minimizers.
- The Neighbor class builds and stores neighbor lists. The NeighList class stores a single list (for all atoms). A NeighRequest class instance is created by pair, fix, or compute styles when they need a particular kind of neighbor list and use the NeighRequest properties to select the neighbor list settings for the given request. There can be multiple instances of the NeighRequest class and the Neighbor class will try to optimize how they are computed by creating copies or sub-lists where possible.
- The Comm class performs inter-processor communication, typically of ghost atom information. This usually involves MPI message exchanges with 6 neighboring processors in the 3d logical grid of processors mapped to the simulation box. There are two *communication styles* enabling different ways to do the domain decomposition. Sometimes the Irregular class is used, when atoms may migrate to arbitrary processors.
- The Domain class stores the simulation box geometry, as well as geometric Regions and any user definition of a Lattice. The latter are defined by the `region` and `lattice` commands in an input script.
- The Force class computes various forces between atoms. The Pair parent class is for non-bonded or pairwise forces, which in LAMMPS also includes many-body forces such as the Tersoff 3-body potential if those are computed by walking pairwise neighbor lists. The Bond, Angle, Dihedral, Improper parent classes are styles for bonded interactions within a static molecular topology. The KSpace parent class is for computing long-range Coulombic interactions. One of its child classes, PPPM, uses the FFT3D and Remap classes to redistribute and communicate grid-based information across the parallel processors.
- The Modify class stores lists of class instances derived from the `Fix` and `Compute` base classes.
- The Group class manipulates groups that atoms are assigned to via the `group` command. It also has functions to compute various attributes of groups of atoms.
- The Output class is used to generate 3 kinds of output from a LAMMPS simulation: thermodynamic information printed to the screen and log file, dump file snapshots, and restart files. These correspond to the *Thermo*, *Dump*,

and *WriteRestart* classes respectively. The Dump class is a base class with several derived classes implementing various dump style variants.

- The Timer class logs timing information, output at the end of a run.

## 15.3 Code design

This section explains some of the code design choices in LAMMPS with the goal of helping developers write new code similar to the existing code. Please see the section on *Requirements for contributed code* for more specific recommendations and guidelines. While that section is organized more in the form of a checklist for code contributors, the focus here is on overall code design strategy, choices made between possible alternatives, and discussing some relevant C++ programming language constructs.

Historically, the basic design philosophy of the LAMMPS C++ code was a “C with classes” style. The motivation was to make it easy to modify LAMMPS for people without significant training in C++ programming. Data structures and code constructs were used that resemble the previous implementation(s) in Fortran. A contributing factor to this choice also was that at the time, C++ compilers were often not mature and some of the advanced features contained bugs or did not function as the standard required. There were also disagreements between compiler vendors as to how to interpret the C++ standard documents.

However, C++ compilers have now advanced significantly. In 2020 we decided to require the C++11 standard as the minimum C++ language standard for LAMMPS. Since then we have begun to also replace some of the C-style constructs with equivalent C++ functionality, either from the C++ standard library or as custom classes or functions, in order to improve readability of the code and to increase code reuse through abstraction of commonly used functionality.

---

**Note:** Please note that as of spring 2022 there is still a sizable chunk of legacy code in LAMMPS that has not yet been refactored to reflect these style conventions in full. LAMMPS has a large code base and many different contributors and there also is a hierarchy of precedence in which the code is adapted. Highest priority has been the code in the `src` folder, followed by code in packages in order of their popularity and complexity (simpler code is adapted sooner), followed by code in the `lib` folder. Source code that is downloaded from external packages or libraries during compilation is not subject to the conventions discussed here.

---

### 15.3.1 Object oriented code

LAMMPS is designed to be an object oriented code. Each simulation is represented by an instance of the LAMMPS class. When running in parallel each MPI process creates such an instance. This can be seen in the `main.cpp` file where the core steps of running a LAMMPS simulation are the following 3 lines of code:

```
LAMMPS *lammps = new LAMMPS(argc, argv, lammps_comm);
lammps->input->file();
delete lammps;
```

The first line creates a LAMMPS class instance and passes the command line arguments and the global communicator to its constructor. The second line triggers the LAMMPS instance to process the input (either from standard input or a provided input file) until the simulation ends. The third line deletes the LAMMPS instance. The remainder of the `main.cpp` file has code for error handling, MPI configuration, and other special features.

The basic LAMMPS class hierarchy which is created by the LAMMPS class constructor is shown in *LAMMPS class topology*. When input commands are processed, additional class instances are created, or deleted, or replaced. Likewise specific member functions of specific classes are called to trigger actions such as creating atoms, computing forces, computing properties, time-propagating the system, or writing output.

## Compositing and Inheritance

LAMMPS makes extensive use of the object oriented programming (OOP) principles of *compositing* and *inheritance*. Classes like the LAMMPS class are a **composite** containing pointers to instances of other classes like `Atom`, `Comm`, `Force`, `Neighbor`, `Modify`, and so on. Each of these classes implement certain functionality by storing and manipulating data related to the simulation and providing member functions that trigger certain actions. Some of those classes like `Force` are themselves composites, containing instances of classes describing different force interactions. Similarly the `Modify` class contains a list of `Fix` and `Compute` classes. If the input commands that correspond to these classes include the word *style*, then LAMMPS stores only a single instance of that class. E.g. *atom\_style*, *comm\_style*, *pair\_style*, *bond\_style*. If the input command does not include the word *style*, there can be many instances of that class defined. E.g. *region*, *fix*, *compute*, *dump*.

**Inheritance** enables creation of *derived* classes that can share common functionality in their base class while providing a consistent interface. The derived classes replace (dummy or pure) functions in the base class. The higher level classes can then call those methods of the instantiated classes without having to know which specific derived class variant was instantiated. In LAMMPS these derived classes are often referred to as “styles”, e.g. pair styles, fix styles, atom styles and so on.

This is the origin of the flexibility of LAMMPS. For example pair styles implement a variety of different non-bonded interatomic potentials functions. All details for the implementation of a potential are stored and executed in a single class.

As mentioned above, there can be multiple instances of classes derived from the `Fix` or `Compute` base classes. They represent a different facet of LAMMPS flexibility as they provide methods which can be called at different points in time within a timestep, as explained in *Developer\_flow*. This allows the input script to tailor how a specific simulation is run, what diagnostic computations are performed, and how the output of those computations is further processed or output.

Additional code sharing is possible by creating derived classes from the derived classes (e.g., to implement an accelerated version of a pair style) where only a subset of the derived class methods are replaced with accelerated versions.

## Polymorphism

Polymorphism and dynamic dispatch are another OOP feature that play an important role in how LAMMPS selects what code to execute. In a nutshell, this is a mechanism where the decision of which member function to call from a class is determined at runtime and not when the code is compiled. To enable it, the function has to be declared as `virtual` and all corresponding functions in derived classes should use the `override` property. Below is a brief example.

```
class Base {
public:
    virtual ~Base() = default;
    void call();
    void normal();
    virtual void poly();
};

void Base::call() {
    normal();
    poly();
}

class Derived : public Base {
public:
    ~Derived() override = default;
```

(continues on next page)

(continued from previous page)

```

void normal();
void poly() override;
};

// [...]

Base *base1 = new Base();
Base *base2 = new Derived();

base1->call();
base2->call();

```

The difference in behavior of the `normal()` and the `poly()` member functions is which of the two member functions is called when executing `base1->call()` versus `base2->call()`. Without polymorphism, a function within the base class can only call member functions within the same scope, that is `Base::call()` will always call `Base::normal()`. But for the `base2->call()` case the call of the virtual member function will be dispatched to `Derived::poly()` instead. This mechanism means that functions are called within the scope of the class type that was used to *create* the class instance are invoked; even if they are assigned to a pointer using the type of a base class. This is the desired behavior and this way LAMMPS can even use styles that are loaded at runtime from a shared object file with the *plugin command*.

A special case of virtual functions are so-called pure functions. These are virtual functions that are initialized to 0 in the class declaration (see example below).

```

class Base {
public:
    virtual void pure() = 0;
};

```

This has the effect that an instance of the base class cannot be created and that derived classes **must** implement these functions. Many of the functions listed with the various class styles in the section *Modifying & extending LAMMPS* are pure functions. The motivation for this is to define the interface or API of the functions but defer their implementation to the derived classes.

However, there are downsides to this. For example, calls to virtual functions from within a constructor, will not be in the scope of the derived class and thus it is good practice to either avoid calling them or to provide an explicit scope such as `Base::poly()` or `Derived::poly()`. Furthermore, any destructors in classes containing virtual functions should be declared virtual too, so they will be processed in the expected order before types are removed from dynamic dispatch.

---

### Important Notes

In order to be able to detect incompatibilities at compile time and to avoid unexpected behavior, it is crucial that all member functions that are intended to replace a virtual or pure function use the `override` property keyword. For the same reason, the use of overloads or default arguments for virtual functions should be avoided as they lead to confusion over which function is supposed to override which and which arguments need to be declared.

---

## Style Factories

In order to create class instances for different styles, LAMMPS often uses a programming pattern called *Factory*. Those are functions that create an instance of a specific derived class, say `PairLJCut` and return a pointer to the type of the common base class of that style, `Pair` in this case. To associate the factory function with the style keyword, an `std::map` class is used with function pointers indexed by their keyword (for example “lj/cut” for `PairLJCut` and “morse” for `PairMorse`). A couple of typedefs help keep the code readable and a template function is used to implement the actual factory functions for the individual classes. Below is an example of such a factory function from the `Force` class as declared in `force.h` and implemented in `force.cpp`. The file `style_pair.h` is generated during compilation and includes all main header files (i.e. those starting with `pair_`) of pair styles and then the macro `PairStyle()` will associate the style name “lj/cut” with a factory function creating an instance of the `PairLJCut` class.

```
// from force.h
typedef Pair *(*PairCreator)(LAMMPS *);
typedef std::map<std::string, PairCreator> PairCreatorMap;
PairCreatorMap *pair_map;

// from force.cpp
template <typename S, typename T> static S *style_creator(LAMMPS *lmp)
{
    return new T(lmp);
}

// [...]

pair_map = new PairCreatorMap();

#define PAIR_CLASS
#define PairStyle(key, Class) (*pair_map)[#key] = &style_creator<Pair, Class>;
#include "style_pair.h"
#undef PairStyle
#undef PAIR_CLASS

// from pair_lj_cut.h

#ifdef PAIR_CLASS
PairStyle(lj/cut,PairLJCut);
#else
// [...]
```

Similar code constructs are present in other files like `modify.cpp` and `modify.h` or `neighbor.cpp` and `neighbor.h`. Those contain similar macros and include `style_*.h` files for creating class instances of styles they manage.

## 15.3.2 I/O and output formatting

### C-style stdio versus C++ style iostreams

LAMMPS uses the “stdio” library of the standard C library for reading from and writing to files and console instead of C++ “iostreams”. This is mainly motivated by better performance, better control over formatting, and less effort to achieve specific formatting.

Since mixing “stdio” and “iostreams” can lead to unexpected behavior, use of the latter is strongly discouraged. Also output to the screen should not use the predefined `stdout` FILE pointer, but rather the `screen` and `logfile` FILE pointers managed by the LAMMPS class. Furthermore, output should generally only be done by MPI rank 0 (`comm->me == 0`). Output that is sent to both `screen` and `logfile` should use the `utils::logmesg()` convenience function.

We also discourage the use of stringstream because the bundled `{fmt}` library and the customized tokenizer classes can provide the same functionality in a cleaner way with better performance. This also helps maintain a consistent programming syntax with code from many different contributors.

### Formatting with the {fmt} library

The LAMMPS source code includes a copy of the `{fmt}` library which is preferred over formatting with the “printf()” family of functions. The primary reason is that it allows a typesafe default format for any type of supported data. This is particularly useful for formatting integers of a given size (32-bit or 64-bit) which may require different format strings depending on compile time settings or compilers/operating systems. Furthermore, `{fmt}` gives better performance, has more functionality, a familiar formatting syntax that has similarities to `format()` in Python, and provides a facility that can be used to integrate format strings and a variable number of arguments into custom functions in a much simpler way than the `varargs` mechanism of the C library. Finally, `{fmt}` has been included into the C++20 language standard, so changes to adopt it are future-proof.

Formatted strings are frequently created by calling the `fmt::format()` function which will return a string as a `std::string` class instance. In contrast to the `%` placeholder in `printf()`, the `{fmt}` library uses `{}` to embed format descriptors. In the simplest case, no additional characters are needed as `{fmt}` will choose the default format based on the data type of the argument. Otherwise the `fmt::print()` function may be used instead of `printf()` or `fprintf()`. In addition, several LAMMPS output functions, that originally accepted a single string as argument have been overloaded to accept a format string with optional arguments as well (e.g., `Error::all()`, `Error::one()`, `utils::logmesg()`).

### Summary of the {fmt} format syntax

The syntax of the format string is “`{[<argument id>]:<format spec>}`”, where either the argument id or the format spec (separated by a colon ‘:’) is optional. The argument id is usually a number starting from 0 that is the index to the arguments following the format string. By default these are assigned in order (i.e. 0, 1, 2, 3, 4 etc.). The most common case for using argument id would be to use the same argument in multiple places in the format string without having to provide it as an argument multiple times. In LAMMPS the argument id is rarely used.

More common is the use of a format specifier, which starts with a colon. This may optionally be followed by a fill character (default is ‘ ’). If provided, the fill character **must** be followed by an alignment character (‘<’, ‘^’, ‘>’ for left, centered, or right alignment (default)). The alignment character may be used without a fill character. The next important format parameter would be the minimum width, which may be followed by a dot ‘.’ and a precision for floating point numbers. The final character in the format string would be an indicator for the “presentation”, i.e. ‘d’ for decimal presentation of integers, ‘x’ for hexadecimal, ‘o’ for octal, ‘c’ for character etc. This mostly follows the “printf()” scheme but without requiring an additional length parameter to distinguish between different integer widths. The `{fmt}` library will detect those and adapt the formatting accordingly. For floating point numbers there are correspondingly, ‘g’ for generic presentation, ‘e’ for exponential presentation, and ‘f’ for fixed point presentation.

Thus “{:8}” would represent *any* type argument using at least 8 characters; “{:<8}” would do this as left aligned, “{:^8}” as centered, “{:>8}” as right aligned. If a specific presentation is selected, the argument type must be compatible or else the {fmt} formatting code will throw an exception. Some format string examples are given below:

```
auto mesg = fmt::format(" CPU time: {:4d}:{:02d}:{:02d}\n", cpuh, cpum, cpus);
mesg = fmt::format("{:<8s}| {:<10.5g} | {:<10.5g} | {:<10.5g} |{:6.1f} |{:6.2f}\n",
                  label, time_min, time, time_max, time_sq, tmp);
utils::logmesg(lmp, "{:>6} = max # of 1-2 neighbors\n", maxall);
utils::logmesg(lmp, "Lattice spacing in x,y,z = {:.8} {:.8} {:.8}\n",
               xlattice, ylattice, zlattice);
```

which will create the following output lines:

```
CPU time:    0:02:16
Pair      | 2.0133      | 2.0133      | 2.0133      | 0.0 | 84.21
      4 = max # of 1-2 neighbors
Lattice spacing in x,y,z = 1.6795962 1.6795962 1.6795962
```

Finally, a special feature of the {fmt} library is that format parameters like the width or the precision may be also provided as arguments. In that case a nested format is used where a pair of curly braces (with an optional argument id) “{ }” are used instead of the value, for example “{:{}d}” will consume two integer arguments, the first will be the value shown and the second the minimum width.

For more details and examples, please consult the [{fmt} syntax documentation website](#).

### 15.3.3 Memory management

Dynamical allocation of small data and objects can be done with the the C++ commands “new” and “delete/delete[]”. Large data should use the member functions of the `Memory` class, most commonly, `Memory::create()`, `Memory::grow()`, and `Memory::destroy()`, which provide variants for vectors, 2d arrays, 3d arrays, etc. These can also be used for small data.

The use of `malloc()`, `calloc()`, `realloc()` and `free()` directly is strongly discouraged. To simplify adapting legacy code into the LAMMPS code base the member functions `Memory::smalloc()`, `Memory::srealloc()`, and `Memory::sfree()` are available, which perform additional error checks for safety.

Use of these custom memory allocation functions is motivated by the following considerations:

- memory allocation failures on *any* MPI rank during a parallel run will trigger an immediate abort of the entire parallel calculation instead of stalling it
- a failing “new” will trigger an exception which is also captured by LAMMPS and triggers a global abort
- allocation of multi-dimensional arrays will be done in a C compatible fashion but so that the storage of the actual data is stored in one large contiguous block. Thus when MPI communication is needed, the data can be communicated directly (similar to Fortran arrays).
- the “destroy()” and “sfree()” functions may safely be called on NULL pointers
- the “destroy()” functions will nullify the pointer variables making “use after free” errors easy to detect
- it is possible to use a larger than default memory alignment (not on all operating systems, since the allocated storage pointers must be compatible with `free()` for technical reasons)

In the practical implementation of code this means that any pointer variables that are class members should be initialized to a `nullptr` value in their respective constructors. That way it is safe to call `Memory::destroy()` or `delete[]` on them before *any* allocation outside the constructor. This helps prevent memory leaks.

## 15.4 Parallel algorithms

LAMMPS is designed to enable running simulations in parallel using the MPI parallel communication standard with distributed data via domain decomposition. The parallelization aims to be efficient result in good strong scaling (= good speedup for the same system) and good weak scaling (= the computational cost of enlarging the system is proportional to the system size). Additional parallelization using GPUs or OpenMP can also be applied within the sub-domain assigned to an MPI process. For clarity, most of the following illustrations show the 2d simulation case. The underlying algorithms in those cases, however, apply to both 2d and 3d cases equally well.

---

**Note:** The text and most of the figures in this chapter were adapted for the manual from the section on parallel algorithms in the *new LAMMPS paper*.

---

### 15.4.1 Partitioning

The underlying spatial decomposition strategy used by LAMMPS for distributed-memory parallelism is set with the *comm\_style* command and can be either “brick” (a regular grid) or “tiled”.

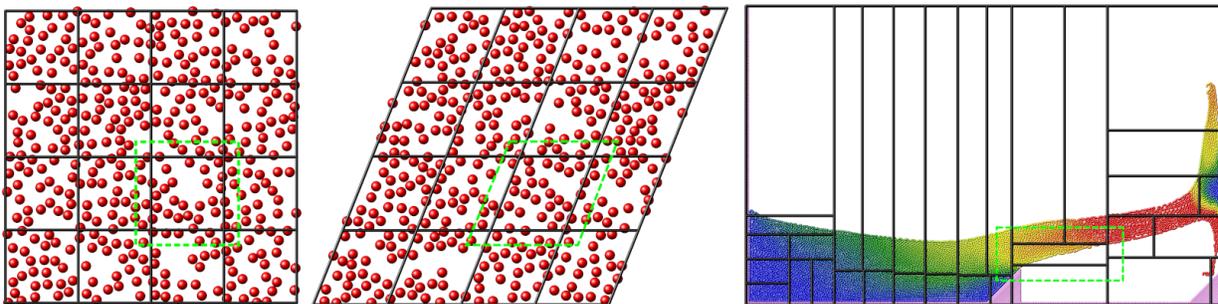

Fig. 2: domain decomposition

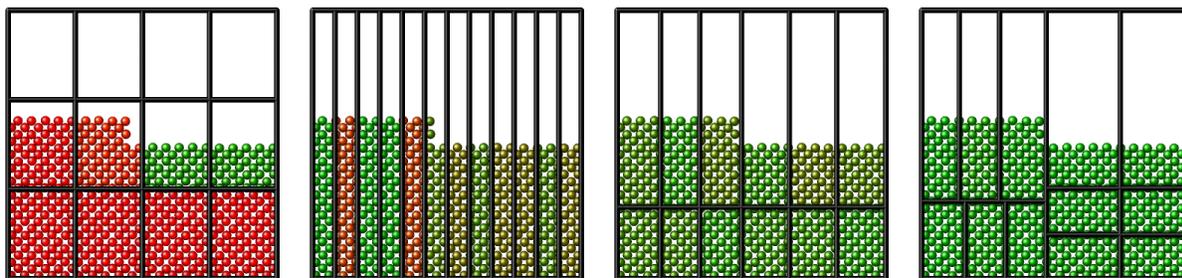

This figure shows the different kinds of domain decomposition used for MPI parallelization: “brick” on the left with an orthogonal (left) and a triclinic (middle) simulation domain, and a “tiled” decomposition (right). The black lines show the division into sub-domains and the contained atoms are “owned” by the corresponding MPI process. The green dashed lines indicate how sub-domains are extended with “ghost” atoms up to the communication cutoff distance.

The LAMMPS simulation box is a 3d or 2d volume, which can be orthogonal or triclinic in shape, as illustrated in the *domain decomposition* figure for the 2d case. Orthogonal means the box edges are aligned with the  $x$ ,  $y$ ,  $z$  Cartesian axes, and the box faces are thus all rectangular. Triclinic allows for a more general parallelepiped shape in which edges are aligned with three arbitrary vectors and the box faces are parallelograms. In each dimension box faces can be periodic, or non-periodic with fixed or shrink-wrapped boundaries. In the fixed case, atoms which move outside the face are deleted; shrink-wrapped means the position of the box face adjusts continuously to enclose all the atoms.

For distributed-memory MPI parallelism, the simulation box is spatially decomposed (partitioned) into non-overlapping sub-domains which fill the box. The default partitioning, “brick”, is most suitable when atom density is roughly uniform, as shown in the left-side images of the *domain decomposition* figure. The sub-domains comprise a regular grid and all sub-domains are identical in size and shape. Both the orthogonal and triclinic boxes can deform continuously during a simulation, e.g. to compress a solid or shear a liquid, in which case the processor sub-domains likewise deform.

For models with non-uniform density, the number of particles per processor can be load-imbalanced with the default partitioning. This reduces parallel efficiency, as the overall simulation rate is limited by the slowest processor, i.e. the one with the largest computational load. For such models, LAMMPS supports multiple strategies to reduce the load imbalance:

- The processor grid decomposition is by default based on the simulation cell volume and tries to optimize the volume to surface ratio for the sub-domains. This can be changed with the *processors command*.
- The parallel planes defining the size of the sub-domains can be shifted with the *balance command*. Which can be done in addition to choosing a more optimal processor grid.
- The recursive bisectioning algorithm in combination with the “tiled” communication style can produce a partitioning with equal numbers of particles in each sub-domain.

The pictures above demonstrate different decompositions for a 2d system with 12 MPI ranks. The atom colors indicate the load imbalance of each sub-domain with green being optimal and red the least optimal.

Due to the vacuum in the system, the default decomposition is unbalanced with several MPI ranks without atoms (left). By forcing a 1x12x1 processor grid, every MPI rank does computations now, but number of atoms per sub-domain is still uneven and the thin slice shape increases the amount of communication between sub-domains (center left). With a 2x6x1 processor grid and shifting the sub-domain divisions, the load imbalance is further reduced and the amount of communication required between sub-domains is less (center right). And using the recursive bisectioning leads to further improved decomposition (right).

## 15.4.2 Communication

Following the partitioning scheme in use all per-atom data is distributed across the MPI processes, which allows LAMMPS to handle very large systems provided it uses a correspondingly large number of MPI processes. Since the per-atom data (atom IDs, positions, velocities, types, etc.) To be able to compute the short-range interactions MPI processes need not only access to data of atoms they “own” but also information about atoms from neighboring sub-domains, in LAMMPS referred to as “ghost” atoms. These are copies of atoms storing required per-atom data for up to the communication cutoff distance. The green dashed-line boxes in the *domain decomposition* figure illustrate the extended ghost-atom sub-domain for one processor.

This approach is also used to implement periodic boundary conditions: atoms that lie within the cutoff distance across a periodic boundary are also stored as ghost atoms and taken from the periodic replication of the sub-domain, which may be the same sub-domain, e.g. if running in serial. As a consequence of this, force computation in LAMMPS is not subject to minimum image conventions and thus cutoffs may be larger than half the simulation domain.

Efficient communication patterns are needed to update the “ghost” atom data, since that needs to be done at every MD time step or minimization step. The diagrams of the *ghost-atom-comm* figure illustrate how ghost atom communication is performed in two stages for a 2d simulation (three in 3d) for both a regular and irregular partitioning of the simulation box. For the regular case (left) atoms are exchanged first in the *x*-direction, then in *y*, with four neighbors in the grid of processor sub-domains.

In the *x* stage, processor ranks 1 and 2 send owned atoms in their red-shaded regions to rank 0 (and vice versa). Then in the *y* stage, ranks 3 and 4 send atoms in their blue-shaded regions to rank 0, which includes ghost atoms they received in the *x* stage. Rank 0 thus acquires all its ghost atoms; atoms in the solid blue corner regions are communicated twice before rank 0 receives them.

For the irregular case (right) the two stages are similar, but a processor can have more than one neighbor in each direction. In the *x* stage, MPI ranks 1,2,3 send owned atoms in their red-shaded regions to rank 0 (and vice versa).

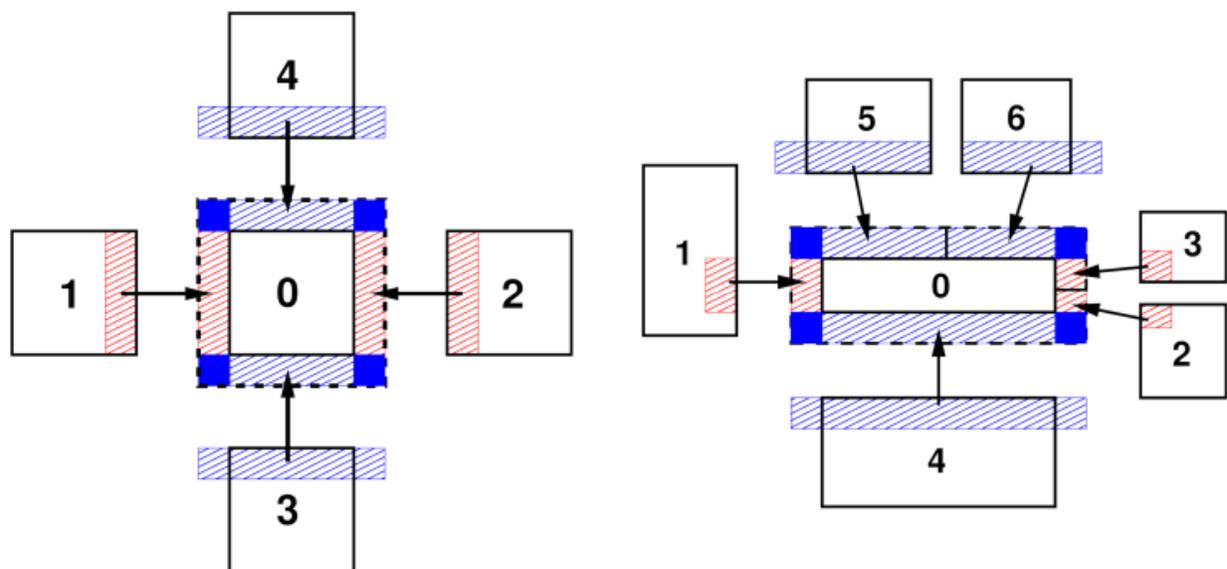

Fig. 3: ghost atom communication

This figure shows the ghost atom communication patterns between sub-domains for “brick” (left) and “tiled” communication styles for 2d simulations. The numbers indicate MPI process ranks. Here the sub-domains are drawn spatially separated for clarity. The dashed-line box is the extended sub-domain of processor 0 which includes its ghost atoms. The red- and blue-shaded boxes are the regions of communicated ghost atoms.

These include only atoms between the lower and upper  $y$ -boundary of rank 0’s sub-domain. In the  $y$  stage, ranks 4,5,6 send atoms in their blue-shaded regions to rank 0. This may include ghost atoms they received in the  $x$  stage, but only if they are needed by rank 0 to fill its extended ghost atom regions in the  $\pm y$  directions (blue rectangles). Thus in this case, ranks 5 and 6 do not include ghost atoms they received from each other (in the  $x$  stage) in the atoms they send to rank 0. The key point is that while the pattern of communication is more complex in the irregular partitioning case, it can still proceed in two stages (three in 3d) via atom exchanges with only neighboring processors.

When attributes of owned atoms are sent to neighboring processors to become attributes of their ghost atoms, LAMMPS calls this a “forward” communication. On timesteps when atoms migrate to new owning processors and neighbor lists are rebuilt, each processor creates a list of its owned atoms which are ghost atoms in each of its neighbor processors. These lists are used to pack per-atom coordinates (for example) into message buffers in subsequent steps until the next reneighboring.

A “reverse” communication is when computed ghost atom attributes are sent back to the processor who owns the atom. This is used (for example) to sum partial forces on ghost atoms to the complete force on owned atoms. The order of the two stages described in the *ghost atom communication* figure is inverted and the same lists of atoms are used to pack and unpack message buffers with per-atom forces. When a received buffer is unpacked, the ghost forces are summed to owned atom forces. As in forward communication, forces on atoms in the four blue corners of the diagrams are sent, received, and summed twice (once at each stage) before owning processors have the full force.

These two operations are used many places within LAMMPS aside from exchange of coordinates and forces, for example by manybody potentials to share intermediate per-atom values, or by rigid-body integrators to enable each atom in a body to access body properties. Here are additional details about how these communication operations are performed in LAMMPS:

- When exchanging data with different processors, forward and reverse communication is done using `MPI_Send()` and `MPI_IRecv()` calls. If a processor is “exchanging” atoms with itself, only the pack and unpack operations are performed, e.g. to create ghost atoms across periodic boundaries when running on a single processor.
- For forward communication of owned atom coordinates, periodic box lengths are added and subtracted when the receiving processor is across a periodic boundary from the sender. There is then no need to apply a minimum

image convention when calculating distances between atom pairs when building neighbor lists or computing forces.

- The cutoff distance for exchanging ghost atoms is typically equal to the neighbor cutoff. But it can also be chosen to be longer if needed, e.g. half the diameter of a rigid body composed of multiple atoms or over 3x the length of a stretched bond for dihedral interactions. It can also exceed the periodic box size. For the regular communication pattern (left), if the cutoff distance extends beyond a neighbor processor's sub-domain, then multiple exchanges are performed in the same direction. Each exchange is with the same neighbor processor, but buffers are packed/unpacked using a different list of atoms. For forward communication, in the first exchange a processor sends only owned atoms. In subsequent exchanges, it sends ghost atoms received in previous exchanges. For the irregular pattern (right) overlaps of a processor's extended ghost-atom sub-domain with all other processors in each dimension are detected.

### 15.4.3 Neighbor lists

To compute forces efficiently, each processor creates a Verlet-style neighbor list which enumerates all pairs of atoms  $i, j$  ( $i$  = owned,  $j$  = owned or ghost) with separation less than the applicable neighbor list cutoff distance. In LAMMPS the neighbor lists are stored in a multiple-page data structure; each page is a contiguous chunk of memory which stores vectors of neighbor atoms  $j$  for many  $i$  atoms. This allows pages to be incrementally allocated or deallocated in blocks as needed. Neighbor lists typically consume the most memory of any data structure in LAMMPS. The neighbor list is rebuilt (from scratch) once every few timesteps, then used repeatedly each step for force or other computations. The neighbor cutoff distance is  $R_n = R_f + \Delta_s$ , where  $R_f$  is the (largest) force cutoff defined by the interatomic potential for computing short-range pairwise or manybody forces and  $\Delta_s$  is a "skin" distance that allows the list to be used for multiple steps assuming that atoms do not move very far between consecutive time steps. Typically the code triggers reneighboring when any atom has moved half the skin distance since the last reneighboring; this and other options of the neighbor list rebuild can be adjusted with the `neigh_modify` command.

On steps when reneighboring is performed, atoms which have moved outside their owning processor's sub-domain are first migrated to new processors via communication. Periodic boundary conditions are also (only) enforced on these steps to ensure each atom is re-assigned to the correct processor. After migration, the atoms owned by each processor are stored in a contiguous vector. Periodically each processor spatially sorts owned atoms within its vector to reorder it for improved cache efficiency in force computations and neighbor list building. For that atoms are spatially binned and then reordered so that atoms in the same bin are adjacent in the vector. Atom sorting can be disabled or its settings modified with the `atom_modify` command.

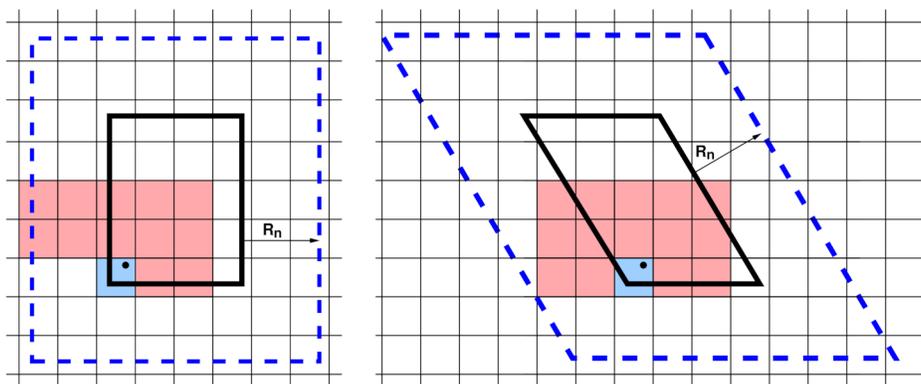

Fig. 4: neighbor list stencils

A 2d simulation sub-domain (thick black line) and the corresponding ghost atom cutoff region (dashed blue line) for both orthogonal (left) and triclinic (right) domains. A regular grid of neighbor bins (thin lines) overlays the entire simulation domain and need not align with sub-domain boundaries; only the portion overlapping the augmented sub-domain is shown. In the triclinic case it overlaps the bounding box of the tilted rectangle. The blue- and red-shaded bins represent a stencil of bins searched to find neighbors of a particular atom (black dot).

To build a local neighbor list in linear time, the simulation domain is overlaid (conceptually) with a regular 3d (or 2d) grid of neighbor bins, as shown in the *neighbor list stencils* figure for 2d models and a single MPI processor's sub-domain. Each processor stores a set of neighbor bins which overlap its sub-domain extended by the neighbor cutoff distance  $R_n$ . As illustrated, the bins need not align with processor boundaries; an integer number in each dimension is fit to the size of the entire simulation box.

Most often LAMMPS builds what it calls a “half” neighbor list where each  $i,j$  neighbor pair is stored only once, with either atom  $i$  or  $j$  as the central atom. The build can be done efficiently by using a pre-computed “stencil” of bins around a central origin bin which contains the atom whose neighbors are being searched for. A stencil is simply a list of integer offsets in  $x,y,z$  of nearby bins surrounding the origin bin which are close enough to contain any neighbor atom  $j$  within a distance  $R_n$  from any atom  $i$  in the origin bin. Note that for a half neighbor list, the stencil can be asymmetric since each atom only need store half its nearby neighbors.

These stencils are illustrated in the figure for a half list and a bin size of  $\frac{1}{2}R_n$ . There are 13 red+blue stencil bins in 2d (for the orthogonal case, 15 for triclinic). In 3d there would be 63, 13 in the plane of bins that contain the origin bin and 25 in each of the two planes above it in the  $z$  direction (75 for triclinic). The reason the triclinic stencil has extra bins is because the bins tile the bounding box of the entire triclinic domain and thus are not periodic with respect to the simulation box itself. The stencil and logic for determining which  $i,j$  pairs to include in the neighbor list are altered slightly to account for this.

To build a neighbor list, a processor first loops over its “owned” plus “ghost” atoms and assigns each to a neighbor bin. This uses an integer vector to create a linked list of atom indices within each bin. It then performs a triply-nested loop over its owned atoms  $i$ , the stencil of bins surrounding atom  $i$ 's bin, and the  $j$  atoms in each stencil bin (including ghost atoms). If the distance  $r_{ij} < R_n$ , then atom  $j$  is added to the vector of atom  $i$ 's neighbors.

Here are additional details about neighbor list build options LAMMPS supports:

- The choice of bin size is an option; a size half of  $R_n$  has been found to be optimal for many typical cases. Smaller bins incur additional overhead to loop over; larger bins require more distance calculations. Note that for smaller bin sizes, the 2d stencil in the figure would be more semi-circular in shape (hemispherical in 3d), with bins near the corners of the square eliminated due to their distance from the origin bin.
- Depending on the interatomic potential(s) and other commands used in an input script, multiple neighbor lists and stencils with different attributes may be needed. This includes lists with different cutoff distances, e.g. for force computation versus occasional diagnostic computations such as a radial distribution function, or for the r-RESPA time integrator which can partition pairwise forces by distance into subsets computed at different time intervals. It includes “full” lists (as opposed to half lists) where each  $i,j$  pair appears twice, stored once with  $i$  and  $j$ , and which use a larger symmetric stencil. It also includes lists with partial enumeration of ghost atom neighbors. The full and ghost-atom lists are used by various manybody interatomic potentials. Lists may also use different criteria for inclusion of a pair interaction. Typically this simply depends only on the distance between two atoms and the cutoff distance. But for finite-size coarse-grained particles with individual diameters (e.g. polydisperse granular particles), it can also depend on the diameters of the two particles.
- When using *pair style hybrid* multiple sub-lists of the master neighbor list for the full system need to be generated, one for each sub-style, which contains only the  $i,j$  pairs needed to compute interactions between subsets of atoms for the corresponding potential. This means not all  $i$  or  $j$  atoms owned by a processor are included in a particular sub-list.
- Some models use different cutoff lengths for pairwise interactions between different kinds of particles which are stored in a single neighbor list. One example is a solvated colloidal system with large colloidal particles where colloid/colloid, colloid/solvent, and solvent/solvent interaction cutoffs can be dramatically different. Another is a model of polydisperse finite-size granular particles; pairs of particles interact only when they are in contact with each other. Mixtures with particle size ratios as high as 10-100x may be used to model realistic systems. Efficient neighbor list building algorithms for these kinds of systems are available in LAMMPS. They include a method which uses different stencils for different cutoff lengths and trims the stencil to only include bins that straddle the cutoff sphere surface. More recently a method which uses both multiple stencils and multiple bin sizes was developed; it builds neighbor lists efficiently for systems with particles of any size ratio, though other considerations (timestep size, force computations) may limit the ability to model systems with huge polydispersity.

- For small and sparse systems and as a fallback method, LAMMPS also supports neighbor list construction without binning by using a full  $O(N^2)$  loop over all  $i,j$  atom pairs in a sub-domain when using the *neighbor nsq* command.
- Dependent on the “pair” setting of the *newton* command, the “half” neighbor lists may contain **all** pairs of atoms where atom  $j$  is a ghost atom (i.e. when the *newton* pair setting is *off*) For the *newton* pair *on* setting the atom  $j$  is only added to the list if its  $z$  coordinate is larger, or if equal the  $y$  coordinate is larger, and that is equal, too, the  $x$  coordinate is larger. For homogeneously dense systems that will result in picking neighbors from a same size sector in always the same direction relative to the “owned” atom and thus it should lead to similar length neighbor lists and thus reduce the chance of a load imbalance.

### 15.4.4 Long-range interactions

For charged systems, LAMMPS can compute long-range Coulombic interactions via the FFT-based particle-particle/particle-mesh (PPPM) method implemented in *k-space style pppm and its variants*. For that Coulombic interactions are partitioned into short- and long-range components. The short-ranged portion is computed in real space as a loop over pairs of charges within a cutoff distance, using neighbor lists. The long-range portion is computed in reciprocal space using a *k-space* style. For the PPPM implementation the simulation cell is overlaid with a regular FFT grid in 3d. It proceeds in several stages:

- a) each atom’s point charge is interpolated to nearby FFT grid points,
- b) a forward 3d FFT is performed,
- c) a convolution operation is performed in reciprocal space,
- d) one or more inverse 3d FFTs are performed, and
- e) electric field values from grid points near each atom are interpolated to compute its forces.

For any of the spatial-decomposition partitioning schemes each processor owns the brick-shaped portion of FFT grid points contained within its sub-domain. The two interpolation operations use a stencil of grid points surrounding each atom. To accommodate the stencil size, each processor also stores a few layers of ghost grid points surrounding its brick. Forward and reverse communication of grid point values is performed similar to the corresponding *atom data communication*. In this case, electric field values on owned grid points are sent to neighboring processors to become ghost point values. Likewise charge values on ghost points are sent and summed to values on owned points.

For triclinic simulation boxes, the FFT grid planes are parallel to the box faces, but the mapping of charge and electric field values to/from grid points is done in reduced coordinates where the tilted box is conceptually a unit cube, so that the stencil and FFT operations are unchanged. However the FFT grid size required for a given accuracy is larger for triclinic domains than it is for orthogonal boxes.

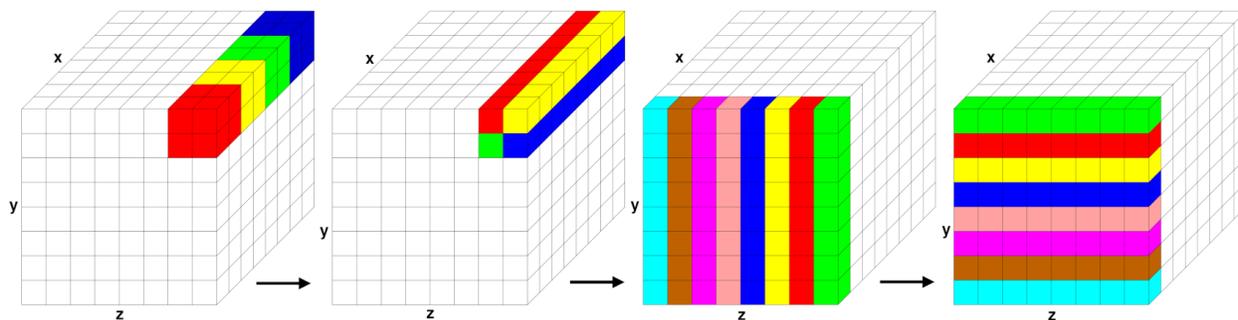

Fig. 5: parallel FFT in PPPM

Stages of a parallel FFT for a simulation domain overlaid with an  $8 \times 8 \times 8$  3d FFT grid, partitioned across 64 processors. Within each of the 4 diagrams, grid cells of the same color are owned by a single processor; for simplicity only cells owned by 4 or 8 of the 64 processors are colored. The two images on the left illustrate brick-to-pencil communication. The two images on the right illustrate pencil-to-pencil communication, which in this case transposes the  $y$  and  $z$  dimensions of the grid.

Parallel 3d FFTs require substantial communication relative to their computational cost. A 3d FFT is implemented by a series of 1d FFTs along the  $x$ -,  $y$ -, and  $z$ -direction of the FFT grid. Thus the FFT grid cannot be decomposed like atoms into 3 dimensions for parallel processing of the FFTs but only in 1 (as planes) or 2 (as pencils) dimensions and in between the steps the grid needs to be transposed to have the FFT grid portion “owned” by each MPI process complete in the direction of the 1d FFTs it has to perform. LAMMPS uses the pencil-decomposition algorithm as shown in the *parallel FFT in PPPM* figure.

Initially (far left), each processor owns a brick of same-color grid cells (actually grid points) contained within its sub-domain. A brick-to-pencil communication operation converts this layout to 1d pencils in the  $x$ -dimension (center left). Again, cells of the same color are owned by the same processor. Each processor can then compute a 1d FFT on each pencil of data it wholly owns using a call to the configured FFT library. A pencil-to-pencil communication then converts this layout to pencils in the  $y$  dimension (center right) which effectively transposes the  $x$  and  $y$  dimensions of the grid, followed by 1d FFTs in  $y$ . A final transpose of pencils from  $y$  to  $z$  (far right) followed by 1d FFTs in  $z$  completes the forward FFT. The data is left in a  $z$ -pencil layout for the convolution operation. One or more inverse FFTs then perform the sequence of 1d FFTs and communication steps in reverse order; the final layout of resulting grid values is the same as the initial brick layout.

Each communication operation within the FFT (brick-to-pencil or pencil-to-pencil or pencil-to-brick) converts one tiling of the 3d grid to another, where a tiling in this context means an assignment of a small brick-shaped subset of grid points to each processor, the union of which comprise the entire grid. The parallel *fftMPI* library written for LAMMPS allows arbitrary definitions of the tiling so that an irregular partitioning of the simulation domain can use it directly. Transforming data from one tiling to another is implemented in *fftMPI* using point-to-point communication, where each processor sends data to a few other processors, since each tile in the initial tiling overlaps with a handful of tiles in the final tiling.

The transformations could also be done using collective communication across all  $P$  processors with a single call to `MPI_Alltoall()`, but this is typically much slower. However, for the specialized brick and pencil tiling illustrated in *parallel FFT in PPPM* figure, collective communication across the entire MPI communicator is not required. In the example an  $8^3$  grid with 512 grid cells is partitioned across 64 processors; each processor owns a  $2 \times 2 \times 2$  3d brick of grid cells. The initial brick-to-pencil communication (upper left to upper right) only requires collective communication within subgroups of 4 processors, as illustrated by the 4 colors. More generally, a brick-to-pencil communication can be performed by partitioning  $P$  processors into  $P^{\frac{2}{3}}$  subgroups of  $P^{\frac{1}{3}}$  processors each. Each subgroup performs collective communication only within its subgroup. Similarly, pencil-to-pencil communication can be performed by partitioning  $P$  processors into  $P^{\frac{1}{2}}$  subgroups of  $P^{\frac{1}{2}}$  processors each. This is illustrated in the figure for the  $y \Rightarrow z$  communication (center). An eight-processor subgroup owns the front  $yz$  plane of data and performs collective communication within the subgroup to transpose from a  $y$ -pencil to  $z$ -pencil layout.

LAMMPS invokes point-to-point communication by default, but also provides the option of partitioned collective communication when using a *kpspace\_modify collective yes* command to switch to that mode. In the latter case, the code detects the size of the disjoint subgroups and partitions the single  $P$ -size communicator into multiple smaller communicators, each of which invokes collective communication. Testing on a large IBM Blue Gene/Q machine at Argonne National Labs showed a significant improvement in FFT performance for large processor counts; partitioned collective communication was faster than point-to-point communication or global collective communication involving all  $P$  processors.

Here are some additional details about FFTs for long-range and related grid/particle operations that LAMMPS supports:

- The *fftMPI* library allows each grid dimension to be a multiple of small prime factors (2,3,5), and allows any number of processors to perform the FFT. The resulting brick and pencil decompositions are thus not always as well-aligned but the size of subgroups of processors for the two modes of communication (brick/pencil and pencil/pencil) still scale as  $O(P^{\frac{1}{3}})$  and  $O(P^{\frac{1}{2}})$ .
- For efficiency in performing 1d FFTs, the grid transpose operations illustrated in Figure [ref{fig:fft}](#) also involve reordering the 3d data so that a different dimension is contiguous in memory. This reordering can be done during the packing or unpacking of buffers for MPI communication.
- For large systems and particularly a large number of MPI processes, the dominant cost for parallel FFTs is often the communication, not the computation of 1d FFTs, even though the latter scales as  $N \log(N)$  in the number of

grid points  $N$  per grid direction. This is due to the fact that only a 2d decomposition into pencils is possible while atom data (and their corresponding short-range force and energy computations) can be decomposed efficiently in 3d.

This can be addressed by reducing the number of MPI processes involved in the MPI communication by using *hybrid MPI + OpenMP parallelization*. This will use OpenMP parallelization inside the MPI domains and while that may have a lower parallel efficiency, it reduces the communication overhead.

As an alternative it is also possible to start a *multi-partition* calculation and then use the *verlet/split integrator* to perform the PPPM computation on a dedicated, separate partition of MPI processes. This uses an integer “1: $p$ ” mapping of  $p$  sub-domains of the atom decomposition to one sub-domain of the FFT grid decomposition and where pairwise non-bonded and bonded forces and energies are computed on the larger partition and the PPPM kspace computation concurrently on the smaller partition.

- LAMMPS also implements PPPM-based solvers for other long-range interactions, dipole and dispersion (Lennard-Jones), which can be used in conjunction with long-range Coulombics for point charges.
- LAMMPS implements a `GridComm` class which overlays the simulation domain with a regular grid, partitions it across processors in a manner consistent with processor sub-domains, and provides methods for forward and reverse communication of owned and ghost grid point values. It is used for PPPM as an FFT grid (as outlined above) and also for the MSM algorithm which uses a cascade of grid sizes from fine to coarse to compute long-range Coulombic forces. The `GridComm` class is also useful for models where continuum fields interact with particles. For example, the two-temperature model (TTM) defines heat transfer between atoms (particles) and electrons (continuum gas) where spatial variations in the electron temperature are computed by finite differences of a discretized heat equation on a regular grid. The `fix ttm/grid` command uses the `GridComm` class internally to perform its grid operations on a distributed grid instead of the original `fix ttm` which uses a replicated grid.

### 15.4.5 OpenMP Parallelism

The styles in the INTEL, KOKKOS, and OPENMP package offer to use OpenMP thread parallelism to predominantly distribute loops over local data and thus follow an orthogonal parallelization strategy to the decomposition into spatial domains used by the *MPI partitioning*. For clarity, this section discusses only the implementation in the OPENMP package as it is the simplest. The INTEL and KOKKOS package offer additional options and are more complex since they support more features and different hardware like co-processors or GPUs.

One of the key decisions when implementing the OPENMP package was to keep the changes to the source code small, so that it would be easier to maintain the code and keep it in sync with the non-threaded standard implementation. This is achieved by a) making the OPENMP version a derived class from the regular version (e.g. `PairLJCutOMP` from `PairLJCut`) and overriding only methods that are multi-threaded or need to be modified to support multi-threading (similar to what was done in the OPT package), b) keeping the structure in the modified code very similar so that side-by-side comparisons are still useful, and c) offloading additional functionality and multi-thread support functions into three separate classes `ThrOMP`, `ThrData`, and `FixOMP`. `ThrOMP` provides additional, multi-thread aware functionality not available in the corresponding base class (e.g. `Pair` for `PairLJCutOMP`) like multi-thread aware variants of the “tally” functions. Those functions are made available through multiple inheritance so those new functions have to have unique names to avoid ambiguities; typically `_thr` is appended to the name of the function. `ThrData` is a classes that manages per-thread data structures. It is used instead of extending the corresponding storage to per-thread arrays to avoid slowdowns due to “false sharing” when multiple threads update adjacent elements in an array and thus force the CPU cache lines to be reset and re-fetched. `FixOMP` finally manages the “multi-thread state” like settings and access to per-thread storage, it is activated by the *package omp* command.

## Avoiding data races

A key problem when implementing thread parallelism in an MD code is to avoid data races when updating accumulated properties like forces, energies, and stresses. When interactions are computed, they always involve multiple atoms and thus there are race conditions when multiple threads want to update per-atom data of the same atoms. Five possible strategies have been considered to avoid this:

- 1) restructure the code so that there is no overlapping access possible when computing in parallel, e.g. by breaking lists into multiple parts and synchronizing threads in between.
- 2) have each thread be “responsible” for a specific group of atoms and compute these interactions multiple times, once on each thread that is responsible for a given atom and then have each thread only update the properties of this atom.
- 3) use mutexes around functions and regions of code where the data race could happen
- 4) use atomic operations when updating per-atom properties
- 5) use replicated per-thread data structures to accumulate data without conflicts and then use a reduction to combine those results into the data structures used by the regular style.

Option 5 was chosen for the OPENMP package because it would retain the performance for the case of 1 thread and the code would be more maintainable. Option 1 would require extensive code changes, particularly to the neighbor list code; options 2 would have incurred a 2x or more performance penalty for the serial case; option 3 causes significant overhead and would enforce serialization of operations in inner loops and thus defeat the purpose of multi-threading; option 4 slows down the serial case although not quite as bad as option 2. The downside of option 5 is that the overhead of the reduction operations grows with the number of threads used, so there would be a crossover point where options 2 or 4 would result in faster executing. That is why option 2 for example is used in the GPU package because a GPU is a processor with a massive number of threads. However, since the MPI parallelization is generally more effective for typical MD systems, the expectation is that thread parallelism is only used for a smaller number of threads (2-8). At the time of its implementation, that number was equivalent to the number of CPU cores per CPU socket on high-end supercomputers.

Thus arrays like the force array are dimensioned to the number of atoms times the number of threads when enabling OpenMP support and inside the compute functions a pointer to a different chunk is obtained by each thread. Similarly, accumulators like potential energy or virial are kept in per-thread instances of the ThrData class and then only reduced and stored in their global counterparts at the end of the force computation.

## Loop scheduling

Multi-thread parallelization is applied by distributing (outer) loops statically across threads. Typically this would be the loop over local atoms  $i$  when processing  $i,j$  pairs of atoms from a neighbor list. The design of the neighbor list code results in atoms having a similar number of neighbors for homogeneous systems and thus load imbalances across threads are not common and typically happen for systems where also the MPI parallelization would be unbalanced, which would typically have a more pronounced impact on the performance. This same loop scheduling scheme can also be applied to the reduction operations on per-atom data to try and reduce the overhead of the reduction operation.

## Neighbor list parallelization

In addition to the parallelization of force computations, also the generation of the neighbor lists is parallelized. As explained previously, neighbor lists are built by looping over “owned” atoms and storing the neighbors in “pages”. In the OPENMP variants of the neighbor list code, each thread operates on a different chunk of “owned” atoms and allocates and fills its own set of pages with neighbor list data. This is achieved by each thread keeping its own instance of the *MyPage* page allocator class.

## 15.5 Communication patterns

This page describes various inter-processor communication operations provided by LAMMPS, mostly in the core *Comm* class. These are operations for common tasks implemented using MPI library calls. They are used by other classes to perform communication of different kinds. These operations are useful to know about when writing new code for LAMMPS that needs to communicate data between processors.

### 15.5.1 Owned and ghost atoms

As described on the *parallel partitioning algorithms* page, LAMMPS spatially decomposes the simulation domain, either in a *brick* or *tiled* manner. Each processor (MPI task) owns atoms within its sub-domain and additionally stores ghost atoms within a cutoff distance of its sub-domain.

#### Forward and reverse communication

As described on the *parallel communication algorithms* page, the most common communication operations are first, *forward communication* which sends owned atom information from each processor to nearby processors to store with their ghost atoms. The need to do this communication arises when data from the owned atoms is updated (e.g. their positions) and this updated information needs to be **copied** to the corresponding ghost atoms.

And second, *reverse communication* which sends ghost atom information from each processor to the owning processor to **accumulate** (sum) the values with the corresponding owned atoms. The need for this arises when data is computed and also stored with ghost atoms (e.g. forces when using a “half” neighbor list) and thus those terms need to be added to their corresponding atoms on the process where they are “owned” atoms. Please note, that with the *newton off* setting this does not happen and the neighbor lists are constructed so that these interactions are computed on both MPI processes containing one of the atoms and only the data pertaining to the local atom is stored.

The time-integration classes in LAMMPS invoke these operations each timestep via the *forward\_comm()* and *reverse\_comm()* methods in the *Comm* class. Which per-atom data is communicated depends on the currently used *atom style* and whether *comm\_modify vel* setting is “no” (default) or “yes”.

Similarly, *Pair* style classes can invoke the *forward\_comm(this)* and *reverse\_comm(this)* methods in the *Comm* class to perform the same operations on per-atom data that is generated and stored within the pair style class. Note that this function requires passing the `this` pointer as the first argument to enable the *Comm* class to call the “pack” and “unpack” functions discussed below. An example of the use of these functions are many-body pair styles like the embedded-atom method (EAM) which compute intermediate values in the first part of the *compute()* function that need to be stored by both owned and ghost atoms for the second part of the force computation. The *Comm* class methods perform the MPI communication for buffers of per-atom data. They “call back” to the *Pair* class so it can *pack* or *unpack* the buffer with data the *Pair* class owns. There are 4 such methods that the *Pair* class must define, assuming it uses both forward and reverse communication:

- `pack_forward_comm()`
- `unpack_forward_comm()`
- `pack_reverse_comm()`

- `unpack_reverse_comm()`

The arguments to these methods include the buffer and a list of atoms to pack or unpack. The *Pair* class also must set the `comm_forward` and `comm_reverse` variables which store the number of values stored in the communication buffers for each operation. This means, if desired, it can choose to store multiple per-atom values in the buffer, and they will be communicated together to minimize communication overhead. The communication buffers are defined vectors containing double values. To correctly store integers that may be 64-bit (bigint, tagint, imageint) in the buffer, you need to use the `ubuf union` construct.

The *Fix*, *Compute*, and *Dump* classes can also invoke the same kind of forward and reverse communication operations using the same *Comm* class methods. Likewise the same pack/unpack methods and `comm_forward/comm_reverse` variables must be defined by the calling *Fix*, *Compute*, or *Dump* class.

For *Fix* classes there is an optional second argument to the `forward_comm()` and `reverse_comm()` call which can be used when the fix performs multiple modes of communication, with different numbers of values per atom. The fix should set the `comm_forward` and `comm_reverse` variables to the maximum value, but can invoke the communication for a particular mode with a smaller value. For this to work, the `pack_forward_comm()`, etc methods typically use a class member variable to choose which values to pack/unpack into/from the buffer.

Finally, for reverse communications in *Fix* classes there is also the `reverse_comm_variable()` method that allows the communication to have a different amount of data per-atom. It invokes these corresponding callback methods:

- `pack_reverse_comm_size()`
- `unpack_reverse_comm_size()`

which have extra arguments to specify the amount of data stored in the buffer for each atom.

## 15.5.2 Higher level communication

There are also several higher-level communication operations provided in LAMMPS which work for either *brick* or *tiled* decompositions. They may be useful for a new class to invoke if it requires more sophisticated communication than the *forward* and *reverse* methods provide. The 3 communication operations described here are

- ring
- irregular
- rendezvous

You can invoke these *grep* command in the LAMMPS src directory, to see a list of classes that invoke the 3 operations.

- `grep "\->ring" *.cpp */*.cpp`
- `grep "irregular\->" *.cpp`
- `grep "\->rendezvous" *.cpp */*.cpp`

### Ring operation

The *ring* operation is invoked via the `ring()` method in the *Comm* class.

Each processor first creates a buffer with a list of values, typically associated with a subset of the atoms it owns. Now think of the  $P$  processors as connected to each other in a *ring*. Each processor  $M$  sends data to the next  $M+1$  processor. It receives data from the preceding  $M-1$  processor. The ring is periodic so that the last processor sends to the first processor, and the first processor receives from the last processor.

Invoking the `ring()` method passes each processor's buffer in  $P$  steps around the ring. At each step a *callback* method, provided as an argument to `ring()`, in the caller is invoked. This allows each processor to examine the data buffer provided by every other processor. It may extract values needed by its atoms from the buffers, or it may alter placeholder

values in the buffer. In the latter case, when the *ring* operation is complete, each processor can examine its original buffer to extract modified values.

Note that the *ring* operation is similar to an `MPI_Alltoall()` operation where every processor effectively sends and receives data to every other processor. The difference is that the *ring* operation does it one step at a time, so the total volume of data does not need to be stored by every processor. However, the *ring* operation is also less efficient than `MPI_Alltoall()` because of the  $P$  stages required. So it is typically only suitable for small data buffers and occasional operations that are not time-critical.

## Irregular operation

The *irregular* operation is provided by the *Irregular* class. What LAMMPS terms irregular communication is when each processor knows what data it needs to send to what processor, but does not know what processors are sending it data. An example is when load-balancing is performed and each processor needs to send some of its atoms to new processors.

The *Irregular* class provides 5 high-level methods useful in this context:

- `create_data()`
- `exchange_data()`
- `create_atom()`
- `exchange_atom()`
- `migrate_atoms()`

For the `create_data()` method, each processor specifies a list of  $N$  datums to send, each to a specified processor. Internally, the method creates efficient data structures for performing the communication. The `exchange_data()` method triggers the communication to be performed. Each processor provides the vector of  $N$  datums to send, and the size of each datum. All datums must be the same size.

The `create_atom()` and `exchange_atom()` methods are similar except that the size of each datum can be different. Typically this is used to communicate atoms, each with a variable amount of per-atom data, to other processors.

The `migrate_atoms()` method is a convenience wrapper on the `create_atom()` and `exchange_atom()` methods to simplify communication of all the per-atom data associated with an atom so that the atom can effectively migrate to a new owning processor. It is similar to the `exchange()` method in the *Comm* class invoked when atoms move to neighboring processors (in the regular or tiled decomposition) during timestepping, except that it allows atoms to have moved arbitrarily long distances and still be properly communicated to a new owning processor.

## Rendezvous operation

Finally, the *rendezvous* operation is invoked via the `rendezvous()` method in the *Comm* class. Depending on how much communication is needed and how many processors a LAMMPS simulation is running on, it can be a much more efficient choice than the *ring()* method. It uses the *irregular* operation internally once or twice to do its communication. The rendezvous algorithm is described in detail in (*Plimpton*), including some LAMMPS use cases.

For the `rendezvous()` method, each processor specifies a list of  $N$  datums to send and which processor to send each of them to. Internally, this communication is performed as an irregular operation. The received datums are returned to the caller via invocation of *callback* function, provided as an argument to `rendezvous()`. The caller can then process the received datums and (optionally) assemble a new list of datums to communicate to a new list of specific processors. When the callback function exits, the `rendezvous()` method performs a second irregular communication on the new list of datums.

Examples in LAMMPS of use of the *rendezvous* operation are the *fix rigid/small* and *fix shake* commands (for one-time identification of the rigid body atom clusters) and the identification of special\_bond 1-2, 1-3 and 1-4 neighbors within molecules. See the *special\_bonds* command for context.

(Plimpton) Plimpton and Knight, JPDC, 147, 184-195 (2021).

## 15.6 How a timestep works

The first and most fundamental operation within LAMMPS to understand is how a timestep is structured. Timestepping is performed by calling methods of the Integrate class instance within the Update class. Since Integrate is a base class, it will point to an instance of a derived class corresponding to what is selected by the *run\_style* input script command.

In this section, the timestep implemented by the Verlet class is described. A similar timestep protocol is implemented by the Respa class, for the r-RESPA hierarchical timestepping method.

The Min base class performs energy minimization, so does not perform a literal timestep. But it has logic similar to what is described here, to compute forces and invoke fixes at each iteration of a minimization. Differences between time integration and minimization are highlighted at the end of this section.

The Verlet class is encoded in the `src/verlet.cpp` and `verlet.h` files. It implements the velocity-Verlet timestepping algorithm. The workhorse method is `Verlet::run()`, but first we highlight several other methods in the class.

- The `init()` method is called at the beginning of each dynamics run. It simply sets some internal flags, based on user settings in other parts of the code.
- The `setup()` or `setup_minimal()` methods are also called before each run. The velocity-Verlet method requires current forces be calculated before the first timestep, so these routines compute forces due to all atomic interactions, using the same logic that appears in the timestepping described next. A few fixes are also invoked, using the mechanism described in the next section. Various counters are also initialized before the run begins. The `setup_minimal()` method is a variant that has a flag for performing less setup. This is used when runs are continued and information from the previous run is still valid. For example, if repeated short LAMMPS runs are being invoked, interleaved by other commands, via the *pre no* and *every* options of the run command, the `setup_minimal()` method is used.
- The `force_clear()` method initializes force and other arrays to zero before each timestep, so that forces (torques, etc) can be accumulated.

Now for the `Verlet::run()` method. Its basic structure in hi-level pseudo code is shown below. In the actual code in `src/verlet.cpp` some of these operations are conditionally invoked.

```

loop over N timesteps:
  if timeout condition: break
  ev_set()

  fix->initial_integrate()
  fix->post_integrate()

  nflag = neighbor->decide()
  if nflag:
    fix->pre_exchange()
    domain->pbcb()
    domain->reset_box()
    comm->setup()
    neighbor->setup_bins()
    comm->exchange()
    comm->borders()
    fix->pre_neighbor()

```

(continues on next page)

(continued from previous page)

```

neighbor->build()
fix->post_neighbor()
else:
  comm->forward_comm()

force_clear()
fix->pre_force()

pair->compute()
bond->compute()
angle->compute()
dihedral->compute()
improper->compute()
kspace->compute()

fix->pre_reverse()
comm->reverse_comm()

fix->post_force()
fix->final_integrate()
fix->end_of_step()

if any output on this step:
  output->write()

# after loop
fix->post_run()

```

The `ev_set()` method (in the parent `Integrate` class), sets two flags (*eflag* and *vflag*) for energy and virial computation. Each flag encodes whether global and/or per-atom energy and virial should be calculated on this timestep, because some fix or variable or output will need it. These flags are passed to the various methods that compute particle interactions, so that they either compute and tally the corresponding data or can skip the extra calculations if the energy and virial are not needed. See the comments for the `Integrate::ev_set()` method which document the flag values.

At various points of the timestep, fixes are invoked, e.g. `fix->initial_integrate()`. In the code, this is actually done via the `Modify` class which stores all the `Fix` objects and lists of which should be invoked at what point in the timestep. Fixes are the LAMMPS mechanism for tailoring the operations of a timestep for a particular simulation. As described elsewhere, each fix has one or more methods, each of which is invoked at a specific stage of the timestep, as show in the timestep pseudo-code. All the active fixes defined in an input script, that are flagged to have an `initial_integrate()` method are invoked at the beginning of each timestep. Examples are *fix nve* or *fix nvt* or *fix npt* which perform the start-of-timestep velocity-Verlet integration operations to update velocities by a half-step, and coordinates by a full step. The `post_integrate()` method is next for operations that need to happen immediately after those updates. Only a few fixes use this, e.g. to reflect particles off box boundaries in the *FixWallReflect* class.

The `decide()` method in the `Neighbor` class determines whether neighbor lists need to be rebuilt on the current timestep (conditions can be changed using the *neigh\_modify every/delay/check* command. If not, coordinates of ghost atoms are acquired by each processor via the `forward_comm()` method of the `Comm` class. If neighbor lists need to be built, several operations within the inner if clause of the pseudo-code are first invoked. The `pre_exchange()` method of any defined fixes is invoked first. Typically this inserts or deletes particles from the system.

Periodic boundary conditions are then applied by the `Domain` class via its `pbcc()` method to remap particles that have moved outside the simulation box back into the box. Note that this is not done every timestep, but only when neighbor lists are rebuilt. This is so that each processor's sub-domain will have consistent (nearby) atom coordinates for its owned and ghost atoms. It is also why dumped atom coordinates may be slightly outside the simulation box if not

dumped on a step where the neighbor lists are rebuilt.

The box boundaries are then reset (if needed) via the `reset_box()` method of the `Domain` class, e.g. if box boundaries are shrink-wrapped to current particle coordinates. A change in the box size or shape requires internal information for communicating ghost atoms (`Comm` class) and neighbor list bins (`Neighbor` class) be updated. The `setup()` method of the `Comm` class and `setup_bins()` method of the `Neighbor` class perform the update.

The code is now ready to migrate atoms that have left a processor's geometric sub-domain to new processors. The `exchange()` method of the `Comm` class performs this operation. The `borders()` method of the `Comm` class then identifies ghost atoms surrounding each processor's sub-domain and communicates ghost atom information to neighboring processors. It does this by looping over all the atoms owned by a processor to make lists of those to send to each neighbor processor. On subsequent timesteps, the lists are used by the `Comm::forward_comm()` method.

Fixes with a `pre_neighbor()` method are then called. These typically re-build some data structure stored by the fix that depends on the current atoms owned by each processor.

Now that each processor has a current list of its owned and ghost atoms, LAMMPS is ready to rebuild neighbor lists via the `build()` method of the `Neighbor` class. This is typically done by binning all owned and ghost atoms, and scanning a stencil of bins around each owned atom's bin to make a Verlet list of neighboring atoms within the force cutoff plus neighbor skin distance.

In the next portion of the timestep, all interaction forces between particles are computed, after zeroing the per-atom force vector via the `force_clear()` method. If the `newton` flag is set to *on* by the `newton` command, forces are added to both owned and ghost atoms, otherwise only to owned (aka local) atoms.

Pairwise forces are calculated first, which enables the global virial (if requested) to be calculated cheaply (at  $O(N)$  cost instead of  $O(N^2)$  at the end of the `Pair::compute()` method), by a dot product of atom coordinates and forces. By including owned and ghost atoms in the dot product, the effect of periodic boundary conditions is correctly accounted for. Molecular topology interactions (bonds, angles, dihedrals, impropers) are calculated next (if supported by the current atom style). The final contribution is from long-range Coulombic interactions, invoked by the `KSpace` class.

The `pre_reverse()` method in fixes is used for operations that have to be done *before* the upcoming reverse communication (e.g. to perform additional data transfers or reductions for data computed during the force computation and stored with ghost atoms).

If the `newton` flag is on, forces on ghost atoms are communicated and summed back to their corresponding owned atoms. The `reverse_comm()` method of the `Comm` class performs this operation, which is essentially the inverse operation of sending copies of owned atom coordinates to other processor's ghost atoms.

At this point in the timestep, the total force on each (local) atom is known. Additional force constraints (external forces, SHAKE, etc) are applied by Fixes that have a `post_force()` method. The second half of the velocity-Verlet integration, `final_integrate()` is then performed (another half-step update of the velocities) via fixes like `nve`, `nvt`, `npt`.

At the end of the timestep, fixes that contain an `end_of_step()` method are invoked. These typically perform a diagnostic calculation, e.g. the `ave/time` and `ave/spatial` fixes. The final operation of the timestep is to perform any requested output, via the `write()` method of the `Output` class. There are 3 kinds of LAMMPS output: thermodynamic output to the screen and log file, snapshots of atom data to a dump file, and restart files. See the `thermo_style`, `dump`, and `restart` commands for more details.

The flow of control during energy minimization iterations is similar to that of a molecular dynamics timestep. Forces are computed, neighbor lists are built as needed, atoms migrate to new processors, and atom coordinates and forces are communicated to neighboring processors. The only difference is what `Fix` class operations are invoked when. Only a subset of LAMMPS fixes are useful during energy minimization, as explained in their individual doc pages. The relevant `Fix` class methods are `min_pre_exchange()`, `min_pre_force()`, and `min_post_force()`. Each fix is invoked at the appropriate place within the minimization iteration. For example, the `min_post_force()` method is analogous to the `post_force()` method for dynamics; it is used to alter or constrain forces on each atom, which affects the minimization procedure.

After all iterations are completed there is a `cleanup` step which calls the `post_run()` method of fixes to perform operations only required at the end of a calculations (like freeing temporary storage or creating final outputs).

## 15.7 Writing new styles

The *Modifying & extending LAMMPS* section of the manual gives an overview of how LAMMPS can be extended by writing new classes that derive from existing parent classes in LAMMPS. Here, some specific coding details are provided for writing code for LAMMPS.

### 15.7.1 Writing a new fix style

Writing fixes is a flexible way of extending LAMMPS. Users can implement many things using fixes:

- changing particles attributes (positions, velocities, forces, etc.). Examples: `FixNVE`, `FixFreeze`.
- reading/writing data. Example: `FixRestart`.
- adding or modifying properties due to geometry. Example: `FixWall`.
- interacting with other subsystems or external code: Examples: `FixTTM`, `FixExternal`, `FixLATTE`
- saving information for analysis or future use (previous positions, for instance). Examples: `Fix AveTime`, `FixStoreState`.

All fixes are derived from the `Fix` base class and must have a constructor with the signature: `FixPrintVel(class LAMMPS *, int, char **)`.

Every fix must be registered in LAMMPS by writing the following lines of code in the header before include guards:

```
#ifndef FIX_CLASS
// clang-format off
FixStyle(print/vel,FixPrintVel);
// clang-format on
#else
/* the definition of the FixPrintVel class comes here */
...
#endif
```

Where `print/vel` is the style name of your fix in the input script and `FixPrintVel` is the name of the class. The header file would be called `fix_print_vel.h` and the implementation file `fix_print_vel.cpp`. These conventions allow LAMMPS to automatically integrate it into the executable when compiling and associate your new fix class with the designated keyword when it parses the input script.

Let's write a simple fix which will print the average velocity at the end of each timestep. First of all, implement a constructor:

```
FixPrintVel::FixPrintVel(LAMMPS *lmp, int nargs, char **arg)
: Fix(lmp, nargs, arg)
{
  if (nargs < 4)
    error->all(FLERR,"Illegal fix print/vel command");

  nevery = utils::inumeric(FLERR,arg[3],false,lmp);
  if (nevery <= 0)
```

(continues on next page)

(continued from previous page)

```

error->all(FLERR,"Illegal fix print/vel command");
}

```

In the constructor you should parse your fix arguments which are specified in the script. All fixes have pretty much the same syntax: `fix <fix-ID> <fix group> <fix name> <fix arguments ...>`. The first 3 parameters are parsed by Fix base class constructor, while `<fix arguments>` should be parsed by you. In our case, we need to specify how often we want to print an average velocity. For instance, once in 50 timesteps: `fix 1 print/vel 50`. There is a special variable in the Fix class called `nevery` which specifies how often the method `end_of_step()` is called. Thus all we need to do is just set it up.

The next method we need to implement is `setmask()`:

```

int FixPrintVel::setmask()
{
    int mask = 0;
    mask |= FixConst::END_OF_STEP;
    return mask;
}

```

Here the user specifies which methods of your fix should be called during execution. The constant `END_OF_STEP` corresponds to the `end_of_step()` method. The most important available methods that are called during a timestep and the order in which they are called are shown in the previous section.

```

void FixPrintVel::end_of_step()
{
    // for add3, scale3
    using namespace MathExtra;

    double** v = atom->v;
    int nlocal = atom->nlocal;
    double localAvgVel[4]; // 4th element for particles count
    memset(localAvgVel, 0, 4 * sizeof(double));
    for (int particleInd = 0; particleInd < nlocal; ++particleInd) {
        add3(localAvgVel, v[particleInd], localAvgVel);
    }
    localAvgVel[3] = nlocal;
    double globalAvgVel[4];
    memset(globalAvgVel, 0, 4 * sizeof(double));
    MPI_Allreduce(localAvgVel, globalAvgVel, 4, MPI_DOUBLE, MPI_SUM, world);
    scale3(1.0 / globalAvgVel[3], globalAvgVel);
    if ((comm->me == 0) && screen) {
        fmt::print(screen, "{}, {}, {}\n",
                  globalAvgVel[0], globalAvgVel[1], globalAvgVel[2]);
    }
}

```

In the code above, we use `MathExtra` routines defined in `math_extra.h`. There are bunch of math functions to work with arrays of doubles as with math vectors. It is also important to note that LAMMPS code should always assume to be run in parallel and that atom data is thus distributed across the MPI ranks. Thus you can only process data from local atoms directly and need to use MPI library calls to combine or exchange data. For serial execution, LAMMPS comes bundled with the MPI STUBS library that contains the MPI library function calls in dummy versions that only work for a single MPI rank.

In this code we use an instance of `Atom` class. This object is stored in the `Pointers` class (see `pointers.h`) which is

the base class of the Fix base class. This object contains references to various class instances (the original instances are created and held by the LAMMPS class) with all global information about the simulation system. Data from the Pointers class is available to all classes inherited from it using protected inheritance. Hence when you write your own class, which is going to use LAMMPS data, don't forget to inherit from Pointers or pass an Pointer to it to all functions that need access. When writing fixes we inherit from class Fix which is inherited from Pointers so there is no need to inherit from it directly.

The code above computes average velocity for all particles in the simulation. Yet you have one unused parameter in fix call from the script: `group_name`. This parameter specifies the group of atoms used in the fix. So we should compute average for all particles in the simulation only if `group_name == "all"`, but it can be any group. The group membership information of an atom is contained in the `mask` property of an atom and the bit corresponding to a given group is stored in the `groupbit` variable which is defined in Fix base class:

```
for (int i = 0; i < nlocal; ++i) {
  if (atom->mask[i] & groupbit) {
    // Do all job here
  }
}
```

Class Atom encapsulates atoms positions, velocities, forces, etc. User can access them using particle index. Note, that particle indexes are usually changed every few timesteps because of neighbor list rebuilds and spatial sorting (to improve cache efficiency).

Let us consider another Fix example: We want to have a fix which stores atoms position from previous time step in your fix. The local atoms indexes may not be valid on the next iteration. In order to handle this situation there are several methods which should be implemented:

- `double memory_usage()`: return how much memory the fix uses (optional)
- `void grow_arrays(int)`: do reallocation of the per particle arrays in your fix
- `void copy_arrays(int i, int j, int delflag)`: copy i-th per-particle information to j-th. Used when atom sorting is performed. if `delflag` is set and atom `j` owns a body, move the body information to atom `i`.
- `void set_arrays(int i)`: sets i-th particle related information to zero

Note, that if your class implements these methods, it must call `add_callback` and `delete_callback` to constructor and destructor. Since we want to store positions of atoms from previous timestep, we need to add `double** xold` to the header file. Then add allocation code to the constructor:

```
FixSavePos::FixSavePos(LAMMPS *lmp, int narg, char **arg), xold(nullptr)
{
  //...
  memory->create(xold, atom->nmax, 3, "FixSavePos:x");
  atom->add_callback(0);
}

FixSavePos::~FixSavePos() {
  atom->delete_callback(id, 0);
  memory->destroy(xold);
}
```

Implement the aforementioned methods:

```
double FixSavePos::memory_usage()
{
  int nmax = atom->nmax;
```

(continues on next page)

(continued from previous page)

```

    double bytes = 0.0;
    bytes += nmax * 3 * sizeof(double);
    return bytes;
}

void FixSavePos::grow_arrays(int nmax)
{
    memory->grow(xold, nmax, 3, "FixSavePos:xold");
}

void FixSavePos::copy_arrays(int i, int j, int delflag)
{
    memcpy(xold[j], xold[i], sizeof(double) * 3);
}

void FixSavePos::set_arrays(int i)
{
    memset(xold[i], 0, sizeof(double) * 3);
}

int FixSavePos::pack_exchange(int i, double *buf)
{
    int m = 0;
    buf[m++] = xold[i][0];
    buf[m++] = xold[i][1];
    buf[m++] = xold[i][2];

    return m;
}

int FixSavePos::unpack_exchange(int nlocal, double *buf)
{
    int m = 0;
    xold[nlocal][0] = buf[m++];
    xold[nlocal][1] = buf[m++];
    xold[nlocal][2] = buf[m++];

    return m;
}

```

Now, a little bit about memory allocation. We use the Memory class which is just a bunch of template functions for allocating 1D and 2D arrays. So you need to add include `memory.h` to have access to them.

Finally, if you need to write/read some global information used in your fix to the restart file, you might do it by setting flag `restart_global = 1` in the constructor and implementing methods `void write_restart(FILE *fp)` and `void restart(char *buf)`. If, in addition, you want to write the per-atom property to restart files additional settings and functions are needed:

- a fix flag indicating this needs to be set `restart_peratom = 1`;
- `atom->add_callback()` and `atom->delete_callback()` must be called a second time with the final argument set to 1 instead of 0 (indicating restart processing instead of per-atom data memory management).
- the functions `void pack_restart(int i, double *buf)` and `void unpack_restart(int nlocal, int nth)` need to be implemented

## 15.8 Notes for developers and code maintainers

This section documents how some of the code functionality within LAMMPS works at a conceptual level. Comments on code in source files typically document what a variable stores, what a small section of code does, or what a function does and its input/outputs. The topics on this page are intended to document code functionality at a higher level.

Available topics are:

- *Reading and parsing of text and text files*
  - *Requesting and accessing neighbor lists*
  - *Fix contributions to instantaneous energy, virial, and cumulative energy*
  - *KSpace PPPM FFT grids*
- 

### 15.8.1 Reading and parsing of text and text files

It is frequently required for a class in LAMMPS to read in additional data from a file, e.g. potential parameters from a potential file for manybody potentials. LAMMPS provides several custom classes and convenience functions to simplify the process. They offer the following benefits:

- better code reuse and fewer lines of code needed to implement reading and parsing data from a file
- better detection of format errors, incompatible data, and better error messages
- exit with an error message instead of silently converting only part of the text to a number or returning a 0 on unrecognized text and thus reading incorrect values
- re-entrant code through avoiding global static variables (as used by `strtok()`)
- transparent support for translating unsupported UTF-8 characters to their ASCII equivalents (the text-to-value conversion functions **only** accept ASCII characters)

In most cases (e.g. potential files) the same data is needed on all MPI ranks. Then it is best to do the reading and parsing only on MPI rank 0, and communicate the data later with one or more `MPI_Bcast()` calls. For reading generic text and potential parameter files the custom classes *TextFileReader* and *PotentialFileReader* are available. They allow reading the file as individual lines for which they can return a tokenizer class (see below) for parsing the line. Or they can return blocks of numbers as a vector directly. The documentation on *File reader classes* contains an example for a typical case.

When reading per-atom data, the data on each line of the file usually needs to include an atom ID so it can be associated with a particular atom. In that case the data can be read in multi-line chunks and broadcast to all MPI ranks with `utils::read_lines_from_file()`. Those chunks are then split into lines, parsed, and applied only to atoms the MPI rank “owns”.

For splitting a string (incrementally) into words and optionally converting those to numbers, the *Tokenizer* and *ValueTokenizer* can be used. Those provide a superset of the functionality of `strtok()` from the C-library and the latter also includes conversion to different types. Any errors while processing the string in those classes will result in an exception, which can be caught and the error processed as needed. Unlike the C-library functions `atoi()`, `atof()`, `strtol()`, or `strtod()` the conversion will check if the converted text is a valid integer or floating point number and will not silently return an unexpected or incorrect value. For example, `atoi()` will return 12 when converting “12.5”, while the *ValueTokenizer* class will throw an *InvalidIntegerException* if `ValueTokenizer::next_int()` is called on the same string.

## 15.8.2 Requesting and accessing neighbor lists

LAMMPS uses Verlet-style neighbor lists to avoid having to loop over *all* pairs of *all* atoms when computing pairwise properties with a cutoff (e.g. pairwise forces or radial distribution functions). There are three main algorithms that can be selected by the *neighbor command*: *bin* (the default, uses binning to achieve linear scaling with system size), *nsq* (without binning, quadratic scaling), *multi* (with binning, optimized for varying cutoffs or polydisperse granular particles). In addition to how the neighbor lists are constructed a number of different variants of neighbor lists need to be created (e.g. “full” or “half”) for different purposes and styles and those may be required in every time step (“perpetual”) or on some steps (“occasional”).

The neighbor list creation is managed by the `Neighbor` class. Individual classes can obtain a neighbor list by creating an instance of a `NeighRequest` class which is stored in a list inside the `Neighbor` class. The `Neighbor` class will then analyze the various requests and apply optimizations where neighbor lists that have the same settings will be created only once and then copied, or a list may be constructed by processing a neighbor list from a different request that is a superset of the requested list. The neighbor list build is then *processed in parallel*.

The most commonly required neighbor list is a so-called “half” neighbor list, where each pair of atoms is listed only once (except when the *newton command setting* for pair is off; in that case pairs straddling sub-domains or periodic boundaries will be listed twice). Thus these are the default settings when a neighbor list request is created in:

```
void Pair::init_style()
{
  neighbor->add_request(this);
}

void Pair::init_list(int /*id*/, NeighList *ptr)
{
  list = ptr;
}
```

The `this` pointer argument is required so the neighbor list code can access the requesting class instance to store the assembled neighbor list with that instance by calling its `init_list()` member function. The optional second argument (omitted here) contains a bitmask of flags that determines the kind of neighbor list requested. The default value used here asks for a perpetual “half” neighbor list.

Non-default values of the second argument need to be used to adjust a neighbor list request to the specific needs of a style an additional request flag is needed. The *tersoff* pair style, for example, needs a “full” neighbor list:

```
void PairTersoff::init_style()
{
  // [...]
  neighbor->add_request(this, NeighConst::REQ_FULL);
}
```

When a pair style supports r-RESPA time integration with different cutoff regions, the request flag may depend on the corresponding r-RESPA settings. Here an example from pair style `lj/cut`:

```
void PairLJCut::init_style()
{
  int list_style = NeighConst::REQ_DEFAULT;

  if (update->whichflag == 1 && utils::strmatch(update->integrate_style, "^respa")) {
    auto respa = (Respa *) update->integrate;
    if (respa->level_inner >= 0) list_style = NeighConst::REQ_RESPA_INOUT;
    if (respa->level_middle >= 0) list_style = NeighConst::REQ_RESPA_ALL;
  }
}
```

(continues on next page)

(continued from previous page)

```

}
neighbor->add_request(this, list_style);
// [...]
}

```

Granular pair styles need neighbor lists based on particle sizes and not cutoff and also may require to have the list of previous neighbors available (“history”). For example with:

```

if (use_history) neighbor->add_request(this, NeighConst::REQ_SIZE | NeighConst::REQ_
↪HISTORY);
else neighbor->add_request(this, NeighConst::REQ_SIZE);

```

In case a class would need to make multiple neighbor list requests with different settings each request can set an id which is then used in the corresponding `init_list()` function to assign it to the suitable pointer variable. This is done for example by the *pair style meam*:

```

void PairMEAM::init_style()
{
// [...]
neighbor->add_request(this, NeighConst::REQ_FULL)->set_id(1);
neighbor->add_request(this)->set_id(2);
}
void PairMEAM::init_list(int id, NeighList *ptr)
{
if (id == 1) listfull = ptr;
else if (id == 2) listhalf = ptr;
}

```

Fixes may require a neighbor list that is only build occasionally (or just once) and this can also be indicated by a flag. As an example here is the request from the `FixPeriNeigh` class which is created internally by *Peridynamics pair styles*:

```

neighbor->add_request(this, NeighConst::REQ_FULL | NeighConst::REQ_OCCASIONAL);

```

It is also possible to request a neighbor list that uses a different cutoff than what is usually inferred from the pair style settings (largest cutoff of all pair styles plus neighbor list skin). The following is used in the *compute rdf* command implementation:

```

if (cutflag)
neighbor->add_request(this, NeighConst::REQ_OCCASIONAL)->set_cutoff(mycutneigh);
else
neighbor->add_request(this, NeighConst::REQ_OCCASIONAL);

```

The neighbor list request function has a slightly different set of arguments when created by a command style. In this case the neighbor list is *always* an occasional neighbor list, so that flag is not needed. However for printing the neighbor list summary the name of the requesting command should be set. Below is the request from the *delete atoms* command:

```

neighbor->add_request(this, "delete_atoms", NeighConst::REQ_FULL);

```

### 15.8.3 Fix contributions to instantaneous energy, virial, and cumulative energy

Fixes can calculate contributions to the instantaneous energy and/or virial of the system, both in a global and peratom sense. Fixes that perform thermostating or barostating can calculate the cumulative energy they add to or subtract from the system, which is accessed by the *ecouple* and *econserve* thermodynamic keywords. This subsection explains how both work and what flags to set in a new fix to enable this functionality.

Let's start with thermostating and barostating fixes. Examples are the *fix langevin* and *fix npt* commands. Here is what the fix needs to do:

- Set the variable *ecouple\_flag* = 1 in the constructor. Also set *scalar\_flag* = 1, *extscalar* = 1, and *global\_freq* to a timestep increment which matches how often the fix is invoked.
- Implement a *compute\_scalar()* method that returns the cumulative energy added or subtracted by the fix, e.g. by rescaling the velocity of atoms. The sign convention is that subtracted energy is positive, added energy is negative. This must be the total energy added to the entire system, i.e. an “extensive” quantity, not a per-atom energy. Cumulative means the summed energy since the fix was instantiated, even across multiple runs. This is because the energy is used by the *econserve* thermodynamic keyword to check that the fix is conserving the total energy of the system, i.e. potential energy + kinetic energy + coupling energy = a constant.

And here is how the code operates:

- The *Modify* class makes a list of all fixes that set *ecouple\_flag* = 1.
- The *thermo\_style custom* command defines *ecouple* and *econserve* keywords.
- These keywords sum the energy contributions from all the *ecouple\_flag* = 1 fixes by invoking the *energy\_couple()* method in the *Modify* class, which calls the *compute\_scalar()* method of each fix in the list.

Next, here is how a fix contributes to the instantaneous energy and virial of the system. First, it sets any or all of these flags to a value of 1 in their constructor:

- *energy\_global\_flag* to contribute to global energy, example: *fix indent*
- *energy\_peratom\_flag* to contribute to peratom energy, *fix cmap*
- *virial\_global\_flag* to contribute to global virial, example: *fix wall*
- *virial\_peratom\_flag* to contribute to peratom virial, example: *fix wall*

The fix must also do the following:

- For global energy, implement a *compute\_scalar()* method that returns the energy added or subtracted on this timestep. Here the sign convention is that added energy is positive, subtracted energy is negative.
- For peratom energy, invoke the *ev\_init(eflag,vflag)* function each time the fix is invoked, which initializes peratom energy storage. The value of *eflag* may need to be stored from an earlier call to the fix during the same timestep. See how the *fix cmap* command does this in *src/MOLECULE/fix\_cmap.cpp*. When an energy for one or more atoms is calculated, invoke the *ev\_tally()* function to tally the contribution to each atom. Both the *ev\_init()* and *ev\_tally()* methods are in the parent *Fix* class.
- For global and/or peratom virial, invoke the *v\_init(vflag)* function each time the fix is invoked, which initializes virial storage. When forces on one or more atoms are calculated, invoke the *v\_tally()* function to tally the contribution. Both the *v\_init()* and *v\_tally()* methods are in the parent *Fix* class. Note that there are several variants of *v\_tally()*; choose the one appropriate to your fix.

**Note:** The *ev\_init()* and *ev\_tally()* methods also account for global and peratom virial contributions. Thus you do not need to invoke the *v\_init()* and *v\_tally()* methods, if the fix also calculates peratom energies.

The fix must also specify whether (by default) to include or exclude these contributions to the global/peratom energy/virial of the system. For the fix to include the contributions, set either of both of these variables in the constructor:

- *thermo\_energy* = 1, for global and peratom energy
- *thermo\_virial* = 1, for global and peratom virial

Note that these variables are zeroed in `fix.cpp`. Thus if you don't set the variables, the contributions will be excluded (by default)

However, the user has ultimate control over whether to include or exclude the contributions of the fix via the *fix modify* command:

- `fix modify energy yes` to include global and peratom energy contributions
- `fix modify virial yes` to include global and peratom virial contributions

If the fix contributes to any of the global/peratom energy/virial values for the system, it should be explained on the fix doc page, along with the default values for the *energy yes/no* and *virial yes/no* settings of the *fix modify* command.

Finally, these 4 contributions are included in the output of 4 computes:

- global energy in *compute pe*
- peratom energy in *compute pe/atom*
- global virial in *compute pressure*
- peratom virial in *compute stress/atom*

These computes invoke a method of the `Modify` class to include contributions from fixes that have the corresponding flags set, e.g. *energy\_peratom\_flag* and *thermo\_energy* for *compute pe/atom*.

Note that each compute has an optional keyword to either include or exclude all contributions from fixes. Also note that *compute pe* and *compute pressure* are what is used (by default) by *thermodynamic output* to calculate values for its *pe* and *press* keywords.

## 15.8.4 KSpace PPPM FFT grids

The various *KSpace PPPM* styles in LAMMPS use FFTs to solve Poisson's equation. This subsection describes:

- how FFT grids are defined
- how they are decomposed across processors
- how they are indexed by each processor
- how particle charge and electric field values are mapped to/from the grid

An FFT grid cell is a 3d volume; grid points are corners of a grid cell and the code stores values assigned to grid points in vectors or 3d arrays. A global 3d FFT grid has points indexed 0 to N-1 inclusive in each dimension.

Each processor owns two subsets of the grid, each subset is brick-shaped. Depending on how it is used, these subsets are allocated as a 1d vector or 3d array. Either way, the ordering of values within contiguous memory is fastest, then y, z slowest.

For the 3d decomposition of the grid, the global grid is partitioned into bricks that correspond to the sub-domains of the simulation box that each processor owns. Often, this is a regular 3d array ( $P_x$  by  $P_y$  by  $P_z$ ) of bricks, where  $P$  = number of processors =  $P_x * P_y * P_z$ . More generally it can be a tiled decomposition, where each processor owns a brick and the union of all the bricks is the global grid. Tiled decompositions are produced by load balancing with the RCB algorithm; see the *balance rcb* command.

For the FFT decomposition of the grid, each processor owns a brick that spans the entire x dimension of the grid while the y and z dimensions are partitioned as a regular 2d array ( $P_1$  by  $P_2$ ), where  $P = P_1 * P_2$ .

The following indices store the inclusive bounds of the brick a processor owns, within the global grid:

```
nxlo_in,nxhi_in,nylo_in,nyhi_in,nzlo_in,nzhi_in = 3d decomposition brick
nxlo_fft,nxhi_fft,nylo_fft,nyhi_fft,nzlo_fft,nzhi_fft = FFT decomposition brick
nxlo_out,nxhi_out,nylo_out,nyhi_out,nzlo_out,nzhi_out = 3d decomposition brick + ghost
↪cells
```

The `in` and `fft` indices are from 0 to N-1 inclusive in each dimension, where N is the grid size.

The `out` indices index an array which stores the `in` subset of the grid plus ghost cells that surround it. These indices can thus be  $< 0$  or  $\geq N$ .

The number of ghost cells a processor owns in each of the 6 directions is a function of:

```
neighbor skin distance (since atoms can move outside a proc subdomain)
qdist = offset or charge from atom due to TIP4P fictitious charge
order = mapping stencil size
shift = factor used when order is an even number (see below)
```

Here is an explanation of how the PPPM variables `order`, `nlower` / `nupper`, `shift`, and `OFFSET` work. They are the relevant variables that determine how atom charge is mapped to grid points and how field values are mapped from grid points to atoms:

```
order = # of nearby grid points in each dim that atom charge/field are mapped to/from
nlower,nupper = extent of stencil around the grid point an atom is assigned to
OFFSET = large integer added/subtracted when mapping to avoid  $\text{int}(-0.75) = 0$  when  $-1$  is
↪the desired result
```

The `particle_map()` method assigns each atom to a grid point.

If `order` is even, say 4:

```
atom is assigned to grid point to its left (in each dim)
shift = OFFSET
nlower = -1, nupper = 2, which are offsets from assigned grid point
window of mapping grid pts is thus 2 grid points to left of atom, 2 to right
```

If `order` is odd, say 5:

```
atom is assigned to left/right grid pt it is closest to (in each dim)
shift = OFFSET + 0.5
nlower = 2, nupper = 2
if point is in left half of cell, then window of affected grid pts is 3 grid points to
↪left of atom, 2 to right
if point is in right half of cell, then window of affected grid pts is 2 grid points to
↪left of atom, 3 to right
```

These settings apply to each dimension, so that if `order` = 5, an atom's charge is mapped to 125 grid points that surround the atom.

## 15.9 Notes for updating code written for older LAMMPS versions

This section documents how C++ source files that are available *outside of the LAMMPS source distribution* (e.g. in external USER packages or as source files provided as a supplement to a publication) that are written for an older version of LAMMPS and thus need to be updated to be compatible with the current version of LAMMPS. Due to the active development of LAMMPS it is likely to always be incomplete. Please contact [developer@lammps.org](mailto:developer@lammps.org) in case you run across an issue that is not (yet) listed here. Please also review the latest information about the LAMMPS *programming style conventions*, especially if you are considering to submit the updated version for inclusion into the LAMMPS distribution.

Available topics in mostly chronological order are:

- *Setting flags in the constructor*
  - *Rename of `pack/unpack_comm()` to `pack/unpack_forward_comm()`*
  - *Use `ev_init()` to initialize variables derived from `eflag` and `vflag`*
  - *Use `utils::numeric()` functions instead of `force->numeric()`*
  - *Use `utils::open_potential()` function to open potential files*
  - *Simplify customized error messages*
  - *Use of “override” instead of “virtual”*
  - *Simplified and more compact neighbor list requests*
  - *Split of fix STORE into fix STORE/GLOBAL and fix STORE/PERATOM*
  - *Use `Output::get_dump_by_id()` instead of `Output::find_dump()`*
- 

### 15.9.1 Setting flags in the constructor

As LAMMPS gains additional functionality, new flags may need to be set in the constructor or a class to signal compatibility with such features. Most of the time the defaults are chosen conservatively, but sometimes the conservative choice is the uncommon choice, and then those settings need to be made when updating code.

Pair styles:

- `manybody_flag`: set to 1 if your pair style is not pair-wise additive
- `restartinfo`: set to 0 if your pair style does not store data in restart files

### 15.9.2 Rename of `pack/unpack_comm()` to `pack/unpack_forward_comm()`

Changed in version 8Aug2014.

In this change set the functions to pack data into communication buffers and to unpack data from communication buffers for *forward communications* were renamed from `pack_comm()` and `unpack_comm()` to `pack_forward_comm()` and `unpack_forward_comm()`, respectively. Also the meaning of the return value of these functions was changed: rather than returning the number of items per atom stored in the buffer, now the total number of items added (or unpacked) needs to be returned. Here is an example from the *PairEAM* class. Of course the member function declaration in corresponding header file needs to be updated accordingly.

Old:

```

int PairEAM::pack_comm(int n, int *list, double *buf, int pbc_flag, int *pbc)
{
  int m = 0;
  for (int i = 0; i < n; i++) {
    int j = list[i];
    buf[m++] = fp[j];
  }
  return 1;
}

```

New:

```

int PairEAM::pack_forward_comm(int n, int *list, double *buf, int pbc_flag, int *pbc)
{
  int m = 0;
  for (int i = 0; i < n; i++) {
    int j = list[i];
    buf[m++] = fp[j];
  }
  return m;
}

```

**Note:** Because the various “pack” and “unpack” functions are defined in the respective base classes as dummy functions doing nothing, and because of the the name mismatch the custom versions in the derived class will no longer be called, there will be no compilation error when this change is not applied. Only calculations will suddenly produce incorrect results because the required forward communication calls will cease to function correctly.

### 15.9.3 Use `ev_init()` to initialize variables derived from `eflag` and `vflag`

Changed in version 29Mar2019.

There are several variables that need to be initialized based on the values of the “eflag” and “vflag” variables and since sometimes there are new bits added and new variables need to be set to 1 or 0. To make this consistent, across all styles, there is now an inline function `ev_init(eflag, vflag)` that makes those settings consistently and calls either `ev_setup()` or `ev_unset()`. Example from a pair style:

Old:

```

if (eflag || vflag) ev_setup(eflag, vflag);
else evflag = vflag_fdotr = eflag_global = eflag_atom = 0;

```

New:

```

ev_init(eflag, vflag);

```

Not applying this change will not cause a compilation error, but can lead to inconsistent behavior and incorrect tallying of energy or virial.

## 15.9.4 Use `utils::numeric()` functions instead of `force->numeric()`

Changed in version 18Sep2020.

The “`numeric()`” conversion functions (including “`inumeric()`”, “`bnumeric()`”, and “`tnumeric()`”) have been moved from the `Force` class to the `utils` namespace. Also they take an additional argument that selects whether the `Error::all()` or `Error::one()` function should be called in case of an error. The former should be used when *all* MPI processes call the conversion function and the latter *must* be used when they are called from only one or a subset of the MPI processes.

Old:

```
val = force->numeric(FLERR, arg[1]);
num = force->inumeric(FLERR, arg[2]);
```

New:

```
val = utils::numeric(FLERR, true, arg[1], lmp);
num = utils::inumeric(FLERR, false, arg[2], lmp);
```

**See also:**

`utils::numeric()`, `utils::inumeric()`, `utils::bnumeric()`, `utils::tnumeric()`

## 15.9.5 Use `utils::open_potential()` function to open potential files

Changed in version 18Sep2020.

The `utils::open_potential()` function must be used to replace calls to `force->open_potential()` and should be used to replace `fopen()` for opening potential files for reading. The custom function does three additional steps compared to `fopen()`: 1) it will try to parse the `UNITS:` and `DATE:` metadata will stop with an error on a units mismatch and will print the date info, if present, in the log file; 2) for pair styles that support it, it will set up possible automatic unit conversions based on the embedded unit information and LAMMPS’ current units setting; 3) it will not only try to open a potential file at the given path, but will also search in the folders listed in the `LAMMPS_POTENTIALS` environment variable. This allows to keep potential files in a common location instead of having to copy them around for simulations.

Old:

```
fp = force->open_potential(filename);
fp = fopen(filename, "r");
```

New:

```
fp = utils::open_potential(filename, lmp);
```

## 15.9.6 Simplify customized error messages

Changed in version 14May2021.

Aided by features of the bundled `{fmt}` library, error messages now can have a variable number of arguments and the string will be interpreted as a `{fmt}` style format string so that custom error messages can be easily customized without having to use temporary buffers and `sprintf()`. Example:

Old:

```

if (fptr == NULL) {
    char str[128];
    sprintf(str, "Cannot open AEAM potential file %s", filename);
    error->one(FLERR, str);
}

```

New:

```

if (fptr == nullptr)
    error->one(FLERR, "Cannot open AEAM potential file {}: {}", filename,
↳utils::getsyserror());

```

### 15.9.7 Use of “override” instead of “virtual”

Changed in version 17Feb2022.

Since LAMMPS requires C++11 we switched to use the “override” keyword instead of “virtual” to indicate polymorphism in derived classes. This allows the C++ compiler to better detect inconsistencies when an override is intended or not. Please note that “override” has to be added to **all** polymorph functions in derived classes and “virtual” *only* to the function in the base class (or the destructor). Here is an example from the `FixWallReflect` class:

Old:

```

FixWallReflect(class LAMMPS *, int, char **);
virtual ~FixWallReflect();
int setmask();
void init();
void post_integrate();

```

New:

```

FixWallReflect(class LAMMPS *, int, char **);
~FixWallReflect() override;
int setmask() override;
void init() override;
void post_integrate() override;

```

This change set will neither cause a compilation failure, nor will it change functionality, but if you plan to submit the updated code for inclusion into the LAMMPS distribution, it will be requested for achieve a consistent *programming style*.

### 15.9.8 Simplified function names for forward and reverse communication

Changed in version 24Mar2022.

Rather than using the function name to distinguish between the different forward and reverse communication functions for styles, LAMMPS now uses the type of the “this” pointer argument.

Old:

```

comm->forward_comm_pair(this);
comm->forward_comm_fix(this);
comm->forward_comm_compute(this);

```

(continues on next page)

(continued from previous page)

```
comm->forward_comm_dump(this);  
comm->reverse_comm_pair(this);  
comm->reverse_comm_fix(this);  
comm->reverse_comm_compute(this);  
comm->reverse_comm_dump(this);
```

New:

```
comm->forward_comm(this);  
comm->reverse_comm(this);
```

This change is **required** or else the code will not compile.

## 15.9.9 Simplified and more compact neighbor list requests

Changed in version 24Mar2022.

This change set reduces the amount of code required to request a neighbor list. It enforces consistency and no longer requires to change internal data of the request. More information on neighbor list requests can be [found here](#). Example from the ComputeRDF class:

Old:

```
int irequest = neighbor->request(this,instance_me);  
neighbor->requests[irequest]->pair = 0;  
neighbor->requests[irequest]->compute = 1;  
neighbor->requests[irequest]->occasional = 1;  
if (cutflag) {  
    neighbor->requests[irequest]->cut = 1;  
    neighbor->requests[irequest]->cutoff = mycutneigh;  
}
```

New:

```
auto req = neighbor->add_request(this, NeighConst::REQ_OCCASIONAL);  
if (cutflag) req->set_cutoff(mycutneigh);
```

Public access to the NeighRequest class data members has been removed so this update is **required** to avoid compilation failure.

## 15.9.10 Split of fix STORE into fix STORE/GLOBAL and fix STORE/PERATOM

Changed in version 15Sep2022.

This change splits the GLOBAL and PERATOM modes of fix STORE into two separate fixes STORE/GLOBAL and STORE/PERATOM. There was very little shared code between the two fix STORE modes and the two different code paths had to be prefixed with if statements. Furthermore, some flags were used differently in the two modes leading to confusion. Splitting the code into two fix styles, makes it more easily maintainable. Since these are internal fixes, there is no user visible change.

Old:

```
#include "fix_store.h"

FixStore *fix = dynamic_cast<FixStore *>(
  modify->add_fix(fmt::format("{} {} STORE peratom 1 13",id_pole,group->names[0]));

FixStore *fix = dynamic_cast<FixStore *>(modify->get_fix_by_id(id_pole));
```

New:

```
#include "fix_store_peratom.h"

FixStorePeratom *fix = dynamic_cast<FixStorePeratom *>(
  modify->add_fix(fmt::format("{} {} STORE/PERATOM 1 13",id_pole,group->names[0]));

FixStorePeratom *fix = dynamic_cast<FixStorePeratom *>(modify->get_fix_by_id(id_pole));
```

Old:

```
#include "fix_store.h"

FixStore *fix = dynamic_cast<FixStore *>(
  modify->add_fix(fmt::format("{} {} STORE global 1 1",id_fix,group->names[igroup]));

FixStore *fix = dynamic_cast<FixStore *>(modify->get_fix_by_id(id_fix));
```

New:

```
#include "fix_store_global.h"

FixStoreGlobal *fix = dynamic_cast<FixStoreGlobal *>(
  modify->add_fix(fmt::format("{} {} STORE/GLOBAL 1 1",id_fix,group->names[igroup]));

FixStoreGlobal *fix = dynamic_cast<FixStoreGlobal *>(modify->get_fix_by_id(id_fix));
```

This change is **required** or else the code will not compile.

### 15.9.11 Use Output::get\_dump\_by\_id() instead of Output::find\_dump()

Changed in version 15Sep2022.

The accessor function to individual dump style instances has been changed from Output::find\_dump() returning the index of the dump instance in the list of dumps to Output::get\_dump\_by\_id() returning a pointer to the dump directly. Example:

Old:

```
int idump = output->find_dump(arg[iarg+1]);
if (idump < 0)
  error->all(FLERR, "Dump ID in hyper command does not exist");
memory->grow(dumplist,ndump+1,"hyper:dumplist");
dumplist[ndump++] = idump;

[...]
```

(continues on next page)

(continued from previous page)

```

if (dumpflag)
  for (int idump = 0; idump < ndump; idump++)
    output->dump[dumplist[idump]]->write();

```

New:

```

auto idump = output->get_dump_by_id(arg[iarg+1]);
if (!idump) error->all(FLERR, "Dump ID {} in hyper command does not exist", arg[iarg+1]);
dumplist.emplace_back(idump);

[...]

if (dumpflag) for (auto idump : dumplist) idump->write();

```

This change is **required** or else the code will not compile.

## 15.10 Writing plugins

Plugins provide a mechanism to add functionality to a LAMMPS executable without recompiling LAMMPS. The functionality for this and the *plugin command* are implemented in the *PLUGIN package* which must be installed to use plugins.

Plugins use the operating system's capability to load dynamic shared object (DSO) files in a way similar shared libraries and then reference specific functions in those DSOs. Any DSO file with plugins has to include an initialization function with a specific name, "lammplugin\_init", that has to follow specific rules described below. When loading the DSO with the "plugin" command, this function is looked up and called and will then register the contained plugin(s) with LAMMPS.

When the environment variable LAMMPS\_PLUGIN\_PATH is set, then LAMMPS will search the directory (or directories) listed in this path for files with names that end in *plugin.so* (e.g. *helloplugin.so*) and will try to load the contained plugins automatically at start-up. For plugins that are loaded this way, the behavior of LAMMPS should be identical to a binary where the corresponding code was compiled in statically as a package.

From the programmer perspective this can work because of the object oriented design of LAMMPS where all pair style commands are derived from the class *Pair*, all fix style commands from the class *Fix* and so on and usually only functions present in those base classes are called directly. When a *pair\_style command* or *fix command* is issued a new instance of such a derived class is created. This is done by a so-called factory function which is mapped to the style name. Thus when, for example, the LAMMPS processes the command `pair_style lj/cut 2.5`, LAMMPS will look up the factory function for creating the *PairLJCut* class and then execute it. The return value of that function is a *Pair \** pointer and the pointer will be assigned to the location for the currently active pair style.

A DSO file with a plugin thus has to implement such a factory function and register it with LAMMPS so that it gets added to the map of available styles of the given category. To register a plugin with LAMMPS an initialization function has to be present in the DSO file called `lammplugin_init` which is called with three `void *` arguments: a pointer to the current LAMMPS instance, a pointer to the opened DSO handle, and a pointer to the registration function. The registration function takes two arguments: a pointer to a `lammplugin_t` struct with information about the plugin and a pointer to the current LAMMPS instance. Please see below for an example of how the registration is done.

### 15.10.1 Members of `lammplugin_t`

Member	Description
<code>version</code>	LAMMPS Version string the plugin was compiled for
<code>style</code>	Style of the plugin (pair, bond, fix, command, etc.)
<code>name</code>	Name of the plugin style
<code>info</code>	String with information about the plugin
<code>author</code>	String with the name and email of the author
<code>creator.v1</code>	Pointer to factory function for pair, bond, angle, dihedral, improper, kspace, or command styles
<code>creator.v2</code>	Pointer to factory function for compute, fix, or region styles
<code>handle</code>	Pointer to the open DSO file handle

Only one of the two alternate creator entries can be used at a time and which of those is determined by the style of plugin. The “creator.v1” element is for factory functions of supported styles computing forces (i.e. pair, bond, angle, dihedral, or improper styles) or command styles and the function takes as single argument the pointer to the LAMMPS instance. The factory function is cast to the `lammplugin_factory1` type before assignment. The “creator.v2” element is for factory functions creating an instance of a fix, compute, or region style and takes three arguments: a pointer to the LAMMPS instance, an integer with the length of the argument list and a `char **` pointer to the list of arguments. The factory function pointer needs to be cast to the `lammplugin_factory2` type before assignment.

### 15.10.2 Pair style example

As an example, a hypothetical pair style plugin “morse2” implemented in a class `PairMorse2` in the files `pair_morse2.h` and `pair_morse2.cpp` with the factory function and initialization function would look like this:

```
#include "lammplugin.h"
#include "version.h"
#include "pair_morse2.h"

using namespace LAMMPS_NS;

static Pair *morse2creator(LAMMPS *lmp)
{
    return new PairMorse2(lmp);
}

extern "C" void lammplugin_init(void *lmp, void *handle, void *regfunc)
{
    lammplugin_regfunc register_plugin = (lammplugin_regfunc) regfunc;
    lammplugin_t plugin;

    plugin.version = LAMMPS_VERSION;
    plugin.style   = "pair";
    plugin.name    = "morse2";
    plugin.info    = "Morse2 variant pair style v1.0";
    plugin.author  = "Axel Kohlmeyer (akohlmey@gmail.com)";
    plugin.creator.v1 = (lammplugin_factory1 *) &morse2creator;
    plugin.handle  = handle;
    (*register_plugin)(amp;plugin, lmp);
}
```

The factory function in this example is called `morse2creator()`. It receives a pointer to the LAMMPS class

as only argument and thus has to be assigned to the *creator.v1* member of the plugin struct and cast to the `lammplugin_factory1` function pointer type. It returns a pointer to the allocated class instance derived from the `Pair` class. This function may be declared static to avoid clashes with other plugins. The name of the derived class, `PairMorse2`, however must be unique inside the entire LAMMPS executable.

### 15.10.3 Fix style example

If the factory function would be for a fix or compute, which take three arguments (a pointer to the LAMMPS class, the number of arguments and the list of argument strings), then the pointer type is `lammplugin_factory2` and it must be assigned to the *creator.v2* member of the plugin struct. Below is an example for that:

```
#include "lammplugin.h"
#include "version.h"
#include "fix_nve2.h"

using namespace LAMMPS_NS;

static Fix *nve2creator(LAMMPS *lmp, int argc, char **argv)
{
    return new FixNVE2(lmp,argc,argv);
}

extern "C" void lammplugin_init(void *lmp, void *handle, void *regfunc)
{
    lammplugin_regfunc register_plugin = (lammplugin_regfunc) regfunc;
    lammplugin_t plugin;

    plugin.version = LAMMPS_VERSION;
    plugin.style = "fix";
    plugin.name = "nve2";
    plugin.info = "NVE2 variant fix style v1.0";
    plugin.author = "Axel Kohlmeyer (akohlmey@gmail.com)";
    plugin.creator.v2 = (lammplugin_factory2 *) &nve2creator;
    plugin.handle = handle;
    (*register_plugin)(&plugin,lmp);
}
```

### 15.10.4 Command style example

Command styles also use the first variant of factory function as demonstrated in the following example, which also shows that the implementation of the plugin class may be within the same source file as the plugin interface code:

```
#include "lammplugin.h"

#include "comm.h"
#include "error.h"
#include "command.h"
#include "version.h"

#include <cstring>
```

(continues on next page)

(continued from previous page)

```

namespace LAMMPS_NS {
  class Hello : public Command {
  public:
    Hello(class LAMMPS *lmp) : Command(lmp) {};
    void command(int, char **);
  };
}

using namespace LAMMPS_NS;

void Hello::command(int argc, char **argv)
{
  if (argc != 1) error->all(FLERR, "Illegal hello command");
  if (comm->me == 0)
    utils::logmesg(lmp, fmt::format("Hello, {}!\n", argv[0]));
}

static void hellocreator(LAMMPS *lmp)
{
  return new Hello(lmp);
}

extern "C" void lammpsplugin_init(void *lmp, void *handle, void *regfunc)
{
  lammpsplugin_t plugin;
  lammpsplugin_regfunc register_plugin = (lammpsplugin_regfunc) regfunc;

  plugin.version = LAMMPS_VERSION;
  plugin.style   = "command";
  plugin.name    = "hello";
  plugin.info    = "Hello world command v1.1";
  plugin.author  = "Axel Kohlmeyer (akohlmey@gmail.com)";
  plugin.creator.v1 = (lammpsplugin_factory1 *) &hellocreator;
  plugin.handle  = handle;
  (*register_plugin)(amp;plugin, lmp);
}

```

### 15.10.5 Additional Details

The initialization function **must** be called `lammpsplugin_init`, it **must** have C bindings and it takes three void pointers as arguments. The first is a pointer to the LAMMPS class that calls it and it needs to be passed to the registration function. The second argument is a pointer to the internal handle of the DSO file, this needs to be added to the plugin info struct, so that the DSO can be closed and unloaded when all its contained plugins are unloaded. The third argument is a function pointer to the registration function and needs to be stored in a variable of `lammpsplugin_regfunc` type and then called with a pointer to the `lammpsplugin_t` struct and the pointer to the LAMMPS instance as arguments to register a single plugin. There may be multiple calls to multiple plugins in the same initialization function.

To register a plugin a struct of the `lammpsplugin_t` needs to be filled with relevant info: current LAMMPS version string, kind of style, name of style, info string, author string, pointer to factory function, and the DSO handle. The registration function is called with a pointer to the address of this struct and the pointer of the LAMMPS class. The registration function will then add the factory function of the plugin style to the respective style map under the provided name. It will also make a copy of the struct in a list of all loaded plugins and update the reference counter for loaded

plugins from this specific DSO file.

The pair style itself (i.e. the PairMorse2 class in this example) can be written just like any other pair style that is included in LAMMPS. For a plugin, the use of the PairStyle macro in the section encapsulated by `#ifdef PAIR_CLASS` is not needed, since the mapping of the class name to the style name is done by the plugin registration function with the information from the `lammpsplugin_t` struct. It may be included in case the new code is intended to be later included in LAMMPS directly.

A plugin may be registered under an existing style name. In that case the plugin will override the existing code. This can be used to modify the behavior of existing styles or to debug new versions of them without having to re-compile or re-install all of LAMMPS.

### 15.10.6 Compiling plugins

Plugins need to be compiled with the same compilers and libraries (e.g. MPI) and compilation settings (MPI on/off, OpenMP, integer sizes) as the LAMMPS executable and library. Otherwise the plugin will likely not load due to mismatches in the function signatures (LAMMPS is C++ so scope, type, and number of arguments are encoded into the symbol names and thus differences in them will lead to failed plugin load commands. Compilation of the plugin can be managed via both, CMake or traditional GNU makefiles. Some examples that can be used as a template are in the `examples/plugins` folder. The CMake script code has some small adjustments to allow building the plugins for running unit tests with them.

Another example that converts the KIM package into a plugin can be found in the `examples/kim/plugin` folder. No changes to the sources of the KIM package themselves are needed; only the plugin interface and loader code needs to be added. This example only supports building with CMake, but is probably a more typical example. To compile you need to run CMake with `-DLAMMPS_SOURCE_DIR=<path/to/lammps/src/folder>`. Other configuration setting are identical to those for compiling LAMMPS.

A second example for a plugin from a package is in the `examples/PACKAGES/pace/plugin` folder that will create a plugin from the ML-PACE package. In this case the bulk of the code is in a static external library that is being downloaded and compiled first and then combined with the pair style wrapper and the plugin loader. This example also contains a NSIS script that can be used to create an Installer package for Windows (the mutual licensing terms of the external library and LAMMPS conflict when distributing binaries, so the ML-PACE package cannot be linked statically, but the LAMMPS headers required to build the plugin are also available under a less restrictive license). This will automatically set the required environment variable and launching a (compatible) LAMMPS binary will load and register the plugin and the ML-PACE package can then be used as it was linked into LAMMPS.

## 15.11 Adding tests for unit testing

This section discusses adding or expanding tests for the unit test infrastructure included into the LAMMPS source code distribution. Unlike example inputs, unit tests focus on testing the “local” behavior of individual features, tend to run fast, and should be set up to cover as much of the added code as possible. When contributing code to the distribution, the LAMMPS developers will appreciate if additions to the integrated unit test facility are included.

Given the complex nature of MD simulations where many operations can only be performed when suitable “real” simulation environment has been set up, not all tests will be unit tests in the strict definition of the term. They are rather executed on a more abstract level by issuing LAMMPS script commands and then inspecting the changes to the internal data. For some classes of tests, generic test programs have been written that can be applied to parts of LAMMPS that use the same interface (via polymorphism) and those are driven by input files, so tests can be added by simply adding more of those input files. Those tests should be seen more as a hybrid between unit and regression tests.

When adding tests it is recommended to also *enable support for code coverage reporting*, and study the coverage reports so that it is possible to monitor which parts of the code of a given file are executed during the tests and which tests would need to be added to increase the coverage.

The tests are grouped into categories and corresponding folders. The following sections describe how the tests are implemented and executed in those categories with increasing complexity of tests and implementation.

### 15.11.1 Tests for utility functions

These tests are driven by programs in the `unittest/utils` folder and most closely resemble conventional unit tests. There is one test program for each namespace or group of classes or file. The naming convention for the sources and executables is that they start with `test_`. The following sources and groups of tests are currently available:

File name:	Test name:	Description:
<code>test_argutils.cpp</code>	ArgInfo	Tests for ArgInfo class used by LAMMPS
<code>test_fmtlib.cpp</code>	FmtLib	Tests for <code>fmtlib::</code> functions used by LAMMPS
<code>test_math_eigen_impl.cpp</code>	MathEigen	Tests for <code>MathEigen::</code> classes and functions
<code>test_mempool.cpp</code>	MemPool	Tests for <i>MyPage</i> and <i>MyPoolChunk</i>
<code>test_tokenizer.cpp</code>	Tokenizer	Tests for <i>Tokenizer</i> and <i>ValueTokenizer</i>
<code>test_utils.cpp</code>	Utils	Tests for <code>utils::</code> <i>functions</i>

To add tests either an existing source file needs to be modified or a new source file needs to be added to the distribution and enabled for testing. To add a new file suitable CMake script code needs to be added to the `CMakeLists.txt` file in the `unittest/utils` folder. Example:

```
add_executable(test_tokenizer test_tokenizer.cpp)
target_link_libraries(test_tokenizer PRIVATE lammops GTest::GMockMain GTest::GMock_
↳GTest::GTest)
add_test(Tokenizer test_tokenizer)
```

This adds instructions to build the `test_tokenizer` executable from `test_tokenizer.cpp` and links it with the GoogleTest libraries and the LAMMPS library as well as it uses the `main()` function from the GoogleMock library of GoogleTest. The third line registers the executable as a test program to be run from `ctest` under the name `Tokenizer`.

The test executable itself will execute multiple individual tests through the GoogleTest framework. In this case each test consists of creating a tokenizer class instance with a given string and explicit or default separator choice, and then executing member functions of the class and comparing their results with expected values. A few examples:

```
TEST(Tokenizer, empty_string)
{
    Tokenizer t("", " ");
    ASSERT_EQ(t.count(), 0);
}

TEST(Tokenizer, two_words)
{
    Tokenizer t("test word", " ");
    ASSERT_EQ(t.count(), 2);
}

TEST(Tokenizer, default_separators)
{
    Tokenizer t(" \r\n test \t word \f");
    ASSERT_THAT(t.next(), Eq("test"));
    ASSERT_THAT(t.next(), Eq("word"));
    ASSERT_EQ(t.count(), 2);
}
```

Each of these TEST functions will become an individual test run by the test program. When using the `ctest` command as a front end to run the tests, their output will be suppressed and only a summary printed, but adding the `'-V'` option will then produce output from the tests above like the following:

```
[...]
1: [ RUN      ] Tokenizer.empty_string
1: [         OK ] Tokenizer.empty_string (0 ms)
1: [ RUN      ] Tokenizer.two_words
1: [         OK ] Tokenizer.two_words (0 ms)
1: [ RUN      ] Tokenizer.default_separators
1: [         OK ] Tokenizer.default_separators (0 ms)
[...]
```

The MathEigen test collection has been adapted from a standalone test and does not use the GoogleTest framework and thus not representative. The other test sources, however, can serve as guiding examples for additional tests.

### 15.11.2 Tests for individual LAMMPS commands

The tests `unittest/commands` are a bit more complex as they require to first create a `LAMMPS` class instance and then use the `C++ API` to pass individual commands to that LAMMPS instance. For that reason these tests use a GoogleTest “test fixture”, i.e. a class derived from `testing::Test` that will create (and delete) the required LAMMPS class instance for each set of tests in a `TEST_F()` function. Please see the individual source files for different examples of setting up suitable test fixtures. Here is an example for implementing a test using a fixture by first checking the default value and then issuing LAMMPS commands and checking whether they have the desired effect:

```
TEST_F(SimpleCommandsTest, ResetTimestep)
{
    ASSERT_EQ(lmp->update->ntimestep, 0);

    BEGIN_HIDE_OUTPUT();
    command("reset_timestep 10");
    END_HIDE_OUTPUT();
    ASSERT_EQ(lmp->update->ntimestep, 10);

    BEGIN_HIDE_OUTPUT();
    command("reset_timestep 0");
    END_HIDE_OUTPUT();
    ASSERT_EQ(lmp->update->ntimestep, 0);

    TEST_FAILURE(".*ERROR: Timestep must be >= 0.*", command("reset_timestep -10"));
    TEST_FAILURE(".*ERROR: Illegal reset_timestep .*", command("reset_timestep"));
    TEST_FAILURE(".*ERROR: Illegal reset_timestep .*", command("reset_timestep 10 10"));
    TEST_FAILURE(".*ERROR: Expected integer .*", command("reset_timestep xxx"));
}
```

Please note the use of the `BEGIN_HIDE_OUTPUT` and `END_HIDE_OUTPUT` functions that will capture output from running LAMMPS. This is normally discarded but by setting the verbose flag (via setting the `TEST_ARGS` environment variable, `TEST_ARGS=-v`) it can be printed and used to understand why tests fail unexpectedly.

Another complexity of these tests stems from the need to capture situations where LAMMPS will stop with an error, i.e. handle so-called “death tests”. Here the LAMMPS code will operate differently depending on whether it was configured to throw C++ exceptions on errors or call either `exit()` or `MPI_Abort()`. In the latter case, the test code also needs to detect whether LAMMPS was compiled with the OpenMPI library, as OpenMPI is **only** compatible the death test options of the GoogleTest library when C++ exceptions are enabled; otherwise those “death tests” must be

skipped to avoid reporting bogus failures. The specifics of this step are implemented in the `TEST_FAILURE()` macro. These tests operate by capturing the screen output when executing the failing command and then comparing that with a provided regular expression string pattern. Example:

```
TEST_F(SimpleCommandsTest, UnknownCommand)
{
    TEST_FAILURE(".*ERROR: Unknown command.*", lmp->input->one("XXX one two"));
}
```

The following test programs are currently available:

File name:	Test name:	Description:
test_simple_commands.cpp	SimpleCommands	Tests for LAMMPS commands that do not require a box
test_lattice_region.cpp	LatticeRegion	Tests to validate the <i>lattice</i> and <i>region</i> commands
test_groups.cpp	GroupTest	Tests to validate the <i>group</i> command
test_variables.cpp	VariableTest	Tests to validate the <i>variable</i> command
test_kim_commands.cpp	KimCommands	Tests for several commands from the <i>KIM package</i>
test_reset_ids.cpp	ResetIDs	Tests to validate the <i>reset_atom_ids</i> and <i>reset_mol_ids</i> commands

### 15.11.3 Tests for the C-style library interface

Tests for validating the LAMMPS C-style library interface are in the `unittest/c-library` folder. They are implemented in either way used for utility functions and for LAMMPS commands, but use the functions implemented in the `src/library.cpp` file as much as possible. There may be some overlap with other tests, but only in as much as is required to test the C-style library API. The tests are distributed over multiple test programs which tries to match the grouping of the functions in the source code and *in the manual*.

This group of tests also includes tests invoking LAMMPS in parallel through the library interface, provided that LAMMPS was compiled with MPI support. These include tests where LAMMPS is run in multi-partition mode or only on a subset of the MPI world communicator. The CMake script code for adding this kind of test looks like this:

```
if (BUILD_MPI)
    add_executable(test_library_mpi test_library_mpi.cpp)
    target_link_libraries(test_library_mpi PRIVATE lammps GTest::GTest GTest::GMock)
    target_compile_definitions(test_library_mpi PRIVATE ${TEST_CONFIG_DEFS})
    add_mpi_test(NAME LibraryMPI NUM_PROCS 4 COMMAND $<TARGET_FILE:test_library_mpi>)
endif()
```

Note the custom function `add_mpi_test()` which adapts how `ctest` will execute the test so it is launched in parallel (with 4 MPI ranks).

### 15.11.4 Tests for the Python module and package

The `unittest/python` folder contains primarily tests for classes and functions in the LAMMPS python module but also for commands in the PYTHON package. These tests are only enabled, if the necessary prerequisites are detected or enabled during configuration and compilation of LAMMPS (shared library build enabled, Python interpreter found, Python development files found).

The Python tests are implemented using the `unittest` standard Python module and split into multiple files with similar categories as the tests for the C-style library interface.

### 15.11.5 Tests for the Fortran interface

Tests for using the Fortran module are in the `unittest/fortran` folder. Since they are also using the GoogleTest library, they require to also implement test wrappers in C++ that will call fortran functions which provide a C function interface through `ISO_C_BINDINGS` that will in turn call the functions in the LAMMPS Fortran module. This part of the unit tests is incomplete since the Fortran module it is based on is incomplete as well.

### 15.11.6 Tests for the C++-style library interface

The tests in the `unittest/cplusplus` folder are somewhat similar to the tests for the C-style library interface, but do not need to test the several convenience and utility functions that are only available through the C-style interface. Instead it can focus on the more generic features that are used internally. This part of the unit tests is currently still mostly in the planning stage.

### 15.11.7 Tests for reading and writing file formats

The `unittest/formats` folder contains test programs for reading and writing files like data files, restart files, potential files or dump files. This covers simple things like the file i/o convenience functions in the `utils::` namespace to complex tests of atom styles where creating and deleting of atoms with different properties is tested in different ways and through script commands or reading and writing of data or restart files.

### 15.11.8 Tests for styles computing or modifying forces

These are tests common configurations for pair styles, bond styles, angle styles, kspace styles and certain fix styles. Those are tests driven by some test executables build from sources in the `unittest/force-styles` folder and use LAMMPS input template and data files as well as input files in YAML format from the `unittest/force-styles/tests` folder. The YAML file names have to follow some naming conventions so they get associated with the test programs and categorized and listed with canonical names in the list of tests as displayed by `ctest -N`. If you add a new YAML file, you need to re-run CMake to update the corresponding list of tests.

A minimal YAML file for a (molecular) pair style test will look something like the following (see `mol-pair-zero.yaml`):

```
---
lammps_version: 24 Aug 2020
date_generated: Tue Sep 15 09:44:21 202
epsilon: 1e-14
prerequisites: ! |
  atom full
  pair zero
pre_commands: ! ""
```

(continues on next page)

(continued from previous page)

```

post_commands: ! ""
input_file: in.fourmol
pair_style: zero 8.0
pair_coeff: ! |
  * *
extract: ! ""
natoms: 29
init_vdwl: 0
init_coul: 0

[...]

```

The following table describes the available keys and their purpose for testing pair styles:

Key:	Description:
lammmps_version	LAMMPS version used to last update the reference data
date_generated	date when the file was last updated
epsilon	base value for the relative precision required for tests to pass
prerequisites	list of style kind / style name pairs required to run the test
pre_commands	LAMMPS commands to be executed before the input template file is read
post_commands	LAMMPS commands to be executed right before the actual tests
input_file	LAMMPS input file template based on pair style zero
pair_style	arguments to the pair_style command to be tested
pair_coeff	list of pair_coeff arguments to set parameters for the input template
extract	list of keywords supported by Pair::extract() and their dimension
natoms	number of atoms in the input file template
init_vdwl	non-Coulomb pair energy after “run 0”
init_coul	Coulomb pair energy after “run 0”
init_stress	stress tensor after “run 0”
init_forces	forces on atoms after “run 0”
run_vdwl	non-Coulomb pair energy after “run 4”
run_coul	Coulomb pair energy after “run 4”
run_stress	stress tensor after “run 4”
run_forces	forces on atoms after “run 4”

The test program will read all this data from the YAML file and then create a LAMMPS instance, apply the settings/commands from the YAML file as needed and then issue a “run 0” command, write out a restart file, a data file and a coeff file. The actual test will then compare computed energies, stresses, and forces with the reference data, issue a “run 4” command and compare to the second set of reference data. This will be run with both the newton\_pair setting enabled and disabled and is expected to generate the same results (allowing for some numerical noise). Then it will restart from the previously generated restart and compare with the reference and also start from the data file. A final check will use multi-cutoff r-RESPA (if supported by the pair style) at a 1:1 split and compare to the Verlet results. These sets of tests are run with multiple test fixtures for accelerated styles (OPT, OPENMP, INTEL) and for the latter two with 4 OpenMP threads enabled. For these tests the relative error (epsilon) is lowered by a common factor due to the additional numerical noise, but the tests are still comparing to the same reference data.

Additional tests will check whether all listed extract keywords are supported and have the correct dimensionality and the final set of tests will set up a few pairs of atoms explicitly and in such a fashion that the forces on the atoms computed from Pair::compute() will match individually with the results from Pair::single(), if the pair style does support that functionality.

With this scheme a large fraction of the code of any tested pair style will be executed and consistent results are required for different settings and between different accelerated pair style variants and the base class, as well as for computing

individual pairs through the `Pair::single()` where supported.

The `test_pair_style` tester is used with 4 categories of test inputs:

- pair styles compatible with molecular systems using bonded interactions and exclusions. For pair styles requiring a KSpace style the KSpace computations are disabled. The YAML files match the pattern “mol-pair-\*.yaml” and the tests are correspondingly labeled with “MolPairStyle:\*”
- pair styles not compatible with the previous input template. The YAML files match the pattern “atomic-pair-\*.yaml” and the tests are correspondingly labeled with “AtomicPairStyle:\*”
- manybody pair styles. The YAML files match the pattern “atomic-pair-\*.yaml” and the tests are correspondingly labeled with “AtomicPairStyle:\*”
- kspace styles. The YAML files match the pattern “kspace-\*.yaml” and the tests are correspondingly labeled with “KSpaceStyle:\*”. In these cases a compatible pair style is defined, but the computation of the pair style contributions is disabled.

The `test_bond_style` and `test_angle_style` are set up in a similar fashion and share support functions with the pair style tester. The final group of tests in this section is for fix styles that add/manipulate forces and velocities, e.g. for time integration, thermostats and more.

Adding a new test is easiest done by copying and modifying an existing test for a style that is similar to one to be tested. The file name should follow the naming conventions described above and after copying the file, the first step is to replace the style names where needed. The coefficient values do not have to be meaningful, just in a reasonable range for the given system. It does not matter if some forces are large, for as long as they do not diverge.

The template input files define a large number of index variables at the top that can be modified inside the YAML file to control the behavior. For example, if a pair style requires a “newton on” setting, the following can be used in as the “pre\_commands” section:

```
pre_commands: ! |
  variable newton_pair delete
  variable newton_pair index on
```

And for a pair style requiring a kspace solver the following would be used as the “post\_commands” section:

```
post_commands: ! |
  pair_modify table 0
  kspace_style pppm/tip4p 1.0e-6
  kspace_modify gewald 0.3
  kspace_modify compute no
```

Note that this disables computing the kspace contribution, but still will run the setup. The “gewald” parameter should be set explicitly to speed up the run. For styles with long-range electrostatics, typically two tests are added one using the (slower) analytic approximation of the `erfc()` function and the other using the tabulated coulomb, to test both code paths. The reference results in the YAML files then should be compared manually, if they agree well enough within the limits of those two approximations.

The `test_pair_style` and equivalent programs have special command line options to update the YAML files. Running a command like

```
$ test_pair_style mol-pair-lennard_mdf.yaml -g new.yaml
```

will read the settings from the `mol-pair-lennard_mdf.yaml` file and then compute the reference data and write a new file with to `new.yaml`. If this step fails, there are likely some (LAMMPS or YAML) syntax issues in the YAML file that need to be resolved and then one can compare the two files to see if the output is as expected.

It is also possible to do an update in place with:

```
$ test_pair_style mol-pair-lennard_mdf.yaml -u
```

And one can finally run the full set of tests with:

```
$ test_pair_style mol-pair-lennard_mdf.yaml
```

This will just print a summary of the groups of tests. When using the “-v” flag the test will also keep any LAMMPS output and when using the “-s” flag, there will be some statistics reported on the relative errors for the individual checks which can help to figure out what would be a good choice of the epsilon parameter. It should be as small as possible to catch any unintended side effects from changes elsewhere, but large enough to accommodate the numerical noise due to the implementation of the potentials and differences in compilers.

---

**Note:** These kinds of tests can be very sensitive to compiler optimization and thus the expectation is that they pass with compiler optimization turned off. When compiler optimization is enabled, there may be some failures, but one has to carefully check whether those are acceptable due to the enhanced numerical noise from reordering floating-point math operations or due to the compiler mis-compiling the code. That is not always obvious.

---

### 15.11.9 Tests for programs in the tools folder

The `unittest/tools` folder contains tests for programs in the `tools` folder. This currently only contains tests for the LAMMPS shell, which are implemented as a python scripts using the `unittest` Python module and launching the tool commands through the `subprocess` Python module.

## 15.12 C++ base classes

LAMMPS is designed to be used as a C++ class library where one can set up and drive a simulation through creating a class instance and then calling some abstract operations or commands on that class or its member class instances. These are interfaced to the *C library API*, which providing an additional level of abstraction simplification for common operations. The C API is also the basis for calling LAMMPS from Python or Fortran.

When used from a C++ program, most of the symbols and functions in LAMMPS are wrapped into the `LAMMPS_NS` namespace so they will not collide with your own classes or other libraries. This, however, does not extend to the additional libraries bundled with LAMMPS in the `lib` folder and some of the low-level code of some packages.

Behind the scenes this is implemented through inheritance and polymorphism where base classes define the abstract interface and derived classes provide the specialized implementation for specific models or optimizations or ports to accelerator platforms. This document will provide an outline of the fundamental class hierarchy and some selected examples for derived classes of specific models.

---

**Note:** Please see the *note about thread-safety* in the library Howto doc page.

---

### 15.12.1 LAMMPS Class

The LAMMPS class is encapsulating an MD simulation state and thus it is the class that needs to be created when starting a new simulation system state. The LAMMPS executable essentially creates one instance of this class and passes the command line flags and tells it to process the provided input (a file or `stdin`). It shuts the class down when control is returned to it and then exits. When using LAMMPS as a library from another code it is required to create an instance of this class, either directly from C++ with `new LAMMPS()` or through one of the library interface functions like `lammps_open()` of the C-library interface, or the `lammps.lammps` class constructor of the Python module, or the `lammps()` constructor of the Fortran module.

In order to avoid clashes of function names, all of the core code in LAMMPS is placed into the `LAMMPS_NS` namespace. Functions or variables outside of that namespace must be “static”, i.e. visible only to the scope of the file/object they are defined in. Code in packages or the libraries in the `lib` folder may not adhere to this as some of them are adapted from legacy code or consist of external libraries with their own requirements and policies.

---

class **LAMMPS**

*LAMMPS* simulation instance.

The *LAMMPS* class contains pointers of all constituent class instances and global variables that are used by a *LAMMPS* simulation. Its contents represent the entire state of the simulation.

The *LAMMPS* class manages the components of an MD simulation by creating, deleting, and initializing instances of the classes it is composed of, processing command line flags, and providing access to some global properties. The specifics of setting up and running a simulation are handled by the individual component class instances.

#### Public Functions

const char \***match\_style**(const char \*style, const char \*name)

Return name of package that a specific style belongs to.

This function checks the given name against all list of styles for all type of styles and if the name and the style match, it returns which package this style belongs to.

##### Parameters

- **style** – Type of style (e.g. atom, pair, fix, etc.)
- **name** – Name of style

##### Returns

Name of the package this style is part of

**LAMMPS**(int, char\*\*, MPI\_Comm)

Create a *LAMMPS* simulation instance

The *LAMMPS* constructor starts up a simulation by allocating all fundamental classes in the necessary order, parses input switches and their arguments, initializes communicators, screen and logfile output FILE pointers.

##### Parameters

- **narg** – number of arguments
- **arg** – list of arguments
- **communicator** – MPI communicator used by this *LAMMPS* instance

**~LAMMPS()**

Shut down a *LAMMPS* simulation instance

The *LAMMPS* destructor shuts down the simulation by deleting top-level class instances, closing screen and log files for the global instance (aka “world”) and files and MPI communicators in sub-partitions (“universes”). Then it deletes the fundamental class instances and copies of data inside the class.

**Public Static Functions**

static bool **is\_installed\_pkg**(const char \*pkg)

Return true if a *LAMMPS* package is enabled in this binary

**Parameters**

**pkg** – name of package

**Returns**

true if yes, else false

class **Pointers**

Base class for *LAMMPS* features.

The *Pointers* class contains references to many of the pointers and members of the *LAMMPS\_NS::LAMMPS* class. Derived classes thus gain access to the constituent class instances in the *LAMMPS* composite class and thus to the core functionality of *LAMMPS*.

This kind of construct is needed, since the *LAMMPS* constructor should only be run once per *LAMMPS* instance and thus classes cannot be derived from *LAMMPS* itself. The *Pointers* class constructor instead only initializes C++ references to component pointer in the *LAMMPS* class.

Subclassed by *Atom*, *Input*, *PotentialFileReader*

**15.12.2 LAMMPS Atom and AtomVec Base Classes**

class **Atom** : protected *Pointers*

Class to provide access to atom data.

The *Atom* class provides access to atom style related global settings and per-atom data that is stored with atoms and migrates with them from sub-domain to sub-domain as atoms move around. This includes topology data, which is stored with either one specific atom or all atoms involved depending on the settings of the *newton command*.

The actual per-atom data is allocated and managed by one of the various classes derived from the *AtomVec* class as determined by the *atom\_style command*. The pointers in the *Atom* class are updated by the *AtomVec* class as needed.

## Public Functions

**Atom**(class *LAMMPS*\*)

*Atom* class constructor

This resets and initialized all kinds of settings, parameters, and pointer variables for per-atom arrays. This also initializes the factory for creating instances of classes derived from the AtomVec base class, which correspond to the selected atom style.

### Parameters

**\_lmp** – pointer to the base *LAMMPS* class

virtual int **add\_custom**(const char\*, int, int)

Add a custom per-atom property with the given name and type and size.

This function will add a custom per-atom property with one or more values with the name “name” to the list of custom properties. This function is called, e.g. from *fix property/atom*.

### Parameters

- **name** – Name of the property (w/o a “i\_” or “d\_” or “i2\_” or “d2\_” prefix)
- **flag** – Data type of property: 0 for int, 1 for double
- **cols** – Number of values: 0 for a single value, 1 or more for a vector of values

### Returns

index of property in the respective list of properties

virtual void **remove\_custom**(int, int, int)

Remove a custom per-atom property of a given type and size.

This will remove a property that was requested, e.g. by the *fix property/atom* command. It frees the allocated memory and sets the pointer to `nullptr` for the entry in the list so it can be reused. The lists of these pointers are never compacted or shrink, so that indices to name mappings remain valid.

### Parameters

- **index** – Index of property in the respective list of properties
- **flag** – Data type of property: 0 for int, 1 for double
- **cols** – Number of values: 0 for a single value, 1 or more for a vector of values

void **\*extract**(const char\*)

Provide access to internal data of the *Atom* class by keyword

This function is a way to access internal per-atom data. This data is distributed across MPI ranks and thus only the data for “local” atoms are expected to be available. Whether also data for “ghost” atoms is stored and up-to-date depends on various simulation settings.

This table lists a large part of the supported names, their data types, length of the data area, and a short description.

Name	Type	Items per atom	Description
mass	double	1	per-type mass. This array is <b>NOT</b> a per-atom array but of length <code>nTYPES+1</code> , element 0 is ignored.
id	tagint	1	atom ID of the particles
type	int	1	atom type of the particles
mask	int	1	bitmask for mapping to groups. Individual bits are set to 0 or 1 for each group.
image	imageint	1	3 image flags encoded into a single integer. See <a href="#">lammers_encode_image_flags()</a> .
x	double	3	x-, y-, and z-coordinate of the particles
v	double	3	x-, y-, and z-component of the velocity of the particles
f	double	3	x-, y-, and z-component of the force on the particles
molecule	int	1	molecule ID of the particles
q	double	1	charge of the particles
mu	double	3	dipole moment of the particles
omega	double	3	x-, y-, and z-component of rotational velocity of the particles
angmom	double	3	x-, y-, and z-component of angular momentum of the particles
torque	double	3	x-, y-, and z-component of the torque on the particles
radius	double	1	radius of the (extended) particles
rmass	double	1	per-atom mass of the particles. <code>nullptr</code> if per-type masses are used. See the <a href="#">rmass_flag</a> setting.
ellipsoid	int	1	1 if the particle is an ellipsoidal particle, 0 if not
line	int	1	1 if the particle is a line particle, 0 if not
tri	int	1	1 if the particle is a triangulated particle, 0 if not
body	int	1	1 if the particle is a body particle, 0 if not
quat	double	4	four quaternion components of the particles
i_name	int	1	single integer value defined by fix property/atom vector name
d_name	double	1	single double value defined by fix property/atom vector name
i2_name	int	n	N integer values defined by fix property/atom array name
d2_name	double	n	N double values defined by fix property/atom array name

*See also*

[lammers\\_extract\\_atom\(\)](#)

**See also:**

[extract\\_datatype](#)

**Parameters**

**name** – string with the keyword of the desired property. Typically the name of the pointer variable returned

**Returns**

pointer to the requested data cast to `void *` or `nullptr`

int **extract\_datatype**(const char\*)

Provide data type info about internal data of the *Atom* class

New in version 18Sep2020.

**See also:**

*extract*

**Parameters**

**name** – string with the keyword of the desired property.

**Returns**

data type constant for desired property or -1

struct **PerAtom**

### 15.12.3 LAMMPS Input Base Class

class **Input** : protected *Pointers*

Class for processing commands and input files.

The Input class contains methods for reading, pre-processing and parsing LAMMPS commands and input files and will dispatch commands to the respective class instances or contains the code to execute the commands directly. It also contains the instance of the Variable class which performs computations and text substitutions.

**Public Functions**

**Input**(class *LAMMPS\**, int, char\*\*)

*Input* class constructor

This sets up the input processing, processes the *-var* and *-echo* command line flags, holds the factory of commands and creates and initializes an instance of the Variable class.

To execute a command, a specific class instance, derived from *Command*, is created, then its *command()* member function executed, and finally the class instance is deleted.

**Parameters**

- **lmp** – pointer to the base *LAMMPS* class
- **argc** – number of entries in *argv*

- **argv** – argument vector

void **file()**

Process all input from the FILE \* pointer *infile*

This will read lines from *infile*, parse and execute them until the end of the file is reached. The *infile* pointer will usually point to `stdin` or the input file given with the `-in` command line flag.

void **file(const char\*)**

Process all input from the file *filename*

This function opens the file at the path *filename*, put the current file pointer stored in *infile* on a stack and instead assign *infile* with the newly opened file pointer. Then it will call the `Input::file()` function to read, parse and execute the contents of that file. When the end of the file is reached, it is closed and the previous file pointer from the *infile* file pointer stack restored to *infile*.

#### Parameters

**filename** – name of file with *LAMMPS* commands

char \***one(const std::string&)**

Process a single command from a string in *single*

This function takes the text in *single*, makes a copy, parses that, executes the command and returns the name of the command (without the arguments). If there was no command in *single* it will return `nullptr`.

#### Parameters

**single** – string with *LAMMPS* command

#### Returns

string with name of the parsed command w/o arguments

## 15.13 Platform abstraction functions

The `platform` sub-namespace inside the `LAMMPS_NS` namespace provides a collection of wrapper and convenience functions and utilities that perform common tasks for which platform specific code would be required or for which a more high-level abstraction would be convenient and reduce duplicated code. This reduces redundant implementations and encourages consistent behavior and thus has some overlap with the “*utils*” sub-namespace.

### 15.13.1 Time functions

double `LAMMPS_NS::platform::cputime()`

Return the consumed CPU time for the current process in seconds

This is a wrapper around the POSIX function `getrusage()` and its Windows equivalent. It is to be used in a similar fashion than `MPI_Wtime()`. Its resolution may be rather low so it can only be trusted when observing processes consuming at seconds or more of CPU time.

#### Returns

used CPU time in seconds

double `LAMMPS_NS::platform::walltime()`

Return the wall clock state for the current process in seconds

This clock is counting continuous time is initialized during Load of the executable/library. Its absolute value must be considered arbitrary and thus elapsed wall times are measured in taking differences. It is therefore to be used in a similar fashion as `MPI_Wtime()` but has a different offset, usually leading to better resolution.

**Returns**

wall clock time in seconds

`void LAMMPS_NS::platform::usleep(int usec)`

Suspend execution for a microsecond interval

This emulates the `usleep(3)` BSD function call also mentioned in POSIX.1-2001. This is not a precise delay; it may be longer, but not shorter.

**Parameters**

`usec` – length of delay in microseconds

### 15.13.2 Platform information functions

`std::string LAMMPS_NS::platform::os_info()`

Return string with the operating system version and architecture info

**Returns**

string with info about the OS and the platform is is running on

`std::string LAMMPS_NS::platform::compiler_info()`

Return string with compiler version info

This function uses predefined compiler macros to identify Compilers and their version and configuration info.

**Returns**

string with the compiler information text

`std::string LAMMPS_NS::platform::cxx_standard()`

Return string with C++ standard version used to compile *LAMMPS*.

This function uses predefined compiler macros to identify the C++ standard version used to compile *LAMMPS* with.

**Returns**

string with the C++ standard version or “unknown”

`std::string LAMMPS_NS::platform::openmp_standard()`

Return string with OpenMP standard version info

This function uses predefined compiler macros to identify OpenMP support and the supported version of the standard.

**Returns**

string with the openmp information text

`std::string LAMMPS_NS::platform::mpi_vendor()`

Return string with MPI vendor info

This function uses predefined macros to identify the vendor of the MPI library used.

**Returns**

string with the MPI vendor information text

```
std::string LAMMPS_NS::platform::mpi_info(int &major, int &minor)
```

Return string with MPI version info

This function uses predefined macros and MPI function calls to identify the version of the MPI library used.

#### Parameters

- **major** – major version of the MPI standard (set on exit)
- **minor** – minor version of the MPI standard (set on exit)

#### Returns

string with the MPI version information text

```
std::string LAMMPS_NS::platform::compress_info()
```

Return string with list of available compression types and executables

This function tests which of the supported compression executables are available for reading or writing compressed files where supported.

#### Returns

string with list of available compression tools

### 15.13.3 File and path functions and global constants

```
constexpr char LAMMPS_NS::platform::filepathsep[] = "/"
```

Platform specific file path component separator

This is a string with the character that separates directories and filename in paths on a platform. If multiple are characters are provided, the first is the preferred one.

```
constexpr char LAMMPS_NS::platform::pathvarsep = ':'
```

Platform specific path environment variable component separator

This is the character that separates entries in “PATH”-style environment variables.

```
const char *LAMMPS_NS::platform::guesspath(FILE *fp, char *buf, int len)
```

Try to detect pathname from FILE pointer

Currently only supported on Linux, MacOS, and Windows. Otherwise will report “(unknown)”.

On Linux the folder `/proc/self/fd` holds symbolic links to the actual pathnames associated with each open file descriptor of the current process. On MacOS the same kind of information can be obtained using `fcntl(fd, F_GETPATH, buf)`. On Windows we use `GetFinalPathNameByHandleA()` which is available with Windows Vista and later. If the buffer is too small (< 16 bytes) a null pointer is returned.

This function is used to provide a filename with error messages in functions where the filename is not passed as an argument, but the FILE \* pointer.

#### Parameters

- **fp** – FILE pointer struct from STDIO library for which we want to detect the name
- **buf** – storage buffer for pathname. output will be truncated if not large enough
- **len** – size of storage buffer. output will be truncated to this length - 1

**Returns**

pointer to the storage buffer with path or a NULL pointer if buf is invalid or the buffer size is too small

std::string LAMMPS\_NS::platform::path\_basename(const std::string &path)

Strip off leading part of path, return just the filename

**Parameters**

**path** – file path

**Returns**

file name

std::string LAMMPS\_NS::platform::path\_join(const std::string &a, const std::string &b)

Join two pathname segments

This uses the forward slash ‘/’ character unless *LAMMPS* is compiled for Windows where it uses the backward slash ‘\’

**Parameters**

- **a** – first path
- **b** – second path

**Returns**

combined path

bool LAMMPS\_NS::platform::file\_is\_readable(const std::string &path)

Check if file exists and is readable

**Parameters**

**path** – file path

**Returns**

true if file exists and is readable

bool LAMMPS\_NS::platform::is\_console(FILE \*fp)

Check if a file pointer may be connected to a console

**Parameters**

**fp** – file pointer

**Returns**

true if the file pointer is flagged as a TTY

bool LAMMPS\_NS::platform::path\_is\_directory(const std::string &path)

Check if a path is a directory

**Parameters**

**path** – directory path

**Returns**

true if the directory exists

std::string LAMMPS\_NS::platform::current\_directory()

Get string with path to the current directory

**Returns**

path to the current directory or empty string

`std::vector<std::string> LAMMPS_NS::platform::list_directory(const std::string &dir)`

Get list of entries in a directory

This provides a list of strings of the entries in the directory without the leading path name while also skipping over “..” and “.”.

**Parameters**

**dir** – path to directory

**Returns**

vector with strings of all directory entries

`int LAMMPS_NS::platform::chdir(const std::string &path)`

Change current directory

**Parameters**

**path** – new current working directory path

**Returns**

-1 if unsuccessful, otherwise  $\geq 0$

`int LAMMPS_NS::platform::mkdir(const std::string &path)`

Create a directory

Unlike the the `mkdir()` or `_mkdir()` functions of the C library, this function will also try to create non-existing sub-directories in case they don't exist, and thus behave like the `mkdir -p` command rather than plain `mkdir` or ``md`.

**Parameters**

**path** – directory path

**Returns**

-1 if unsuccessful, otherwise  $\geq 0$

`int LAMMPS_NS::platform::rmdir(const std::string &path)`

Delete a directory

Unlike the the `rmdir()` or `_rmdir()` functions of the C library, this function will check for the contents of the folder and recurse into any sub-folders, if necessary and delete all contained folders and their contents before deleting the folder *path*.

**Parameters**

**path** – directory path

**Returns**

-1 if unsuccessful, otherwise  $\geq 0$

`int LAMMPS_NS::platform::unlink(const std::string &path)`

Delete a file

**Parameters**

**path** – path to file to be deleted

**Returns**

0 on success, -1 on error

### 15.13.4 Standard I/O function wrappers

constexpr bigint LAMMPS\_NS::platform::END\_OF\_FILE = -1  
constant to seek to the end of the file

bigint LAMMPS\_NS::platform::ftell(FILE \*fp)

Get current file position

**Parameters**

**fp** – FILE pointer of the given file

**Returns**

current FILE pointer position cast to a bigint

int LAMMPS\_NS::platform::fseek(FILE \*fp, bigint pos)

Set absolute file position

If the absolute position is END\_OF\_FILE, then position at the end of the file.

**Parameters**

- **fp** – FILE pointer of the given file
- **pos** – new position of the FILE pointer

**Returns**

0 if successful, otherwise -1

int LAMMPS\_NS::platform::ftruncate(FILE \*fp, bigint length)

Truncate file to a given length and re-position file pointer

**Parameters**

- **fp** – FILE pointer of the given file
- **length** – length to which the file is being truncated to

**Returns**

0 if successful, otherwise -1

FILE \*LAMMPS\_NS::platform::popen(const std::string &cmd, const std::string &mode)

Open a pipe to a command for reading or writing

**Parameters**

- **cmd** – command for the pipe
- **mode** – “r” for reading from *cmd* or “w” for writing to *cmd*

**Returns**

file pointer to the pipe if successful or null

int LAMMPS\_NS::platform::pclose(FILE \*fp)

Close a previously opened pipe

**Parameters**

**fp** – FILE pointer for the pipe

**Returns**

exit status of the pipe command or -1 in case of errors

### 15.13.5 Environment variable functions

int LAMMPS\_NS::platform::putenv(const std::string &vardef)

Add variable to the environment

**Parameters**

**vardef** – variable name or variable definition (NAME=value)

**Returns**

-1 if failure otherwise 0

int LAMMPS\_NS::platform::unsetenv(const std::string &variable)

Delete variable from the environment

**Parameters**

**variable** – variable name

**Returns**

-1 if failure otherwise 0

std::vector<std::string> LAMMPS\_NS::platform::list\_pathenv(const std::string &var)

Get list of entries in a path environment variable

This provides a list of strings of the entries in an environment variable that is containing a “path” like “PATH” or “LD\_LIBRARY\_PATH”.

**Parameters**

**var** – name of the environment variable

**Returns**

vector with strings of all entries in that path variable

std::string LAMMPS\_NS::platform::find\_exe\_path(const std::string &cmd)

Find pathname of an executable in the standard search path

This function will traverse the list of directories in the PATH environment variable and look for the executable *cmd*. If the file exists and is executable the full path is returned as string, otherwise an empty string is returned.

On Windows the *cmd* string must not include an extension as this function will automatically append the extensions “.exe”, “.com” and “.bat” and look for those paths. On Windows also the current directory is checked (and first), while otherwise not unless “.” exists in the PATH environment variable.

Because of the nature of the check, this will not detect shell functions built-in command or aliases.

**Parameters**

**cmd** – name of command

**Returns**

vector with strings of all directory entries

### 15.13.6 Dynamically loaded object or library functions

void \*LAMMPS\_NS::platform::**dlopen**(const std::string &fname)

Open a shared object file or library

**Parameters**

**fname** – name or path of the shared object

**Returns**

handle to the shared object or null

int LAMMPS\_NS::platform::**dlclose**(void \*handle)

Close a shared object

This releases the object corresponding to the provided handle. Resolved symbols associated with this handle may not be used after this call

**Parameters**

**handle** – handle to an opened shared object

**Returns**

0 if successful, non-zero of not

void \*LAMMPS\_NS::platform::**dlsym**(void \*handle, const std::string &symbol)

Resolve a symbol in shared object

**Parameters**

- **handle** – handle to an opened shared object
- **symbol** – name of the symbol to extract

**Returns**

pointer to the resolved symbol or null

std::string LAMMPS\_NS::platform::**dlerror**()

Obtain error diagnostic info after dynamic linking function calls

Return a human-readable string describing the most recent error that occurred when using one of the functions for dynamic loading objects the last call to this function. The string is empty, if there was no error.

**Returns**

string with error message or empty

### 15.13.7 Compressed file I/O functions

bool LAMMPS\_NS::platform::**has\_compress\_extension**(const std::string &file)

Check if a file name ends in a known extension for a compressed file format

Currently supported file extensions are: .gz, .bz2, .zst, .xz, .lzma, lz4

**Parameters**

**file** – name of the file to check

**Returns**

true if the file has a known extension, otherwise false

FILE \*LAMMPS\_NS::platform::**compressed\_read**(const std::string &file)

Open pipe to compressed text file for reading

**Parameters****file** – name of the file to open**Returns**

FILE pointer to pipe using for reading the compressed file.

FILE \*LAMMPS\_NS::platform::compressed\_write(const std::string &amp;file)

Open pipe to compressed text file for writing

**Parameters****file** – name of the file to open**Returns**

FILE pointer to pipe using for reading the compressed file.

## 15.14 Utility functions

The `utils` sub-namespace inside the `LAMMPS_NS` namespace provides a collection of convenience functions and utilities that perform common tasks that are required repeatedly throughout the LAMMPS code like reading or writing to files with error checking or translation of strings into specific types of numbers with checking for validity. This reduces redundant implementations and encourages consistent behavior and thus has some overlap with the “*platform*” sub-namespace.

### 15.14.1 I/O with status check and similar functions

The the first two functions are wrappers around the corresponding C library calls `fgets()` or `fread()`. They will check if there were errors on reading or an unexpected end-of-file state was reached. In that case, the functions will stop with an error message, indicating the name of the problematic file, if possible unless the `error` argument is a NULL pointer.

The `utils::fgets_trunc()` function will work similar for `fgets()` but it will read in a whole line (i.e. until the end of line or end of file), but store only as many characters as will fit into the buffer including a final newline character and the terminating NULL byte. If the line in the file is longer it will thus be truncated in the buffer. This function is used by `utils::read_lines_from_file()` to read individual lines but make certain they follow the size constraints.

The `utils::read_lines_from_file()` function will read the requested number of lines of a maximum length into a buffer and will return 0 if successful or 1 if not. It also guarantees that all lines are terminated with a newline character and the entire buffer with a NULL character.

---

```
void LAMMPS_NS::utils::sfgets(const char *srcname, int srcline, char *s, int size, FILE *fp, const char
                             *filename, Error *error)
```

Safe wrapper around `fgets()` which aborts on errors or EOF and prints a suitable error message to help debugging.

Use `nullptr` as the error parameter to avoid the abort on EOF or error.

**Parameters**

- **srcname** – name of the calling source file (from `FLERR` macro)
- **srcline** – line in the calling source file (from `FLERR` macro)
- **s** – buffer for storing the result of `fgets()`
- **size** – size of buffer `s` (max number of bytes read by `fgets()`)
- **fp** – file pointer used by `fgets()`

- **filename** – file name associated with fp (may be a null pointer; then *LAMMPS* will try to detect)
- **error** – pointer to Error class instance (for abort) or nullptr

void LAMMPS\_NS::utils::sfread(const char \*srcname, int srcline, void \*s, size\_t size, size\_t num, FILE \*fp, const char \*filename, Error \*error)

Safe wrapper around fread() which aborts on errors or EOF and prints a suitable error message to help debugging.

Use nullptr as the error parameter to avoid the abort on EOF or error.

#### Parameters

- **srcname** – name of the calling source file (from FLERR macro)
- **srcline** – line in the calling source file (from FLERR macro)
- **s** – buffer for storing the result of fread()
- **size** – size of data elements read by fread()
- **num** – number of data elements read by fread()
- **fp** – file pointer used by fread()
- **filename** – file name associated with fp (may be a null pointer; then *LAMMPS* will try to detect)
- **error** – pointer to Error class instance (for abort) or nullptr

char \*LAMMPS\_NS::utils::fgets\_trunc(char \*s, int size, FILE \*fp)

Wrapper around fgets() which reads whole lines but truncates the data to the buffer size and ensures a newline char at the end.

This function is useful for reading line based text files with possible comments that should be parsed later. This applies to data files, potential files, atomfile variable files and so on. It is used instead of fgets() by utils::read\_lines\_from\_file().

#### Parameters

- **s** – buffer for storing the result of fgets()
- **size** – size of buffer s (max number of bytes returned)
- **fp** – file pointer used by fgets()

int LAMMPS\_NS::utils::read\_lines\_from\_file(FILE \*fp, int nlines, int nmax, char \*buffer, int me, MPI\_Comm comm)

Read N lines of text from file into buffer and broadcast them

This function uses repeated calls to fread() to fill a buffer with newline terminated text. If a line does not end in a newline (e.g. at the end of a file), it is added. The caller has to allocate an nlines by nmax sized buffer for storing the text data. Reading is done by MPI rank 0 of the given communicator only, and thus only MPI rank 0 needs to provide a valid file pointer.

#### Parameters

- **fp** – file pointer used by fread
- **nlines** – number of lines to be read
- **nmax** – maximum length of a single line
- **buffer** – buffer for storing the data.
- **me** – MPI rank of calling process in MPI communicator

- **comm** – MPI communicator for broadcast

**Returns**

1 if the read was short, 0 if read was successful

## 15.14.2 String to number conversions with validity check

These functions should be used to convert strings to numbers. They are strongly preferred over C library calls like `atoi()` or `atof()` since they check if the **entire** string is a valid (floating-point or integer) number, and will error out instead of silently returning the result of a partial conversion or zero in cases where the string is not a valid number. This behavior improves detecting typos or issues when processing input files.

Similarly the `utils::logical()` function will convert a string into a boolean and will only accept certain words.

The `do_abort` flag should be set to `true` in case this function is called only on a single MPI rank, as that will then trigger the a call to `Error::one()` for errors instead of `Error::all()` and avoids a “hanging” calculation when run in parallel.

Please also see `utils::is_integer()` and `utils::is_double()` for testing strings for compliance without conversion.

```
double LAMMPS_NS::utils::numeric(const char *file, int line, const std::string &str, bool do_abort, LAMMPS
                               *Imp)
```

Convert a string to a floating point number while checking if it is a valid floating point or integer number

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call `Error::one()` or `Error::all()`
- **Imp** – pointer to top-level *LAMMPS* class instance

**Returns**

double precision floating point number

```
double LAMMPS_NS::utils::numeric(const char *file, int line, const char *str, bool do_abort, LAMMPS *Imp)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call `Error::one()` or `Error::all()`
- **Imp** – pointer to top-level *LAMMPS* class instance

**Returns**

double precision floating point number

int LAMMPS\_NS::utils::inumeric(const char \*file, int line, const std::string &str, bool do\_abort, LAMMPS \*Imp)

Convert a string to an integer number while checking if it is a valid integer number (regular int)

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call Error::one() or Error::all()
- **Imp** – pointer to top-level LAMMPS class instance

**Returns**

integer number (regular int)

int LAMMPS\_NS::utils::inumeric(const char \*file, int line, const char \*str, bool do\_abort, LAMMPS \*Imp)

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call Error::one() or Error::all()
- **Imp** – pointer to top-level LAMMPS class instance

**Returns**

double precision floating point number

bigint LAMMPS\_NS::utils::bnumeric(const char \*file, int line, const std::string &str, bool do\_abort, LAMMPS \*Imp)

Convert a string to an integer number while checking if it is a valid integer number (bigint)

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call Error::one() or Error::all()
- **Imp** – pointer to top-level LAMMPS class instance

**Returns**

integer number (bigint)

bigint LAMMPS\_NS::utils::bnumeric(const char \*file, int line, const char \*str, bool do\_abort, LAMMPS \*Imp)

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number

- **do\_abort** – determines whether to call `Error::one()` or `Error::all()`
- **lmp** – pointer to top-level *LAMMPS* class instance

**Returns**

double precision floating point number

```
tagint LAMMPS_NS::utils::tnumeric(const char *file, int line, const std::string &str, bool do_abort, LAMMPS
                               *lmp)
```

Convert a string to an integer number while checking if it is a valid integer number (tagint)

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call `Error::one()` or `Error::all()`
- **lmp** – pointer to top-level *LAMMPS* class instance

**Returns**

integer number (tagint)

```
tagint LAMMPS_NS::utils::tnumeric(const char *file, int line, const char *str, bool do_abort, LAMMPS *lmp)
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to number
- **do\_abort** – determines whether to call `Error::one()` or `Error::all()`
- **lmp** – pointer to top-level *LAMMPS* class instance

**Returns**

double precision floating point number

```
int LAMMPS_NS::utils::logical(const char *file, int line, const std::string &str, bool do_abort, LAMMPS *lmp)
```

Convert a string to a boolean while checking whether it is a valid boolean term. Valid terms are ‘yes’, ‘no’, ‘true’, ‘false’, ‘on’, ‘off’, and ‘1’, ‘0’. Only lower case is accepted.

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to logical
- **do\_abort** – determines whether to call `Error::one()` or `Error::all()`
- **lmp** – pointer to top-level *LAMMPS* class instance

**Returns**

1 if string resolves to “true”, otherwise 0

int LAMMPS\_NS::utils::logical(const char \*file, int line, const char \*str, bool do\_abort, LAMMPS \*Imp)

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

**Parameters**

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be converted to logical
- **do\_abort** – determines whether to call Error::one() or Error::all()
- **Imp** – pointer to top-level LAMMPS class instance

**Returns**

1 if string resolves to “true”, otherwise 0

### 15.14.3 String processing

The following are functions to help with processing strings and parsing files or arguments.

---

char \*LAMMPS\_NS::utils::strdup(const std::string &text)

Make C-style copy of string in new storage

This allocates a storage buffer and copies the C-style or C++ style string into it. The buffer is allocated with “new” and thus needs to be deallocated with “delete[]”.

**Parameters**

**text** – string that should be copied

**Returns**

new buffer with copy of string

std::string LAMMPS\_NS::utils::lowercase(const std::string &line)

Convert string to lowercase

**Parameters**

**line** – string that should be converted

**Returns**

new string with all lowercase characters

std::string LAMMPS\_NS::utils::uppercase(const std::string &line)

Convert string to uppercase

**Parameters**

**line** – string that should be converted

**Returns**

new string with all uppercase characters

std::string LAMMPS\_NS::utils::trim(const std::string &line)

Trim leading and trailing whitespace. Like TRIM() in Fortran.

**Parameters**

**line** – string that should be trimmed

**Returns**

new string without whitespace (string)

`std::string LAMMPS_NS::utils::trim_comment` (const std::string &line)

Return string with anything from the first '#' character onward removed

**Parameters**

**line** – string that should be trimmed

**Returns**

new string without comment (string)

`std::string LAMMPS_NS::utils::star_subst` (const std::string &name, bigint step, int pad)

Replace first '\*' character in a string with a number, optionally zero-padded

If there is no '\*' character in the string, return the original string. If the number requires more characters than the value of the *pad* argument, do not add zeros; otherwise add as many zeroes as needed to the left to make the number representation *pad* characters wide.

**Parameters**

- **name** – string with file containing a '\*' (or not)
- **step** – step number to replace the (first) '\*'
- **pad** – zero-padding (may be zero)

**Returns**

processed string

`inline bool LAMMPS_NS::utils::has_utf8` (const std::string &line)

Check if a string will likely have UTF-8 encoded characters

UTF-8 uses the 7-bit standard ASCII table for the first 127 characters and all other characters are encoded as multiple bytes. For the multi-byte characters the first byte has either the highest two, three, or four bits set followed by a zero bit and followed by one, two, or three more bytes, respectively, where the highest bit is set and the second highest bit set to 0. The remaining bits combined are the character code, which is thus limited to 21-bits.

For the sake of efficiency this test only checks if a character in the string has the highest bit set and thus is very likely an UTF-8 character. It will not be able to tell this this is a valid UTF-8 character or whether it is a 2-byte, 3-byte, or 4-byte character.

*See also*

[\*utils::utf8\\_subst\(\)\*](#)

**Parameters**

**line** – string that should be checked

**Returns**

true if string contains UTF-8 encoded characters (bool)

`std::string LAMMPS_NS::utils::utf8_subst` (const std::string &line)

Replace known UTF-8 characters with ASCII equivalents

*See also*

`utils::has_utf8()`

**Parameters**

**line** – string that should be converted

**Returns**

new string with ascii replacements (string)

`size_t LAMMPS_NS::utils::count_words(const char *text)`

Count words in C-string, ignore any whitespace matching `"\t\r\n\f"`

**Parameters**

**text** – string that should be searched

**Returns**

number of words found

`size_t LAMMPS_NS::utils::count_words(const std::string &text)`

Count words in string, ignore any whitespace matching `"\t\r\n\f"`

**Parameters**

**text** – string that should be searched

**Returns**

number of words found

`size_t LAMMPS_NS::utils::count_words(const std::string &text, const std::string &separators)`

Count words in string with custom choice of separating characters

**Parameters**

- **text** – string that should be searched
- **separators** – string containing characters that will be treated as whitespace

**Returns**

number of words found

`size_t LAMMPS_NS::utils::trim_and_count_words(const std::string &text, const std::string &separators = "\t\r\n\f")`

Count words in a single line, trim anything from `#` onward

**Parameters**

- **text** – string that should be trimmed and searched
- **separators** – string containing characters that will be treated as whitespace

**Returns**

number of words found

`std::string LAMMPS_NS::utils::join_words(const std::vector<std::string> &words, const std::string &sep)`

Take list of words and join them with a given separator text.

This is the inverse operation of what the `split_words()` function Tokenizer classes do.

**Parameters**

- **words** – STL vector with strings
- **sep** – separator string (may be empty)

**Returns**

string with the concatenated words and separators

```
std::vector<std::string> LAMMPS_NS::utils::split_words(const std::string &text)
```

Take text and split into non-whitespace words.

This can handle strings with single and double quotes, escaped quotes, and escaped codes within quotes, but due to using an STL container and STL strings is rather slow because of making copies. Designed for parsing command lines and similar text and not for time critical processing. Use a tokenizer class if performance matters.

*See also*

*Tokenizer, ValueTokenizer*

**Parameters**

**text** – string that should be split

**Returns**

STL vector with the words

```
std::vector<std::string> LAMMPS_NS::utils::split_lines(const std::string &text)
```

Take multi-line text and split into lines

**Parameters**

**text** – string that should be split

**Returns**

STL vector with the lines

```
bool LAMMPS_NS::utils::strmatch(const std::string &text, const std::string &pattern)
```

Match text against a simplified regex pattern

More flexible and specific matching of a string against a pattern. This function is supposed to be a more safe, more specific and simple to use API to find pattern matches. The purpose is to replace uses of either `strncmp()` or `strstr()` in the code base to find sub-strings safely. With `strncmp()` finding prefixes, the number of characters to match must be counted, which can lead to errors, while using “`^pattern`” will do the same with less problems. Matching for suffixes using `strstr()` is not as specific as ‘`pattern$`’, and complex matches, e.g. “`^rigid.*Vsmall.*`”, to match all small body optimized rigid fixes require only one test.

The use of `std::string` arguments allows for simple concatenation even with `char *` type variables. Example: `utils::strmatch(text, std::string("^") + charptr)`

**Parameters**

- **text** – the text to be matched against the pattern
- **pattern** – the search pattern, which may contain regexp markers

**Returns**

true if the pattern matches, false if not

```
std::string LAMMPS_NS::utils::strfind(const std::string &text, const std::string &pattern)
```

Find sub-string that matches a simplified regex pattern

This function is a companion function to `utils::strmatch()`. Arguments and logic is the same, but instead of a boolean, it returns the sub-string that matches the regex pattern. There can be only one match. This can be used as a more flexible alternative to `strstr()`.

**Parameters**

- **text** – the text to be matched against the pattern
- **pattern** – the search pattern, which may contain regexp markers

**Returns**

the string that matches the pattern or an empty one

`bool LAMMPS_NS::utils::is_integer(const std::string &str)`

Check if string can be converted to valid integer

**Parameters**

**str** – string that should be checked

**Returns**

true, if string contains valid a integer, false otherwise

`bool LAMMPS_NS::utils::is_double(const std::string &str)`

Check if string can be converted to valid floating-point number

**Parameters**

**str** – string that should be checked

**Returns**

true, if string contains valid number, false otherwise

`bool LAMMPS_NS::utils::is_id(const std::string &str)`

Check if string is a valid ID ID strings may contain only letters, numbers, and underscores.

**Parameters**

**str** – string that should be checked

**Returns**

true, if string contains valid id, false otherwise

`int LAMMPS_NS::utils::is_type(const std::string &str)`

Check if string is a valid type label, or numeric type, or numeric type range. Numeric type or type range may only contain digits or the '\*' character. Type label strings may not contain a digit, or a '\*', or a '#' character as the first character to distinguish them from comments and numeric types or type ranges. They also may not contain any whitespace. If the string is a valid numeric type or type range the function returns 0, if it is a valid type label the function returns 1, otherwise it returns -1.

**Parameters**

**str** – string that should be checked

**Returns**

0, 1, or -1, depending on whether the string is valid numeric type, valid type label or neither, respectively

### 15.14.4 Potential file functions

`std::string LAMMPS_NS::utils::get_potential_file_path(const std::string &path)`

Determine full path of potential file. If file is not found in current directory, search directories listed in LAMMPS\_POTENTIALS environment variable

**Parameters**

**path** – file path

**Returns**

full path to potential file

`std::string LAMMPS_NS::utils::get_potential_date(const std::string &path, const std::string &potential_name)`

Read potential file and return DATE field if it is present

**Parameters**

- **path** – file path
- **potential\_name** – name of potential that is being read

**Returns**

DATE field if present

`std::string LAMMPS_NS::utils::get_potential_units(const std::string &path, const std::string &potential_name)`

Read potential file and return UNITS field if it is present

**Parameters**

- **path** – file path
- **potential\_name** – name of potential that is being read

**Returns**

UNITS field if present

`int LAMMPS_NS::utils::get_supported_conversions(const int property)`

Return bitmask of available conversion factors for a given property

**Parameters**

**property** – property to be converted

**Returns**

bitmask indicating available conversions

`double LAMMPS_NS::utils::get_conversion_factor(const int property, const int conversion)`

Return unit conversion factor for given property and selected from/to units

**Parameters**

- **property** – property to be converted
- **conversion** – constant indicating the conversion

**Returns**

conversion factor

FILE \*LAMMPS\_NS::utils::open\_potential(const std::string &name, LAMMPS \*Imp, int \*auto\_convert)

Open a potential file as specified by *name*

If opening the file directly fails, the function will search for it in the list of folder pointed to by the environment variable LAMMPS\_POTENTIALS (if it is set).

If the potential file has a UNITS tag in the first line, the tag's value is compared to the current unit style setting. The behavior of the function then depends on the value of the *auto\_convert* parameter. If it is a null pointer, then the unit values must match or else the open will fail with an error. Otherwise the bitmask that *auto\_convert* points to is used check for compatibility with possible automatic conversions by the calling function. If compatible, the bitmask is set to the required conversion or `utils::NOCONVERT`.

#### Parameters

- **name** – file- or pathname of the potential file
- **Imp** – pointer to top-level LAMMPS class instance
- **auto\_convert** – pointer to unit conversion bitmask or `nullptr`

#### Returns

FILE pointer of the opened potential file or `nullptr`

## 15.14.5 Argument processing

template<typename TYPE>

void LAMMPS\_NS::utils::bounds(const char \*file, int line, const std::string &str, bigint nmin, bigint nmax, TYPE &nlo, TYPE &nhi, Error \*error)

Compute index bounds derived from a string with a possible wildcard

This functions processes the string in *str* and set the values of *nlo* and *nhi* according to the following five cases:

- a single number, *i*: *nlo* = *i*; *nhi* = *i*;
- a single asterisk, *\**: *nlo* = *nmin*; *nhi* = *nmax*;
- a single number followed by an asterisk, *i\**: *nlo* = *i*; *nhi* = *nmax*;
- a single asterisk followed by a number, *\*i*: *nlo* = *nmin*; *nhi* = *i*;
- two numbers with an asterisk in between. *i\*j*: *nlo* = *i*; *nhi* = *j*;

#### Parameters

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – string to be processed
- **nmin** – smallest possible lower bound
- **nmax** – largest allowed upper bound
- **nlo** – lower bound
- **nhi** – upper bound
- **error** – pointer to Error class for out-of-bounds messages

```
int LAMMPS_NS::utils::expand_args(const char *file, int line, int nargs, char **arg, int mode, char **&earg,
                                LAMMPS *lmp)
```

Expand list of arguments when containing fix/compute wildcards

This function searches the list of arguments in *arg* for strings of the kind `c_ID[*]` or `f_ID[*]` referring to computes or fixes. Any such strings are replaced by one or more strings with the `*` character replaced by the corresponding possible numbers as determined from the fix or compute instance. Other strings are just copied. If the *mode* parameter is set to 0, expand global vectors, but not global arrays; if it is set to 1, expand global arrays (by column) but not global vectors.

If any expansion happens, the *earg* list and all its strings are new allocations and must be freed explicitly by the caller. Otherwise *arg* and *earg* will point to the same address and no explicit de-allocation is needed by the caller.

#### Parameters

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **nargs** – number of arguments in current list
- **arg** – argument list, possibly containing wildcards
- **mode** – select between global vectors(=0) and arrays (=1)
- **earg** – new argument list with wildcards expanded
- **lmp** – pointer to top-level *LAMMPS* class instance

#### Returns

number of arguments in expanded list

```
char *LAMMPS_NS::utils::expand_type(const char *file, int line, const std::string &str, int mode, LAMMPS
                                   *lmp)
```

Expand type label string into its equivalent numeric type

This function checks if a given string may be a type label and then searches the labelmap type indicated by the *mode* argument for the corresponding numeric type. If this is found a copy of the numeric type string is made and returned. Otherwise a null pointer is returned. If a string is returned, the calling code must free it with `delete[]`.

#### Parameters

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **str** – type string to be expanded
- **mode** – select labelmap using constants from *Atom* class
- **lmp** – pointer to top-level *LAMMPS* class instance

#### Returns

pointer to expanded string or null pointer

## 15.14.6 Convenience functions

template<typename ...**Args**>

void LAMMPS\_NS::utils::logmesg(LAMMPS \*Imp, const std::string &format, *Args*&&... args)

Send formatted message to screen and logfile, if available

This function simplifies the repetitive task of outputting some message to both the screen and/or the log file. The template wrapper with `fntlib` format and argument processing allows this function to work similar to `fmt::print()`.

### Parameters

- **Imp** – pointer to *LAMMPS* class instance
- **format** – format string of message to be printed
- **args** – arguments to format string

void LAMMPS\_NS::utils::logmesg(LAMMPS \*Imp, const std::string &mesg)

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

### Parameters

- **Imp** – pointer to *LAMMPS* class instance
- **mesg** – string with message to be printed

std::string LAMMPS\_NS::utils::errorurl(int errorcode)

Return text redirecting the user to a specific paragraph in the manual

The *LAMMPS* manual contains detailed detailed explanations for errors and warnings where a simple error message may not be sufficient. These can be reached through URLs with a numeric code. This function creates the corresponding text to be included into the error message that redirects the user to that URL.

### Parameters

**errorcode** – number pointing to a paragraph in the manual

void LAMMPS\_NS::utils::missing\_cmd\_args(const std::string &file, int line, const std::string &cmd, Error \*error)

Print error message about missing arguments for command

This function simplifies the repetitive reporting missing arguments to a command.

### Parameters

- **file** – name of source file for error message
- **line** – line number in source file for error message
- **cmd** – name of the failing command
- **error** – pointer to Error class instance (for abort) or nullptr

void LAMMPS\_NS::utils::flush\_buffers(LAMMPS \*Imp)

Flush output buffers

This function calls `fflush()` on screen and logfile FILE pointers if available and thus tells the operating system to output all currently buffered data. This is local operation and independent from buffering by a file system or an MPI library.

std::string LAMMPS\_NS::utils::getsyserror()

Return a string representing the current system error status

This is a wrapper around calling strerror(errno).

**Returns**

error string

std::string LAMMPS\_NS::utils::check\_packages\_for\_style(const std::string &style, const std::string &name, *LAMMPS* \*Imp)

Report if a requested style is in a package or may have a typo

**Parameters**

- **style** – type of style that is to be checked for
- **name** – name of style that was not found
- **Imp** – pointer to top-level *LAMMPS* class instance

**Returns**

string usable for error messages

double LAMMPS\_NS::utils::timespec2seconds(const std::string &timespec)

Convert a time string to seconds

The strings “off” and “unlimited” result in -1

**Parameters**

**timespec** – a string in the following format: ([[HH:]MM:]SS)

**Returns**

total in seconds

int LAMMPS\_NS::utils::date2num(const std::string &date)

Convert a *LAMMPS* version date to a number

This will generate a number YYYYMMDD from a date string (with or without blanks) that is suitable for numerical comparisons, i.e. later dates will generate a larger number.

The day may or may not have a leading zero, the month is identified by the first 3 letters (so there may be more) and the year may be 2 or 4 digits (the missing 2 digits will be assumed as 20. That is 04 corresponds to 2004).

No check is made whether the date is valid.

**Parameters**

**date** – string in the format (Day Month Year)

**Returns**

date code

std::string LAMMPS\_NS::utils::current\_date()

Return current date as string

This will generate a string containing the current date in YYYY-MM-DD format.

**Returns**

string with current date

### 15.14.7 Customized standard functions

int LAMMPS\_NS::utils::binary\_search(const double needle, const int n, const double \*haystack)

Binary search in a vector of ascending doubles of length N

If the value is smaller than the smallest value in the vector, 0 is returned. If the value is larger or equal than the largest value in the vector, N-1 is returned. Otherwise the index that satisfies the condition

haystack[index] <= value < haystack[index+1]

is returned, i.e. a value from 1 to N-2. Note that if there are tied values in the haystack, always the larger index is returned as only that satisfied the condition.

#### Parameters

- **needle** – search value for which are are looking for the closest index
- **n** – size of the haystack array
- **haystack** – array with data in ascending order.

#### Returns

index of value in the haystack array smaller or equal to needle

void LAMMPS\_NS::utils::merge\_sort(int \*index, int num, void \*ptr, int (\*comp)(int, int, void\*))

Custom merge sort implementation

This function provides a custom upward hybrid merge sort implementation with support to pass an opaque pointer to the comparison function, e.g. for access to class members. This avoids having to use global variables. For improved performance, it uses an in-place insertion sort on initial chunks of up to 64 elements and switches to merge sort from then on.

#### Parameters

- **index** – Array with indices to be sorted
- **num** – Length of the index array
- **ptr** – Pointer to opaque object passed to comparison function
- **comp** – Pointer to comparison function

---

## 15.15 Special Math functions

The `MathSpecial` namespace implements a selection of custom and optimized mathematical functions for a variety of applications.

double LAMMPS\_NS::MathSpecial::factorial(const int n)

Fast tabulated factorial function

This function looks up pre-computed factorial values for arguments of  $n = 0$  to a maximum of 167, which is the maximal value representable by a double precision floating point number. For other values of  $n$  a NaN value is returned.

#### Parameters

**n** – argument (valid:  $0 \leq n \leq 167$ )

#### Returns

value of  $n!$  as double precision number or NaN

```
double LAMMPS_NS::MathSpecial::exp2_x86(double x)
```

Fast implementation of  $2^x$  without argument checks for little endian CPUs

This function implements an optimized version of `pow(2.0, x)` that does not check for valid arguments and thus may only be used where arguments are well behaved. The implementation makes assumptions about the layout of double precision floating point numbers in memory and thus will only work on little endian CPUs. If little endian cannot be safely detected, the result of calling `pow(2.0, x)` will be returned. This function also is the basis for the fast exponential `fm_exp(x)`.

**Parameters**

**x** – argument

**Returns**

value of  $2^x$  as double precision number

```
double LAMMPS_NS::MathSpecial::fm_exp(double x)
```

Fast implementation of `exp(x)` for little endian CPUs

This function implements an optimized version of `exp(x)` for little endian CPUs. It calls the `exp2_x86(x)` function with a suitable prefactor to `x` to return `exp(x)`. The implementation makes assumptions about the layout of double precision floating point numbers in memory and thus will only work on little endian CPUs. If little endian cannot be safely detected, the result of calling the `exp(x)` implementation in the standard math library will be returned.

**Parameters**

**x** – argument

**Returns**

value of  $e^x$  as double precision number

```
static inline double LAMMPS_NS::MathSpecial::my_erfcx(const double x)
```

Fast scaled error function complement `exp(x*x)*erfc(x)` for coul/long styles

This is a portable fast implementation of `exp(x*x)*erfc(x)` that can be used in coul/long pair styles as a replacement for the polynomial expansion that is/was widely used. Unlike the polynomial expansion, that is only accurate at the level of single precision floating point it provides full double precision accuracy, but at comparable speed (unlike the `erfc()` implementation shipped with GNU standard math library).

**Parameters**

**x** – argument

**Returns**

value of  $e^{(x*x)*erfc(x)}$

```
static inline double LAMMPS_NS::MathSpecial::expmsq(double x)
```

Fast implementation of `exp(-x*x)` for little endian CPUs for coul/long styles

This function implements an optimized version of `exp(-x*x)` based on `exp2_x86()` for use with little endian CPUs. If little endian cannot be safely detected, the result of calling the `exp(-x*x)` implementation in the standard math library will be returned.

**Parameters**

**x** – argument

**Returns**

value of  $e^{(-x*x)}$  as double precision number

```
static inline double LAMMPS_NS::MathSpecial::square(const double &x)
```

Fast inline version of `pow(x, 2.0)`

**Parameters**

**x** – argument

**Returns** $x^*x$ 

```
static inline double LAMMPS_NS::MathSpecial::cube(const double &x)
```

Fast inline version of `pow(x, 3.0)`

**Parameters**

**x** – argument

**Returns** $x^*x$ 

```
static inline double LAMMPS_NS::MathSpecial::powsign(const int n)
```

```
static inline double LAMMPS_NS::MathSpecial::powint(const double &x, const int n)
```

```
static inline double LAMMPS_NS::MathSpecial::powsinxx(const double &x, int n)
```

---

## 15.16 Tokenizer classes

The purpose of the tokenizer classes is to simplify the recurring task of breaking lines of text down into words and/or numbers. Traditionally, LAMMPS code would be using the `strtok()` function from the C library for that purpose, but that function has two significant disadvantages: 1) it cannot be used concurrently from different LAMMPS instances since it stores its status in a global variable and 2) it modifies the string that it is processing. These classes were implemented to avoid both of these issues and also to reduce the amount of code that needs to be written.

The basic procedure is to create an instance of the tokenizer class with the string to be processed as an argument and then do a loop until all available tokens are read. The constructor has a default set of separator characters, but that can be overridden. The default separators are all “whitespace” characters, i.e. the space character, the tabulator character, the carriage return character, the linefeed character, and the form feed character.

Listing 1: Tokenizer class example listing entries of the PATH environment variable

```
#include "tokenizer.h"
#include <stdlib>
#include <string>
#include <iostream>

using namespace LAMMPS_NS;

int main(int, char **)
{
    const char *path = getenv("PATH");

    if (path != nullptr) {
        Tokenizer p(path, ".");
        while (p.has_next())
            std::cout << "Entry: " << p.next() << "\n";
    }
    return 0;
}
```

Most tokenizer operations cannot fail except for `LAMMPS_NS::Tokenizer::next()` (when used without first checking with `LAMMPS_NS::Tokenizer::has_next()`) and `LAMMPS_NS::Tokenizer::skip()`. In case of failure, the class will throw an exception, so you may need to wrap the code using the tokenizer into a try / catch block to handle errors. The `LAMMPS_NS::ValueTokenizer` class may also throw an exception when a (type of) number is requested as next token that is not compatible with the string representing the next word.

Listing 2: ValueTokenizer class example with exception handling

```
#include "tokenizer.h"
#include <cstdlib>
#include <string>
#include <iostream>

using namespace LAMMPS_NS;

int main(int, char **)
{
    const char *text = "1 2 3 4 5 20.0 21 twentytwo 2.3";
    double num1(0), num2(0), num3(0), num4(0);

    ValueTokenizer t(text);
    // read 4 doubles after skipping over 5 numbers
    try {
        t.skip(5);
        num1 = t.next_double();
        num2 = t.next_double();
        num3 = t.next_double();
        num4 = t.next_double();
    } catch (TokenizerException &e) {
        std::cout << "Reading numbers failed: " << e.what() << "\n";
    }
    std::cout << "Values: " << num1 << " " << num2 << " " << num3 << " " << num4 << "\n";
    return 0;
}
```

This code example should produce the following output:

```
Reading numbers failed: Not a valid floating-point number: 'twentytwo'
Values: 20 21 0 0
```

class **Tokenizer**

### Public Functions

**Tokenizer**(std::string str, std::string separators = TOKENIZER\_DEFAULT\_SEPARATORS)

Class for splitting text into words

This tokenizer will break down a string into sub-strings (i.e words) separated by the given separator characters. If the string contains certain known UTF-8 characters they will be replaced by their ASCII equivalents processing the string.

*See also*

*ValueTokenizer*, *utils::split\_words()*, *utils::utf8\_subst()*

**Parameters**

- **str** – string to be processed
- **\_separators** – string with separator characters (default: ”\t\r\n\f”)

void **reset()**

Re-position the tokenizer state to the first word, i.e. the first non-separator character

void **skip**(int n = 1)

Skip over a given number of tokens

**Parameters**

**n** – number of tokens to skip over

bool **has\_next()** const

Indicate whether more tokens are available

**Returns**

true if there are more tokens, false if not

bool **contains**(const std::string &str) const

Search the text to be processed for a sub-string.

**Parameters**

**str** – string to be searched for

**Returns**

true if string was found, false if not

std::string **next()**

Retrieve next token.

**Returns**

string with the next token

size\_t **count()**

Count number of tokens in text.

**Returns**

number of counted tokens

std::vector<std::string> **as\_vector()**

Retrieve the entire text converted to an STL vector of tokens.

**Returns**

The STL vector

class **TokenizerException** : public exception

General Tokenizer exception class

Subclassed by *InvalidFloatException*, *InvalidIntegerException*

## Public Functions

explicit **TokenizerException**(const std::string &msg, const std::string &token)

Thrown during retrieving or skipping tokens

### Parameters

- **msg** – String with error message
- **token** – String of the token/word that caused the error

inline const char \***what**() const noexcept override

Retrieve message describing the thrown exception

### Returns

string with error message

class **ValueTokenizer**

## Public Functions

**ValueTokenizer**(const std::string &str, const std::string &separators =  
TOKENIZER\_DEFAULT\_SEPARATORS)

Class for reading text with numbers

*See also*

*Tokenizer*

**See also:**

Tokenizer *InvalidIntegerException InvalidFloatException*

### Parameters

- **str** – String to be processed
- **separators** – String with separator characters (default: "\t\r\n\f")

std::string **next\_string**()

Retrieve next token

### Returns

string with next token

tagint **next\_tagint**()

Retrieve next token and convert to tagint

### Returns

value of next token

bigint **next\_bigint**()

Retrieve next token and convert to bigint

### Returns

value of next token

int **next\_int**()

Retrieve next token and convert to int

**Returns**

value of next token

double **next\_double**()

Retrieve next token and convert to double

**Returns**

value of next token

bool **has\_next**() const

Indicate whether more tokens are available

**Returns**

true if there are more tokens, false if not

bool **contains**(const std::string &value) const

Search the text to be processed for a sub-string.

**Parameters**

**value** – string with value to be searched for

**Returns**

true if string was found, false if not

void **skip**(int ntokens = 1)

Skip over a given number of tokens

**Parameters**

**n** – number of tokens to skip over

size\_t **count**()

Count number of tokens in text.

**Returns**

number of counted tokens

class **InvalidIntegerException** : public *TokenizerException*

Exception thrown by ValueTokenizer when trying to convert an invalid integer string

### Public Functions

inline explicit **InvalidIntegerException**(const std::string &token)

Thrown during converting string to integer number

**Parameters**

**token** – String of the token/word that caused the error

class **InvalidFloatException** : public *TokenizerException*

Exception thrown by ValueTokenizer when trying to convert an floating point string

## Public Functions

inline explicit **InvalidFloatException**(const std::string &token)

Thrown during converting string to floating point number

### Parameters

**token** – String of the token/word that caused the error

## 15.17 Argument parsing classes

The purpose of argument parsing classes is to simplify and unify how arguments of commands in LAMMPS are parsed and to make abstractions of repetitive tasks.

The `LAMMPS_NS::ArgInfo` class provides an abstraction for parsing references to compute or fix styles, variables or custom integer or double properties handled by *fix property/atom*. These would start with a “c\_”, “f\_”, “v\_”, “d\_”, “d2\_”, “i\_”, or “i2\_” followed by the ID or name of that instance and may be postfixed with one or two array indices “[<number>]” with numbers > 0.

A typical code segment would look like this:

Listing 3: Usage example for ArgInfo class

```
int nvalues = 0;
for (iarg = 0; iarg < nargnew; iarg++) {
    ArgInfo argi(arg[iarg]);

    which[nvalues] = argi.get_type();
    argindex[nvalues] = argi.get_index1();
    ids[nvalues] = argi.copy_name();

    if ((which[nvalues] == ArgInfo::UNKNOWN)
        || (which[nvalues] == ArgInfo::NONE)
        || (argi.get_dim() > 1))
        error->all(FLERR, "Illegal compute XXX command");

    nvalues++;
}
```

class **ArgInfo**

### Public Types

enum **ArgTypes**

constants for argument types

*Values:*

enumerator **ERROR**

enumerator **UNKNOWN**

enumerator **NONE**

enumerator **X**

enumerator **V**

enumerator **F**

enumerator **COMPUTE**

enumerator **FIX**

enumerator **VARIABLE**

enumerator **KEYWORD**

enumerator **TYPE**

enumerator **MOLECULE**

enumerator **DNAME**

enumerator **INAME**

enumerator **DENSITY\_NUMBER**

enumerator **DENSITY\_MASS**

enumerator **MASS**

enumerator **TEMPERATURE**

enumerator **BIN1D**

enumerator **BIN2D**

enumerator **BIN3D**

enumerator **BINSPHERE**

enumerator **BINCYLINDER**

## Public Functions

**ArgInfo**(const std::string &arg, int allowed = *COMPUTE* | *FIX* | *VARIABLE*)

Class for processing references to fixes, computes and variables

This class provides an abstraction for the repetitive task of parsing arguments that may contain references to fixes, computes, variables, or custom per-atom properties. It will identify the name and the index value in the first and second dimension, if present.

### Parameters

- **arg** – string with possible reference
- **allowed** – integer with bitmap of allowed types of references

inline int **get\_type**() const

get type of reference

Return a type constant for the reference. This may be either *COMPUTE*, *FIX*, *VARIABLE* (if not restricted to a subset of those by the “allowed” argument of the constructor) or *NONE*, if it is not a recognized or allowed reference, or *UNKNOWN*, in case some error happened identifying or parsing the values of the indices

### Returns

integer with a constant from ArgTypes enumerator

inline int **get\_dim**() const

get dimension of reference

This will return either 0, 1, 2 depending on whether the reference has no, one or two “[{number}]” postfixes.

### Returns

integer with the dimensionality of the reference

inline int **get\_index1**() const

get index of first dimension

This will return the number in the first “[{number}]” postfix or 0 if there is no postfix.

### Returns

integer with index or the postfix or 0

inline int **get\_index2**() const

get index of second dimension

This will return the number in the second “[{number}]” postfix or -1 if there is no second postfix.

### Returns

integer with index of the postfix or -1

inline const char \***get\_name**() const

return reference to the ID or name of the reference

This string is pointing to an internal storage element and is only valid to use while the ArgInfo class instance is in scope. If you need a long-lived string make a copy with `copy_name()`.

### Returns

C-style char \* string

char \*copy\_name()

make copy of the ID of the reference as C-style string

The ID is copied into a buffer allocated with “new” and thus must be later deleted with “delete []” to avoid a memory leak. Because it is a full copy in a newly allocated buffer, the lifetime of this string extends beyond the the time the ArgInfo class is in scope.

**Returns**

copy of string as char \*

---

## 15.18 File reader classes

The purpose of the file reader classes is to simplify the recurring task of reading and parsing files. They can use the *ValueTokenizer* class to process the read in text. The *TextFileReader* is a more general version while *PotentialFileReader* is specialized to implement the behavior expected for looking up and reading/parsing files with potential parameters in LAMMPS. The potential file reader class requires a LAMMPS instance, requires to be run on MPI rank 0 only, will use the *utils::get\_potential\_file\_path* function to look up and open the file, and will call the *LAMMPS\_NS::Error* class in case of failures to read or to convert numbers, so that LAMMPS will be aborted.

Listing 4: Use of PotentialFileReader class in pair style coul/streitz

```
PotentialFileReader reader(lmp, file, "coul/streitz");
char * line;

while((line = reader.next_line(NPARAMS_PER_LINE))) {
  try {
    ValueTokenizer values(line);
    std::string iname = values.next_string();

    int ielement;
    for (ielement = 0; ielement < nelements; ielement++)
      if (iname == elements[ielement]) break;

    if (nparams == maxparam) {
      maxparam += DELTA;
      params = (Param *) memory->srealloc(params,maxparam*sizeof(Param),
                                         "pair:params");
    }

    params[nparams].ielement = ielement;
    params[nparams].chi = values.next_double();
    params[nparams].eta = values.next_double();
    params[nparams].gamma = values.next_double();
    params[nparams].zeta = values.next_double();
    params[nparams].zcore = values.next_double();

  } catch (TokenizerException & e) {
    error->one(FLERR, e.what());
  }
  nparams++;
}
```

A file that would be parsed by the reader code fragment looks like this:

```
# DATE: 2015-02-19 UNITS: metal CONTRIBUTOR: Ray Shan CITATION: Streitzi and Mintmire,  
↪Phys Rev B, 50, 11996-12003 (1994)  
#  
# X (eV)          J (eV)          gamma (1/AA)    zeta (1/AA)    Z (e)

```

class **TextFileReader**

### Public Functions

**TextFileReader**(const std::string &filename, const std::string &filetype)

Class for reading and parsing text files

The value of the class member variable *ignore\_comments* controls whether any text following the pound sign (#) should be ignored (true) or not (false). Default: true, i.e. ignore.

*See also*

[TextFileReader](#)

#### Parameters

- **filename** – Name of file to be read
- **filetype** – Description of file type for error messages

**TextFileReader**(FILE \*fp, std::string filetype)

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

This function is useful in combination with [utils::open\\_potential\(\)](#).

---

**Note:** The FILE pointer is not closed in the destructor, but will be advanced when reading from it.

---

#### Parameters

- **fp** – File descriptor of the already opened file
- **filetype** – Description of file type for error messages

virtual **~TextFileReader**()

Closes the file

void **set\_bufsize**(int)

adjust line buffer size

void **rewind**()

Reset file to the beginning

void **skip\_line**()

Read the next line and ignore it

char **\*next\_line**(int nparams = 0)

Read the next line(s) until *nparams* words have been read.

This reads a line and counts the words in it, if the number is less than the requested number, it will read the next line, as well. Output will be a string with all read lines combined. The purpose is to somewhat replicate the reading behavior of formatted files in Fortran.

If the *ignore\_comments* class member has the value *true*, then any text read in is truncated at the first '#' character.

**Parameters**

**nparams** – Number of words that must be read. Default: 0

**Returns**

String with the concatenated text

void **next\_dvector**(double \*list, int n)

Read lines until *n* doubles have been read and stored in array *list*

This reads lines from the file using the *next\_line()* function, and splits them into floating-point numbers using the *ValueTokenizer* class and stores the number in the provided list.

**Parameters**

- **list** – Pointer to array with suitable storage for *n* doubles
- **n** – Number of doubles to be read

*ValueTokenizer* **next\_values**(int nparams, const std::string &separators =  
TOKENIZER\_DEFAULT\_SEPARATORS)

Read text until *nparams* words are read and passed to a tokenizer object for custom parsing.

This reads lines from the file using the *next\_line()* function, and splits them into floating-point numbers using the *ValueTokenizer* class and stores the number in the provided list.

**Parameters**

- **nparams** – Number of words to be read
- **separators** – String with list of separators.

**Returns**

*ValueTokenizer* object for read in text

## Public Members

bool **ignore\_comments**

Controls whether comments are ignored.

class **PotentialFileReader** : protected *Pointers*

## Public Functions

**PotentialFileReader**(class *LAMMPS* \*Imp, const std::string &filename, const std::string &potential\_name, const std::string &name\_suffix, const int auto\_convert = 0)

Class for reading and parsing *LAMMPS* potential files

The value of the class member variable *ignore\_comments* controls whether any text following the pound sign (#) should be ignored (true) or not (false). Default: true, i.e. ignore.

*See also*

*TextFileReader*

### Parameters

- **Imp** – Pointer to *LAMMPS* instance
- **filename** – Name of file to be read
- **potential\_name** – Name of potential style for error messages
- **name\_suffix** – Suffix added to potential name in error messages
- **auto\_convert** – Bitmask of supported unit conversions

**~PotentialFileReader**() override

Closes the file

void **ignore\_comments**(bool value)

Set comment (= text after '#') handling preference for the file to be read

### Parameters

**value** – Comment text is ignored if true, or not if false

void **rewind**()

Reset file to the beginning

void **skip\_line**()

Read a line but ignore its content

char \***next\_line**(int nparams = 0)

Read the next line(s) until *nparams* words have been read.

This reads a line and counts the words in it, if the number is less than the requested number, it will read the next line, as well. Output will be a string with all read lines combined. The purpose is to somewhat replicate the reading behavior of formatted files in Fortran.

### Parameters

**nparams** – Number of words that must be read. Default: 0

### Returns

String with the concatenated text

void **next\_dvector**(double \*list, int n)

Read lines until *n* doubles have been read and stored in array *list*

This reads lines from the file using the *next\_line*() function, and splits them into floating-point numbers using the *ValueTokenizer* class and stores the number in the provided list.

### Parameters

- **list** – Pointer to array with suitable storage for *n* doubles

- **n** – Number of doubles to be read

*ValueTokenizer* **next\_values**(int nparams, const std::string &separators =  
TOKENIZER\_DEFAULT\_SEPARATORS)

Read text until *nparams* words are read and passed to a tokenizer object for custom parsing.

This reads lines from the file using the `next_line()` function, and splits them into floating-point numbers using the `ValueTokenizer` class and stores the number in the provided list.

#### Parameters

- **nparams** – Number of words to be read
- **separators** – String with list of separators.

#### Returns

`ValueTokenizer` object for read in text

double **next\_double**()

Read next line and convert first word to a double

#### Returns

Value of first word in line as double

int **next\_int**()

Read next line and convert first word to an int

#### Returns

Value of first word in line as int

tagint **next\_tagint**()

Read next line and convert first word to a tagint

#### Returns

Value of first word in line as tagint

bigint **next\_bigint**()

Read next line and convert first word to a bigint

#### Returns

Value of first word in line as bigint

std::string **next\_string**()

Read next line and return first word

#### Returns

First word of read in line

---

## 15.19 Memory pool classes

The memory pool classes are used for cases where otherwise many small memory allocations would be needed and where the data would be either all used or all freed. One example for that is the storage of neighbor lists. The memory management strategy is based on the assumption that allocations will be in chunks of similar sizes. The allocation is then not done per individual call for a reserved chunk of memory, but for a “page” that can hold multiple chunks of data. A parameter for the maximum chunk size must be provided, as that is used to determine whether a new page of memory must be used.

The `MyPage` class offers two ways to reserve a chunk: 1) with `MyPage::get()` the chunk size needs to be known in advance, 2) with `MyPage::vget()` a pointer to the next chunk is returned, but its size is registered later with `MyPage::vgot()`.

Listing 5: Example of using `MyPage`

```
#include "my_page.h"
using namespace LAMMPS_NS;

MyPage<double> *dpage = new MyPage<double>;
// max size of chunk: 256, size of page: 10240 doubles (=81920 bytes)
dpage->init(256,10240);

double **build_some_lists(int num)
{
    dpage->reset();
    double **dlist = new double*[num];
    for (int i=0; i < num; ++i) {
        double *dptr = dpage.vget();
        int jnum = 0;
        for (int j=0; j < jmax; ++j) {
            // compute some dvalue for eligible loop index j
            dptr[j] = dvalue;
            ++jnum;
        }
        if (dpage.status() != 0) {
            // handle out of memory or jnum too large errors
        }
        dpage.vgot(jnum);
        dlist[i] = dptr;
    }
    return dlist;
}
```

```
template<class T>
```

```
class MyPage
```

Templated class for storing chunks of datums in pages.

The size of the chunk may vary from call to call, but must be less or equal than the `maxchunk` setting. The chunks are not returnable like with `malloc()` (i.e. you cannot call `free()` on them individually). One can only reset and start over. The purpose of this class is to replace many small memory allocations via `malloc()` with a few large ones. Since the pages are never freed until the class is re-initialized, they can be re-used without having to re-allocate them by calling the `reset()` method.

The settings `maxchunk`, `pagesize`, and `pagedelta` control the memory allocation strategy. The `maxchunk` value represents the expected largest number of items per chunk. If there is less space left on the current page, a new page is allocated for the next chunk. The `pagesize` value represents how many items can fit on a single page. It should have space for multiple chunks of size `maxchunk`. The combination of these two parameters determines how much memory is wasted by either switching to the next page too soon or allocating too large pages that never get properly used. It is an error, if a requested chunk is larger than `maxchunk`. The `pagedelta` parameter determines how many pages are allocated in one go. In combination with the `pagesize` setting, this determines how often blocks of memory get allocated (fewer allocations will result in faster execution).

**Note:** This is a template class with explicit instantiation. If the class is used with a new data type a new explicit instantiation may need to be added at the end of the file `src/my_page.cpp` to avoid symbol lookup errors.

---

## Public Functions

### MyPage()

Create a class instance

Need to call `init()` before use to define allocation settings

int **init**(int user\_maxchunk = 1, int user\_pagesize = 1024, int user\_pagedelta = 1)

(Re-)initialize the set of pages and allocation parameters.

This also frees all previously allocated storage and allocates the first page(s).

#### Parameters

- **user\_maxchunk** – Expected maximum number of items for one chunk
- **user\_pagesize** – Number of items on a single memory page
- **user\_pagedelta** – Number of pages to allocate with one malloc

#### Returns

1 if there were invalid parameters, 2 if there was an allocation error or 0 if successful

*T* \***get**(int n = 1)

Pointer to location that can store *N* items.

This will allocate more pages as needed. If the parameter *N* is larger than the *maxchunk* setting an error is flagged.

#### Parameters

**n** – number of items for which storage is requested

#### Returns

memory location or null pointer, if error or allocation failed

inline *T* \***vget**()

Get pointer to location that can store *maxchunk* items.

This will return the same pointer as the previous call to this function unless `vgot()` is called afterwards to record how many items of the chunk were actually used.

#### Returns

pointer to chunk of memory or null pointer if run out of memory

inline void **vgot**(int n)

Mark *N* items as used of the chunk reserved with a preceding call to `vget()`.

This will advance the internal pointer inside the current memory page. It is not necessary to call this function for *N* = 0, that is the reserved storage was not used. A following call to `vget()` will then reserve the same location again. It is an error if *N* > *maxchunk*.

#### Parameters

**n** – Number of items used in previously reserved chunk

void **reset**()

Reset state of memory pool without freeing any memory

```
inline double size() const
```

Return total size of allocated pages

**Returns**

total storage used in bytes

```
inline int status() const
```

Return error status

**Returns**

0 if no error, 1 requested chunk size > maxchunk, 2 if malloc failed

```
template<class T>
```

```
class MyPoolChunk
```

Templated class for storing chunks of datums in pages.

The size of the chunk may vary from call to call between the *minchunk* and *maxchunk* setting. Chunks may be returned to the pool for re-use. Chunks can be reserved in *nbin* different sizes between *minchunk* and *maxchunk*. The *chunksperpage* setting specifies how many chunks are stored on any page and the *pagedelta* setting determines how many pages are allocated in one go. Pages are never freed, so they can be re-used without re-allocation.

---

**Note:** This is a template class with explicit instantiation. If the class is used with a new data type a new explicit instantiation may need to be added at the end of the file `src/my_pool_chunk.cpp` to avoid symbol lookup errors.

---

## Public Functions

```
MyPoolChunk(int user_minchunk = 1, int user_maxchunk = 1, int user_nbin = 1, int user_chunkperpage = 1024, int user_pagedelta = 1)
```

Create a class instance and set memory pool parameters

**Parameters**

- **user\_minchunk** – Minimal chunk size
- **user\_maxchunk** – Maximal chunk size
- **user\_nbin** – Number of bins of different chunk sizes
- **user\_chunkperpage** – Number of chunks per page
- **user\_pagedelta** – Number of pages to allocate in one go

```
~MyPoolChunk()
```

Destroy class instance and free all allocated memory

```
T *get(int &index)
```

Return pointer/index of unused chunk of size maxchunk

**Parameters**

**index** – Index of chunk in memory pool

**Returns**

Pointer to requested chunk of storage

*T* \***get**(int n, int &index)

Return pointer/index of unused chunk of size N

**Parameters**

- **n** – Size of chunk
- **index** – Index of chunk in memory pool

**Returns**

Pointer to requested chunk of storage

void **put**(int index)

Put indexed chunk back into memory pool via free list

**Parameters**

**index** – Memory chunk index returned by call to *get()*

double **size**() const

Return total size of allocated pages

**Returns**

total storage used in bytes

inline int **status**() const

Return error status

**Returns**

0 if no error, 1 if invalid input, 2 if malloc() failed, 3 if chunk > maxchunk

---

## 15.20 Eigensolver functions

The `MathEigen` sub-namespace of the `LAMMPS_NS` namespace contains functions and classes for eigensolvers. Currently only the *jacobi3 function* is used in various places in LAMMPS. That function is built on top of a group of more generic eigensolvers that are maintained in the `math_eigen_impl.h` header file. This header contains the implementation of three template classes:

1. “Jacobi” calculates all of the eigenvalues and eigenvectors of a dense, symmetric, real matrix.
2. The “PEigenDense” class only calculates the principal eigenvalue (ie. the largest or smallest eigenvalue), and its corresponding eigenvector. However it is much more efficient than “Jacobi” when applied to large matrices (larger than 13x13). PEigenDense also can understand complex-valued Hermitian matrices.
3. The “LambdaLanczos” class is a generalization of “PEigenDense” which can be applied to arbitrary sparse matrices.

The “`math_eigen_impl.h`” code is an amalgamation of `jacobi_pd` by Andrew Jewett at Scripps Research (under CC0-1.0 license) and `LambdaLanczos` by Yuya Kurebayashi at Tohoku University (under MIT license)

---

int `MathEigen::jacobi3`(double const \*const \*mat, double \*eval, double \*\*evec)

A specialized function which finds the eigenvalues and eigenvectors of a 3x3 matrix (in double \*\* format).

**Parameters**

- **mat** – the 3x3 matrix you wish to diagonalize
  - **eval** – store the eigenvalues here
-

- **evect** – store the eigenvectors here...

### Returns

0 if eigenvalue calculation converged, 1 if it failed

```
int MathEigen::jacobi3(double const mat[3][3], double *eval, double evect[3][3])
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

## 15.21 Communication buffer coding with *ubuf*

LAMMPS uses communication buffers where it collects data from various class instances and then exchanges the data with neighboring sub-domains. For simplicity those buffers are defined as `double` buffers and used for doubles and integer numbers. This presents a unique problem when 64-bit integers are used. While the storage needed for a `double` is also 64-bit, it cannot be used by a simple assignment. To get around that limitation, LAMMPS uses the *ubuf* union. It is used in the various “pack” and “unpack” functions in the LAMMPS classes to store and retrieve integers that may be 64-bit from the communication buffers.

union **ubuf**

*#include <lmptype.h>* Data structure for packing 32-bit and 64-bit integers into double (communication) buffers

Using this union avoids aliasing issues by having member types (`double`, `int`) referencing the same buffer memory location.

The explicit constructor for 32-bit integers prevents compilers from (incorrectly) calling the double constructor when storing an `int` into a double buffer.

**Usage:**

Listing 6: To copy an integer into a double buffer:

```
double buf[2];
int    foo = 1;
tagint bar = 2<<40;
buf[1] = ubuf(foo).d;
buf[2] = ubuf(bar).d;
```

Listing 7: To copy from a double buffer back to an int:

```
foo = (int)    ubuf(buf[1]).i;  
bar = (tagint) ubuf(buf[2]).i;
```

The typecasts prevent compiler warnings about possible truncation issues.

## **Part III**

# **Command Reference**

## COMMANDS

### 16.1 angle\_coeff command

#### 16.1.1 Syntax

```
angle_coeff N args
```

- N = numeric angle type (see asterisk form below), or type label
- args = coefficients for one or more angle types

#### 16.1.2 Examples

```
angle_coeff 1 300.0 107.0
angle_coeff * 5.0
angle_coeff 2*10 5.0

labelmap angle 1 hydroxyl
angle_coeff hydroxyl 300.0 107.0
```

#### 16.1.3 Description

Specify the angle force field coefficients for one or more angle types. The number and meaning of the coefficients depends on the angle style. Angle coefficients can also be set in the data file read by the *read\_data* command or in a restart file.

*N* can be specified in one of two ways. An explicit numeric value can be used, as in the first example above. Or *N* can be a type label, which is an alphanumeric string defined by the *labelmap* command or in a section of a data file read by the *read\_data* command.

For numeric values only, a wild-card asterisk can be used to set the coefficients for multiple angle types. This takes the form “\*” or “\*n” or “n\*” or “m\*n”. If *N* is the number of angle types, then an asterisk with no numeric values means all types from 1 to *N*. A leading asterisk means all types from 1 to *n* (inclusive). A trailing asterisk means all types from *n* to *N* (inclusive). A middle asterisk means all types from *m* to *n* (inclusive).

Note that using an *angle\_coeff* command can override a previous setting for the same angle type. For example, these commands set the coeffs for all angle types, then overwrite the coeffs for just angle type 2:

```
angle_coeff * 200.0 107.0 1.2
angle_coeff 2 50.0 107.0
```

A line in a data file that specifies angle coefficients uses the exact same format as the arguments of the *angle\_coeff* command in an input script, except that wild-card asterisks should not be used since coefficients for all  $N$  types must be listed in the file. For example, under the “Angle Coeffs” section of a data file, the line that corresponds to the first example above would be listed as

```
1 300.0 107.0
```

The *angle\_style class2* is an exception to this rule, in that an additional argument is used in the input script to allow specification of the cross-term coefficients. See its doc page for details.

---

The list of all angle styles defined in LAMMPS is given on the *angle\_style* doc page. They are also listed in more compact form on the *Commands angle* doc page.

On either of those pages, click on the style to display the formula it computes and its coefficients as specified by the associated *angle\_coeff* command.

---

## 16.1.4 Restrictions

This command must come after the simulation box is defined by a *read\_data*, *read\_restart*, or *create\_box* command.

An angle style must be defined before any angle coefficients are set, either in the input script or in a data file.

## 16.1.5 Related commands

*angle\_style*

## 16.1.6 Default

none

# 16.2 angle\_style command

## 16.2.1 Syntax

```
angle_style style
```

- style = *none* or *zero* or *hybrid* or *amoeba* or *charmm* or *class2* or *class2/p6* or *cosine* or *cosine/buck6d* or *cosine/delta* or *cosine/periodic* or *cosine/shift* or *cosine/shift/exp* or *cosine/squared* or *cross* or *dipole* or *fourier* or *fourier/simple* or *gaussian* or *harmonic* or *mm3* or *quartic* or *spica* or *table*

## 16.2.2 Examples

```
angle_style harmonic
angle_style charmm
angle_style hybrid harmonic cosine
```

## 16.2.3 Description

Set the formula(s) LAMMPS uses to compute angle interactions between triplets of atoms, which remain in force for the duration of the simulation. The list of angle triplets is read in by a *read\_data* or *read\_restart* command from a data or restart file.

Hybrid models where angles are computed using different angle potentials can be setup using the *hybrid* angle style.

The coefficients associated with a angle style can be specified in a data or restart file or via the *angle\_coeff* command.

All angle potentials store their coefficient data in binary restart files which means *angle\_style* and *angle\_coeff* commands do not need to be re-specified in an input script that restarts a simulation. See the *read\_restart* command for details on how to do this. The one exception is that *angle\_style hybrid* only stores the list of sub-styles in the restart file; angle coefficients need to be re-specified.

---

**Note:** When both an angle and pair style is defined, the *special\_bonds* command often needs to be used to turn off (or weight) the pairwise interaction that would otherwise exist between 3 bonded atoms.

---

In the formulas listed for each angle style, *theta* is the angle between the 3 atoms in the angle.

---

Here is an alphabetic list of angle styles defined in LAMMPS. Click on the style to display the formula it computes and coefficients specified by the associated *angle\_coeff* command.

Click on the style to display the formula it computes, any additional arguments specified in the *angle\_style* command, and coefficients specified by the associated *angle\_coeff* command.

There are also additional accelerated pair styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the [Commands angle](#) page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- *none* - turn off angle interactions
- *zero* - topology but no interactions
- *hybrid* - define multiple styles of angle interactions
- *amoeba* - AMOEBA angle
- *charmm* - CHARMM angle
- *class2* - COMPASS (class 2) angle
- *class2/p6* - COMPASS (class 2) angle expanded to 6th order
- *cosine* - angle with cosine term
- *cosine/buck6d* - same as cosine with Buckingham term between 1-3 atoms
- *cosine/delta* - angle with difference of cosines
- *cosine/periodic* - DREIDING angle
- *cosine/shift* - angle cosine with a shift

- *cosine/shift/exp* - cosine with shift and exponential term in spring constant
  - *cosine/squared* - angle with cosine squared term
  - *cross* - cross term coupling angle and bond lengths
  - *dipole* - angle that controls orientation of a point dipole
  - *fourier* - angle with multiple cosine terms
  - *fourier/simple* - angle with a single cosine term
  - *gaussian* - multi-centered Gaussian-based angle potential
  - *harmonic* - harmonic angle
  - *mesocnt* - piecewise harmonic and linear angle for bending-buckling of nanotubes
  - *mm3* - anharmonic angle
  - *quartic* - angle with cubic and quartic terms
  - *spica* - harmonic angle with repulsive SPICA pair style between 1-3 atoms
  - *table* - tabulated by angle
- 

## 16.2.4 Restrictions

Angle styles can only be set for atom\_styles that allow angles to be defined.

Most angle styles are part of the MOLECULE package. They are only enabled if LAMMPS was built with that package. See the *Build package* page for more info. The doc pages for individual bond potentials tell if it is part of a package.

## 16.2.5 Related commands

*angle\_coeff*

## 16.2.6 Default

```
angle_style none
```

## 16.3 atom\_modify command

### 16.3.1 Syntax

```
atom_modify keyword values ...
```

- one or more keyword/value pairs may be appended
- keyword = *id* or *map* or *first* or *sort*

```

id value = yes or no
map value = yes or array or hash
first value = group-ID = group whose atoms will appear first in internal atom lists
sort values = Nfreq binsize
    Nfreq = sort atoms spatially every this many time steps
    binsize = bin size for spatial sorting (distance units)

```

### 16.3.2 Examples

```

atom_modify map yes
atom_modify map hash sort 10000 2.0
atom_modify first colloid

```

### 16.3.3 Description

Modify certain attributes of atoms defined and stored within LAMMPS, in addition to what is specified by the *atom\_style* command. The *id* and *map* keywords must be specified before a simulation box is defined; other keywords can be specified any time.

The *id* keyword determines whether non-zero atom IDs can be assigned to each atom. If the value is *yes*, which is the default, IDs are assigned, whether you use the *create\_atoms* or *read\_data* or *read\_restart* commands to initialize atoms. If the value is *no* the IDs for all atoms are assumed to be 0.

If atom IDs are used, they must all be positive integers. They should also be unique, though LAMMPS does not check for this. Typically they should also be consecutively numbered (from 1 to *Natoms*), though this is not required. Molecular *atom styles* are those that store bond topology information (styles *bond*, *angle*, *molecular*, *full*). These styles require atom IDs since the IDs are used to encode the topology. Some other LAMMPS commands also require the use of atom IDs. E.g. some many-body pair styles use them to avoid double computation of the I-J interaction between two atoms.

The only reason not to use atom IDs is if you are running an atomic simulation so large that IDs cannot be uniquely assigned. For a default LAMMPS build this limit is  $2^{31}$  or about 2 billion atoms. However, even in this case, you can use 64-bit atom IDs, allowing  $2^{63}$  or about  $9e18$  atoms, if you build LAMMPS with the `-DLAMMPS_BIGBIG` switch. This is described on the *Build\_settings* doc page. If atom IDs are not used, they must be specified as 0 for all atoms, e.g. in a data or restart file.

The *map* keyword determines how atoms with specific IDs are found when required. An example are the *bond* (*angle*, etc) methods which need to find the local index of an atom with a specific global ID which is a *bond* (*angle*, etc) partner. LAMMPS performs this operation efficiently by creating a “map”, which is either an *array* or *hash* table, as described below.

When the *map* keyword is not specified in your input script, LAMMPS only creates a map for *atom\_styles* for molecular systems which have permanent bonds (*angles*, etc). No map is created for atomic systems, since it is normally not needed. However some LAMMPS commands require a map, even for atomic systems, and will generate an error if one does not exist. The *map* keyword thus allows you to force the creation of a map. The *yes* value will create either an *array* or *hash* style map, as explained in the next paragraph. The *array* and *hash* values create an array-style or hash-style map respectively.

For an *array*-style map, each processor stores a lookup table of length *N*, where *N* is the largest atom ID in the system. This is a fast, simple method for many simulations, but requires too much memory for large simulations. For a *hash*-style map, a hash table is created on each processor, which finds an atom ID in constant time (independent of the global number of atom IDs). It can be slightly slower than the *array* map, but its memory cost is proportional to the number of atoms owned by a processor, i.e.  $N/P$  when *N* is the total number of atoms in the system and *P* is the number of processors.

The *first* keyword allows a *group* to be specified whose atoms will be maintained as the first atoms in each processor's list of owned atoms. This is only useful when the specified group is a small fraction of all the atoms, and there are other operations LAMMPS is performing that will be sped-up significantly by being able to loop over the smaller set of atoms. Otherwise the reordering required by this option will be a net slow-down. The *neigh\_modify include* and *comm\_modify group* commands are two examples of commands that require this setting to work efficiently. Several *fixes*, most notably time integration fixes like *fix nve*, also take advantage of this setting if the group they operate on is the group specified by this command. Note that specifying "all" as the group-ID effectively turns off the *first* option.

It is OK to use the *first* keyword with a group that has not yet been defined, e.g. to use the *atom\_modify first* command at the beginning of your input script. LAMMPS does not use the group until a simulation is run.

The *sort* keyword turns on a spatial sorting or reordering of atoms within each processor's sub-domain every *Nfreq* timesteps. If *Nfreq* is set to 0, then sorting is turned off. Sorting can improve cache performance and thus speed-up a LAMMPS simulation, as discussed in a paper by (*Meloni*). Its efficacy depends on the problem size (atoms/processor), how quickly the system becomes disordered, and various other factors. As a general rule, sorting is typically more effective at speeding up simulations of liquids as opposed to solids. In tests we have done, the speed-up can range from zero to 3-4x.

Reordering is performed every *Nfreq* timesteps during a dynamics run or iterations during a minimization. More precisely, reordering occurs at the first reneighboring that occurs after the target timestep. The reordering is performed locally by each processor, using bins of the specified *binsize*. If *binsize* is set to 0.0, then a binsize equal to half the *neighbor* cutoff distance (force cutoff plus skin distance) is used, which is a reasonable value. After the atoms have been binned, they are reordered so that atoms in the same bin are adjacent to each other in the processor's 1d list of atoms.

The goal of this procedure is for atoms to put atoms close to each other in the processor's one-dimensional list of atoms that are also near to each other spatially. This can improve cache performance when pairwise interactions and neighbor lists are computed. Note that if bins are too small, there will be few atoms/bin. Likewise if bins are too large, there will be many atoms/bin. In both cases, the goal of cache locality will be undermined.

---

**Note:** Running a simulation with sorting on versus off should not change the simulation results in a statistical sense. However, a different ordering will induce round-off differences, which will lead to diverging trajectories over time when comparing two simulations. Various commands, particularly those which use random numbers (e.g. *velocity create*, and *fix langevin*), may generate (statistically identical) results which depend on the order in which atoms are processed. The order of atoms in a *dump* file will also typically change if sorting is enabled.

---

### 16.3.4 Restrictions

The *first* and *sort* options cannot be used together. Since sorting is on by default, it will be turned off if the *first* keyword is used with a group-ID that is not "all".

### 16.3.5 Related commands

none

### 16.3.6 Default

By default, *id* is yes. By default, atomic systems (no bond topology info) do not use a map. For molecular systems (with bond topology info), a map is used. The default map style is array if no atom ID is larger than 1 million, otherwise the default is hash. By default, a “first” group is not defined. By default, sorting is enabled with a frequency of 1000 and a binsize of 0.0, which means the neighbor cutoff will be used to set the bin size. If no neighbor cutoff is defined, sorting will be turned off.

(Meloni) Meloni, Rosati and Colombo, J Chem Phys, 126, 121102 (2007).

## 16.4 atom\_style command

### 16.4.1 Syntax

```
atom_style style args
```

- style = *amoeba* or *angle* or *atomic* or *body* or *bond* or *charge* or *dielectric* or *dipole* or *dpd* or *edpd* or *electron* or *ellipsoid* or *full* or *line* or *mdpd* or *mesont* or *molecular* or *oxdna* or *peri* or *smd* or *sph* or *sphere* or *bpm/sphere* or *spin* or *tdpd* or *tri* or *template* or *wavepacket* or *hybrid*

args = none for any style except the following

*body* args = *bstyle* *bstyle-args*

*bstyle* = style of body particles

*bstyle-args* = additional arguments specific to the *bstyle*

see the [Howto body](#) doc

page for details

*sphere* arg = 0/1 (optional) for static/dynamic particle radii

*bpm/sphere* arg = 0/1 (optional) for static/dynamic particle radii

*tdpd* arg = *Nspecies*

*Nspecies* = # of chemical species

*template* arg = *template-ID*

*template-ID* = ID of molecule template specified in a separate [molecule](#) command

*hybrid* args = list of one or more sub-styles, each with their args

- accelerated styles (with same args) = *angle/kk* or *atomic/kk* or *bond/kk* or *charge/kk* or *full/kk* or *molecular/kk* or *spin/kk*

### 16.4.2 Examples

```
atom_style atomic
atom_style bond
atom_style full
atom_style body nparticle 2 10
atom_style hybrid charge bond
atom_style hybrid charge body nparticle 2 5
atom_style spin
atom_style template myMols
atom_style hybrid template twomols charge
atom_style tdpd 2
```

### 16.4.3 Description

Define what style of atoms to use in a simulation. This determines what attributes are associated with the atoms. This command must be used before a simulation is setup via a *read\_data*, *read\_restart*, or *create\_box* command.

**Note:** Many of the atom styles discussed here are only enabled if LAMMPS was built with a specific package, as listed below in the Restrictions section.

Once a style is assigned, it cannot be changed, so use a style general enough to encompass all attributes. E.g. with style *bond*, angular terms cannot be used or added later to the model. It is OK to use a style more general than needed, though it may be slightly inefficient.

The choice of style affects what quantities are stored by each atom, what quantities are communicated between processors to enable forces to be computed, and what quantities are listed in the data file read by the *read\_data* command.

These are the additional attributes of each style and the typical kinds of physical systems they are used to model. All styles store coordinates, velocities, atom IDs and types. See the *read\_data*, *create\_atoms*, and *set* commands for info on how to set these various quantities.

<i>amoeba</i>	molecular + charge + 1/5 neighbors	AMOEBHA/HIPPO polarized force fields
<i>angle</i>	bonds and angles	bead-spring polymers with stiffness
<i>atomic</i>	only the default values	coarse-grain liquids, solids, metals
<i>body</i>	mass, inertia moments, quaternion, angular momentum	arbitrary bodies
<i>bond</i>	bonds	bead-spring polymers
<i>charge</i>	charge	atomic system with charges
<i>dielectric</i>	dipole, area, curvature	system with surface polarization
<i>dipole</i>	charge and dipole moment	system with dipolar particles
<i>dpd</i>	internal temperature and internal energies	DPD particles
<i>edpd</i>	temperature and heat capacity	eDPD particles
<i>electron</i>	charge and spin and eradius	electronic force field
<i>ellipsoid</i>	shape, quaternion, angular momentum	aspherical particles
<i>full</i>	molecular + charge	bio-molecules
<i>line</i>	end points, angular velocity	rigid bodies
<i>mdpd</i>	density	mDPD particles
<i>mesont</i>	mass, radius, length, buckling, connections, tube id	mesoscopic nanotubes
<i>molecular</i>	bonds, angles, dihedrals, impropers	uncharged molecules
<i>oxdna</i>	nucleotide polarity	coarse-grained DNA and RNA models
<i>peri</i>	mass, volume	mesoscopic Peridynamic models
<i>smd</i>	volume, kernel diameter, contact radius, mass	solid and fluid SPH particles
<i>sph</i>	rho, esph, cv	SPH particles
<i>sphere</i>	diameter, mass, angular velocity	granular models
<i>bpm/sphere</i>	diameter, mass, angular velocity, quaternion	granular bonded particle models (BPM)
<i>spin</i>	magnetic moment	system with magnetic particles
<i>tdpd</i>	chemical concentration	tDPD particles
<i>template</i>	template index, template atom	small molecules with fixed topology
<i>tri</i>	corner points, angular momentum	rigid bodies
<i>wavepacket</i>	charge, spin, eradius, etag, cs_re, cs_im	AWPMD

**Note:** It is possible to add some attributes, such as a molecule ID, to atom styles that do not have them via the *fix property/atom* command. This command also allows new custom attributes consisting of extra integer or floating-point values to be added to atoms. See the *fix property/atom* page for examples of cases where this is useful and details on

how to initialize, access, and output the custom values.

All of the above styles define point particles, except the *sphere*, *bpm/sphere*, *ellipsoid*, *electron*, *peri*, *wavepacket*, *line*, *tri*, and *body* styles, which define finite-size particles. See the [Howto spherical](#) page for an overview of using finite-size particle models with LAMMPS.

All of the point-particle styles assign mass to particles on a per-type basis, using the *mass* command, The finite-size particle styles assign mass to individual particles on a per-particle basis.

For the *sphere* and *bpm/sphere* styles, the particles are spheres and each stores a per-particle diameter and mass. If the diameter > 0.0, the particle is a finite-size sphere. If the diameter = 0.0, it is a point particle. Note that by use of the *disc* keyword with the *fix nve/sphere*, *fix nvt/sphere*, *fix nph/sphere*, *fix npt/sphere* commands for the *sphere* style, spheres can be effectively treated as 2d discs for a 2d simulation if desired. See also the *set density/disc* command. The *sphere* and *bpm/sphere* styles take an optional 0 or 1 argument. A value of 0 means the radius of each sphere is constant for the duration of the simulation. A value of 1 means the radii may vary dynamically during the simulation, e.g. due to use of the *fix adapt* command.

For the *ellipsoid* style, the particles are ellipsoids and each stores a flag which indicates whether it is a finite-size ellipsoid or a point particle. If it is an ellipsoid, it also stores a shape vector with the 3 diameters of the ellipsoid and a quaternion 4-vector with its orientation.

For the *dielectric* style, each particle can be either a physical particle (e.g. an ion), or an interface particle representing a boundary element. For physical particles, the per-particle properties are the same as *atom\_style full*. For interface particles, in addition to these properties, each particle also has an area, a normal unit vector, a mean local curvature, the mean and difference of the dielectric constants of two sides of the interface, and the local dielectric constant at the boundary element. The distinction between the physical and interface particles is only meaningful when *fix polarize* commands are applied to the interface particles.

For the *dipole* style, a point dipole is defined for each point particle. Note that if you wish the particles to be finite-size spheres as in a Stockmayer potential for a dipolar fluid, so that the particles can rotate due to dipole-dipole interactions, then you need to use *atom\_style hybrid sphere dipole*, which will assign both a diameter and dipole moment to each particle.

For the *electron* style, the particles representing electrons are 3d Gaussians with a specified position and bandwidth or uncertainty in position, which is represented by the *eradius* = electron size.

For the *peri* style, the particles are spherical and each stores a per-particle mass and volume.

The *bpm/sphere* style is part of the BPM package.

The *oxdna* style is for coarse-grained nucleotides and stores the 3'-to-5' polarity of the nucleotide strand, which is set through the bond topology in the data file. The first (second) atom in a bond definition is understood to point towards the 3'-end (5'-end) of the strand. Note that this style is part of the CG-DNA package.

The *dpd* style is for dissipative particle dynamics (DPD) particles. Note that it is part of the DPD-REACT package, and is not for use with the *pair\_style dpd* or *dpd/stat* commands, which can simply use *atom\_style atomic*. *Atom\_style dpd* extends DPD particle properties with internal temperature (*dpdTheta*), internal conductive energy (*uCond*), internal mechanical energy (*uMech*), and internal chemical energy (*uChem*).

The *edpd* style is for energy-conserving dissipative particle dynamics (eDPD) particles which store a temperature (*edpd\_temp*), and heat capacity (*edpd\_cv*).

The *mdpd* style is for many-body dissipative particle dynamics (mDPD) particles which store a density (*rho*) for considering density-dependent many-body interactions.

The *tdpd* style is for transport dissipative particle dynamics (tDPD) particles which store a set of chemical concentration. An integer "cc\_species" is required to specify the number of chemical species involved in a tDPD system.

The *sph* style is for smoothed particle hydrodynamics (SPH) particles which store a density (*rho*), energy (*esph*), and heat capacity (*cv*).

The *smd* style is for a general formulation of Smooth Particle Hydrodynamics. Both fluids and solids can be modeled. Particles store the mass and volume of an integration point, a kernel diameter used for calculating the field variables (e.g. stress and deformation) and a contact radius for calculating repulsive forces which prevent individual physical bodies from penetrating each other.

For the *spin* style, a magnetic spin is associated to each atom. Those spins have a norm (their magnetic moment) and a direction.

The *wavepacket* style is similar to *electron*, but the electrons may consist of several Gaussian wave packets, summed up with coefficients  $cs = (cs\_re, cs\_im)$ . Each of the wave packets is treated as a separate particle in LAMMPS, wave packets belonging to the same electron must have identical *etag* values.

For the *line* style, the particles are idealized line segments and each stores a per-particle mass and length and orientation (i.e. the end points of the line segment).

For the *tri* style, the particles are planar triangles and each stores a per-particle mass and size and orientation (i.e. the corner points of the triangle).

The *template* style allows molecular topology (bonds, angles, etc) to be defined via a molecule template using the *molecule* command. The template stores one or more molecules with a single copy of the topology info (bonds, angles, etc) of each. Individual atoms only store a template index and template atom to identify which molecule and which atom-within-the-molecule they represent. Using the *template* style instead of the *bond*, *angle*, *molecular* styles can save memory for systems comprised of a large number of small molecules, all of a single type (or small number of types). See the paper by Grime and Voth, in (*Grime*), for examples of how this can be advantageous for large-scale coarse-grained systems. The `examples/template` directory has a few demo inputs and examples showing the use of the *template* atom style versus *molecular*.

---

**Note:** When using the *template* style with a *molecule template* that contains multiple molecules, you should insure the atom types, bond types, angle\_types, etc in all the molecules are consistent. E.g. if one molecule represents H2O and another CO2, then you probably do not want each molecule file to define 2 atom types and a single bond type, because they will conflict with each other when a mixture system of H2O and CO2 molecules is defined, e.g. by the *read\_data* command. Rather the H2O molecule should define atom types 1 and 2, and bond type 1. And the CO2 molecule should define atom types 3 and 4 (or atom types 3 and 2 if a single oxygen type is desired), and bond type 2.

---

For the *body* style, the particles are arbitrary bodies with internal attributes defined by the “style” of the bodies, which is specified by the *bstyle* argument. Body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc.

The *Howto body* page describes the body styles LAMMPS currently supports, and provides more details as to the kind of body particles they represent. For all styles, each body particle stores moments of inertia and a quaternion 4-vector, so that its orientation and position can be time integrated due to forces and torques.

Note that there may be additional arguments required along with the *bstyle* specification, in the `atom_style body` command. These arguments are described on the *Howto body* doc page.

---

Typically, simulations require only a single (non-hybrid) atom style. If some atoms in the simulation do not have all the properties defined by a particular style, use the simplest style that defines all the needed properties by any atom. For example, if some atoms in a simulation are charged, but others are not, use the *charge* style. If some atoms have bonds, but others do not, use the *bond* style.

The only scenario where the *hybrid* style is needed is if there is no single style which defines all needed properties of all atoms. For example, as mentioned above, if you want dipolar particles which will rotate due to torque, you need to use “`atom_style hybrid sphere dipole`”. When a hybrid style is used, atoms store and communicate the union of all quantities implied by the individual styles.

When using the *hybrid* style, you cannot combine the *template* style with another molecular style that stores bond, angle, etc info on a per-atom basis.

LAMMPS can be extended with new atom styles as well as new body styles; see the [Modify](#) doc page.

---

Styles with a *gpu*, *intel*, *kk*, *omp*, or *opt* suffix are functionally the same as the corresponding style without the suffix. They have been optimized to run faster, depending on your available hardware, as discussed on the [Accelerator packages](#) page. The accelerated styles take the same arguments and should produce the same results, except for round-off and precision issues.

These accelerated styles are part of the GPU, INTEL, KOKKOS, OPENMP, and OPT packages, respectively. They are only enabled if LAMMPS was built with those packages. See the [Build package](#) page for more info.

You can specify the accelerated styles explicitly in your input script by including their suffix, or you can use the *-suffix command-line switch* when you invoke LAMMPS, or you can use the *suffix* command in your input script.

See the [Accelerator packages](#) page for more instructions on how to use the accelerated styles effectively.

---

#### 16.4.4 Restrictions

This command cannot be used after the simulation box is defined by a *read\_data* or *create\_box* command.

Many of the styles listed above are only enabled if LAMMPS was built with a specific package, as listed below. See the [Build package](#) page for more info.

The *amoeba* style is part of the AMOEBA package.

The *angle*, *bond*, *full*, *molecular*, and *template* styles are part of the MOLECULE package.

The *line* and *tri* styles are part of the ASPHERE package.

The *body* style is part of the BODY package.

The *dipole* style is part of the DIPOLE package.

The *peri* style is part of the PERI package for Peridynamics.

The *oxdna* style is part of the CG-DNA package for coarse-grained simulation of DNA and RNA.

The *electron* style is part of the EFF package for *electronic force fields*.

The *dpd* style is part of the DPD-REACT package for dissipative particle dynamics (DPD).

The *edpd*, *mdpd*, and *tdpd* styles are part of the DPD-MESO package for energy-conserving dissipative particle dynamics (eDPD), many-body dissipative particle dynamics (mDPD), and transport dissipative particle dynamics (tDPD), respectively.

The *sph* style is part of the SPH package for smoothed particle hydrodynamics (SPH). See [this PDF guide](#) to using SPH in LAMMPS.

The *mesont* style is part of the MESONT package.

The *spin* style is part of the SPIN package.

The *wavepacket* style is part of the AWPMD package for the *antisymmetrized wave packet MD method*.

## 16.4.5 Related commands

*read\_data, pair\_style*

## 16.4.6 Default

The default atom style is atomic. If atom\_style sphere is used its default argument is 0.

(Grime) Grime and Voth, to appear in J Chem Theory & Computation (2014).

## 16.5 balance command

### 16.5.1 Syntax

```
balance thresh style args ... keyword args ...
```

- thresh = imbalance threshold that must be exceeded to perform a re-balance
- one style/arg pair can be used (or multiple for x,y,z)
- style = *x* or *y* or *z* or *shift* or *rcb*
  - x* args = *uniform* or Px-1 numbers between 0 and 1
    - uniform* = evenly spaced cuts between processors in x dimension
    - numbers = Px-1 ascending values between 0 and 1, Px - # of processors in x<sub>dimension</sub>  
→dimension
    - x* can be specified together with *y* or *z*
  - y* args = *uniform* or Py-1 numbers between 0 and 1
    - uniform* = evenly spaced cuts between processors in y dimension
    - numbers = Py-1 ascending values between 0 and 1, Py - # of processors in y<sub>dimension</sub>  
→dimension
    - y* can be specified together with *x* or *z*
  - z* args = *uniform* or Pz-1 numbers between 0 and 1
    - uniform* = evenly spaced cuts between processors in z dimension
    - numbers = Pz-1 ascending values between 0 and 1, Pz - # of processors in z<sub>dimension</sub>  
→dimension
    - z* can be specified together with *x* or *y*
  - shift* args = dimstr Niter stopthresh
    - dimstr = sequence of letters containing "x" or "y" or "z", each not more than once
    - Niter = # of times to iterate within each dimension of dimstr sequence
    - stopthresh = stop balancing when this imbalance threshold is reached
  - rcb* args = none
- zero or more keyword/arg pairs may be appended
- keyword = *weight* or *out*
  - weight* style args = use weighted particle counts for the balancing
    - style = *group* or *neigh* or *time* or *var* or *store*
    - group args = Ngroup group1 weight1 group2 weight2 ...
      - Ngroup = number of groups with assigned weights
      - group1, group2, ... = group IDs
      - weight1, weight2, ... = corresponding weight factors

```

    neigh factor = compute weight based on number of neighbors
                    factor = scaling factor (> 0)
    time factor = compute weight based on time spend computing
                    factor = scaling factor (> 0)
    var name = take weight from atom-style variable
                    name = name of the atom-style variable
    store name = store weight in custom atom property defined by fix property/atom
↪command
    name = atom property name (without d_ prefix)
out arg = filename
    filename = write each processor's sub-domain to a file

```

## 16.5.2 Examples

```

balance 0.9 x uniform y 0.4 0.5 0.6
balance 1.2 shift xz 5 1.1
balance 1.0 shift xz 5 1.1
balance 1.1 rcb
balance 1.0 shift x 10 1.1 weight group 2 fast 0.5 slow 2.0
balance 1.0 shift x 10 1.1 weight time 0.8 weight neigh 0.5 weight store balance
balance 1.0 shift x 20 1.0 out tmp.balance

```

## 16.5.3 Description

This command adjusts the size and shape of processor sub-domains within the simulation box, to attempt to balance the number of atoms or particles and thus indirectly the computational cost (load) more evenly across processors. The load balancing is “static” in the sense that this command performs the balancing once, before or between simulations. The processor sub-domains will then remain static during the subsequent run. To perform “dynamic” balancing, see the *fix balance* command, which can adjust processor sub-domain sizes and shapes on-the-fly during a *run*.

Load-balancing is typically most useful if the particles in the simulation box have a spatially-varying density distribution or when the computational cost varies significantly between different particles. E.g. a model of a vapor/liquid interface, or a solid with an irregular-shaped geometry containing void regions, or *hybrid pair style simulations* which combine pair styles with different computational cost. In these cases, the LAMMPS default of dividing the simulation box volume into a regular-spaced grid of 3d bricks, with one equal-volume sub-domain per processor, may assign numbers of particles per processor in a way that the computational effort varies significantly. This can lead to poor performance when the simulation is run in parallel.

The balancing can be performed with or without per-particle weighting. With no weighting, the balancing attempts to assign an equal number of particles to each processor. With weighting, the balancing attempts to assign an equal aggregate computational weight to each processor, which typically induces a different number of atoms assigned to each processor. Details on the various weighting options and examples for how they can be used are *given below*.

Note that the *processors* command allows some control over how the box volume is split across processors. Specifically, for a  $P_x$  by  $P_y$  by  $P_z$  grid of processors, it allows choice of  $P_x$ ,  $P_y$ , and  $P_z$ , subject to the constraint that  $P_x * P_y * P_z = P$ , the total number of processors. This is sufficient to achieve good load-balance for some problems on some processor counts. However, all the processor sub-domains will still have the same shape and same volume.

The requested load-balancing operation is only performed if the current “imbalance factor” in particles owned by each processor exceeds the specified *thresh* parameter. The imbalance factor is defined as the maximum number of particles (or weight) owned by any processor, divided by the average number of particles (or weight) per processor. Thus an imbalance factor of 1.0 is perfect balance.

As an example, for 10000 particles running on 10 processors, if the most heavily loaded processor has 1200 particles, then the factor is 1.2, meaning there is a 20% imbalance. Note that a re-balance can be forced even if the current balance is perfect (1.0) by specifying a *thresh* < 1.0.

---

**Note:** Balancing is performed even if the imbalance factor does not exceed the *thresh* parameter if a “grid” style is specified when the current partitioning is “tiled”. The meaning of “grid” vs “tiled” is explained below. This is to allow forcing of the partitioning to “grid” so that the *comm\_style brick* command can then be used to replace a current *comm\_style tiled* setting.

---

When the balance command completes, it prints statistics about the result, including the change in the imbalance factor and the change in the maximum number of particles on any processor. For “grid” methods (defined below) that create a logical 3d grid of processors, the positions of all cutting planes in each of the 3 dimensions (as fractions of the box length) are also printed.

---

**Note:** This command attempts to minimize the imbalance factor, as defined above. But depending on the method a perfect balance (1.0) may not be achieved. For example, “grid” methods (defined below) that create a logical 3d grid cannot achieve perfect balance for many irregular distributions of particles. Likewise, if a portion of the system is a perfect lattice, e.g. the initial system is generated by the *create\_atoms* command, then “grid” methods may be unable to achieve exact balance. This is because entire lattice planes will be owned or not owned by a single processor.

---

---

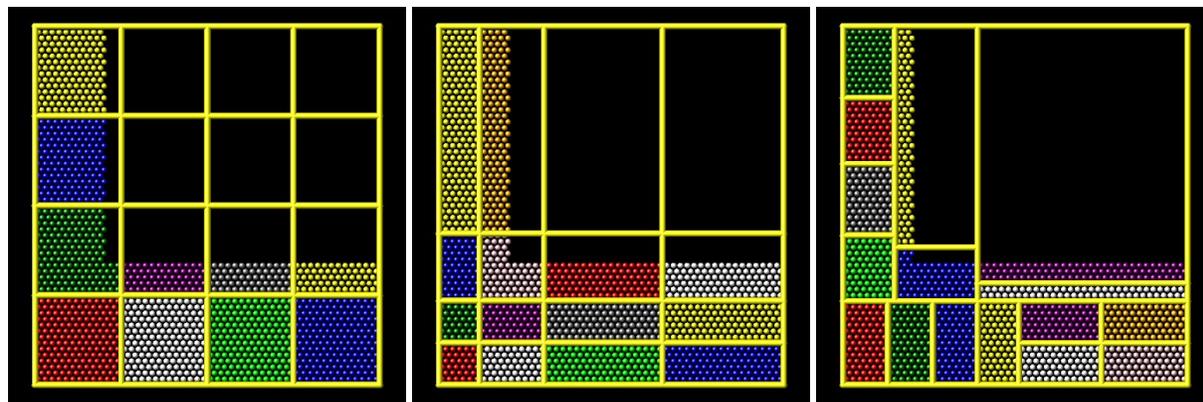

**Note:** The imbalance factor is also an estimate of the maximum speed-up you can hope to achieve by running a perfectly balanced simulation versus an imbalanced one. In the example above, the 10000 particle simulation could run up to 20% faster if it were perfectly balanced, versus when imbalanced. However, computational cost is not strictly proportional to particle count, and changing the relative size and shape of processor sub-domains may lead to additional computational and communication overheads, e.g. in the PPPM solver used via the *kpspace\_style* command. Thus you should benchmark the run times of a simulation before and after balancing.

---

---

The method used to perform a load balance is specified by one of the listed styles (or more in the case of *x,y,z*), which are described in detail below. There are 2 kinds of styles.

The *x*, *y*, *z*, and *shift* styles are “grid” methods which produce a logical 3d grid of processors. They operate by changing the cutting planes (or lines) between processors in 3d (or 2d), to adjust the volume (area in 2d) assigned to each processor, as in the following 2d diagram where processor sub-domains are shown and particles are colored by the processor that owns them.

The leftmost diagram is the default partitioning of the simulation box across processors (one sub-box for each of 16 processors); the middle diagram is after a “grid” method has been applied. The *rcb* style is a “tiling” method which

does not produce a logical 3d grid of processors. Rather it tiles the simulation domain with rectangular sub-boxes of varying size and shape in an irregular fashion so as to have equal numbers of particles (or weight) in each sub-box, as in the rightmost diagram above.

The “grid” methods can be used with either of the *comm\_style* command options, *brick* or *tiled*. The “tiling” methods can only be used with *comm\_style tiled*. Note that it can be useful to use a “grid” method with *comm\_style tiled* to return the domain partitioning to a logical 3d grid of processors so that “comm\_style brick” can afterwards be specified for subsequent *run* commands.

When a “grid” method is specified, the current domain partitioning can be either a logical 3d grid or a tiled partitioning. In the former case, the current logical 3d grid is used as a starting point and changes are made to improve the imbalance factor. In the latter case, the tiled partitioning is discarded and a logical 3d grid is created with uniform spacing in all dimensions. This becomes the starting point for the balancing operation.

When a “tiling” method is specified, the current domain partitioning (“grid” or “tiled”) is ignored, and a new partitioning is computed from scratch.

---

The *x*, *y*, and *z* styles invoke a “grid” method for balancing, as described above. Note that any or all of these 3 styles can be specified together, one after the other, but they cannot be used with any other style. This style adjusts the position of cutting planes between processor sub-domains in specific dimensions. Only the specified dimensions are altered.

The *uniform* argument spaces the planes evenly, as in the left diagrams above. The *numeric* argument requires listing Ps-1 numbers that specify the position of the cutting planes. This requires knowing  $P_s = P_x$  or  $P_y$  or  $P_z =$  the number of processors assigned by LAMMPS to the relevant dimension. This assignment is made (and the  $P_x$ ,  $P_y$ ,  $P_z$  values printed out) when the simulation box is created by the “create\_box” or “read\_data” or “read\_restart” command and is influenced by the settings of the *processors* command.

Each of the numeric values must be between 0 and 1, and they must be listed in ascending order. They represent the fractional position of the cutting place. The left (or lower) edge of the box is 0.0, and the right (or upper) edge is 1.0. Neither of these values is specified. Only the interior Ps-1 positions are specified. Thus if there are 2 processors in the x dimension, you specify a single value such as 0.75, which would make the left processor’s sub-domain 3x larger than the right processor’s sub-domain.

---

The *shift* style invokes a “grid” method for balancing, as described above. It changes the positions of cutting planes between processors in an iterative fashion, seeking to reduce the imbalance factor, similar to how the *fix balance shift* command operates.

The *dimstr* argument is a string of characters, each of which must be an “x” or “y” or “z”. Each character can appear zero or one time, since there is no advantage to balancing on a dimension more than once. You should normally only list dimensions where you expect there to be a density variation in the particles.

Balancing proceeds by adjusting the cutting planes in each of the dimensions listed in *dimstr*, one dimension at a time. For a single dimension, the balancing operation (described below) is iterated on up to *Niter* times. After each dimension finishes, the imbalance factor is re-computed, and the balancing operation halts if the *stoptresh* criterion is met.

A re-balance operation in a single dimension is performed using a recursive multisectioning algorithm, where the position of each cutting plane (line in 2d) in the dimension is adjusted independently. This is similar to a recursive bisectioning for a single value, except that the bounds used for each bisectioning take advantage of information from neighboring cuts if possible. At each iteration, the count of particles on either side of each plane is tallied. If the counts do not match the target value for the plane, the position of the cut is adjusted to be halfway between a low and high bound. The low and high bounds are adjusted on each iteration, using new count information, so that they become closer together over time. Thus as the recursion progresses, the count of particles on either side of the plane gets closer to the target value.

After the balanced plane positions are determined, if any pair of adjacent planes are closer together than the neighbor skin distance (as specified by the *neigh\_modify* command), then the plane positions are shifted to separate them by at

least this amount. This is to prevent particles being lost when dynamics are run with processor sub-domains that are too narrow in one or more dimensions.

Once the re-balancing is complete and final processor sub-domains assigned, particles are migrated to their new owning processor, and the balance procedure ends.

---

**Note:** At each re-balance operation, the bisectioning for each cutting plane (line in 2d) typically starts with low and high bounds separated by the extent of a processor's sub-domain in one dimension. The size of this bracketing region shrinks by 1/2 every iteration. Thus if *Niter* is specified as 10, the cutting plane will typically be positioned to 1 part in 1000 accuracy (relative to the perfect target position). For *Niter* = 20, it will be accurate to 1 part in a million. Thus there is no need to set *Niter* to a large value. LAMMPS will check if the threshold accuracy is reached (in a dimension) is less iterations than *Niter* and exit early. However, *Niter* should also not be set too small, since it will take roughly the same number of iterations to converge even if the cutting plane is initially close to the target value.

---

The *rcb* style invokes a “tiled” method for balancing, as described above. It performs a recursive coordinate bisectioning (RCB) of the simulation domain. The basic idea is as follows.

The simulation domain is cut into 2 boxes by an axis-aligned cut in one of the dimensions, leaving one new sub-box on either side of the cut. Which dimension is chosen for the cut depends on the particle (weight) distribution within the parent box. Normally the longest dimension of the box is cut, but if all (or most) of the particles are at one end of the box, a cut may be performed in another dimension to induce sub-boxes that are more cube-ish (3d) or square-ish (2d) in shape.

After the cut is made, all the processors are also partitioned into 2 groups, half assigned to the box on the lower side of the cut, and half to the box on the upper side. (If the processor count is odd, one side gets an extra processor.) The cut is positioned so that the number of (weighted) particles in the lower box is exactly the number that the processors assigned to that box should own for load balance to be perfect. This also makes load balance for the upper box perfect. The positioning of the cut is done iteratively, by a bisectioning method (median search). Note that counting particles on either side of the cut requires communication between all processors at each iteration.

That is the procedure for the first cut. Subsequent cuts are made recursively, in exactly the same manner. The subset of processors assigned to each box make a new cut in one dimension of that box, splitting the box, the subset of processors, and the particles in the box in two. The recursion continues until every processor is assigned a sub-box of the entire simulation domain, and owns the (weighted) particles in that sub-box.

---

This sub-section describes how to perform weighted load balancing using the *weight* keyword.

By default, all particles have a weight of 1.0, which means each particle is assumed to require the same amount of computation during a timestep. There are, however, scenarios where this is not a good assumption. Measuring the computational cost for each particle accurately would be impractical and slow down the computation. Instead the *weight* keyword implements several ways to influence the per-particle weights empirically by properties readily available or using the user's knowledge of the system. Note that the absolute value of the weights are not important; only their relative ratios affect which particle is assigned to which processor. A particle with a weight of 2.5 is assumed to require 5x more computational than a particle with a weight of 0.5. For all the options below the weight assigned to a particle must be a positive value; an error will be generated if a weight is  $\leq 0.0$ .

Below is a list of possible weight options with a short description of their usage and some example scenarios where they might be applicable. It is possible to apply multiple weight flags and the weightings they induce will be combined through multiplication. Most of the time, however, it is sufficient to use just one method.

The *group* weight style assigns weight factors to specified *groups* of particles. The *group* style keyword is followed by the number of groups, then pairs of group IDs and the corresponding weight factor. If a particle belongs to none of the specified groups, its weight is not changed. If it belongs to multiple groups, its weight is the product of the weight factors.

This weight style is useful in combination with pair style *hybrid*, e.g. when combining a more costly many-body potential with a fast pairwise potential. It is also useful when using *run\_style respa* where some portions of the system have many bonded interactions and others none. It assumes that the computational cost for each group remains constant over time. This is a purely empirical weighting, so a series test runs to tune the assigned weight factors for optimal performance is recommended.

The *neigh* weight style assigns the same weight to each particle owned by a processor based on the total count of neighbors in the neighbor list owned by that processor. The motivation is that more neighbors means a higher computational cost. The style does not use neighbors per atom to assign a unique weight to each atom, because that value can vary depending on how the neighbor list is built.

The *factor* setting is applied as an overall scale factor to the *neigh* weights which allows adjustment of their impact on the balancing operation. The specified *factor* value must be positive. A value  $> 1.0$  will increase the weights so that the ratio of max weight to min weight increases by *factor*. A value  $< 1.0$  will decrease the weights so that the ratio of max weight to min weight decreases by *factor*. In both cases the intermediate weight values increase/decrease proportionally as well. A value  $= 1.0$  has no effect on the *neigh* weights. As a rule of thumb, we have found a *factor* of about 0.8 often results in the best performance, since the number of neighbors is likely to overestimate the ideal weight.

This weight style is useful for systems where there are different cutoffs used for different pairs of interactions, or the density fluctuates, or a large number of particles are in the vicinity of a wall, or a combination of these effects. If a simulation uses multiple neighbor lists, this weight style will use the first suitable neighbor list it finds. It will not request or compute a new list. A warning will be issued if there is no suitable neighbor list available or if it is not current, e.g. if the *balance* command is used before a *run* or *minimize* command is used, in which case the neighbor list may not yet have been built. In this case no weights are computed. Inserting a *run 0 post no* command before issuing the *balance* command, may be a workaround for this case, as it will induce the neighbor list to be built.

The *time* weight style uses *timer data* to estimate weights. It assigns the same weight to each particle owned by a processor based on the total computational time spent by that processor. See details below on what time window is used. It uses the same timing information as is used for the *MPI task timing breakdown*, namely, for sections *Pair*, *Bond*, *Kspace*, and *Neigh*. The time spent in those portions of the timestep are measured for each MPI rank, summed, then divided by the number of particles owned by that processor. I.e. the weight is an effective CPU time/particle averaged over the particles on that processor.

The *factor* setting is applied as an overall scale factor to the *time* weights which allows adjustment of their impact on the balancing operation. The specified *factor* value must be positive. A value  $> 1.0$  will increase the weights so that the ratio of max weight to min weight increases by *factor*. A value  $< 1.0$  will decrease the weights so that the ratio of max weight to min weight decreases by *factor*. In both cases the intermediate weight values increase/decrease proportionally as well. A value  $= 1.0$  has no effect on the *time* weights. As a rule of thumb, effective values to use are typically between 0.5 and 1.2. Note that the timer quantities mentioned above can be affected by communication which occurs in the middle of the operations, e.g. pair styles with intermediate exchange of data within the force computation, and likewise for KSpace solves.

When using the *time* weight style with the *balance* command, the timing data is taken from the preceding run command, i.e. the timings are for the entire previous run. For the *fix balance* command the timing data is for only the timesteps since the last balancing operation was performed. If timing information for the required sections is not available, e.g. at the beginning of a run, or when the *timer* command is set to either *loop* or *off*, a warning is issued. In this case no weights are computed.

---

**Note:** The *time* weight style is the most generic option, and should be tried first, unless the *group* style is easily applicable. However, since the computed cost function is averaged over all particles on a processor, the weights may not be highly accurate. This style can also be effective as a secondary weight in combination with either *group* or *neigh* to offset some of inaccuracies in either of those heuristics.

---

The *var* weight style assigns per-particle weights by evaluating an *atom-style variable* specified by *name*. This is provided as a more flexible alternative to the *group* weight style, allowing definition of a more complex heuristics based

on information (global and per atom) available inside of LAMMPS. For example, atom-style variables can reference the position of a particle, its velocity, the volume of its Voronoi cell, etc.

The *store* weight style does not compute a weight factor. Instead it stores the current accumulated weights in a custom per-atom vector specified by *name*. This must be a vector defined as *d\_name* via the *fix property/atom* command. This means the values in the vector can be read as part of a data file with the *read\_data* command or specified with the *set* command. These weights can also be output in a *dump* file, so this is a way to examine, debug, or visualize the per-particle weights used during the load-balancing operation.

Note that the name of the custom per-atom vector is specified just as *name*, not as *d\_name* as it is for other commands that use different kinds of custom atom vectors or arrays as arguments.

---

The *out* keyword writes a text file to the specified *filename* with the results of the balancing operation. The file contains the bounds of the sub-domain for each processor after the balancing operation completes. The format of the file is compatible with the [Pizza.py mdump](#) tool which has support for manipulating and visualizing mesh files. An example is shown here for a balancing by 4 processors for a 2d problem:

```
ITEM: TIMESTEP
0
ITEM: NUMBER OF NODES
16
ITEM: BOX BOUNDS
0 10
0 10
0 10
ITEM: NODES
1 1 0 0 0
2 1 5 0 0
3 1 5 5 0
4 1 0 5 0
5 1 5 0 0
6 1 10 0 0
7 1 10 5 0
8 1 5 5 0
9 1 0 5 0
10 1 5 5 0
11 1 5 10 0
12 1 10 5 0
13 1 5 5 0
14 1 10 5 0
15 1 10 10 0
16 1 5 10 0
ITEM: TIMESTEP
0
ITEM: NUMBER OF SQUARES
4
ITEM: SQUARES
1 1 1 2 3 4
2 1 5 6 7 8
3 1 9 10 11 12
4 1 13 14 15 16
```

The coordinates of all the vertices are listed in the NODES section, 5 per processor. Note that the 4 sub-domains share vertices, so there will be duplicate nodes in the list.

The “SQUARES” section lists the node IDs of the 4 vertices in a rectangle for each processor (1 to 4).

For a 3d problem, the syntax is similar with 8 vertices listed for each processor, instead of 4, and “SQUARES” replaced by “CUBES”.

## 16.5.4 Restrictions

For 2d simulations, the *z* style cannot be used. Nor can a “z” appear in *dimstr* for the *shift* style.

Balancing through recursive bisectioning (*rcb* style) requires *comm\_style tiled*

## 16.5.5 Related commands

*group*, *processors*, *fix balance*, *comm\_style*

## 16.5.6 Default

none

# 16.6 bond\_coeff command

## 16.6.1 Syntax

```
bond_coeff N args
```

- N = numeric bond type (see asterisk form below), or type label
- args = coefficients for one or more bond types

## 16.6.2 Examples

```
bond_coeff 5 80.0 1.2
bond_coeff * 30.0 1.5 1.0 1.0
bond_coeff 1*4 30.0 1.5 1.0 1.0
bond_coeff 1 harmonic 200.0 1.0 (for bond_style hybrid)
```

```
labelmap bond 5 carbonyl
```

```
bond_coeff carbonyl 80.0 1.2
```

### 16.6.3 Description

Specify the bond force field coefficients for one or more bond types. The number and meaning of the coefficients depends on the bond style. Bond coefficients can also be set in the data file read by the *read\_data* command or in a restart file.

$N$  can be specified in one of several ways. An explicit numeric value can be used, as in the first example above. Or  $N$  can be a type label, which is an alphanumeric string defined by the *labelmap* command or in a section of a data file read by the *read\_data* command.

For numeric values only, a wild-card asterisk can be used to set the coefficients for multiple bond types. This takes the form “\*” or “\*n” or “n\*” or “m\*n”. If  $N$  is the number of bond types, then an asterisk with no numeric values means all types from 1 to  $N$ . A leading asterisk means all types from 1 to  $n$  (inclusive). A trailing asterisk means all types from  $n$  to  $N$  (inclusive). A middle asterisk means all types from  $m$  to  $n$  (inclusive).

Note that using a *bond\_coeff* command can override a previous setting for the same bond type. For example, these commands set the coeffs for all bond types, then overwrite the coeffs for just bond type 2:

```
bond_coeff * 100.0 1.2
bond_coeff 2 200.0 1.2
```

A line in a data file that specifies bond coefficients uses the exact same format as the arguments of the *bond\_coeff* command in an input script, except that wild-card asterisks should not be used since coefficients for all  $N$  types must be listed in the file. For example, under the “Bond Coeffs” section of a data file, the line that corresponds to the first example above would be listed as

```
5 80.0 1.2
```

---

The list of all bond styles defined in LAMMPS is given on the *bond\_style* doc page. They are also listed in more compact form on the *Commands bond* doc page.

On either of those pages, click on the style to display the formula it computes and its coefficients as specified by the associated *bond\_coeff* command.

---

### 16.6.4 Restrictions

This command must come after the simulation box is defined by a *read\_data*, *read\_restart*, or *create\_box* command.

A bond style must be defined before any bond coefficients are set, either in the input script or in a data file.

### 16.6.5 Related commands

*bond\_style*

### 16.7.1 Syntax

```
bond_style style args
```

- style = *none* or *zero* or *hybrid* or *bpm/rotational* or *bpm/spring* or *class2* or *fene* or *fene/expand* or *fene/nm* or *gaussian* or *gromos* or *harmonic* or *harmonic/shift* or *harmonic/shift/cut* or *morse* or *nonlinear* or *oxdna/fene* or *oxdena2/fene* or *oxrna2/fene* or *quartic* or *special* or *table*
- args = none for any style except *hybrid*
  - *hybrid* args = list of one or more styles

### 16.7.2 Examples

```
bond_style harmonic
bond_style fene
bond_style hybrid harmonic fene
```

### 16.7.3 Description

Set the formula(s) LAMMPS uses to compute bond interactions between pairs of atoms. In LAMMPS, a bond differs from a pairwise interaction, which are set via the *pair\_style* command. Bonds are defined between specified pairs of atoms and remain in force for the duration of the simulation (unless the bond breaks which is possible in some bond potentials). The list of bonded atoms is read in by a *read\_data* or *read\_restart* command from a data or restart file. By contrast, pair potentials are typically defined between all pairs of atoms within a cutoff distance and the set of active interactions changes over time.

Hybrid models where bonds are computed using different bond potentials can be setup using the *hybrid* bond style.

The coefficients associated with a bond style can be specified in a data or restart file or via the *bond\_coeff* command.

All bond potentials store their coefficient data in binary restart files which means *bond\_style* and *bond\_coeff* commands do not need to be re-specified in an input script that restarts a simulation. See the *read\_restart* command for details on how to do this. The one exception is that *bond\_style hybrid* only stores the list of sub-styles in the restart file; bond coefficients need to be re-specified.

---

**Note:** When both a bond and pair style is defined, the *special\_bonds* command often needs to be used to turn off (or weight) the pairwise interaction that would otherwise exist between 2 bonded atoms.

---

In the formulas listed for each bond style,  $r$  is the distance between the 2 atoms in the bond.

---

Here is an alphabetic list of bond styles defined in LAMMPS. Click on the style to display the formula it computes and coefficients specified by the associated *bond\_coeff* command.

Click on the style to display the formula it computes, any additional arguments specified in the `bond_style` command, and coefficients specified by the associated `bond_coeff` command.

There are also additional accelerated pair styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the [Commands bond](#) doc page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- *none* - turn off bonded interactions
- *zero* - topology but no interactions
- *hybrid* - define multiple styles of bond interactions
- *bpm/rotational* - breakable bond with forces and torques based on deviation from reference state
- *bpm/spring* - breakable bond with forces based on deviation from reference length
- *class2* - COMPASS (class 2) bond
- *fene* - FENE (finite-extensible non-linear elastic) bond
- *fene/expand* - FENE bonds with variable size particles
- *fene/nm* - FENE bonds with a generalized Lennard-Jones potential
- *gaussian* - multicentered Gaussian-based bond potential
- *gromos* - GROMOS force field bond
- *harmonic* - harmonic bond
- *harmonic/shift* - shifted harmonic bond
- *harmonic/shift/cut* - shifted harmonic bond with a cutoff
- *mesocnt* - Harmonic bond wrapper with parameterization presets for nanotubes
- *mm3* - MM3 anharmonic bond
- *morse* - Morse bond
- *nonlinear* - nonlinear bond
- *oxdna/fene* - modified FENE bond suitable for DNA modeling
- *oxdna2/fene* - same as oxdna but used with different pair styles
- *oxrna2/fene* - modified FENE bond suitable for RNA modeling
- *quartic* - breakable quartic bond
- *special* - enable special bond exclusions for 1-5 pairs and beyond
- *table* - tabulated by bond length

## 16.7.4 Restrictions

Bond styles can only be set for atom styles that allow bonds to be defined.

Most bond styles are part of the MOLECULE package. They are only enabled if LAMMPS was built with that package. See the *Build package* page for more info. The doc pages for individual bond potentials tell if it is part of a package.

## 16.7.5 Related commands

*bond\_coeff*, *delete\_bonds*

## 16.7.6 Default

```
bond_style none
```

# 16.8 bond\_write command

## 16.8.1 Syntax

```
bond_write btype N inner outer file keyword itype jtype
```

- btype = bond types
- N = # of values
- inner,outer = inner and outer bond length (distance units)
- file = name of file to write values to
- keyword = section name in file for this set of tabulated values
- itype,jtype = 2 atom types (optional)

## 16.8.2 Examples

```
bond_write 1 500 0.5 3.5 table.txt Harmonic_1
bond_write 3 1000 0.1 6.0 table.txt Morse
```

## 16.8.3 Description

Write energy and force values to a file as a function of distance for the currently defined bond potential. This is useful for plotting the potential function or otherwise debugging its values. If the file already exists, the table of values is appended to the end of the file to allow multiple tables of energy and force to be included in one file.

The energy and force values are computed at distances from inner to outer for 2 interacting atoms forming a bond of type btype, using the appropriate *bond\_coeff* coefficients. N evenly spaced distances are used.

For example, for N = 7, inner = 1.0, and outer = 4.0, values are computed at r = 1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0.

The file is written in the format used as input for the *bond\_style table* option with *keyword* as the section name. Each line written to the file lists an index number (1-N), a distance (in distance units), an energy (in energy units), and a force

(in force units). In case a new file is created, the first line will be a comment with a “DATE:” and “UNITS:” tag with the current date and *units* settings. For subsequent invocations of the `bond_write` command for the same file, data will be appended and the current units settings will be compared to the data from the header, if present, and `bond_write` will refuse to add a table if the units are not the same.

## 16.8.4 Restrictions

All force field coefficients for bond and other kinds of interactions must be set before this command can be invoked.

Due to how the bond force is computed, an inner value  $> 0.0$  must be specified even if the potential has a finite value at  $r = 0.0$ .

## 16.9.1 Syntax

```
boundary x y z
```

- $x,y,z = p$  or  $s$  or  $f$  or  $m$ , one or two letters
  - $p$  is periodic
  - $f$  is non-periodic and fixed
  - $s$  is non-periodic and shrink-wrapped
  - $m$  is non-periodic and shrink-wrapped with a minimum value

## 16.9.2 Examples

```
boundary p p f
boundary p fs p
boundary s f fm
```

### 16.9.3 Description

Set the style of boundaries for the global simulation box in each dimension. A single letter assigns the same style to both the lower and upper face of the box. Two letters assigns the first style to the lower face and the second style to the upper face. The initial size of the simulation box is set by the *read\_data*, *read\_restart*, or *create\_box* commands.

The style *p* means the box is periodic, so that particles interact across the boundary, and they can exit one end of the box and re-enter the other end. A periodic dimension can change in size due to constant pressure boundary conditions or box deformation (see the *fix npt* and *fix deform* commands). The *p* style must be applied to both faces of a dimension.

The styles *f*, *s*, and *m* mean the box is non-periodic, so that particles do not interact across the boundary and do not move from one side of the box to the other.

For style *f*, the position of the face is fixed. If an atom moves outside the face it will be deleted on the next timestep that reneighboring occurs. This will typically generate an error unless you have set the *thermo\_modify lost* option to allow for lost atoms.

For style *s*, the position of the face is set so as to encompass the atoms in that dimension (shrink-wrapping), no matter how far they move. Note that when the difference between the current box dimensions and the shrink-wrap box dimensions is large, this can lead to lost atoms at the beginning of a run when running in parallel. This is due to the large change in the (global) box dimensions also causing significant changes in the individual sub-domain sizes. If these changes are farther than the communication cutoff, atoms will be lost. This is best addressed by setting initial box dimensions to match the shrink-wrapped dimensions more closely, by using *m* style boundaries (see below).

For style *m*, shrink-wrapping occurs, but is bounded by the value specified in the data or restart file or set by the *create\_box* command. For example, if the upper *z* face has a value of 50.0 in the data file, the face will always be positioned at 50.0 or above, even if the maximum *z*-extent of all the atoms becomes less than 50.0. This can be useful if you start a simulation with an empty box or if you wish to leave room on one side of the box, e.g. for atoms to evaporate from a surface.

For triclinic (non-orthogonal) simulation boxes, if the second dimension of a tilt factor (e.g. *y* for *xy*) is periodic, then the periodicity is enforced with the tilt factor offset. If the first dimension is shrink-wrapped, then the shrink wrapping is applied to the tilted box face, to encompass the atoms. E.g. for a positive *xy* tilt, the *xlo* and *xhi* faces of the box are planes tilting in the +*y* direction as *y* increases. These tilted planes are shrink-wrapped around the atoms to determine the *x* extent of the box.

See the [Howto triclinic](#) page for a geometric description of triclinic boxes, as defined by LAMMPS, and how to transform these parameters to and from other commonly used triclinic representations.

## 16.9.4 Restrictions

This command cannot be used after the simulation box is defined by a *read\_data* or *create\_box* command or *read\_restart* command. See the *change\_box* command for how to change the simulation box boundaries after it has been defined.

For 2d simulations, the z dimension must be periodic.

## 16.9.5 Related commands

See the *thermo\_modify* command for a discussion of lost atoms.

## 16.9.6 Default

```
boundary p p p
```

# 16.10 box command

## 16.10.1 Syntax

```
box keyword value ...
```

- one or more keyword/value pairs may be appended
- keyword = *tilt*  
*tilt* value = *small* or *large*

## 16.10.2 Examples

```
box tilt large  
box tilt small
```

## 16.10.3 Description

Set attributes of the simulation box.

For triclinic (non-orthogonal) simulation boxes, the *tilt* keyword allows simulation domains to be created with arbitrary tilt factors, e.g. via the *create\_box* or *read\_data* commands. Tilt factors determine how skewed the triclinic box is; see the *Howto triclinic* page for a discussion of triclinic boxes in LAMMPS.

LAMMPS normally requires that no tilt factor can skew the box more than half the distance of the parallel box length, which is the first dimension in the tilt factor (x for xz). If *tilt* is set to *small*, which is the default, then an error will be generated if a box is created which exceeds this limit. If *tilt* is set to *large*, then no limit is enforced. You can create a box with any tilt factors you wish.

Note that if a simulation box has a large tilt factor, LAMMPS will run less efficiently, due to the large volume of communication needed to acquire ghost atoms around a processor's irregular-shaped sub-domain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

## 16.10.4 Restrictions

This command cannot be used after the simulation box is defined by a *read\_data* or *create\_box* command or *read\_restart* command.

## 16.10.5 Related commands

none

## 16.10.6 Default

The default value is *tilt = small*.

# 16.11 change\_box command

## 16.11.1 Syntax

```
change_box group-ID parameter args ... keyword args ...
```

- group-ID = ID of group of atoms to (optionally) displace
- one or more parameter/arg pairs may be appended

parameter = *x* or *y* or *z* or *xy* or *xz* or *yz* or *boundary* or *ortho* or *triclinic* or *set*  
 ↪ or *remap*

*x*, *y*, *z* args = style value(s)

style = *final* or *delta* or *scale* or *volume*

*final* values = lo hi

lo hi = box boundaries after displacement (distance units)

*delta* values = dlo dhi

dlo dhi = change in box boundaries after displacement (distance units)

*scale* values = factor

factor = multiplicative factor for change in box length after displacement

*volume* value = none = adjust this dim to preserve volume of system

*xy*, *xz*, *yz* args = style value

style = *final* or *delta*

*final* value = tilt

tilt = tilt factor after displacement (distance units)

*delta* value = dtilt

dtilt = change in tilt factor after displacement (distance units)

*boundary* args = *x y z*

*x,y,z* = *p* or *s* or *f* or *m*, one or two letters

*p* is periodic

*f* is non-periodic and fixed

*s* is non-periodic and shrink-wrapped

*m* is non-periodic and shrink-wrapped with a minimum value

*ortho* args = none = change box to orthogonal

*triclinic* args = none = change box to triclinic

*set* args = none = store state of current box

*remap* args = none = remap atom coords from last saved state to current box

- zero or more keyword/value pairs may be appended
- keyword = *units*

```
units value = lattice or box
  lattice = distances are defined in lattice units
  box = distances are defined in simulation box units
```

### 16.11.2 Examples

```
change_box all xy final -2.0 z final 0.0 5.0 boundary p p f remap units box
change_box all x scale 1.1 y volume z volume remap
```

### 16.11.3 Description

Change the volume and/or shape and/or boundary conditions for the simulation box. Orthogonal simulation boxes have 3 adjustable size parameters (x,y,z). Triclinic (non-orthogonal) simulation boxes have 6 adjustable size/shape parameters (x,y,z,xy,xz,yz). Any or all of them can be adjusted independently by this command. Thus it can be used to expand or contract a box, or to apply a shear strain to a non-orthogonal box. It can also be used to change the boundary conditions for the simulation box, similar to the *boundary* command.

The size and shape of the initial simulation box are specified by the *create\_box* or *read\_data* or *read\_restart* command used to setup the simulation. The size and shape may be altered by subsequent runs, e.g. by use of the *fix npt* or *fix deform* commands. The *create\_box*, *read\_data*, and *read\_restart* commands also determine whether the simulation box is orthogonal or triclinic and their doc pages explain the meaning of the xy,xz,yz tilt factors.

See the *Howto triclinic* page for a geometric description of triclinic boxes, as defined by LAMMPS, and how to transform these parameters to and from other commonly used triclinic representations.

The keywords used in this command are applied sequentially to the simulation box and the atoms in it, in the order specified.

Before the sequence of keywords are invoked, the current box size/shape is stored, in case a *remap* keyword is used to map the atom coordinates from a previously stored box size/shape to the current one.

After all the keywords have been processed, any shrink-wrap boundary conditions are invoked (see the *boundary* command) which may change simulation box boundaries, and atoms are migrated to new owning processors.

---

**Note:** This means that you cannot use the *change\_box* command to enlarge a shrink-wrapped box, e.g. to make room to insert more atoms via the *create\_atoms* command, because the simulation box will be re-shrink-wrapped before the *change\_box* command completes. Instead you could do something like this, assuming the simulation box is non-periodic and atoms extend from 0 to 20 in all dimensions:

---

```
change_box all x final -10 20
create_atoms 1 single -5 5 5      # this will fail to insert an atom

change_box all x final -10 20 boundary f s s
create_atoms 1 single -5 5 5
change_box all boundary s s s    # this will work
```

---

**Note:** Unlike the earlier “displace\_box” version of this command, atom remapping is NOT performed by default. This command allows remapping to be done in a more general way, exactly when you specify it (zero or more times) in the

sequence of transformations. Thus if you do not use the *remap* keyword, atom coordinates will not be changed even if the box size/shape changes. If a uniformly strained state is desired, the *remap* keyword should be specified.

---

**Note:** It is possible to lose atoms with this command. E.g. by changing the box without remapping the atoms, and having atoms end up outside of non-periodic boundaries. It is also possible to alter bonds between atoms straddling a boundary in bad ways. E.g. by converting a boundary from periodic to non-periodic. It is also possible when remapping atoms to put them (nearly) on top of each other. E.g. by converting a boundary from non-periodic to periodic. All of these will typically lead to bad dynamics and/or generate error messages.

---

**Note:** The simulation box size/shape can be changed by arbitrarily large amounts by this command. This is not a problem, except that the mapping of processors to the simulation box is not changed from its initial 3d configuration; see the *processors* command. Thus, if the box size/shape changes dramatically, the mapping of processors to the simulation box may not end up as optimal as the initial mapping attempted to be. You may wish to re-balance the atoms by using the *balance* command if that is the case.

---

**Note:** You cannot use this command after reading a restart file (and before a run is performed) if the restart file stored per-atom information from a fix and any of the specified keywords change the box size or shape or boundary conditions. This is because atoms may be moved to new processors and the restart info will not migrate with them. LAMMPS will generate an error if this could happen. Only the *ortho* and *triclinic* keywords do not trigger this error. One solution is to perform a “run 0” command before using the *change\_box* command. This clears the per-atom restart data, whether it has been re-assigned to a new fix or not.

---

**Note:** Because the keywords used in this command are applied one at a time to the simulation box and the atoms in it, care must be taken with triclinic cells to avoid exceeding the limits on skew after each transformation in the sequence. If skew is exceeded before the final transformation this can be avoided by changing the order of the sequence, or breaking the transformation into two or more smaller transformations. For more information on the allowed limits for box skew see the discussion on triclinic boxes on [Howto triclinic](#) doc page.

---

For the *x*, *y*, and *z* parameters, this is the meaning of their styles and values.

For style *final*, the final lo and hi box boundaries of a dimension are specified. The values can be in lattice or box distance units. See the discussion of the units keyword below.

For style *delta*, plus or minus changes in the lo/hi box boundaries of a dimension are specified. The values can be in lattice or box distance units. See the discussion of the units keyword below.

For style *scale*, a multiplicative factor to apply to the box length of a dimension is specified. For example, if the initial box length is 10, and the factor is 1.1, then the final box length will be 11. A factor less than 1.0 means compression.

The *volume* style changes the specified dimension in such a way that the overall box volume remains constant with respect to the operation performed by the preceding keyword. The *volume* style can only be used following a keyword that changed the volume, which is any of the *x*, *y*, *z* keywords. If the preceding keyword “key” had a *volume* style, then both it and the current keyword apply to the keyword preceding “key”. I.e. this sequence of keywords is allowed:

```
change_box all x scale 1.1 y volume z volume
```

The *volume* style changes the associated dimension so that the overall box volume is unchanged relative to its value before the preceding keyword was invoked.

If the following command is used, then the z box length will shrink by the same 1.1 factor the x box length was increased by:

```
change_box all x scale 1.1 z volume
```

If the following command is used, then the y,z box lengths will each shrink by  $\sqrt{1.1}$  to keep the volume constant. In this case, the y,z box lengths shrink so as to keep their relative aspect ratio constant:

```
change_box all x scale 1.1 y volume z volume
```

If the following command is used, then the final box will be a factor of 10% larger in x and y, and a factor of 21% smaller in z, so as to keep the volume constant:

```
change_box all x scale 1.1 z volume y scale 1.1 z volume
```

---

**Note:** For solids or liquids, when one dimension of the box is expanded, it may be physically undesirable to hold the other 2 box lengths constant since that implies a density change. For solids, adjusting the other dimensions via the *volume* style may make physical sense (just as for a liquid), but may not be correct for materials and potentials whose Poisson ratio is not 0.5.

---

For the *scale* and *volume* styles, the box length is expanded or compressed around its mid point.

---

For the *xy*, *xz*, and *yz* parameters, this is the meaning of their styles and values. Note that changing the tilt factors of a triclinic box does not change its volume.

For style *final*, the final tilt factor is specified. The value can be in lattice or box distance units. See the discussion of the *units* keyword below.

For style *delta*, a plus or minus change in the tilt factor is specified. The value can be in lattice or box distance units. See the discussion of the *units* keyword below.

All of these styles change the *xy*, *xz*, *yz* tilt factors. In LAMMPS, tilt factors (*xy*,*xz*,*yz*) for triclinic boxes are required to be no more than half the distance of the parallel box length. For example, if  $x_{lo} = 2$  and  $x_{hi} = 12$ , then the x box length is 10 and the *xy* tilt factor must be between -5 and 5. Similarly, both *xz* and *yz* must be between  $-(x_{hi}-x_{lo})/2$  and  $+(y_{hi}-y_{lo})/2$ . Note that this is not a limitation, since if the maximum tilt factor is 5 (as in this example), then configurations with tilt = ..., -15, -5, 5, 15, 25, ... are all equivalent. Any tilt factor specified by this command must be within these limits.

---

The *boundary* keyword takes arguments that have exactly the same meaning as they do for the *boundary* command. In each dimension, a single letter assigns the same style to both the lower and upper face of the box. Two letters assigns the first style to the lower face and the second style to the upper face.

The style *p* means the box is periodic; the other styles mean non-periodic. For style *f*, the position of the face is fixed. For style *s*, the position of the face is set so as to encompass the atoms in that dimension (shrink-wrapping), no matter how far they move. For style *m*, shrink-wrapping occurs, but is bounded by the current box edge in that dimension, so that the box will become no smaller. See the *boundary* command for more explanation of these style options.

Note that the “boundary” command itself can only be used before the simulation box is defined via a *read\_data* or *create\_box* or *read\_restart* command. This command allows the boundary conditions to be changed later in your input script. Also note that the *read\_restart* will change boundary conditions to match what is stored in the restart file. So if you wish to change them, you should use the *change\_box* command after the *read\_restart* command.

---

**Note:** Changing a periodic boundary to a non-periodic one will also cause the image flag for that dimension of all atoms to be reset to 0. LAMMPS will print a warning message, if that happens. Please note that this reset can lead

to undesired changes when atoms are involved in bonded interactions that straddle periodic boundaries and thus the values of the image flag differs for those atoms.

---

The *ortho* and *triclinic* keywords convert the simulation box to be orthogonal or triclinic (non-orthogonal).

The simulation box is defined as either orthogonal or triclinic when it is created via the *create\_box*, *read\_data*, or *read\_restart* commands.

These keywords allow you to toggle the existing simulation box from orthogonal to triclinic and vice versa. For example, an initial equilibration simulation can be run in an orthogonal box, the box can be toggled to triclinic, and then a *non-equilibrium MD (NEMD) simulation* can be run with deformation via the *fix deform* command.

If the simulation box is currently triclinic and has non-zero tilt in *xy*, *yz*, or *xz*, then it cannot be converted to an orthogonal box.

---

The *set* keyword saves the current box size/shape. This can be useful if you wish to use the *remap* keyword more than once or if you wish it to be applied to an intermediate box size/shape in a sequence of keyword operations. Note that the box size/shape is saved before any of the keywords are processed, i.e. the box size/shape at the time the *create\_box* command is encountered in the input script.

The *remap* keyword remaps atom coordinates from the last saved box size/shape to the current box state. For example, if you stretch the box in the *x* dimension or tilt it in the *xy* plane via the *x* and *xy* keywords, then the *remap* command will dilate or tilt the atoms to conform to the new box size/shape, as if the atoms moved with the box as it deformed.

Note that this operation is performed without regard to periodic boundaries. Also, any shrink-wrapping of non-periodic boundaries (see the *boundary* command) occurs after all keywords, including this one, have been processed.

Only atoms in the specified group are remapped.

---

The *units* keyword determines the meaning of the distance units used to define various arguments. A *box* value selects standard distance units as defined by the *units* command, e.g. Angstroms for *units = real* or *metal*. A *lattice* value means the distance units are in lattice spacings. The *lattice* command must have been previously used to define the lattice spacing.

---

## 16.11.4 Restrictions

If you use the *ortho* or *triclinic* keywords, then at the point in the input script when this command is issued, no *dumps* can be active, nor can a *fix deform* be active. This is because these commands test whether the simulation box is orthogonal when they are first issued. Note that these commands can be used in your script before a *change\_box* command is issued, so long as an *undump* or *unfix* command is also used to turn them off.

## 16.11.5 Related commands

*fix deform*, *boundary*

### 16.11.6 Default

The option default is units = lattice.

## 16.12 clear command

### 16.12.1 Syntax

```
clear
```

### 16.12.2 Examples

```
# (commands for 1st simulation)
clear
# (commands for 2nd simulation)
```

### 16.12.3 Description

This command deletes all atoms, restores all settings to their default values, and frees all memory allocated by LAMMPS. Once a clear command has been executed, it is almost as if LAMMPS were starting over, with only the exceptions noted below. This command enables multiple jobs to be run sequentially from one input script.

These settings are not affected by a clear command: the working directory (*shell* command), log file status (*log* command), echo status (*echo* command), and input script variables (*variable* command).

### 16.12.4 Restrictions

none

## 16.13 comm\_modify command

### 16.13.1 Syntax

```
comm_modify keyword value ...
```

- one or more keyword/value pairs may be appended
- keyword = *mode* or *cutoff* or *cutoff/multi* or *group* or *reduce/multi* or *vel*
  - mode* value = *single*, *multi*, or *multi/old* = communicate atoms within a single or ↵ multiple distances
  - cutoff* value = Rcut (distance units) = communicate atoms from this far away
  - cutoff/multi* collection value
    - collection = atom collection or collection range (supports asterisk notation)
    - value = Rcut (distance units) = communicate atoms for selected types from this ↵ far away
  - reduce/multi* arg = none = reduce number of communicated ghost atoms for multi style
  - cutoff/multi/old* type value
    - type = atom type or type range (supports asterisk notation)
    - value = Rcut (distance units) = communicate atoms for selected types from this ↵ far away
  - group* value = group-ID = only communicate atoms in the group
  - vel* value = *yes* or *no* = do or do not communicate velocity info with ghost atoms

### 16.13.2 Examples

```
comm_modify mode multi reduce/multi
comm_modify mode multi group solvent
comm_modify mode multi cutoff/multi 1 10.0 cutoff/multi 2*4 15.0
comm_modify vel yes
comm_modify mode single cutoff 5.0 vel yes
comm_modify cutoff/multi * 0.0
```

### 16.13.3 Description

This command sets parameters that affect the inter-processor communication of atom information that occurs each timestep as coordinates and other properties are exchanged between neighboring processors and stored as properties of ghost atoms.

---

**Note:** These options apply to the currently defined comm style. When you specify a *comm\_style* or *read\_restart* command, all communication settings are restored to their default or stored values, including those previously reset by a *comm\_modify* command. Thus if your input script specifies a *comm\_style* or *read\_restart* command, you should use the *comm\_modify* command after it.

---

The *mode* keyword determines whether a single or multiple cutoff distances are used to determine which atoms to communicate.

The default mode is *single* which means each processor acquires information for ghost atoms that are within a single distance from its sub-domain. The distance is by default the maximum of the neighbor cutoff across all atom type pairs.

For many systems this is an efficient algorithm, but for systems with widely varying cutoffs for different type pairs, the *multi* or *multi/old* mode can be faster. In *multi*, each atom is assigned to a collection which should correspond to a set of atoms with similar interaction cutoffs. In this case, each atom collection is assigned its own distance cutoff for communication purposes, and fewer atoms will be communicated. In *multi/old*, a similar technique is used but atoms are grouped by atom type. See the *neighbor multi* and *neighbor multi/old* commands for neighbor list construction options that may also be beneficial for simulations of this kind. The *multi* communication mode is only compatible with the *multi* neighbor style. The *multi/old* communication mode is comparable with both the *multi* and *multi/old* neighbor styles.

The *cutoff* keyword allows you to extend the ghost cutoff distance for communication mode *single*, which is the distance from the borders of a processor's sub-domain at which ghost atoms are acquired from other processors. By default the ghost cutoff = neighbor cutoff = pairwise force cutoff + neighbor skin. See the *neighbor* command for more information about the skin distance. If the specified *Rcut* is greater than the neighbor cutoff, then extra ghost atoms will be acquired. If the provided cutoff is smaller, the provided value will be ignored, the ghost cutoff is set to the neighbor cutoff and a warning will be printed. Specifying a cutoff value of 0.0 will reset any previous value to the default. If bonded interactions exist and equilibrium bond length information is available, then also a heuristic based on that bond length is computed. It is used as communication cutoff, if there is no pair style present and no *comm\_modify cutoff* command used. Otherwise a warning is printed, if this bond based estimate is larger than the communication cutoff used.

The *cutoff/multi* option is equivalent to *cutoff*, but applies to communication mode *multi* instead. Since the communication cutoffs are determined per atom collections, a collection specifier is needed and cutoff for one or multiple collections can be extended. Also ranges of collections using the usual asterisk notation can be given. Collections are indexed from 1 to N where N is the total number of collections. Note that the arguments for *cutoff/multi* are parsed right before each simulation to account for potential changes in the number of collections. Custom cutoffs are preserved between runs but if collections are redefined, one may want to re-specify the communication cutoffs. For granular pair styles, the default cutoff is set to the sum of the current maximum atomic radii for each collection. The *cutoff/multi/old* option is similar to *cutoff/multi* except it operates on atom types as opposed to collections.

The *reduce/multi* option applies to *multi* and sets the communication cutoff for a particle equal to the maximum interaction distance between particles in the same collection. This reduces the number of ghost atoms that need to be communicated. This method is only compatible with the *multi* neighbor style and requires a half neighbor list and Newton on. See the *neighbor multi* command for more information.

These are simulation scenarios in which it may be useful or even necessary to set a ghost cutoff > neighbor cutoff:

- a single polymer chain with bond interactions, but no pairwise interactions
- bonded interactions (e.g. dihedrals) extend further than the pairwise cutoff
- ghost atoms beyond the pairwise cutoff are needed for some computation

In the first scenario, a pairwise potential is not defined. Thus the pairwise neighbor cutoff will be 0.0. But ghost atoms are still needed for computing bond, angle, etc interactions between atoms on different processors, or when the interaction straddles a periodic boundary.

The appropriate ghost cutoff depends on the *newton bond* setting. For *newton bond off*, the distance needs to be the furthest distance between any two atoms in the bond, angle, etc. E.g. the distance between 1-4 atoms in a dihedral. For *newton bond on*, the distance between the central atom in the bond, angle, etc and any other atom is sufficient. E.g. the distance between 2-4 atoms in a dihedral.

In the second scenario, a pairwise potential is defined, but its neighbor cutoff is not sufficiently long enough to enable bond, angle, etc terms to be computed. As in the previous scenario, an appropriate ghost cutoff should be set.

In the last scenario, a *fix* or *compute* or *pairwise potential* needs to calculate with ghost atoms beyond the normal pairwise cutoff for some computation it performs (e.g. locate neighbors of ghost atoms in a manybody pair potential). Setting the ghost cutoff appropriately can insure it will find the needed atoms.

---

**Note:** In these scenarios, if you do not set the ghost cutoff long enough, and if there is only one processor in a periodic dimension (e.g. you are running in serial), then LAMMPS may “find” the atom it is looking for (e.g. the partner atom

in a bond), that is on the far side of the simulation box, across a periodic boundary. This will typically lead to bad dynamics (i.e. the bond length is now the simulation box length). To detect if this is happening, see the *neigh\_modify cluster* command.

---

The *group* keyword will limit communication to atoms in the specified group. This can be useful for models where no ghost atoms are needed for some kinds of particles. All atoms (not just those in the specified group) will still migrate to new processors as they move. The group specified with this option must also be specified via the *atom\_modify first* command.

The *vel* keyword enables velocity information to be communicated with ghost particles. Depending on the *atom\_style*, velocity info includes the translational velocity, angular velocity, and angular momentum of a particle. If the *vel* option is set to *yes*, then ghost atoms store these quantities; if *no* then they do not. The *yes* setting is needed by some pair styles which require the velocity state of both the I and J particles to compute a pairwise I,J interaction, as well as by some compute and fix commands.

Note that if the *fix deform* command is being used with its “remap v” option enabled, then the velocities for ghost atoms (in the fix deform group) mirrored across a periodic boundary will also include components due to any velocity shift that occurs across that boundary (e.g. due to dilation or shear).

### 16.13.4 Restrictions

Communication mode *multi* is currently only available for *comm\_style brick*.

### 16.13.5 Related commands

*comm\_style*, *neighbor*

### 16.13.6 Default

The option defaults are mode = single, group = all, cutoff = 0.0, vel = no. The cutoff default of 0.0 means that ghost cutoff = neighbor cutoff = pairwise force cutoff + neighbor skin.

## 16.14 comm\_style command

### 16.14.1 Syntax

<code>comm_style style</code>
-------------------------------

- style = *brick* or *tiled*

## 16.14.2 Examples

```
comm_style brick
comm_style tiled
```

## 16.14.3 Description

This command sets the style of inter-processor communication of atom information that occurs each timestep as coordinates and other properties are exchanged between neighboring processors and stored as properties of ghost atoms.

For the default *brick* style, the domain decomposition used by LAMMPS to partition the simulation box must be a regular 3d grid of bricks, one per processor. Each processor communicates with its 6 Cartesian neighbors in the grid to acquire information for nearby atoms.

For the *tiled* style, a more general domain decomposition can be used, as triggered by the *balance* or *fix balance* commands. The simulation box can be partitioned into non-overlapping rectangular-shaped “tiles” or varying sizes and shapes. Again there is one tile per processor. To acquire information for nearby atoms, communication must now be done with a more complex pattern of neighboring processors.

Note that this command does not actually define a partitioning of the simulation box (a domain decomposition), rather it determines what kinds of decompositions are allowed and the pattern of communication used to enable the decomposition. A decomposition is created when the simulation box is first created, via the *create\_box* or *read\_data* or *read\_restart* commands. For both the *brick* and *tiled* styles, the initial decomposition will be the same, as described by *create\_box* and *processors* commands. The decomposition can be changed via the *balance* or *fix balance* commands.

## 16.14.4 Restrictions

None

## 16.14.5 Related commands

*comm\_modify*, *processors*, *balance*, *fix balance*

## 16.14.6 Default

The default style is brick.

# 16.15 compute command

## 16.15.1 Syntax

```
compute ID group-ID style args
```

- ID = user-assigned name for the computation
- group-ID = ID of the group of atoms to perform the computation on
- style = one of a list of possible style names (see below)
- args = arguments used by a particular style

## 16.15.2 Examples

```
compute 1 all temp
compute newtemp flow temp/partial 1 1 0
compute 3 all ke/atom
```

## 16.15.3 Description

Define a computation that will be performed on a group of atoms. Quantities calculated by a compute are instantaneous values, meaning they are calculated from information about atoms on the current timestep or iteration, though a compute may internally store some information about a previous state of the system. Defining a compute does not perform a computation. Instead computes are invoked by other LAMMPS commands as needed (e.g., to calculate a temperature needed for a thermostat fix or to generate thermodynamic or dump file output). See the *Howto output* page for a summary of various LAMMPS output options, many of which involve computes.

The ID of a compute can only contain alphanumeric characters and underscores.

Computes calculate one of three styles of quantities: global, per-atom, or local. A global quantity is one or more system-wide values (e.g., the temperature of the system). A per-atom quantity is one or more values per atom (e.g., the kinetic energy of each atom). Per-atom values are set to 0.0 for atoms not in the specified compute group. Local quantities are calculated by each processor based on the atoms it owns, but there may be zero or more per atom (e.g., a list of bond distances). Computes that produce per-atom quantities have the word “atom” in their style (e.g., *ke/atom*). Computes that produce local quantities have the word “local” in their style (e.g., *bond/local*). Styles with neither “atom” or “local” in their style produce global quantities.

Note that a single compute can produce either global or per-atom or local quantities, but not both global and per-atom. It can produce local quantities in tandem with global or per-atom quantities. The compute page will explain.

Global, per-atom, and local quantities each come in three kinds: a single scalar value, a vector of values, or a 2d array of values. The doc page for each compute describes the style and kind of values it produces (e.g., a per-atom vector). Some computes produce more than one kind of a single style (e.g., a global scalar and a global vector).

When a compute quantity is accessed, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID is the ID of the compute:

c_ID	entire scalar, vector, or array
c_ID[I]	one element of vector, one column of array
c_ID[I][J]	one element of array

In other words, using one bracket reduces the dimension of the quantity once (vector  $\rightarrow$  scalar, array  $\rightarrow$  vector). Using two brackets reduces the dimension twice (array  $\rightarrow$  scalar). Thus a command that uses scalar compute values as input can also process elements of a vector or array.

Note that commands and *variables* which use compute quantities typically do not allow for all kinds (e.g., a command may require a vector of values, not a scalar). This means there is no ambiguity about referring to a compute quantity as c\_ID even if it produces, for example, both a scalar and vector. The doc pages for various commands explain the details.

In LAMMPS, the values generated by a compute can be used in several ways:

- The results of computes that calculate a global temperature or pressure can be used by fixes that do thermostating or barostating or when atom velocities are created.

- Global values can be output via the *thermo\_style custom* or *fix ave/time* command. Or the values can be referenced in a *variable equal* or *variable atom* command.
- Per-atom values can be output via the *dump custom* command. Or they can be time-averaged via the *fix ave/atom* command or reduced by the *compute reduce* command. Or the per-atom values can be referenced in an *atom-style variable*.
- Local values can be reduced by the *compute reduce* command, or histogrammed by the *fix ave/histo* command, or output by the *dump local* command.

The results of computes that calculate global quantities can be either “intensive” or “extensive” values. Intensive means the value is independent of the number of atoms in the simulation (e.g., temperature). Extensive means the value scales with the number of atoms in the simulation (e.g., total rotational kinetic energy). *Thermodynamic output* will normalize extensive values by the number of atoms in the system, depending on the “thermo\_modify norm” setting. It will not normalize intensive values. If a compute value is accessed in another way (e.g., by a *variable*), you may want to know whether it is an intensive or extensive value. See the page for individual computes for further info.

---

LAMMPS creates its own computes internally for thermodynamic output. Three computes are always created, named “thermo\_temp”, “thermo\_press”, and “thermo\_pe”, as if these commands had been invoked in the input script:

```
compute thermo_temp all temp
compute thermo_press all pressure thermo_temp
compute thermo_pe all pe
```

Additional computes for other quantities are created if the thermo style requires it. See the documentation for the *thermo\_style* command.

Fixes that calculate temperature or pressure, i.e. for thermostatting or barostatting, may also create computes. These are discussed in the documentation for specific *fix* commands.

In all these cases, the default computes LAMMPS creates can be replaced by computes defined by the user in the input script, as described by the *thermo\_modify* and *fix modify* commands.

Properties of either a default or user-defined compute can be modified via the *compute\_modify* command.

Computes can be deleted with the *uncompute* command.

Code for new computes can be added to LAMMPS; see the *Modify* page for details. The results of their calculations accessed in the various ways described above.

---

Each compute style has its own page which describes its arguments and what it does. Here is an alphabetic list of compute styles available in LAMMPS. They are also listed in more compact form on the *Commands compute* doc page.

There are also additional accelerated compute styles included in the LAMMPS distribution for faster performance on CPUs, GPUs, and KNLs. The individual style names on the *Commands compute* page are followed by one or more of (g,i,k,o,t) to indicate which accelerated styles exist.

- *ackland/atom* - determines the local lattice structure based on the Ackland formulation
- *adf* - angular distribution function of triples of atoms
- *aggregate/atom* - aggregate ID for each atom
- *angle* - energy of each angle sub-style
- *angle/local* - theta and energy of each angle
- *angmom/chunk* - angular momentum for each chunk

- *ave/sphere/atom* - compute local density and temperature around each atom
- *basal/atom* - calculates the hexagonal close-packed “c” lattice vector of each atom
- *body/local* - attributes of body sub-particles
- *bond* - energy of each bond sub-style
- *bond/local* - distance and energy of each bond
- *born/matrix* - second derivative of potential with respect to strain
- *centro/atom* - centro-symmetry parameter for each atom
- *centroid/stress/atom* - centroid based stress tensor for each atom
- *chunk/atom* - assign chunk IDs to each atom
- *chunk/spread/atom* - spreads chunk values to each atom in chunk
- *cluster/atom* - cluster ID for each atom
- *cna/atom* - common neighbor analysis (CNA) for each atom
- *cnp/atom* - common neighborhood parameter (CNP) for each atom
- *com* - center of mass of group of atoms
- *com/chunk* - center of mass for each chunk
- *contact/atom* - contact count for each spherical particle
- *coord/atom* - coordination number for each atom
- *damage/atom* - Peridynamic damage for each atom
- *dihedral* - energy of each dihedral sub-style
- *dihedral/local* - angle of each dihedral
- *dilatation/atom* - Peridynamic dilatation for each atom
- *dipole* - dipole vector and total dipole
- *dipole/chunk* - dipole vector and total dipole for each chunk
- *displace/atom* - displacement of each atom
- *dpd* - total values of internal conductive energy, internal mechanical energy, chemical energy, and harmonic average of internal temperature
- *dpd/atom* - per-particle values of internal conductive energy, internal mechanical energy, chemical energy, and internal temperature
- *edpd/temp/atom* - per-atom temperature for each eDPD particle in a group
- *efield/atom* - electric field at each atom
- *entropy/atom* - pair entropy fingerprint of each atom
- *erotate/asphere* - rotational energy of aspherical particles
- *erotate/rigid* - rotational energy of rigid bodies
- *erotate/sphere* - rotational energy of spherical particles
- *erotate/sphere/atom* - rotational energy for each spherical particle
- *event/displace* - detect event on atom displacement
- *fabric* - calculates fabric tensors from pair interactions

- *fep* - compute free energies for alchemical transformation from perturbation theory
- *fep/ta* - compute free energies for a test area perturbation
- *force/tally* - force between two groups of atoms via the tally callback mechanism
- *fragment/atom* - fragment ID for each atom
- *global/atom* - assign global values to each atom from arrays of global values
- *group/group* - energy/force between two groups of atoms
- *gyration* - radius of gyration of group of atoms
- *gyration/chunk* - radius of gyration for each chunk
- *gyration/shape* - shape parameters from gyration tensor
- *gyration/shape/chunk* - shape parameters from gyration tensor for each chunk
- *heat/flux* - heat flux through a group of atoms
- *heat/flux/tally* - heat flux through a group of atoms via the tally callback mechanism
- *heat/flux/virial/tally* - virial heat flux between two groups via the tally callback mechanism
- *hexorder/atom* - bond orientational order parameter  $q_6$
- *hma* - harmonically mapped averaging for atomic crystals
- *improper* - energy of each improper sub-style
- *improper/local* - angle of each improper
- *inertia/chunk* - inertia tensor for each chunk
- *ke* - translational kinetic energy
- *ke/atom* - kinetic energy for each atom
- *ke/atom/eff* - per-atom translational and radial kinetic energy in the electron force field model
- *ke/eff* - kinetic energy of a group of nuclei and electrons in the electron force field model
- *ke/rigid* - translational kinetic energy of rigid bodies
- *mliap* - gradients of energy and forces with respect to model parameters and related quantities for training machine learning interatomic potentials
- *momentum* - translational momentum
- *msd* - mean-squared displacement of group of atoms
- *msd/chunk* - mean-squared displacement for each chunk
- *msd/nongauss* - MSD and non-Gaussian parameter of group of atoms
- *nbond/atom* - calculates number of bonds per atom
- *omega/chunk* - angular velocity for each chunk
- *orientorder/atom* - Steinhardt bond orientational order parameters  $Q_l$
- *pair* - values computed by a pair style
- *pair/local* - distance/energy/force of each pairwise interaction
- *pe* - potential energy
- *pe/atom* - potential energy for each atom

- *mesont* - Nanotube bending, stretching, and intertube energies
- *pe/mol/tally* - potential energy between two groups of atoms separated into intermolecular and intramolecular components via the tally callback mechanism
- *pe/tally* - potential energy between two groups of atoms via the tally callback mechanism
- *plasticity/atom* - Peridynamic plasticity for each atom
- *pressure* - total pressure and pressure tensor
- *pressure/uef* - pressure tensor in the reference frame of an applied flow field
- *property/atom* - convert atom attributes to per-atom vectors/arrays
- *property/chunk* - extract various per-chunk attributes
- *property/local* - convert local attributes to localvectors/arrays
- *ptm/atom* - determines the local lattice structure based on the Polyhedral Template Matching method
- *rdf* - radial distribution function  $g(r)$  histogram of group of atoms
- *reduce* - combine per-atom quantities into a single global value
- *reduce/chunk* - reduce per-atom quantities within each chunk
- *reduce/region* - same as compute reduce, within a region
- *rigid/local* - extract rigid body attributes
- *saed* - electron diffraction intensity on a mesh of reciprocal lattice nodes
- *slice* - extract values from global vector or array
- *smd/contact/radius* - contact radius for Smooth Mach Dynamics
- *smd/damage* - damage status of SPH particles in Smooth Mach Dynamics
- *smd/hourglass/error* - error associated with approximated relative separation in Smooth Mach Dynamics
- *smd/internal/energy* - per-particle enthalpy in Smooth Mach Dynamics
- *smd/plastic/strain* - equivalent plastic strain per particle in Smooth Mach Dynamics
- *smd/plastic/strain/rate* - time rate of the equivalent plastic strain in Smooth Mach Dynamics
- *smd/rho* - per-particle mass density in Smooth Mach Dynamics
- *smd/tlsph/defgrad* - deformation gradient in Smooth Mach Dynamics
- *smd/tlsph/dt* - CFL-stable time increment per particle in Smooth Mach Dynamics
- *smd/tlsph/num/neighs* - number of particles inside the smoothing kernel radius for Smooth Mach Dynamics
- *smd/tlsph/shape* - current shape of the volume of a particle for Smooth Mach Dynamics
- *smd/tlsph/strain* - Green-Lagrange strain tensor for Smooth Mach Dynamics
- *smd/tlsph/strain/rate* - rate of strain for Smooth Mach Dynamics
- *smd/tlsph/stress* - per-particle Cauchy stress tensor for SPH particles
- *smd/triangle/vertices* - coordinates of vertices corresponding to the triangle elements of a mesh for Smooth Mach Dynamics
- *smd/ulsph/effm* - per-particle effective shear modulus
- *smd/ulsph/num/neighs* - number of neighbor particles inside the smoothing kernel radius for Smooth Mach Dynamics

- *smd/ulsph/strain* - logarithmic strain tensor for Smooth Mach Dynamics
- *smd/ulsph/strain/rate* - logarithmic strain rate for Smooth Mach Dynamics
- *smd/ulsph/stress* - per-particle Cauchy stress tensor and von Mises equivalent stress in Smooth Mach Dynamics
- *smd/vol* - per-particle volumes and their sum in Smooth Mach Dynamics
- *snap* - gradients of SNAP energy and forces with respect to linear coefficients and related quantities for fitting SNAP potentials
- *sna/atom* - bispectrum components for each atom
- *sna/grid* - global array of bispectrum components on a regular grid
- *sna/grid/local* - local array of bispectrum components on a regular grid
- *snad/atom* - derivative of bispectrum components for each atom
- *snav/atom* - virial contribution from bispectrum components for each atom
- *sph/e/atom* - per-atom internal energy of Smooth-Particle Hydrodynamics atoms
- *sph/rho/atom* - per-atom density of Smooth-Particle Hydrodynamics atoms
- *sph/t/atom* - per-atom internal temperature of Smooth-Particle Hydrodynamics atoms
- *spin* - magnetic quantities for a system of atoms having spins
- *stress/atom* - stress tensor for each atom
- *stress/cartesian* - stress tensor in cartesian coordinates
- *stress/cylinder* - stress tensor in cylindrical coordinates
- *stress/mop* - normal components of the local stress tensor using the method of planes
- *stress/mop/profile* - profile of the normal components of the local stress tensor using the method of planes
- *stress/spherical* - stress tensor in spherical coordinates
- *stress/tally* - stress between two groups of atoms via the tally callback mechanism
- *tdpd/cc/atom* - per-atom chemical concentration of a specified species for each tDPD particle
- *temp* - temperature of group of atoms
- *temp/asphere* - temperature of aspherical particles
- *temp/body* - temperature of body particles
- *temp/chunk* - temperature of each chunk
- *temp/com* - temperature after subtracting center-of-mass velocity
- *temp/cs* - temperature based on the center-of-mass velocity of atom pairs that are bonded to each other
- *temp/deform* - temperature excluding box deformation velocity
- *temp/deform/eff* - temperature excluding box deformation velocity in the electron force field model
- *temp/drude* - temperature of Core–Drude pairs
- *temp/eff* - temperature of a group of nuclei and electrons in the electron force field model
- *temp/partial* - temperature excluding one or more dimensions of velocity
- *temp/profile* - temperature excluding a binned velocity profile
- *temp/ramp* - temperature excluding ramped velocity component

- *temp/region* - temperature of a region of atoms
- *temp/region/eff* - temperature of a region of nuclei and electrons in the electron force field model
- *temp/rotate* - temperature of a group of atoms after subtracting out their center-of-mass and angular velocities
- *temp/sphere* - temperature of spherical particles
- *temp/uef* - kinetic energy tensor in the reference frame of an applied flow field
- *ti* - thermodynamic integration free energy values
- *torque/chunk* - torque applied on each chunk
- *vacf* - velocity auto-correlation function of group of atoms
- *vcm/chunk* - velocity of center-of-mass for each chunk
- *viscosity/cos* - velocity profile under cosine-shaped acceleration
- *voronoi/atom* - Voronoi volume and neighbors for each atom
- *xrd* - X-ray diffraction intensity on a mesh of reciprocal lattice nodes

### 16.15.4 Restrictions

none

### 16.15.5 Related commands

*uncompute*, *compute\_modify*, *fix ave/atom*, *fix ave/time*, *fix ave/histo*

### 16.15.6 Default

none

## 16.16 compute\_modify command

### 16.16.1 Syntax

```
compute_modify compute-ID keyword value ...
```

- compute-ID = ID of the compute to modify
- one or more keyword/value pairs may be listed
- keyword = *extra/dof* or *extra* or *dynamic/dof* or *dynamic*
  - extra/dof* value = N
    - N = # of extra degrees of freedom to subtract
    - extra* syntax is identical to *extra/dof*, will be disabled at some point
  - dynamic/dof* value = *yes* or *no*
    - yes/no* = do or do not re-compute the number of degrees of freedom (DOF)
      - ↪ contributing to the temperature
    - dynamic* syntax is identical to *dynamic/dof*, will be disabled at some point

## 16.16.2 Examples

```
compute_modify myTemp extra/dof 0
compute_modify newtemp dynamic/dof yes extra/dof 600
```

## 16.16.3 Description

Modify one or more parameters of a previously defined compute. Not all compute styles support all parameters.

The *extra/dof* or *extra* keyword refers to how many degrees of freedom are subtracted (typically from  $3N$ ) as a normalizing factor in a temperature computation. Only computes that compute a temperature use this option. The default is 2 or 3 for *2d* or *3d* systems, which is a correction factor for an ensemble of velocities with zero total linear momentum. For compute temp/partial, if one or more velocity components are excluded, the value used for *extra* is scaled accordingly. You can use a negative number for the *extra* parameter if you need to add degrees-of-freedom. See the *compute temp/asphere* command for an example.

The *dynamic/dof* or *dynamic* keyword determines whether the number of atoms  $N$  in the compute group and their associated degrees of freedom (DOF) are re-computed each time a temperature is computed. Only compute styles that calculate a temperature use this option. By default,  $N$  and their DOF are assumed to be constant. If you are adding atoms or molecules to the system (see the *fix pour*, *fix deposit*, and *fix gcmc* commands) or expect atoms or molecules to be lost (e.g., due to exiting the simulation box or via *fix evaporate*), then this option should be used to ensure the temperature is correctly normalized.

---

**Note:** The *extra* and *dynamic* keywords should not be used as they are deprecated (March 2017) and will eventually be disabled. Instead, use the equivalent *extra/dof* and *dynamic/dof* keywords.

---

## 16.16.4 Restrictions

none

## 16.16.5 Related commands

*compute*

## 16.16.6 Default

The option defaults are *extra/dof* = 2 or 3 for 2d or 3d systems and *dynamic/dof* = *no*.

## 16.17 create\_atoms command

### 16.17.1 Syntax

```
create_atoms type style args keyword values ...
```

- type = atom type (1-Ntypes) of atoms to create (offset for molecule creation)
- style = *box* or *region* or *single* or *mesh* or *random*

*box* args = none  
*region* args = region-ID  
     region-ID = particles will only be created if contained in the region  
*single* args = x y z  
     x,y,z = coordinates of a single particle (distance units)  
*mesh* args = STL-file  
     STL-file = file with triangle mesh in STL format  
*random* args = N seed region-ID  
     N = number of particles to create  
     seed = random # seed (positive integer)  
     region-ID = create atoms within this region, use NULL for entire simulation box

- zero or more keyword/value pairs may be appended
- keyword = *mol* or *basis* or *ratio* or *subset* or *remap* or *var* or *set* or *rotate* or *overlap* or *maxtry* or *units*

*mol* values = template-ID seed  
     template-ID = ID of molecule template specified in a separate *molecule* command  
     seed = random # seed (positive integer)  
*basis* values = M itype  
     M = which basis atom  
     itype = atom type (1-N) to assign to this basis atom  
*ratio* values = frac seed  
     frac = fraction of lattice sites (0 to 1) to populate randomly  
     seed = random # seed (positive integer)  
*subset* values = Nsubset seed  
     Nsubset = # of lattice sites to populate randomly  
     seed = random # seed (positive integer)  
*remap* value = yes or no  
*var* value = name = variable name to evaluate for test of atom creation  
*set* values = dim name  
     dim = x or y or z  
     name = name of variable to set with x, y, or z atom position  
*radscale* value = factor  
     factor = scale factor for setting atom radius  
*meshmode* values = mode arg  
     mode = *bisect* or *grand*  
     *bisect* arg = radthresh  
         radthresh = threshold value for *mesh* to determine when to split triangles.  
     ↪(distance units)  
     *grand* arg = density  
         density = minimum number density for atoms place on *mesh* triangles (inverse.  
     ↪distance squared units)  
*rotate* values = theta Rx Ry Rz  
     theta = rotation angle for single molecule (degrees)  
     Rx,Ry,Rz = rotation vector for single molecule  
*overlap* value = Doverlap  
     Doverlap = only insert if at least this distance from all existing atoms  
*maxtry* value = Ntry  
     Ntry = number of attempts to insert a particle before failure  
*units* value = *lattice* or *box*  
     *lattice* = the geometry is defined in lattice units  
     *box* = the geometry is defined in simulation box units

## 16.17.2 Examples

```

create_atoms 1 box
create_atoms 3 region regsphere basis 2 3
create_atoms 3 region regsphere basis 2 3 ratio 0.5 74637
create_atoms 3 single 0 0 5
create_atoms 1 box var v set x xpos set y ypos
create_atoms 2 random 50 12345 NULL overlap 2.0 maxtry 50
create_atoms 1 mesh open_box.stl meshmode grand 0.1 units box
create_atoms 1 mesh funnel.stl meshmode bisect 4.0 units box radscale 0.9

```

## 16.17.3 Description

This command creates atoms (or molecules) within the simulation box, either on a lattice, or a single atom (or molecule), or on a surface defined by a triangulated mesh, or a random collection of atoms (or molecules). It is an alternative to reading in atom coordinates explicitly via a *read\_data* or *read\_restart* command. A simulation box must already exist, which is typically created via the *create\_box* command. Before using this command, a lattice must also be defined using the *lattice* command, unless you specify the *single* style with *units = box* or the *random* style. For the remainder of this doc page, a created atom or molecule is referred to as a “particle”.

If created particles are individual atoms, they are assigned the specified atom *type*, though this can be altered via the *basis* keyword as discussed below. If molecules are being created, the type of each atom in the created molecule is specified in the file read by the *molecule* command, and those values are added to the specified atom *type* (e.g., if *type* = 2 and the file specifies atom types 1, 2, and 3, then each created molecule will have atom types 3, 4, and 5).

For the *box* style, the *create\_atoms* command fills the entire simulation box with particles on the lattice. If your simulation box is periodic, you should insure its size is a multiple of the lattice spacings, to avoid unwanted atom overlaps at the box boundaries. If your box is periodic and a multiple of the lattice spacing in a particular dimension, LAMMPS is careful to put exactly one particle at the boundary (on either side of the box), not zero or two.

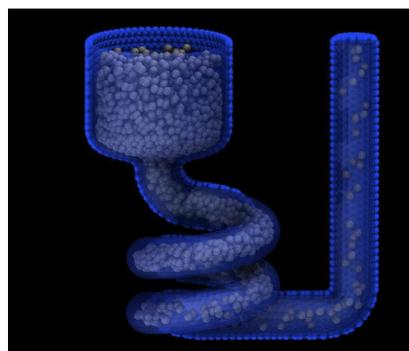

For the *region* style, a geometric volume is filled with particles on the lattice. This volume is what is both inside the simulation box and also consistent with the region volume. See the *region* command for details. Note that a region can be specified so that its “volume” is either inside or outside its geometric boundary. Also note that if a region is the same size as a periodic simulation box (in some dimension), LAMMPS does NOT implement the same logic described above for the *box* style, to insure exactly one particle at periodic boundaries. If this is desired, you should either use the *box* style, or tweak the region size to get precisely the particles you want.

For the *single* style, a single particle is added to the system at the specified coordinates. This can be useful for debugging purposes or to create a tiny system with a handful of particles at specified positions.

New in version 2Jun2022.
